All the nails of a Linx being burned with the skin, beaten into powder, and given in drink, will very much cohibite and restrain abominable Lechery in men: it will also restrain the lust in women being sprinkled upon them: and also very effectually and speedily take away either itch or scurf in man or womans body. The urine of this Beast is accounted very medicinable for those which are troubled with the Strangury, and running of the reins.

The medicines
of the Linx.

The same is also very good and wholesome for the curing of any pain or grief in the winde-pipe or throat; *Bonatus Baro* doth affirm that the nails of Linxes which are in their Countrey, are had in great estimation and price amongst their Peers and Noble men: for there is a very certain opinion amongst them, that those nails being put upon the yard of either Horse or Beast whose urine is kept back or restrained, will in very short space cause them to void it without any grief at all. He reporteth also that their nails do there wax white, and that they include them all in silver, and do commend them for an excellent remedy against the Cramp, if they be worn (peradventure because they are bending and crooked) by which perswasion there are some superstitious men which hang certain roots which are crooked and knotty about them against the Cramp. There are some which do ascertain that these nails are good and ready helps for the soreness of the Uvula which is in the Horses mouthes: and for that cause there are many Horsemen which carry them continually about them.

Pliny.

The Linx or Wolf, which is begotten of a Wolf and a Hinde, the Musk-cat, the Weasill and all such other like Beasts, do more hurt men by their biting teeth-wounds then by poison. There was a certain Hunter, as *Collinus* reporteth, which told him that the flesh of a Linx being sod in some hot pottage or broth, and afterwards eaten, would be a very good and wholesome medicine for the expelling of the Ague, or Quartan Fever; and that the bones of the same Beast being burnt and pounded into powder, would be a very excellent remedy for the curing of wounds which are old and stale, and full of putrifaction, as also the Fistulaes which grow in the thighs or hips of men.

Arnoldus.

Of the Marder, Martel, or Marten.

The several
names.

Two kinds of
Martins.

Places of their
abode.

The use of
their skins, and
how to chuse
the best.

Difference be-
twixt Foins
and Martins.

This beast is called in the Hebrew, *Oach*, or as some say *Ziim*; amongst the *Arabs*, *Easfoz*, or rather *Kachebeon*, or *Kachineon*; in *Latine*, *Martes*; the *Germans*, *Marder*, or *Marter*, like the *English*; the *Italians*, *Marta*, *Martore*, or *Martorello*; the *French*, *Mardre*, or *Foyne*; the *Spaniards*, *Marta*; the *Illyrians* and *Polonians*, *Kuna*; and some latter *Latines* use the words *Marta*, *Martarus*, *Marturus*, and *Marturellus*; and the reason, or etymology of this *Latine* word is taken from *Martia*, which signifieth *Martial*, because this beast in warlike and hostile manner, destroyeth her adversaries, and liveth upon the prey of Hens, Birds, and Mice. The *Germans* divide these into two kinds, which they call by the names of *Tachmarder*, *Huffmarder*, *Steinmarder*, *Buechmarder*, *Feldmarder*, *Wildmarder*, *Thamarder*, *Fiechmarder*, that is to say, the *Fir-martin*, the *Rock-martin*, the *Tame-martin*, the *Beech-martin*, the *Field-martin*, the *Wilde-martin*, and the *Wall-martin*. For they live either in houses, wals, and Temples, or else in rocks, fields, and woods: And yet is not their distinction taken only from the places of their abode, but also from the goodness of their skins.

And therefore the *French* call the word *Martin* by the name of *Foines*: And the skins of the *Fir-martin*, or *Houfe-martin*, are far more beautiful to look upon, then those that live wilde in the trees or Woods. *Agricola* calleth the *Wood-martin* *Baummarder*, because it liveth for the most part in trees, and saith that it never forsaketh the Woods, or very seldom, and therefore in that thing differeth from the *Fir-martin*. But herein he seemeth to be deceived, that he ascribeth to the *Beech-martin*, a loamy or red throat, and also a continual abode among the Woods. For they come sometimes to houses, and to Rocks, for which, as we have said already, it is called a *House-marder*, and *Rock-marder*. And all these multitude of names, do but expresse the two kinds afore-named, whereof the *Fir-Martin* is most excellent; for Princes and great Nobles are clothed therewith, every skin being worth a *French crown*, or four shillings at the least. And they are so much the better, when there are more white hairs aspersed among the yellow.

For their ordinary colour is a deep brown yellow, and these that are clean white, are four times worse then the former; and therefore are not sold for above three or four groats a piece, howsoever the saying of *Martial*, *Venator capta Marte superbus adest*. Here cometh the proud Hunter that hath killed a *Martin*, may very well be applied unto them which take any of these beasts, for they cannot chuse but be very joyful, which get a good sum of money for a little labour, as they have for a *Martins* skin. By inspection of the *Foins*, that is, the *Martins* of the beech; for the *French* men called a *Beech*, *Fau*, from whence cometh the word *Foines*, you may see, that their skins are more dusky, having a tail both greater and blacker then the *Martins* of the *Firs*. And therefore you must understand, that they of the *Firs* are by way of excellency called *Martins*,

and the other of the woods called *Foines*. There is no great difference betwixt their bigness: and if by their skins at any time there seem any inequality, in breadth, or length, it must be attributed to their age and difference of years, and not to any proportion in nature or distinction of kinde. And as we have said that the Fir-Martins are absolutely the best, yet that is not to be understood generally. For the Martins of *Polonia* are so brown, that they are altogether disliked, and are accounted no better then the common Beech-Martins. Wherefore the bright-brown asperfed with white hairs, is ever accounted more pretious without all exception, and by that colour upon the back of the skin, the skinner judgeth of the worth, and not by the yellowness of the throat.

Of these Beech-Martins there are great plenty in the *Alpes*, especially on the South-side, Regions breed-
ing Martins, which look towards *Italy*, but very few of the Wal-Martins. But on those parts of the *Alpes* which look towards *Germany* and the *North*, there are abundance of Fir-Martins with yellow throats, for you must remember that the wilde Martin hath a white throat, and the Fir-Martin a yellow throat.

There are also of both kinds in *Helvetia*, and the most excellent are in the vales towards *Eras Stella*. the *Alpes*. In *France* there are no Martins of the wall, but the Beech-Martins live in hollow beeches. There are also woods full of the Beasts in *Brussia*, which the people there call *Gayni*. *Lanzarucca* a wood of *Scandnavia* fourscore miles long, is full of Martins. Also *Muscovy*, and *Lituania* have store of these Beasts, and *Sabels*. But they of *Lituania*, are the whitest in *Olaus Mag*. the world.

The people of *Sarmatia* in *Europe*, wear garments of these in *Sables*; and the inhabitants of *Jo Bohemus*. *Scythia*, *Hungaria*, neer *Tanais*, do pay yearly unto the Emperor of *Russia*, once called the Duke of *Muscovia*, a certain number of *Sabels* and Martins skins. There are also store of Martins neer *Bragansa*, and generally in all parts of *Europe* except in *England*.

They are in quantity about the bigness of a Cat, having longer bodies, but shorter legs, Their quanti-
ty and several
parts. with heads and tails like a Fox, their skins ordinarily brown, white on the throat, and more yellow on the back.

Their teeth are exceeding white, and unequal, one longer then another, being above measure sharp, and the canine teeth both above and beneath hang out very long. Amongst which on the neather chap, stand six small cutting teeth in a right line over against one another, which I think happeneth not in any other Beast of the world. The grinding teeth are like a saw, being triangular in fashion, eight above and eight beneath. Whereof the furthestmost upon the uppermost side of the mouth, are more deep and inward in the palat, then all the residue, the whole number is thirty two. The long hairs upon their upward lip doe bend clean backwards.

Notwithstanding that there be two kindes of this Beast, as already we have said, yet do the Their copula-
tion. Wood-Martins, or Beech-Martins, greatly desire copulation with the other, wherefore *Albertus* saith, *Miscetur inter se hec genera, & Martes phagi, fere sequitur, Martem abietum, tanquam nobiliorem, ut satum ex ea nobiliorem acquirat.* The Beech-Martin followeth the Fir-Martin, and desireth her copulation as the nobler kind, that he may thereby dignifie his own issue. It should seem that they breed in *March*, and make their nests like the draies of Squirrels, and bring forth many at a time; For it was constantly affirmed by a Countrey-man of *Germany*, that he found a nest of these Martins builded like a Squirrels, having four young ones in it, in the beginning of *April*.

If they be taken when they are young, both one and other kind grow wonderful tame and familiar with Men and Dogs. And *Gejner* had one of these, which loved a little Dog wonderfully, and would follow him abroad whithersoever he went, far or neer. It would also play with Dogs and Men, with teeth and nails, lying flat upon the back like a Cat, and never give any little hurt. But loosened from his chain it would wander abroad into the neighbours houses, and many times far off, but alwayes returne home again. They which tame them, because that they are easily exasperated, and bite deeply when they are angry, do break off the tops of their canine teeth, with a pair of pinsons for the preventing of that mischief. *Ruellius* affirmeth, that the excrement of this Beast smelleth like a Musk-cat, and saith the reason of it is, because they feed upon sweet fruits; but we have heard that they eat Pullen-birds, Eggs, and Mice, but that they eat of fruits it cannot be proved. I rather attribute it unto their own nature. For as the Martin-ape smelleth sweetly after her meat, so may this Martin-weasel render a sweet excrement. To conclude, the skins of these beasts is applyed to gowty legs, and the white hairs of the throat made into a cap, is very soverain for the head-ach. They may be taken with Dogs, or in traps, but commonly they are taken in ditches or pitfalls, according to this Verse of *Calentius*, wherewithal I will conclude;

Et laqueo vulpes, & decipe casse foinas.

Of the MOLE or WANT.

The several
names.

I Do utterly dissent from all them that hold opinion that the Mole or Want is of the kind of Mice, for that all of them in general, both one and other, have two long crooked foreteeth which is not in Moles, and therefore wanting those as the inseparable propriety of kinde, we will take it for granted that it pertaineth not to that rank or order of four-footed Beasts. But concerning the Hebrew name thereof, there is much variance, and little certainty amongst writers. Some of them calling it *Tinschemet*, which word is found Deut. 14. which is also translated by the Chaldees, *Bota* or *Baveta*, a Swan, and the Septuagints and Jerom, *Ibis*, and Rabbi Solomon in another place of the same Chapter translateth it a Bat, which the French call *Chaulve-souris*. But in that place of Levit. 11. where the *Stellio*, the *Lizard*, and *Tinschemet*, are reckoned unclean Beasts; Rabbi Solomon interprets it *Talpom*, the Mole. The Septuagints, *Aspalax*; the Caldee, *Aschuta*; the Arabian, *Lambaraz*; the Persian, *Angurbah-dedach*. There is a sentence, Isa. 2. in Hebrew thus, *Lachepur perot velatalephim*: which by Munster is thus translated, *In die projiciet homo aureos & argenteos deos, in fossuras talpae & vespertilionum*. In that day shall a man cast away his goods of silver and gold into the holes of Moles and Bats. By S. Jerom it is translated thus, *Projiciet homo Idola, usque ut adoraret talpas & vespertiliones*. A man shall cast away his Idols to worship Moles and Bats. Some again make but one word of *Lacheporperot*, and translate it a Beast digging ditches; and the Septuagints, Idols or abominations, and think that they were so called, because their outward forme representeth some such reptile creature, and *Symmachus*, unprofitable things; but *Aquila*, *Orugas*, digging Beasts: and therefore at this day all the learned take *Perot* for Moles, so called by reason of their digging. *Avicen* calleth it *Pelagoz*, a blinde Mouse. In Greek it is called sometimes *Spalax*, but more often *Aspalax*: yet *Albertus* calleth it by a strange Grecian name *Colti* and *Koky*, which he took from *Avicen*. The Italians retain the Latin word *Talpa*; the Spaniards, *Topo*, by which word the Italians at this day call a Mouse. The French call it *Taulpe*; the Germans, *Mulwurf*, and in Saxon, *Molwurffe*, from whence is derived the English Mole, and Molewarp. The Helvetians, *Scher* and *Schermouse*, and the Molehil they call *Scherusen* of digging. The Hollanders and the Flemmings call it *Mol* and *Molmuss*, in imitation of the German word: the Illyrians, *Krtize*. And generally the name is taken from digging and turning up the earth with her nose and back, according to the saying of Virgil;

Aut oculis capti fodere cubilia Talpae.

Some are of opinion, that it is called *Talpa*, because it is appointed to an everlasting darkness in the earth; of which sort *Isidorus* writeth thus, *Talpa dicta est eo quod perpetua caecitate tenebris damnata, est enim absque oculis*.

It is called also in Greek, *Indouros*, and *Siphneus*, of *Siphnon* the earth, because it liveth in the earth, and turneth it upward to make it hollow for passage. The like I might say of his other names, *Ixliocho*, and *Orthoponticos*; But this shall suffice for his name.

Countries of
Moles.

Aristotle.

Ælianus.

Pliny.

Generation of

Moles.

In *Bæotia* about the *Champaignes* called *Orchomenius ager*, there are the greatest store of Moles in the world: for by digging they undermine all the fields, and yet in *Lebadia* another Country of *Bæotia*, there are none at all, and if they be brought thither from any other place they will never dig but die. *Rodolphus*, *Oppianus*, and *Albertus* affirm, that they are created of themselves of wet earth and rain water, for when the earth beginneth to putrifie, the Mole beginneth to take life.

They are all for the most part of a black duskie colour, with rough, short and smooth soft hair as wooll, and those hairs which were whitest when they are yong, are most glistering and perfect black when they are old: and *Gesner* affirmeth that he saw in the end of *October*, a Mole taken which was very white, mixed with a little red, and the red was most of all upon her belly, betwixt her forelegs and

and the neck, and that it could not be a young one, because it was two palms in length betwixt his head and tail.

These Beasts are all blinde and want eyes, and therefore came the proverb *Talpa cecior, Taphlote-* Blindness of
ros a spalacos, blinder then a Mole; to signifie a man without all judgement, wit or foresight; for Moles:
it is most elegantly applyed to the minde. Yet if any man look earnestly upon the places where they should grow, he shall perceive a little passage, by drawing up the membrane or little skin which is black, and therefore *Aristotle* saith of them in this manner probably;

All kindes of Moles want their sight, because they have not their eyes open and naked as other Beasts, but if a man pull up the skin of their browes about the place of their eyes, which is thick and shadoweth their sight, he shall perceive in them inward covered eyes, for they have the black circle, and the apple which is contained therein, and another part of the white circle or skin, but not apparently eminent; neither indeed can they, because nature at the time of generation is hindered, for from the brains there belong to the eyes two strong nervie passages, which are ended at the upper teeth, and therefore their nature being hindered, it leaveth an imperfect work of sight behinde her.

Yet there is in this Beast a plain and bald place of the skin where the eyes should stand, having outwardly a little black spot like a Millet or Poppey-feed, fastened to a nerve inwardly, by pressing it, there followeth a black humor or moistness, and by dissection of a Mole great with young, it is apparent (as hath been proved) that the young ones before birth have eyes, but after birth, living continually in the dark earth without light, they cease to grow to any perfection; for indeed they need them not, because being out of the earth they cannot live above an hour or two. *Albertus*

Esop hath a pretty fable of the Asse, Ape, and Mole, each once complaining of others natural wants; the Asse, that he had no horns, and was therefore unarmed; the Ape, that he had no tail like other Beasts of his stature and quantity, and therefore was unhandsome; to both which the Mole maketh answer, that they may well be silent, for that she wanteth eyes, and so insinuateth, that they which complain shall finde by consideration and comparison of their own wants to others, that they are happy and want nothing that were profitable for them.

Oppianus saith, that there was one *Phineus* which was first deprived of his eye-sight, and afterward turned into a Mole: It should seem he was condemned first to loose his eyes, and afterward his life.

These Moles have no ears, and yet they hear in the earth more nimbly and perfectly then men can above the same, for at every step or small noise and almost breathing, they are terrified and run away, and therefore (*Pliny* saith) that they understand all speeches spoken of themselves, and they hear much better under the earth then being above and out of the earth. And for this cause they dig about their lodging long passages, which bringeth noises and voices to them, being spoken never so low and softly, like as the voice of a man carryed in a trunk, reed or hollow thing. Their several parts and members.

Their snout is not like a Weasils, as *Suidas* saith, but rather like a Shrew-mouses, or (if it be lawful to compare small with great) like to a Hogs. Their teeth are like a Shrews and a Dogs; like a Shrews in the neather teeth and furthestmost inner teeth, which are sharp pointed and low inwardly; and like a Dogs, because they are longer at the sides, although only upon the upper jaw, and therefore they are worthily called by the *Grecians*, *Marootatous*; that is dangerous biting teeth, for as in Swine the under teeth stand out above the upper, and in Elephants and Moles, the upper hang over the neather, for which cause they are called *Hyperphereis*.

The tongue is no greater then the space or hollow in the neather chap, and they have in a manner as little voice as sight, and yet I marvel how the proverb came of *Loquax Talpa*, a prating Mole, in a popular reproach against wordy and talkative persons, which *Ammianus* saith, was first of all applyed to one *Julianus Capella*, after he had so behaved himself, that he had lost the good opinion of all men.

The neck seemeth to be nothing, it is so short, standing equall with the forelegs. The lights are nothing else but distinguished and separated *Fibres*, and hang not together upon any common root or beginning, and they are placed or seated with the heart, which they enclose, much lower toward the belly then in any other Beast. Their gall is yellowish, their feet like a Bears, and short legs, wherefore they move and run but slowly; their fingers or toes wherewithal they dig the earth, are armed with sharp nails, and when she feeleth any harm upon her back, presently she turneth upward and defendeth her self with her snout and feet: with her feet she diggeth, and with her nose casteth away the earth, and therefore such earth is called in *Germany*, *Mal werff*, and in *England*, *Mole-bill*: and she loveth the fields, especially meddowes and Gardens, where the ground is soft, for it is admirable with what celerity she casteth up the earth. *Cardanus*

They have five toes with claws upon each forefoot, and four upon each foot behind, according to *Albertus*, but by diligent inspection you shall finde five behind also, for there is one very little and recurved backward, which a man slightly and negligently looking upon, would take to be nothing. The palm of the fore-feet is broad like a mans hand, and hath a hollow in it if it be put together like a fist, and the toes or fingers with the nails are greater then any other beasts of that quantity. And to the end that he might be well armed to dig, the forepart of her fore-legs consist of two solid and sound bones which are fastened to her shoulders, and her claws spread abroad, not bending downward, and this is peculiar to this Beast not competent to any other, but in her hinder legs both before and behind they are like a Mouses, except in the part beneath the knee, which consisteth

but of one bone which is also forked and twisted. The tail is short and hairy. And thus much for the Anatomy and several parts.

The places of
their abode.

They live as we have said in the earth, and therefore *Cardan* saith, that there is no creature which hath blood and breath that liveth so long together under the earth, and that the earth doth not hinder their expiration and inspiration; for which cause they keep it hollow above them, that at no time they may want breath, although they do not heave in two or three dayes; but I rather believe when they heave, they do it more for meat then for breath, for by digging and removing the earth they take Wormes, and hunt after victuals.

When the Wormes are followed by Moles, (for by digging and heaving, they foreknow their own perdition) they flie to the superficies and very top of the earth, the silly beast knowing that the Mole their adversary, dare not follow them into the light, so that their wit in flying their enemy is greater, then in turning again when they are trod upon. They love also to eat Toads and Frogs, for *Albertus* saith, he saw a great Toad whose leg a Mole held fast in the earth, and that the Toad made an exceeding great noise, crying out for her life, during the time that the Mole did bite her. And therefore Toads and Frogs do eat dead Moles. They eat also the root of Herbs and Plants, for which cause they are called by *Oppianus*, *Poiophagi Herbivora*, herb-eaters.

Enemies to
Moles.

In the month of *July* they come abroad out of the earth, I think to seek meat at that time when wormes be scanty. They are hunted by Weasils, and wilde Cats, for they will follow them into their holes and take them, but the Cats do not eat them: whereas we have said already, that they have an understanding of mens speech when they hear them talk of them;

Understand-
ing of Moles.

I may add thereunto a story of their understanding, thus related by *Gillius* in his own experience and knowledge. When I had (saith he) put down into the earth an earthen pot made of purpose with a narrow mouth to take Moles, it fortuned that within short space as a blind Mole came along she fell into it and could not get forth again, but lay therein whining; one of her fellowes which followed her seeing his mate taken, heaved up the earth above the pot, and with her nose cast in so much, till she had raised up her companion to the brim and was ready to come forth: by which in that blind creature confined to darkness, doth not only appear a wonderful work of Almighty God, that endoweth them with skill to defend, and wisely to provide for their own safety, but also planted in them such a natural and mutual love one to another, which is so much the more admirable, considering their beginning or creation as we have shewed already. Because by their continual hearing and laboring for meat, they do much harm to Gardens and other places of their abode, and therefore in the husband-mans and house-wifes common-wealth, it is an acceptable labor to take and destroy them. For which cause it is good to observe their passages, and mark the times of their coming to labor, which being perceived, they are easily turned out of the earth with a spade, and this was the first and most common way.

Taking of
Moles.

Some have placed a board full of pikes which they fasten upon a small stick in the mole hil or passage, and when the mole cometh to heave up the earth, by touching the stick she bringeth down the pikes and sharp nailed boards upon her own body and back. Other take a Wyar of Iron, and make it to have a very sharp point, which being fastened to a staffe and put into the earth where the Moles passage is, they bend and so set up, that when the Mole cometh along, the pike runneth into her and killeth her.

The *Grecians* (saith *Palladius*) did destroy and drive away their Moles by this invention, they took a great Nut, or any other kind of fruit of that quantity, receipt and solidity, wherein they included Chaffe, Brimstone and Wax, then did they stop all the breathing places of the Moles, except one at the mouth, wherein they set this devise on fire, so as the smoak was driven inward, wherewithal they filled the hole and the place of their walks, and so stopping it, the moles were either killed or driven away.

Paramus.

Also *Paramus* sheweth another means to drive away and take Moles: If you take white Hellebor, and the rindes of wilde Mercury in stead of Hemlock, and dry them and beat them to powder, afterward sift them and mix them with meal and with milk beaten with the white of an Egge, and so make it into little morsels or bals, and lay them in the Mole-hole and passages, it will kill them if they eat thereof, as they will certainly do.

Use of their
several parts.

Many use to kill both Moles and Emmets with the froath of new Oyl. And to conclude, by setting an earthen pot in the earth and Brimstone burning therein, it will certainly drive them forever from that place. Unto which I may add a superstitious conceit of an obscure Author, who writeth, that if you whet a mowing sythe in a field or meddow upon the feast day of Christs Nativity (commonly called Christmas day) all the Moles that are within the hearing thereof, will certainly for ever forsake that field, meddow or Garden.

With the skins of Moles are purses made, for the rough and soft hair, and also black russet colour is very delectable. *Pliny* hath a strange saying, which is this; *Ex pellibus talparum cubicularia vidimus stragula; adeo ne religio quidem a portentis summovet delicias*; that is, We have seen the hangings of Chambers made of mole skins, so that no conscience of religion cannot avert the monstrous love of delights from the affectation of men.

For all the ancient Wise men and Magicians did hold, that this beast was capeable of Religion, *Nullis eque credunt extis, nullum Religionis capax animal, ut si quis cor ejus recens palpantq; devorant, divinationis. & rerum efficiendarum eventus promittat*; they give not so much credit to any intrails

intrails as to theirs; for they judge that no beast is so capable of Religion, because if a man eat the heart of a Mole newly taken out of her belly and panting, he shall be able to divine and foretel infallible events. Another saith, *Veteribus monumentis traditur Gallinaceorum fibras maxime diis gratas videri: sicut Talparum viscera Magi verissima dicunt, illisq; haud secus quam solenni victimam litari, haec enim sunt exta argutissima, in quibus divina mens inesse creditur*: that is, the fibres of Cocks were wont among ancient Monuments to be accounted most acceptable to the Gods, even as the bowels of Moles (as the wise men say) and to offer these as a most solemn sacrifice grateful to the Gods, and that in those intrails it was believed that the minde and pleasure of God was sealed and engraven; and a little after he saith, that the bowels of Moles and frogs do foretel many great and fortunate events.

Alex. ab Al.

But I will leave this paganism, and let it never enter into the heart of a reasonable man, that such beasts can love Religion, or that God hath planted in their bowels and corrupt parts, such letters of his wisdom and fore-knowledge, which he hath not granted to the immortal and incorruptible soul of man. Only this I finde by experience, that before any rain and change of weather, these silly beasts heave up the earth more abundantly then at other times; and that in *Thessaly* (as *Varro* saith) a whole Town was once undermined by Moles. They were wont to sacrifice this beast to *Neptune*, because of the affinity betwixt their names, for in *Greek* *Alphalos*, signifieth *Neptune*, and *Asphalax*, a Mole. *Alunus* also writeth, that they were sacred and dedicated to Hell, because they kept continually within the bosom and bowels of the earth; and to conclude, because that Moles would not live in *Coronea* a part of *Boetia*, before spoken of, and thereof came the common proverb, *Asphalacaeis Coronean*, a Mole is brought to *Coronea*, to signifie the hatred of a gift or ghelt to him that is forced to receive him. Thus much for his natural and moral story; now followeth his medicinal.

The Medicines of the Mole.

There is nothing which is more profitable or medicinable for the curing of the bites of a Shrew, then a Mole being head and clapped thereunto. The same doth also very effectually cure and heal the blows or bitings of a Scorpion. Pills being made with that which proceedeth from Moles with *Pliny*. Hony, eaten nine days together, doth preserve the body of any one from swellings or bunches in the flesh, who shall so eat them. For the avoiding or driving away the hairs which grow in any part of mans body, that they may never return or be renewed again: Take a Mole and lay her in water to be steeped or soaked, so long as she shall not have any hairs left upon her, with this water anoint the place which is full of hairs, and afterwards wash it with lie made of ashes, and then rub it with a linnen cloth; then if you shall see the hairs to return again, wash it twice or thrice in the aforesaid manner, and they will be quite expelled away, and by no means can be made either to renew or come again. For the renewing, and bringing again of those hairs which are fallen or decayed, take a Mole, and burn her whole in the skin, and mingle the dust or powder which cometh from the same with Hony unto the thickness or fashion of an Ointment, and this being rubbed or anointed upon the bare or bald place will without doubt in some short time or space procure the hair to grow thick. For the renewing of hairs which fall from Horses; Take a Mole and boil her in Oyl, until all the flesh be consumed and quite dissolved into a liquid juyce, with this Oyl anoint the place which is bare or destitute of hairs twice every day for some short space, and it will make the hairs to grow in great abundance.

Pliny.

Arnoldus.

Furnerius.

Ruffus.

For the changing of the hairs of Horses from black to white, take a Mole and boil her in Salt water, or lye made of ashes three days together, and when the water or lie shall be quite consumed, put new water or lie thereunto: this being done, wash or bathe the place with the water or lie somewhat hot; presently the black hairs will fall and slide away, and in some short time there will come white. Whosoever shall take a Mole and hold her in his right hand until she die, shall have such an excellent vertue therein, that she shall ease the pain of a womans breasts only by touching them.

The dust of a Mole being burnt, mingled with the white of an Egge, and anointed upon a Sheep, is an excellent and medicinable remedy against the Leprie, which cometh oftentimes upon them. The dust of a Mole mixed with Oyl or Hony, and anointed upon the skin of either man or woman which is full of Leprie, will very speedily and effectually cure and heal the same. The same being used in the aforesaid manner, is very good for the curing of those which are troubled with the disease called the Kings Evil; as also for those which have hard bunches or kernels arising in their arm-holes, and in other parts of their body.

Pliny.

Marcellus.

The whole body of a mole being taken and burned in the skin into dry dust, or powder, is an excellent remedy against the disease called the Fistula, as also for the purging of the corruption in them and healing of them, being once taken by any man. The same being also mixed with Hony, and rub'd upon the teeth of any one who hath pain in them, doth not only ease the pain and grief thereof, but also doth strengthen and make them fast. The blood of a Mole being killed, spread or anointed upon the head of any one which is bald, will very speedily renew and bring the hairs again. The head of a mole being cut off and beaten together with the earth which is stirred up by Moles, and wrought into a paste, and rowled together like a little loaf, is very much used for the healing of all swellings, and for those things which they call Impostumes; as also for all swellings or kernels

Vincenius.

Sextus.

which

which arise in the neck; so that in the time of the curing of these things, the party which is pained and grieved, be not suffered to eat any Swines flesh.

Obscurvi.

The tooth of a living Mole taken out and tyed or bound to the teeth of any who is grieved therein, is commended by the *Magi*, or Wise-men to be an excellent remedy and cure for the same. The heart of a Mole being eaten nine days together, doth very speedily and effectually cure either him or her which shall so eat it, of that pestiferous disease call'd the Kings Evil, if it be so that it hath not been of too long continuance with them. The same is also very good and profitable for the asswaging of Wens, being used in the aforesaid manner. The liver of a Mole being beaten between the hands of him that is troubled with bunches or swellings in his back, and afterwards put upon the same, is a present help and cure. The same effect hath the right foot of a Mole for the asswaging of bunches and swellings arising in the flesh.

of sundry crea-
tures from the
Moufe.

Pausanias.

As we have handled the natures, and delivered the figures of the great beasts, so also must we not disdain in a perfect History to touch the smallest: For Almighty God which hath made them all, hath disseminated in every kinde both of great and small beasts, seeds of his Wisdom, Majesty, and glory. The little Mouse therefore is justly tearmed, *Incola domus nostrae*, an inhabitant in our own houses, *Et rofor omnium rerum*, and a gnawer of all things. And therefore from the sound of her teeth which she maketh in gnawing, she is called *Sorex*. Although we shall shew you afterwards, that *Sorex* is a special kinde, and not the name of the general. Wherefore seeing there be many kindes of Mice, and every one of them desireth a particular tractate, I thought good to begin with the Vulgar little Mouse, and so to descend to the several species and kindes of all, according to the method of the Philosopher, *A notioribus ad minus nota*, from things that are most known to them that are less known. In Hebrew it is called *Achar*, Levit. 11. where the *Septuaginta* translate it *Mys*; the *Chaldee*, *Acbera*; the *Arabians*, *Fer*, or *Phar*; from whence cometh the *Saracen* word *Fara*. The *Persians*, *An Mus*; the *Latines*, *Mus*; the *Italians*, *Topo*, or *Sorice*, *Alforgio*, *O Rato*, *Di casa*, although *Rato* signifieth a Rat, both among the *Germans*, *French*, and *English*. The *Spaniards* call the little Mouse, *Rat*; and the great Rat, *Ratz*; the *French* the little Mouse, *Souris*; which word seems to be derived from the *Latine*, *Sorex*, and the great Mouse they call *Ratt*. The *Germans* the great ones *Ratz*, and the little one *Mys*; the *Illyrians* and *Polonians*, *Myss*, which is the *Greek* word; and the great one they call *Sczurcz*; the *Venetians* call the Rat *Pantegana*, of *Pontis* the vulgar *Greek* name, and the *Romans*, *Sourco*.

Now the dignity of this little beast, may appear by the name, which hath spread it self both to beasts, fishes, men, herbs, and Cities. To beasts as we have shewed before in the *Ichneumon*, which is vulgarly called the *Indian* Mouse, or *Pharaohs* Mouse. And to fishes, for there is a little fish called *Musculus*, and in *Greek*, *Mystocetus*, the Whale-mouse, because it leadeth the way, and sheweth the Whale whither soever she swimmeth, for the avoiding of Rocks, (according to *Pliny*) although *Rondelietus* affirmeth otherwise, namely, that that guide of the Whale is called *Egemon*, and *Egetur*, and *Mystocetus* (he saith) is a shell-fish. Generally most kinde of Oysters are also called *Myss*, because sometimes they gape and make a noise like a Mouse, and close their shells again. The purple fishes be also called *Myss*; there is likewise a kinde of pretious stone called *Mya*, about *Bosphorus Thracius*, and many other such dignities, hath the the name of this beast attained.

There was one *Mys*, the servant of that famous Philosopher *Epicurus*; likewise the name of a Champion or Challenger, in *Suidas* and *Varinus*, and there was another called *Mus*, of excellent skill for engraving in Silver; and therefore did draw upon the shield of *Minerva*, the fight betwixt the *Lapithae*, and the *Centaurs*, and many other things. Whereupon *Martial* made this verse;

Quis labor in Ibiola? docti Myos? anne Myronis?

There

There was a Consul of Rome, whose name was *Mus*, and therefore *Camerarius* made this Riddle of the Mouse; *Parva mihi domus est, sed janua semper aperta, Acciduo sumptu, furtiva vivo sagina, Quod mihi nomen inest, Rome quoque Consul habebat.* The Thracians call'd *Argilus* a Mouse, and the City which he builded *Argelus*. *Myes* was a City of *Ionia*, and a Citizen of that City was called *Myetius*. *Myon* a City of *Locri* in *Epirus*, and the people thereof are called *Myones*. *Myonesus*, a little Region betwixt *Teon* and *Lebedon*, and according to *Stephanus*, an Island near *Ephesus*; the first Port or Haven of *Egypt*, opening to the Red Sea, is called *Muos arnos*, the Mouses haven; and *Mysia* also seemeth to be derived from their stem. There is an Island under the Equinoctial line, called *Insula Murium*, the Mouse Island, because of the abundance of Mice therein: and to conclude, even the herbs and plants of the earth, have received names from this little beast, as *Hordeum*, *Murinum*, *Myacantha*, *Sperage*, *Myopteron*, *Myuon*, *Myartocon*, Mouse-ear, Mouse-foot, and such like. There have been also Comedies made of *Mys*, as that of *Carfinus*, called *Myes*, wherein the Weasel strangleth the night-wandering *Mys*. And another Greek, called *Galeomyomachia*, that is a fight betwixt Cats and Mice, wherein the Poet doth most pleasantly feign names of Mice, as their King he calleth *Creillus*, that is, a flesh-eater, and his eldest son *Pficarpax*, a corn-eater; and his second son *Pfitodarpes*, bread-eater, and his eldest daughter, *Lychopluphe*, candle-eater; and all his Ancestors *Carpodaptai*, that is, fruit-eaters. And then he bringeth other Mice in, as *Turolicos*, *Pficolices*, *Choleoclophos* *Homer* in his *Batrachomyomachia*, that is, a fight betwixt Frogs and Mice, doth very elegantly describe divers proper names of Mice. As *Pficarpax*, whose father was *Tuoxartes*, and his mother *Lychomile*, daughter of *Pternotrocha* the King, and then other Mice, as *Lychopinax*, *Teroglyphus*, *Embaschitrus*, *Lychenor*, *Trogodites*, *Actophagus*, *Pternogli-phus*, *Pternopagus*, *Cnissodictes*, *Sitophagus*, *Artophilus*, *Meridarpax*, and *Thulacotrox*, all which are not only out of the abundance of the Authors wit, but invented for the expressing of the Mouses nature.

Thehetus.

Fictions learned and witty of the proper names of Mice.

The Epithets of Mice are these; short, small, fearful, peaceable, ridiculous, rustick, or Country Mouse, urbane, or City Mouse, greedy, wary, unhappy, harmful, black, obscene, little, whiner, biter, and earthly. And the Greek ones are expressed before in the proper names, and thus much may suffice for the names of Mice. Now to come to their several nature and significations. First of all concerning their colour. It is divers, for although *Color murinus* be a common term for a Mouse colour of Asses, yet notwithstanding Mice are sometimes blackish, sometimes white, sometimes yellow, sometimes brown, and sometime ash colour. There are white Mice among the people of *Savoy*, and *Dauphin* in *France* called *Allobroges*, which the Inhabitants of the Countrey do believe that they feed upon snow. But the white Mouse is above all other most lascivious and lecherous; and therefore it came into a proverb, *Mys Leucos*, *Mys Cacos*, the white Mouse is an ill Mouse, of whose lust *Alciaus* made this Emblem;

The colour of Mice.

Scaliger. Albertus.

The quantity and several parts of Mice, Mathaeolus.

*Delitias & molliem, Mus creditur albus,
Arguere; at ratio non sat aperta mihi est.
An quod ei natura salax, & multa libido est?*

*Ornat Romanus an quia pelle nurus?
Sarmaticum Murem vocitant plerique bellum,
Et celebris suavi est unguine Muscus Arabs.*

Aristotle. Cicero.

Of all which conjectures of the Poets, the first is most probable; for the Ancients were wont to call wanton and effeminate men *Pyrgoi*, and *Leucopygoi*, from their beauty and whiteness. And as there is a difference in their colours, so also there is in their quantity: For some are very great, some meanly great, and some very small. Their heart is very great, and their liver and lights increase in the Winter time. Also the fibres that are in them, do increase and decrease with the waxing and waning of the Moon. For every day of the Moons age, there is a fibre increased in their liver. And therefore *Lucilius* said well, *Luna alit ostrea, & implet echinos, & Muribus fibras auget*: that is to say, The Moon feedeth Oysters, filleth Hedgehogs, and encreaseth fibres in Mice. Some of these Mice have a gall, and some have none, as *Aristotle* and *Pliny* shew in many places.

The Mouses place of conception have many holes in it, during the time she beareth her young ones. There is no creature that heareth more perfectly than a Mouse, they dwell in houses of men, especially near supping and dining rooms, kitchens, or larders, where any meat is stirring. And they make themselves places of abode by gnawing with their teeth, if they finde not convenient lodgings prepared to their hand, and they love the hollow places of wals, or the roofs of houses; and therefore the Wasps which in *Aristophanes* are called *Drophæ*, that is, gnawers of roofs, are to be understood to be Mice, because *Mys Drophia* is a Mouse in the house top. In the day time they lie still, so long as they either see or hear a man, or any other beast harmful unto them, for they discern their enemies; not fearing an Ox, though they run away from a Cat.

Albertus.

Orus.

Aelianus.

They are very desirous of bread, and delight in all those meats which are made of fruit, for the nourishment of men. It is a creature very diligent and exquisite, both to compass, seek out and chuse the same, so that therefore it doth often endanger and lose his own life: and finding any cubboards, wood, or such like hard matter, to withstand his purpose, and hinder his passage, it ceaseth not to weary it self with gnawing, until it obtain the purpose. All kindes of Mice love grain and corn, and prefer the hard before the soft; they love also Cheese, and if they come to many Cheeses together, they tast all, but they eat of the best. And therefore the Egyptians in their Hieroglyphicks do picture a Mouse, to signifie a sound judgement and good choice. Buckmast is very acceptable to Mice, and the Mice in the Isle *Parus*, in *Tenedos*, in the Island *Gyaros*, which is one of the Islands of the *Sporads* in *Cyprus*, and in *Chalcis*, they did eat Iron, as appeareth by *Aristotle*, *Aelianus*, and *Heraclides*. And

it

it was also found, that in a certain Island near *Chalybes*, Mice eat and devour gold, and therefore the Gold-smiths did cut them in pieces among their metals. *Plutarch*, in the life of *Marcellus* saith, that there were many prodigies and fearful signes that did precede the war of *Marius*, amongst other, he saith that Mice did eat the Gold hanging in the Temple, and that one of the Temple-keepers in a certain trap took a female Mouse alive, who littered five little Mice in that place, and devoured three of them. *Anthologius* rehearseth a witty Hexastichon of *Antiphilus*, upon a Mouse which was slit asunder alive, for certain Gold-dust, which she had devoured, whereby was signified how men procure unto themselves exquisite torments, and unavoidable mortal harms by stealing, and increasing of riches signified by Gold. Vulgar Mice do ruminare or chew the cud as well as the Pontick, and they drink by licking or lapping, although their teeth be not sawed. It is reported that the Mice of *Africk*, and especially of *Lybia*, die assoon as they drink. And the reason thereof we will shew afterwards in the taking of Mice, when we come to discourse of their poysons. And for the present it should seem their temperament, or constitution is so moist, that nature can endure no addition. Yet in the plains of *Arcadia*, there are Mice which drink of a certain Fountain without any harm.

Pliny.

Albertus.

Mice cannot drink without danger.

Theophrastus.

Generation of Mice, and their carnal copulation.

The generation and procreation of Mice, is not only by copulation, but also nature worketh wonderfully in ingendering them by earth and small showers, as we will shew in the discourse of wilde Mice.

But the house Mouse whereof we now intreat, is engendered by copulation betwixt male and female, and they are in general most libidinous, as may appear by that saying of *Cratinus* against *Xenophon*, *Phere nun ex aibrias Katapuposunen muos astrapso Xenophontos*, go to now, for from the skies I will strike by lightning the *Murina* wantonness of *Xenophon*: and the female is much more venereous then the male, as appeareth by that fable of *Ipicrates* describing the rage of a lustful woman. *Postremo subiit me detestabilis lena, dejerans per Dianam, per puellam, per Persephattam, se esse vitulam, esse virginem, esse pullam indomitam, at illa myonia erat.* Then followed me that detestable baud, swearing by *Diana*, and *Persephatta*, that she was a Heifer never touched, a Virgin never stained, and a Colt never covered, but the truth is, she was as good a Maid as a Mouse. *Politianus* in stead of *at illa myonia erat*, hath *at illa cavus erat Murinus*, that she was a Mouses hole, signifying that her virginity was lost, and that she suffered any lovers, as a Mouse-hole doth any Mice. And from hence came that verse of *Martial*, describing the speech of a lover to his love, calling him her Mouse and her Joy;

Nam cum me Muremtu, cum mea lumina dicis.

Albertus.

Copulation of Mice.

So that in general all Mice, and not only the white Mouse, are most desirous of copulation. And when they are in copulation, they embrace with their tails, filling one another without all delay. By tasting of Salt, they are made very fruitful, and therefore *Aristotle*, and the Souldiers of *Alexander* the Great, do report, that Mice by licking one another, and by the licking of Salt, do ingender & conceive with young without any other copulation. But what reasons they have to lead them to that opinion, I know not; beside that wonder reported by *Pliny* and *Aristotle*, that in a certain part of *Persia*, a female Mouse being slit asunder alive, all the young females within her belly are also found pregnant conceived with young.

Two miracles in their procreation and multiplication.

It is very certain, that for the time they go with young, and for the number they bring forth, they exceed all other beasts, conceiving every fourteen or sixteen days, so that it hath been found by good experience, that a female Mouse having free liberty to litter in a vessel of millet-seed, within less compass then half a year she hath brought forth one hundred and twenty young ones.

Volaterranus.

Gillius.

Whether Mice be docible.

They live very long, if they be not prevented of their natural course, and dying naturally, they perish not all at once, but by little, and little, first one member, and then another, (*Pliny* saith) *Evolucirbus hirundines sunt indociles, e terrestribus Mures*, among the Fowls of the air, the Swallows are undocible, and among the creatures of the earth, a Mouse; *Albertus* writeth, that he saw in upper *Germany*, a Mouse hold a burning Candle in her feet, at the commandment of her Master all the time his guests were at Supper.

Now the only cause why they grow not tame, is, their natural fear, such as is in Conies, Hares, and Deer. For how can any man or beast love or hearken unto him, who they are perswaded lyeth in wait for their life, and such is the perswasion of all them that fear; which perswasion being once removed by continual familiarity, there is no cause in nature, but that a Mouse may be docible as well as a Hare or Cony, which we have shewed heretofore in their stories.

Prefages and fore-knowledge of Mice.

It is also very certain that Mice which live in a House, if they perceive by the age of it, it be ready to fall down or subject to any other ruin, they foreknow it and depart out of it, as may appear by this notable story which happened in a Town called *Helice* in *Greece*, wherein the Inhabitants committed this abominable act against their neighbours the *Greeks*. For they slew them, and sacrificed them upon their Altars: Whereupon followed the ruine of the City, which was premonstrated by this prodigious event. For five days before the destruction thereof, all the Mice, Weefils, and Serpents, and other reptile creatures, went out of the same in the presence of the Inhabitants, every one assembling to his own rank and company, whereat the people wondered much, for they could not conceive any true cause of their departure; and no marvail. For God which had appointed to

take

to take vengeance on them for their wickedness, did not give them so much knowledge, nor make them so wise as the beasts to avoid his judgement, and their own destruction; and therefore mark what followed. For these beasts were no sooner out of the City, but suddenly in the night time, came such a lamentable Earth-quake and strong tempest, that all the houses did not only fall down, and not one of them stood upright, to the slaughter of men, women, and children, contained in them; but lest any of them should escape the strokes of the timber and house tops, God sent also such a great flood of waters, by reason of the tempestuous winde which drove the waters out of the Sea upon the Town, that swept them all away, leaving no more behinde then naked and bare significations of former buildings. And not only the City and Citizens perished, but also there was ren ships of the *Lacedemonians* in their port all drowned at that instant.

Ælianus.

The wisdom of the Mouse appeareth in the preparation of her house; for considering she hath many enemies, and therefore many means to be hunted from place to place, she committeth not her self to one lodging alone, but provideth many holes; so that when she is hunted in one place she may more safely repose her self in another. Which thing *Plautus* expresth in these words; *Seditamen cogitato, Mus pusillus, quam sapiens sit bestia, etatem qui uni cubili nunquam committit suam: cum unum obstruetur, aliunde perfugium querit*: that is to say, it is good to consider the little Mouse, how wise a beast she is, for she will not commit her life to one lodging, but provideth many harbors, that being molested in one place she may have another refuge to flee unto.

Their natural wisdom.

And as their wisdom is admirable in this provision, so also is their love to be commended one to another, for falling into a vessel of water or other deep thing, out of which they cannot ascend again of themselves, they help one another, by letting down their tails, and if their tails be too short, then they lengthen them by this means: they take one anothers tail in their mouth, and so hang two or three in length, until the Mouse which was fallen down take hold on the neathermost, which being performed, they all of them draw her out. Even so Wolves holding one another by their tails, do swim over great Rivers: and thus hath nature granted that to them which is denied to many men, namely, to love, and to be wise together. But concerning their manners, they are evil, apt to steal, insidious, and deceitful; and men also which are of the same disposition with these beasts, fearing to do any thing publickly, and yet privately enterprise many deceits, are justly reproved in imitation of such beasts. For this cause was it forbidden in Gods Law unto the *Jews*, not only to eat, but to touch Mice, and the Prophet *Esai* ch. 66. saith, *Comedentes carnem suillam, & abominationem, atq; murem, simul consumentur, inquit Dominus*, that is, they which eat Swines flesh, abomination, and the Mouse, shall be destroyed together, saith the Lord: wherein the Prophet threatneth a curse unto the people, that broke the first Law of God in eating flesh forbidden; and the Physicians also say, that the eating of the flesh of Mice engendereth forgetfulness, abomination, and corruption in the stomach.

Their natural love to one another.

Ælianus. Their disposition, and their flesh.

Procopius. Aristas.

Arnoldus.

The eating of bread or other meat which is bitten by Mice, doth encrease in men and children a certain disease in their face, and in the flesh, at the roots of the nails of their fingers certain hard bunches, called by the *Venetians*, *Spelli*; and by the *Germans*, *Leidspissen*; and by the *Latines*, *Dentes Muris*: yet it is affirmed, that the flesh of Mice is good for Hawks, to by given them every day, or every each other day together with the skin; for it helpeth their intrails, purgeth steam and choler; restraineth the fluxions of the belly; driveth out stones and gravel; stayeth the distillation of the head to the eyes; and finally corroborateth the stomach. Yet we have heard that in the Kingdom of *Calecut*, they do eat Mice and Fishes roasted in the Sun. And it is said by some Physicians and Magicians, that the flesh is good against melancholy, and the pain of the teeth; but the medicinal vertues we reserve it to its proper place.

Hurt by Mice to the body of mankind.

Medicine of Hawks.

Demetrius.

Pliny affirmeth a strange wonder, worthy to be remembered and recorded, that when *Hannibal* besieged *Casselinum*, there was a man that sold a Mouse for two hundred pieces of coin, so great was the extremity of famine, that the man which sold it, dyed for hunger, and as it should seem through the want of it, but he which bought it lived by eating thereof; the which thing argueth, that necessity, hunger, and famin, maketh men for the safegard of life, to make more reckoning in extremity of the basest creatures, then in prosperity they do of the best. For that person which gave so much money for a Mouse, at another time would have scorned to have given so much for four Oxen.

Eating of Mice.

And on the other side, the wretched love of gain, which causeth a man to endanger his own life for love of silver. But I rather think that it was the hand of God himself taking vengeance of such a covetous disposition, which would not suffer him to live, that like *Moa* had gotten so much gold.

The enemies of Mice are many, not only men, which by sundry artificial devices kill them, because of harm, but also beasts and wilde fowl do eat their flesh, and live upon them. And first of all Cats and Weefils do principally hunt to catch Mice, and have been therefore by the late Writers called *Murilegi*, for their taking of Mice. And the nature of the Weefil is not only more inclined to hunt after them, then the Cat, but is more terrible also unto them; for if the brains of a Weefil, the hair or rennet be sprinkled upon Cheese, or any other meat whereto Mice resort, they not only forbear to eat thereof, but also to come in that place. They are also driven away by the sprinkling of the ashes of Weefils; and as all noises make them afraid, so none so much as the skreeching or crying of a Weefil, for at the hearing thereof they all fall astonished. And besides, they have more opportunity to follow and take them then Cats, because their bodies are lesser, and their noses and snouts longer, and therefore they follow them many times into their holes, and very nimbly

Enemies of Mice.

Pliny.

nimbly pull them forth when they think they are most secure. Foxes also kill Mice; and in *Italy* there is a black Snake called *Carbonario*, from his colour, resembling coals, which I think to be the same that the *Græcians* call *Myagros*, from his hunting of Mice: This Snake doth also eat and devour Mice. Hawks eat Mice, and all the night-birds, especially the night-crows and Owls. How hateful a Mouse is to the Elephant, we have shewed already in that story, how in the presence thereof he will not touch his meat, nor eat any thing over which a Mouse doth run. Nor yet eat in the cratch or manger wherein a Mouse hath been. *Pozzeinus* affirmeth, that there is great love between Mice and Serpents, for sometimes they play together.

There is a hatred betwixt Bats, Frogs, and Mice, as may appear by *Anthologius*, *Museus*, and others. It is said also that they are hateful to Oysters, whereof I know no reason, except it be because they love their fish. And *Alciatus* hath a pretty embleme, which he entitleth *Captivus ob gulam*, wherein he sheweth, that a Mouse watcheth an Oyster when he gapeth, and seeing it open, thrusts in his head to eat the fish; as soon as ever the Oyster felt his teeth, presently he closeth his shell again, and so crusheth the Mouses head in pieces, whereby he deciphereth the condition of those men which destroy themselves to serve their bellies. And thus much for the love and enmity betwixt Mice and other Beasts.

Now concerning the actions of men, they hunt Mice to be rid from their annoyances, because they do not only destroy the things they eat, and live upon other mens cost; and therefore Parasites are compared unto them whom the *Germans* call *Schmoroszer*, and *Tellerlecker*, that is, smell-feasts, and lick-spickets, are compared to Mice, because they live at other mens tables. But also Mice do defile and corrupt, and make unprofitable whatsoever they taste; and therefore the *Egyptians* when they would describe corruption, do picture a Mouse.

For these causes have men invented many devices, snares, and gins, the general whereof is called by the *Latines*, *Muscipula*; and by the *Græcians*, *Muspala*, and *Myagra*, the divers and several forms whereof I will not disdain to set down. For the wise Reader must consider, that it is as necessary, or rather more necessary for most men to know how to take Mice, then how to take Elephants.

And although every woman, and silly Rat-catcher can give instruction enough therein, yet their knowledge cannot excuse my negligence, if I should omit the inventions and devices of the Ancients, whereby they delivered themselves from the annoyances of these beasts. And therefore first of all to declare the manner of catching them in places where corn is kept: Let your Mouse-trap be placed to catch Mice, right against the door, but let them have room to come in, and in short time it will so fear them, that they will trouble you no more. But if Mice breed in the ground under crevices, except you fill all the crevices with Mouse-traps, you will never catch them, which the Inhabitants of the Island *Pandataria* are fain to do.

Varrus.

There are other kinde of Mouse-traps which do catch Mice alive: and othersome which do kill them, either being pressed down with the weight of it, or stifled with water, or otherwise, as with a strong piece of Iron being small, and hung right against the button of the trap, on the which piece of Iron they hang meat, and so by that means the Mouse is caught by putting her head through the hole to snatch at the meat; for she by stirring the Iron doth loosen the button, and so her head is shut fast in the hole. And there are other kinde of Mouse-traps which are covered all over, into the which the Mouse may run; and if you have put any water therein they are presently stifled. Of all which kinde of traps shall be severally tracted: And first of all those which do catch Mice alive.

The common kinde of this Mouse-trap is made of wood, long, and four-cornerwise, and is framed of four boards, but the hinder part is strengthened with strong wiers of Iron, that she may without danger look in to see what she may get there; and that the smell of that which she findeth there, may allure her to come to it. And the former part hath a hole in the top, through which there is put a small piece of Iron; and also there is made a trap-door in form of a Percullis, to the which the Iron is very slightly hung, that when the Mouse cometh to catch at the meat, she is suddenly taken by falling of the same; but the meat which you fasten to the neather end of this Iron hook must be fat, or the crust of cheese or bread; which if it be a little toasted at the fire, it will not be amiss, that the Mouse may smell it far off. Some do make these kinde of traps double, with one door at one end, and another door at another end. These kinde of Mouse-traps *Petrus Crescent.* doth call traps belonging to houses, which shall be spoken of hereafter.

The other kinde of Mouse-trap is made with Iron hooks hung in the round circle; in the midst of the which brim is put a great many of the same wiers, which being made sharp at every end, are after the form of the top of a crest, or helmet, or as it is made in a bow-net to catch fishes; and upon the hook let there be hung meat, by which means the Mouse coming to the meat, sticketh herself upon the hooks. The manner of making lesser Mouse-traps is with Walnut-tree, and that the middle part of it be not covered, and that there be put to the mouth or brim thereof some kinde of mettle, so that the open part may bend inward, and that the Mouse may not gnaw that which is within, except she creepeth under: which if she shall do, she shall presently be shut in by stirring the trap.

Crescentien.

Also there is another kinde of Mouse-trap which is covered with the bark of a tree, which is cut into equal pieces, and laid cross one over another; but there is tied a Swines skin in the middle, and also an earthen pot covered with the same bark, being first sprinkled with corn, that the Mice may custom to come to it, and being dryed with lying, they break in pieces, but you must lay them together

together again, and fill your pot with water, by the which means as soon as ever they are upon the same, they fall into the pit, and so are stifled.

And also it is reported of those which have tryed the same, that if Mice fall into a vessel without water, and remain there a long time without meat, that then they devour one another, but if they remain there so long until one among them all be left alone, that is to say, the strongest of them all, and that he be suffered to go out, wheresoever he shall finde any Mice he will eat them up, and they shall have much ado to escape him, because he hath been so long accustomed unto them. I was told also of a certain friend of mine, that a man of *Senensis* did set a purse in a hollow place, and made it to open and shut by some devise, so that at length he took a Mouse, which Mouse he fed only with the flesh of Mice, and after he had fed it so a long time, he let it go, who killed all the Mice he did meet, and was not satisfied with them, but went into every hole that he could finde, and eat them up also. Also Mice are taken in vessels, from whence they cannot escape, upon the which vessel let there be put a small staffe, which is so cut in the middle, that she may only hold her self by the meat, and when you have so done, put the kernel of a Nut upon the middle of the staffe, to the which the Mouse coming, doth fall into the vessel with the staffe, and they will be stifled if there be any water: but if there be none she will be killed.

And again, he telleth of another manner of catching of Mice, which is as great as the first, and it is after this manner: Take two smooth boards about the length of thy arm, and in breadth half thy arm, but joyn it so together, that they may be distant from the lower part in length some four fingers or little less, with two small spindles or clefts, which must be at every end one, and fasten Paper under them, and put a piece of paste therein, being cut overthwart in the middle, but you must not fasten it nigh the middle, and let it be so bound, that it may easily be lifted up betwixt the spindles, that if by slipping it should be altered, it might be brought again to the same form. But the two spindles spoken of before, ought to be joyned together in the ends above, and beyond them another small spindle to be made, which may hold in the middle a crooked wedge or batten, upon the which may be hanged a piece of Hogs skin, so that one of them may easily be turned upsidown with the skin, and put thereunto a little piece of earth or stick, that the Mice may easily come to it: So that how many Mice soever shall come thereto, and to the meat, shall be taken, always by rowling the Paper into his wonted place.

There is another manner also, which is to make a round piece of wood fastened on both sides with Needles, and made so that the hinder part of it weigh heavier then the former, and that it stand an inch higher then the other, and then when you have so placed it, throw some corn thereon, that the Mice may be allured thereto, and tie also a piece of flesh upon the former end of it; and so the Mouse going into the middle, by the rowling off the same, slippeth into the kettle which standeth under it, which must be half full of water, the circle presently being as it was before, that very often many Mice are caught in one night by this work, all falling into the kettle. Also there are many kindes of Mice-traps, where Mice do perish by the weight thereof, and they are made of a small piece of wood made hollow, into the which shall fall down another small piece of wood; but it must be made so, that it may fall weighty to press down the Mice going to the meat, and let the meat be tied to another little small piece of wood, which being touched, the heavy piece doth presently fall down, and so by that means the Mouse is taken.

Our Country men do make a trap which is somewhat like to this, let two pieces of boards be joyned together one foot broad, & two foot long, and afterwards let there be put in them a wooden pin, which you must fasten to the lower board, so that it may not touch the uppermost; and you must set it so, that the former part may easily move backward and forward; but moreover, the former board must be fastened to the hinder, like the fashion of a Gibbet or Gallows, with two pieces of wood standing upright, one being put overthwart, or after the fashion of the Greek letter Π , and it must stand some nine inches high, and as broad as the board will suffer you, and let the meat be hung in the middle of it, but that board which is uppermost, must touch both the ends of the other, and notched according to the breadth, the notch being made after the form of a wedge divided into two parts; and another small piece of wood must be put to that which is uppermost, almost two fingers long, and one finger broad, and let there be put into the lower notch a piece of wood with meat at it, so that it may be slightly fastened to the brim of the uppermost, that the meat being presently touched, the other may the easier fall.

And you may lay a stone upon the uppermost board, that it may fall the heavier. And there are some also which to the lower board do fasten iron pins, made very sharp; against the which the Mice are driven by the weight of the fall. Furthermore, there is another kinde of trap made to cover them alive, one part of it cut out of a small piece of wood, the length of the palm of thy hand, and the breadth of one finger, and let the other part of it be cut after the form of a wedge: and let this piece of wood be erected like a little pillar, and let the wedge be put into the notch of another piece of wood, which must be made equal with the other, or very little shorter: and this pillar must be so made, that the Mouse may not perish before she come to the meat: the wood where the meat must stand, ought to be a span long, and you must fasten the meat about the middle of it, but the former part of it must have a cleft, which must begin a little from the brim, and shall be made almost the length of two fingers, and you must make it with two straight corners, and take away half the breadth of the wood. These three pieces of wood being thus made ready, thou shalt

shall erect a little pillar, so that the wedge may be downward, whereby the Mouse may see the meat every where: and let the meat be hung in the former corner of the pillar, so if the Mouse shall touch the meat, he shall be pressed down with the fall of the board. Mice also by the fall of a cleft board are taken, which is held up with a pillar, and having a little spatular of wood, whereon the meat shall lye, so made that the pillar doth not open being parted, except when the Mouse cometh to touch the meat, and so by that means she is taken.

There is also another manner of Mouse-trap used among us, which is, let there be a hole made and compassed about with a board of a foot long, and five or six fingers broad, the compass whereof must be four fingers; into this hole let there be put a vessel made of wood the length of ones fist, but round and very deep; and in the middle of each side of this vessel let there be made a hole, wherein there is put in a thread made of Iron with meat, and let it be compassed about with a small thread which must be fastened overthwart the hole: and the part of the thread which hangeth down must be crooked, that the meat may be fastened thereto, and there must be a piece of the thread without, to the which may be tied a stronger piece of wood, which is the thread whereon the meat is hanged, by the which the Mouse is taken, by putting her head into the vessel to catch at the meat.

And also Mice are taken otherwise, with a great Cane wherein there is a knot, and in the top of it let there be made a little bow with a Lute string, and there stick a great needle in the middle of the pole of the Cane, and let the pole be made just in the middle, and let there be bound a piece of flesh beneath, so prepared, that when the Mouse shall bite, and move the skin, that then the string slip-peth down, and so the needle pierceth through his head, and holdeth him that he cannot run away. But among all the rest, there is an excellent piece of workmanship to catch Mice; which I will here set down: Take a piece of wood, the length of both thy fists, one fist broad, and two fingers thick, and let there be cut off about some two fingers, a little beyond the middle of half the breadth. And that breadth where it was cut, ought to be more declining and lower, after the manner of this letter A. And you must put to the side of this a piece of wood, half a circle long, bending, and in the middle part of each side holes pierced through, so that the half circle may be strait, and plainly placed to the foundation of the wood, that the trap being made, it may rest upon the same half circle, and upon this half circle let there be placed Iron nails very sharp, so that the instrument by falling down may cover the Irons of the half circle as soon as ever they touch the same.

Furthermore, there is another manner of trap, when a vessel out of which they cannot escape, is filled half up with water, and upon the top thereof Oatmeal is put, which will swim, and not sink, making the uppermost face of the water to seem white, and solid, whereunto when the Mouse cometh, she leapeth into the Oatmeal, and so is drowned: And the like may be done with chaffe mingled with Oatmeal: and this in all traps must be observed, wherein Mice are taken alive, that they be presently taken forth, for if they make water in the place, their fellows will for ever suspect the trap, and never come near it, till the savour of the urine be abolished.

Calladius saith, that the thick froth of Oyl, being infused into a dish or brasen Caldron, and set in the middle of the house in the night time, will draw all the Mice unto it, wherein they shall stick fast, and not be able to escape.

Anatolius.

Pliny saith, that if a Mouse be gelded alive, and so let go, she will drive away all the residue; but this is to be understood of the Sorex. If the head of a Mouse be flead; or if a male Mouse be flead all over, or her tail cut off; or if her leg be bound to a post in the house, or a bell be hung about her neck, and so turned going, she will drive away all her fellows. And (*Pliny* saith) that the smoke of the leaves of the Ewe tree, because they are a poyson, will kill Mice, so also will Libbards-bane, and Henbane-seed, and Wolf-bane, for which cause they are severally called *Myoetones*, and the roots of Wolf-bane, are commonly sold in *Savoy* unto the Country people for that purpose.

In *Germany* they mingle it with Oatmeal, and so lay it in balls to kill Mice. The fume of Wall-wort, Calcauth, Parsely, Origanum, and Deaths-herb do also kill Mice: you may also drive them away with the fume of the stone Hamatites, and with green Tamarisk, with the hoof of a Mule, or of Nitre, or the ashes of a Weefil, or a Cat in water, or the gall of an Ox put into bread.

The seed of Cowcubers being sod, and sprinkled upon any thing, Mice will never touch it, likewise wilde Cowcumber and Coloquintida, kill Mice. To keep Mice from Corn, make mortar of the froth of Oyl mingled together with chaff, and let them well dry, and afterwards be wrought thoroughly, then plaister the walls of your garnery therewith, and when they are dry cast more froth of Oyl upon them, and afterwards carry in your corn, and the Mice will never annoy it.

Cato.

Wormwood laid among clothes, and skins, defend them from Mice: And also the water of Wormwood sod, sprinkled upon clothes hath the same operation.

Tragus.

Ink tempered with water, wherein Wormwood hath been washed, or sod, causeth that the Parchment and Paper written therewith, shall never be eaten, or touched with Mice.

Avicen.

Anatolius and *Tarentinus*, in the discourse of the granery or barn, do write, that Milk-thistle mingled with Hony, Water, and fine Flower, or Mil-dust, made into little balls, and laid where Mice may eat of it, doth make them blinde if they tast thereof. White Hellebore mixed with potage, or the seeds of wilde Cowcumber, Coloquintida, and Meal, mingled with black Hellebore, and

Pascaus.

put

put into Cheefe or Bread, or any other kinde of fat meat, killeth both Rats and Mice. So likewise a white Camelion sod in broth, mingled with water and Oyl, killeth Dogs, Swine and Mice.

The juyce of the root of the herb Camelion, mixed with Water and Oyl, draweth Mice unto it, and killeth them by tasting thereof, if they drink not presently: so also doth Henbane. The roots of the bramble Tree, mingled with Butter, Bread, or Hony, Elecampane, and Sea Onions, Scammony, wilde Sparage, Arlenick, Mug-wort, otherwise called Mouse-wort, mingled with Lard in small pieces, with Auripigment, killeth Wols and Mice; and in some Countries, for the better dispersing of the poyson, set drink beside the same, whereof assoon as they tast, they swell and die; but I have seen them die without drinking at all. Mice and Wols, if they tast of the wilde Rose, and drink after it, do not only die, but also fall into madness and bite their fellows, communicating the quality of the disease to every one they bite. Flesh cut into little pieces, and fryed with Butter in a frying pan, and afterwards when it is cold, adde half so much soft pitch thereto, and mingle it together, rowling up the flesh in the Pitch, then distribute it upon little bords, and set it in the place, and places whereunto the Mice do much resort, and water beside it, and when that they have tasted of it a little, they are so eagerly a thirst, that they drink and die.

The like I may say of Rats-bane, Quick-silver, Sublimate, and Precipitate, and divers other things; and thus much may suffice for the catching, taking, and killing of Mice, whereunto I may adde the use of their members and parts, not medicinal, but natural, although I have touched it heretofore in part.

The *Scythians* were wont to be clad with the skins of Mice and Woolfs, and it is observed, that when Mice cry and screeke above their ordinary custom, it presageth an alteration and change of the weather; and thus much shall suffice for their natural discourse.

Having thus discoursed of the nature of the vulgar Mouse, I may also add the moral use thereof, as I finde it recorded among learned Writers, delivered either In History, or in Proverb. It is reported of *Glaucus* the son of *Minos* and *Pasiphae*, that while he followed a Mouse to take her, he fell into a vessel of Hony; but after *Polyades* the Prophet, by laying an herb on him, raised him again to life. *Hatto* an Archbishop of *Metz* in the frontiers of *Germany*, was destroyed by Mice, or as other say by Rats; but the words of *Textor* are;

Hatto Archiepiscopus Moguntiinus a muribus fertur devoratus.

And the error may proceed, because that *Mus* is a general word for the Rat and Mouse; and therefore they which have thought it an unreasonable thing, that so small beasts should destroy so mighty a Prince, have rather attributed it to the Rats then to the Mice; but they ought to have remembred, that it was an extraordinary judgement of God to punish a cruel covetous wretch, and that therefore it was as easie for him to make the little Mouse his instrument, as the great Rat: for we read, that *Herod* was devoured by Worms; and other have been eaten up with Lice. *Adrian* the Pope was strangled by a Fly; and therefore *Hatto* an Archbishop might aswell perish through the afflicting hand of God by a multitude of Mice.

Heliogabalus that wretch, amongst other his monstrous desires, and Tyrannical commands, *Lampridius* affirmeth, that upon a time he commanded, that there should be brought unto him ten thousand Mice alive, a thousand Weefils, and a thousand *Sorices*, or wilde Field-mice, so base were his thoughts, that while he should have attended his Emperial calling, and hearkened to the suits and complaints of poor distressed subjects, he was busied in killing of Mice, and therefore in ancient time, a Mouse-killer was taken for an opprobrious speech, for a base, sluggish, and idle companion.

The like is reported of a *Muscovian* Emperour, who to afflict his people, and to gather mony from them, commanded the Citizens of *Musco*, to bring him a peck full of Fleas: whereunto the people answered, that if they could take so many, yet could not they keep them together from leaping away. And Mice have been brought into publick spectacle, because at *Lavinium* they gnawed asunder the shields of silver; and it was afterward judged a prodigy; for there followed the *Marfick* war. When the *Scythians* understood that *Darius* with his great Army, stood in need of victuals, they sent unto him a Provant-master with these presents or gifts, a Bird, a Mouse, a Frog, and five darts. At the receipt whereof the *Persians* wondered what should be meant thereby; and demanded of the messenger the meaning of the mystery. But the Ambassador answered, he knew not any signification of his presents, but only received charge to deliver them, and make hast back again, and to bid the *Persians*, if they were wise, to lay their wits together, to know and understand the meaning thereof. When the *Persians* heard him say so, they fell to consultation. *Darius* gave his opinion, that the Mouse, signified the earth; the Frog, the waters; the Bird, Horses; and the Darts, warlike furniture and strength of forces; and that the *Scythians* by sending all these unto them, yeilded that the *Persians* should be Lords of their Land, Sea, Horses, and themselves, and that therefore they ought to be of good courage.

But one *Gobrias*, a grave Counsellor, who was one of the seven that slew the *Magi*, or Wizards, answered otherwise, for his conjecture was more true: for said he; *O Persae, nisi effecti ut aves subvioletis in Caelum, aut ut Mures subeat in terram, aut ut ranæ insiliatis in paludes, non remeabitis unde venistis his sagittis confecti*: O ye *Persians*, except ye become like Birds, to flie up into heaven; or like Mice, to creep into the earth; or like Frogs, to leap into the waters, you shall not return

back again unto the place from whence you came, and so indeed it came to pass. We read 1 Sam. 5. that when the Ark of God was taken by the *Philistines*, and they kept it in their Temple at *Haz-zah*, the hand of the Lord fell upon their Princes, and he smote them with Emrods, in the bottom of their belly, that is, God punished them with Mice, for he afflicted their bodies, and the fruits of the earth, for which cause *cap. 6.* they advice with themselves, to send back again the Ark of the Lord with a present of Golden Mice. *Ovid, Homer, and Orpheus*, call *Apollo Smyntheus*, for the *Cretians* in ancient time called Mice *Smynta*: Now the fained cause thereof is thus related by *Ælianus*:

There was one *Crinis* which was a Priest of *Apollo*; who neglected his daily sacrifice, for the which through abundance of Mice he was deprived of the fruits of the earth, for they devoured all. At which loss *Apollo* himself was moved; and taking pity of the misery, appeared to one *Horda* a Neat-herd, commanding him to tell *Crinis*, that all the cause of that penury was, for that he had omitted his accustomed sacrifice, and that it was his duty to offer them again diligently, or else it would be far worse afterward. *Crinis* upon the admonition amended the fault, and immediately *Apollo* killed all the devouring Mice with his darts, whereupon he was called *Smyntheus*. Others again say, that among the *Æolians*, at *Troas* and *Hamaxitus*, they worshipped Mice and *Apollo* both together, and that under his Altar they had meat and nourishment, and also holes to live in safely: and the reason was; because once many thousand of Mice invaded the corn fields of *Æolia* and *Troy*, cutting down the same before it was ripe, and also frustrating the husbandman of fruit and hope: this evil caused them to go to *Delphos*, to ask counsel at the Oracle what they should do to be delivered from that extremity; where the Oracle gave answer that they should go sacrifice to *Apollo Smyntheus*; and afterward they had sacrificed, they were delivered from the Mice, and that therefore they placed a statue or figure of a Mouse in the Temple of *Apollo*.

Sacrificing of
Mice.
Scholiast. Lic.

When the *Trojans* came out of *Creet*, to seek a habitation for themselves, they received an Oracle, that they should there dwell, where the Inhabitants that were born of the earth should set upon them; the accomplishing whereof fell out about *Hamaxitus*; for in the night time a great company of wilde Mice set upon their bows, quivers, and frings, leathers of their bucklers, and all such soft instruments, whereby the people knew, that that was the place, wherein the Oracle had assigned them to build the City; and therefore there they builded *Ida*, so called after the name of *Ida* in *Creet*: and to conclude, we do read that Mice have been sacrificed, for the *Arcadians* are said first of all to have sacrificed to their Gods a Mouse; and secondly a white Horse; and lastly the leaves of an Oak.

And to conclude, *Ælianus* telleth one strange story of Mice in *Heraclea*, that there is not one of them which toucheth any thing that is consecrated to Religion, or to the service of their Gods. In-fomuch, that they touch not their Vines which are sacred to religious uses, but suffer them to come to their natural maturity, but depart out of the Island, to the intent that neither hunger nor folly cause them to touch that which is dedicated to divine uses. And thus much for the natural and moral hory of Mice; now followeth the medicinal.

The Medicines of the Mouse.

Albertus.

The flesh of a Mouse is hot and soft, and very little or nothing fat, and doth expel black and melancholy choler. A Mouse being flead or having his skin pulled off, and afterwards cut through the middle, and put unto a wound or sore wherein there is the head of a Dart or Arrow, or any other thing whatsoever within the wound, will presently and very easily exhale and draw them out of the same. Mice being cut and placed unto wounds which have been bitten by Serpents, or put to places which are stinged by them, do very effectually, and in short space of time cure and perfectly heal them. Mice which do lurk and inhabit in Houses, being cut in twain, and put unto the wounds which are new made by Scorpions, doth very speedily heal them.

Marcellus.

Dioscorides.

Pliny.

Marcellus.

Pliny.

Dioscorides.

A young Mouse being mingled with Salt is an excellent remedy against the biting of the Mouse called a Shrew, which biting Horses and labouring Cattel, it doth venome until it come unto the heart, and then they die, except the aforesaid remedy be used. The Shrew also himself being bruised and laid unto the place which was bitten, is an excellent and very profitable remedy against the same.

A Mouse being divided and put or laid upon Warts, will heal them and quite abolish them, of what kinde soever they shall be. The fat which is distilled from Mice, being mixed with a little Goose-grease and boyled together, is an excellent and medicinable cure for the asswaging and mollifying of swellings and hard lumps or knots which do usually arise in the flesh. Young Mice being beaten into small bits or pieces, and mixed with old Wine, and so boyled or baked, until they come unto a temperate and mollifying medicine; if it be anointed upon the eye-lids, it will very easily procure hair to grow thereon. The same being unbeaten and roasted, and so given to little children to eat, will quickly dry up the froath or spittle which aboundeth in their mouth. There are certain of the wise men or *Magi*, who think it good that a Mouse should be flead, and given to those which are troubled with the Tooth-ach, twice in a month to be eaten. The water wherein a Mouse hath been sod or boyled, is very wholesome and profitable for those to drink who are troubled with the inflammation of the jaws or the disease called the Squincy. Mice,

but

but especially those of *Africk*, having their skin pull'd off, and well steeped in Oyl, and rubbed with Salt, and so boiled, and afterwards taken in drink, are very medicinable for those which have any pain or trouble in their lights and lungs. The same medicine used in the aforesaid manner is very profitable for those which are troubled with a filthy, mattery, and bloody spitting out with retching. *Pliny.*

Sodden Mice are exceeding good to restrain and hold in the urine of Infants or children being too abundant, if they be given in some pleasant or delightful drink. Mice also being cut in twain, and laid unto the feet or legs of those which are gowty is an excellent remedy and cure for them. Mice being dried and beaten to powder, doe very effectually heal and cure those which are scalded or burned with hot water, or fire. Cypres nuts being burned and pounded, or beaten into dust, and mixed with the dust of the hoof of a male or female Mule, being dried or stamped small, and the Oyl of Myrtle added unto the same, with the dirt or dung of Mice being also beaten; and with the dung of a Hedge-hog new made, and with red Arsenick: and all mingled together with Vinegar, and moist or liquid Pitch, and put unto the head of any one who is troubled with the abundance and loose hanging down or over-growing of his hair, it will very speedily and without any difficulty ease him of the same. *Marcellus.*

The dust of a Mouse pounded and beaten to powder, and mingled with a certain Oyl, is very good and wholesome, for those which are grieved with a Tetter, or scab, which may over-run their whole body. The brains or tail of a Mouse being dried and beaten to powder, is very medicinable for those which are troubled with the casting and shedding of their hair; as also for the disease called the Foxes evill; but this operation will work more effectually, if the shedding of the hair doth happen by any venom or poyson. The same in operation hath the whole body of the Mouse being used in the aforesaid manner. *Pliny.*

There is also another excellent remedy to cure and heal the aforesaid disease, which is this: To take Mice which inhabit in houses, and to burn or dry them in a pot, and then beat them; and being so used, to mix them with Oyl of Lawrel, and to rub the hairs which are like to fall or shed with Garlick; and to put them all together into a Frontlet or fore-head cloth, and daily to keep the same medicine or plaister unto them, until the hair do grow fast, and they be rid of that disease. There is also another remedy for the same disease, which is this: To burn a Mouse, and beat him into powder, and then to mingle the same with Hony, and the grease of a Bear, and so to anoint the head, and this is accounted for a very speedy and effectual cure. *Galen.*

The dust or powder of Mice being mixed with Hony and Oyl of Roses, and so baked, or boiled together, and afterward distilled into a clear water, and so poured into the ears of any one which is deaf, or troubled with any pain in his ears, and it will quickly bring him help and remedy. The dust of a dried Mouse being also mingled with Hony, and rubbed upon the teeth of any one which is troubled with a stinking breath, will presently take away the savour thereof. If the urine of a man or woman be too fluent and abundant, let them take the dust or powder of a dried Mouse, being beaten and stamped, and mix it with Wine or with Goats milk, and so drink it up, and he shall speedily have remedy. The grievous and violent inflammation or turning of the eye-lids, is cured after this manner: First, they take the flesh of the Mice, as soon as ever it is beaten small, and mingle it with the yolk of an Egge, and mollifie it into a salve or plaister like unto wax, and then put it into a linnen cloth, and so wrap it upon the eye-lids in the time of sleep, and it will easily bring help and remedy. *Pliny.*

There is an excellent remedy for the over-spreading of the eyes, or to cure the disease in them, called the Pin and the Web; or to help them which are altogether blinde, which is this: To take the blood of a Mouse, the gall of a Cock, and some part or quantity of womans milk, and to take of each of them alike, and then to mingle or mix them together, and being well wrought or kneaded until it come to an ointment, to rub or spread it upon the eyes: and this will in very short space help them unto their sight; for it hath been tryed, and hath helped many. *Marcellus.*

The skin of a Mouse being burned or dried, and beaten into powder, and so mingled with Vinegar, and then anointed upon the head of any one who is pained or troubled with the Head-ach, it will presently ease and help him. The head of a Mouse being also born or carryed in a linnen cloth, doth cure the same disease. The heads of Mice being burned, and beaten into small powder, and then mixed or mingled with Hony, and so anointed upon the legs or feet of them which are troubled with the Gowt, are excellent good and wholesome for the curing of that grievous disease. The same vertue hath the tails or bodies of Mice, being used in the aforesaid manner. Some do think, that the aforesaid disease is more speedily and effectually cured after this manner: First, to take a Beetle or Horse-fly, and stamp it all to pieces, and then to mingle it with soft and liquid Pitch, the skin being prepared or made ready with Nitre: but there must be great care taken, that it eat not too far in the flesh: then to take the head of a Mouse, and the gall and dung of a Mouse, and mingle them together with Ling-wort and Pepper, and so to anoint them, and spread them upon the aforesaid eaten or lanced wounds: and this is very much commended for a very good and medicinable cure for the aforesaid disease. *Galenus.*

The heads of Mice dried and beaten into powder or dust, and then mixed with Hony, and so anointed upon the eyes for the space of ten days together, will clarify the eyes, and expel all pain or blemishes from them. Of the heads of Mice being burned, is made that excellent powder, for the scowring and cleansing of the teeth called Tooth-soap: unto which if Spikenard be added *Pliny.*

- added or mingled, it will take away any filthy sent or strong savour in the mouth. The brains of a Mouse being taken and put or steeped in Wine, and stamped, and beaten small, and anointed upon the brow or fore-head of any one who is troubled with a pain or ach in the head, and he shall soon finde ease and remedy. If any man shall but touch or kiss with his mouth the snout or nostrils of a Mouse, and be troubled with the disease called the Rhume, which falleth down and stuffeth the nostrils, he shall in very short space be eased of the same. The *Magi* or wise men, do very much commend this medicine for the expelling of a quartain Ague or Fever, which is thus; To take the nose or snout of a Mouse, as also the very tops of the ears, and bruise them together, and afterwards tie them in a linnen cloth, which hath had Roses or Rose-leaves in the same, and then binde them unto the arms or wrists of him which is so troubled, and they will very effectually and speedily cure and heal him. For the rottenness and deminishing of the teeth, the best remedy is to take a living Mouse, and to take out one of her teeth, whether the greatest or the least it is no great matter, and hang it by the teeth of the party grieved: but first kill the Mouse from whom you had the tooth, and he shall presently have ease and help of his pain. The heart of a living Mouse being taken out, and hanged upon the left arm of any woman, is of such force and power, as it will cause her never to conceive. The laps or fillets of the liver of a Mouse, being beaten small and mingled with four drams of sowre and unpleasant Wine, is an excellent remedy for those which are troubled with quakings in their joynts; as also for Fevers and shaking Agues. A Mouse being cut or parted in the conjunction of the Sun and the Moon, and the liver pulled out and roasted or boiled, and given to one which is troubled with the aforesaid disease to eat, will very speedily and without any difficulty or pain cure and heal him of the same. The gall of a Mouse being beaten very small, and steeped or washed in Vinegar, and so poured or distilled into the ears of any one who is deaf or thick of hearing, or hath any ach or pain in the same, is counted for the chiefest, and most singular and chiefest remedy or cure which is used for the same.
- Marcellus.* The dung or dirt of a Mouse being new made, is very profitable for those which are troubled with the disease called the *Sciatica*, or Hip-gowt, anointed or rubbed upon the same. Mouse-dung being also mingled with Vinegar and Oyl of Roses, and so anointed or spread upon the fore-head or temples of any one who is troubled with the head-ach, will presently ease and help him of the same.
- Myrepus.* The gum called Benzoin being mixed with Wine and Saffron, and Pepper; as also with the dirt or dung of Mice being new made, and mixed with Vinegar, and mingled all in one medicine, and so strained and given to one to drink, which is spare and lean, in some short space or time it will make him grow very fat.
- Sextus.* The dung or dirt of a Mouse being mingled with certain other medicines, is very good and wholesome for those which are troubled with Tettors, and dry scabs which over-run the whole Body.
- Galen.* The dung of Mice being mingled with the dust or powder of Frankincense, with a little red Arsenick added thereunto, is a very profitable and wholesome medicine for those to use which are troubled with little hard red bunches and swellings arising in divers and several parts of the body. Seven pills being taken out of the dung of a Mouse, and mingled with Vinegar, and anointed upon the fore-head and temples, of those which are grieved therein, will very speedily help and cure him.
- Pliny.* The inward parts of earth mixed with Mouse-dung, white Pepper, and Myrrhe, being of each of them half an ounce, and afterwards mingled with Vinegar all together; and so anointed upon the head of any one which is troubled with the Megrim, will very effectually and speedily ease and rid him of the same. The herb called *Strumus* beaten together with Mouse-dung, and afterwards mixed with Vinegar, is an excellent remedy against the swellings in the head, or little bunches which arising therein become fores, and are full of matter and filthy corruption. The dung or dirt of Mice being melted, dissolved, and mingled with Vinegar, and then rubbed upon the head of any one who is troubled with the scurf or skaules thereon in a bathe or stove, will presently expell and drive them quite away.
- Archig. nes.* The dung of Mice being mingled with Frankincense, and so beaten or tempered together until they come unto the likeness or thickness of Hony, and then anointed upon the legs or feet of any one that is troubled with the Gowt, he shall finde present help and remedy. The same disease also is very effectually cured by the dung of a Mouse, and burned or scorched Barley mingled together, of each being the same weight or quantity, and afterwards mixed with Vinegar all together, and so spread or anointed upon the diseased parts. There is also another excellent remedy for curing of the aforesaid disease, which is thus: To take Cantharides, and bruise them all to pieces, and mingle them with soft or liquid Pitch, and also with Nitre, and so anoint or rub them upon the skin being prepared for the purpose; but there must be great care had, that the skin be not rubbed or lanced too far. Afterwards unto the wound so made, there must be taken the heads, galls, and dung of Mice, being mixed with the herb Lingwort, and Pepper; and so beaten all together until they come unto a temperate salve or medicine, and then anointed upon the said wounds, and they will in very short space cure the same.
- Pliny.* The hairs and dung of a Mouse, parched or dried by the fire, and anointed upon the eye-lids of any one which are pield or bare, will presently procure hair to grow thereon.
- Alexius Pe-*
demontanus. Mouse-dung being dried in the shade is an excellent remedy against the voiding or spitting of blood which floweth from some parts of the body, but especially from the belly. The same

same is also very good to stanch the blood which issueth from wounds being new made. White Sceny-feed, and the dung of a Mouse or Hare being put into broth, with the stem or stalk of Fennil, and so boyled together, and afterwards given unto a woman to drink who is destitute of milk in her breasts, will presently and very speedily procure her milk in great abundance.

The dung of Mice being steeped or washed in rain water, doth ease and refresh the swelling of womens dugs in their time of delivery. The dung of a Mouse being given in any drink or liquor to one that is troubled with the disease called the Colick and stone to drink, will in very short space or time cure him of the same. Mouse-dung being also taken in drink, doth loose the body of either man or woman, how fast soever they be bound. There is an excellent remedy arising from Mouse-dung against the *Sciatica*, or Hip-gowt, which is this: To take nine grains of a Mouses dung mixed or mingled with half a pinte of Wine, and given to the party grieved upon a bench or foot-stool to drink, so that he drink it standing upon that foot only which paineth him, even at the Sun rising; and having so drunk it, let him leap down, and afterwards let him leap three times, and let him do this but three days together, and he shall have present help and remedy of his disease.

Mouse-dung mixed with Frankincense and sweet Wine, and so drunk by any one which is troubled with the Colick and Stone, will presently ease him of the same. But the dung of Mice mingled with Frankincense, Water, and Hony, and so boyled together, and drunk, doth not only drive away the pain of the aforesaid disease, but also doth break and quite dissolve the Stone. Mouse-dung also being taken in drink by it self alone, doth dissolve and mele the Stone in the Bladder. The same being also boyled in water, is very good and profitable for those which cannot make water. The same being new made and anointed upon the belly of any one who is troubled with the Colick or Stone, shall finde present ease and remedy thereby.

There is yet moreover another excellent medicine proceeding from this dung, whereby the fruit in a womans womb may be brought forth either dead or putrified, without any hurt or prejudice unto the woman, which is thus: First to take *Egyptian Salt*, Mouse-dung, and Gourds which are sown in Woods; and afterwards to pour in half a pinte of Hony, being half boyled, and to cast one dram of Rozen into the Hony, the Gourds, and the Mouse-dung, and beat them well and thoroughly together, and then rowl them up, and fashion them in the manner of Acorns, and put them to the belly of the party so grieved as often as you shall think it meet and convenient, and in using this some short space or time, you shall see the aforesaid putrified fruit to proceed and issue forth.

Mouse-dung being parched or burned, and mingled with Hony, is very good and medicinable aswell for those which are troubled with the swellings in their legs and feet; as also for those whose eye-lids are pilled and bald, to make hair to grow again upon them, being spread or anointed thereupon. The dung of Mice being dryed and beaten into small dust or powder, and put into the teeth of any one which are hollow, will presently expel away all pain from them, and also confirm and make the teeth strong. The dust or powder which proceedeth from Mouse-dung, is also very good to cure any disease in the fundament of either man or woman.

The urine of a Mouse is of such strong force, that if it shall but touch any part of a mans body, it will eat unto the very bones. The bitings of Mice are healed by no other means but by green Figs and Garlick being mixed or mingled together, and so anointed thereupon.

Of the RAT.

There is no doubt that this Beast belongeth also to the rank of Mice, and the name thereof we have shewed already, is common both to the *French*, *Spanish*, *Italian*, and *English*, and it may seem to be derived from the *Greek* word *Raster*, or *Heurex*, or *Risor*, for the *Grecians* use all those words. And this beast is four times so big as the common Mouse, being of a blackish dusky colour, more white on the belly, having a long head, not much unlike the head of the Martin; short and round ears, a reasonable rough skin, short legs, and long claws, and exceeding great eyes, such as can see very perfectly in the dark night, and more perfectly then by candle light; with their nails they climbe up steep and hard walls, their tail is very long, and almost naked, void of hair, by reason whereof it is not unworthily counted venomous; for it seemeth to partake with the nature of Serpents. The quantity of their body is much like a Weefils; and sometime you shall see a Rat exceeding the common stature, which the *Germans* call *Ratzen Kunig*, the King of Rats, because of his larger and greater body; and they say that the lesser bring him meat, and he lyeth idle. But my opinion is, that as we read of the Dor-mouse, she nourisheth her parent when she is old; so likewise the younger Rats bring food unto the elder, because through their age, they are not able to hunt for themselves, and are also grown to a great and unweeldy stature of body. Sometimes you shall see white Rats, as was once seen in *Germany*, taken in the middle of *April*; having very red eyes standing forth of their head, and a rough and long beard. And at *Ausburg* in *Germany*, about the Temple called the Church of *S. Huldric*, they abound in greater number then in other places. They do not lie in the earth like Mice, except in the vally of *Loachim*, where for the Summer time they forsake houfes, and go into Cony holes, but

but in the Winter time they return to the houses again. They are more noysome then the little Mouse, for they live by stealth, and feed upon the same meat that they feed upon, and therefore as they exceed in quantity, so they devour more, and do far more harm. They are killed by the same poysons and meats that the common Mice are killed, except Wolf-bane; for if they eat thereof, they vomit it up again, and are safe. They are also taken in the same traps, but three or four times so big: Their flesh is far more hot and sharp then the flesh of the vulgar Mouse, as we have gathered by the dissection of it, and therefore in operation it is very like that it expelleth and dryeth more then the other.

Medicines by
Rats.

Poyson of
Rats.

The excrements are also of the same vertue; and with the dung of Rats the Physitians cure the falling off the hair. And it is said also that when they rage in lust, and follow their copulation, they are more venomous and dangerous then at other times. For if the urine do fall upon the bare place of a man, it maketh the flesh rot unto the bones, neither will it suffer any scar to be made upon the ulcer; and thus much of the vulgar Rat.

Of the WATER-RAT.

Names of Wa-
ter-rats.

Meat of Wa-
ter-rats.

Places of Wa-
ter-rats abode.

A wonder in
the parts of a
female Rat.

Seeing there are two kinds of Rats, one of the earth called *Rattus terrestris*, and the other of the water called *Rattus Fluvialis*, of which we are now to entreat, being also called of the Latines, *Mus aquaticus*; by the Germans, *Twassermaus*, and *Wasserrat*; by the Italians, *Sorgomogange*; by the French, *Rat d'eau*. This beast hunteth fishes in the Winter, and have certain caves in the water sides, and banks of the Rivers or Ponds: For which occasion it being seen in the waters, deceiveth their expectation which look for the return of it to the land. And this beast hath been forgotten by the Ancients, for they have left

of it no description nor story, because it liveth partly in the water, and partly on the land, and therefore he said true, that spake of the habitation and place of abode of this beast, in this sort; *Ego non in fluviis, nec aliis aquis magnis, sed parvis tantum rivis atq; herbosis omnium ripis, hoc animal frequentissimum versari audio.* That is to say; That this beast doth not keep in great Waters or Rivers, but in small and little currents and Ponds, where abundance of grass and other weeds do grow on the sides and banks: *Pliny* attributeth that to the Water-rat, which is proper to the Tortoise; for indeed there is some similitude of natures bewixt these beasts, with this exception, that the females in this kinde have three visible passages for their excrements, one for their urine, another

another for the dung, and the third for the young ones; that is a peculiar place for the littering of their young ones; and this Water-rat over and beside her common nature with other Rats, doth swim over Rivers, and feed upon herbs; and if at any time she be hunted from her native biding and accustomed lodging, then also she goeth among vulgar and common Rats and Mice, and feedeth upon such as they eat: and (*Bellonius* saith) that there are great store of these in *Nilus* and *Strymon*, and that in calm nights when there are no windes, they walk to the shores, & get up upon the banks, eating and gnawing such plants as grow near the waters; and if they hear any noise, they suddenly leap into the waters again. He expresth also the figure of this Rat, which we have omitted because it resembleth in all parts the common Rat, excepting the snout or beak which is rounder or blunter. Among some of the Ancients also, there is mention made of this beast; and no more. Therefore *Aristotle* saith in the *Arcadian Luse*, which is a City so called, (as *Stephanus* writeth,) where *Malampus* did wash the daughters of *Prætus*, and delivered them from their madness: There is a certain Fountain, wherein do live Rats of the Earth, (they should say Rats of the Water,) for hereunto agree both *Pliny* and *Theophrastus*. Likewise in a River of *Cassius*, the ancient Wise-men, which were followers of *Zoroastres*, made great account of the Hedgehog, but hated deadly the Water-rats, and said, that he that could kill most of them, was most dear and acceptable to God. And furthermore they said, that Dogs, Hens, and Hedgehogs, did proceed, and were attended from and by good Angels, and Water-rats by evill. And thus much shall suffice for the discourse of the Rat. The story which ensueth is of strange and less known Mice; and therefore I will distribute them after an alphabetical order, according to their several names.

Of the ALPINE MOUSE.

THE *Alpine Mouse* taketh her name from the *Alpes*, wherein she is bred, and although there be many other kinds of Mice bred in the *Alpes*, yet this being the principal thereof, receiveth denomination from the Mountains, because they are bred in the very tops of the Mountains, and seldom or never come down to the roots. The *Italians* call it *Marmota*, and *Murmot*, and according to *Mathæolus*, *Marmontana*; the *Rhetians*, *Montanella*; and in some part of *Italy*, *Varrofa*; in *France*, *Marmote*; although *Marmot* be also a word among them for a Munkie. The *Germans*, and especially the *Helvetians*, by a corrupt word drawn from a Mouse of the Mountain, *Murmeltier*, and *Murmentle*, and some *Misbellerle*, by reason of his sharp whining voycelike a little Dogs. In *Latine* it is called also *Empra*, which seemeth to be compounded of *Emdor*, and this is the least kinde of *Alpine Mice*, which is found in all the *German Regions*; of which we will speak in the end of this story. Some take this to be called *Taxus*, amongst whom *Brassavolus* is one; yet it hath no property with the *Alpine Mouse*, except lying in a Cave; for it doth not sleep in the Winter, nor hath no outward resemblance with Mice, neither can have any affinity in disposition or manner of living, and therefore I cannot assent thereto. *Grapaldus* & *Alpinus*, both learned *Italians*, say, that the *Armelins* are called *Alpine Mice*, whereunto they are led, because they sleep all the Winter long, like the *Alpine Mouse*; but we shall shew in their due place, that these belong to the Weefils, and not to the Mice, which living in cold Countries, grow white in the Winter time: the *Hebrew* word is *Saphan*, according to some Authors, and is translated *Arctonim*, but we will shew in due place, that the *Arctomys* is the *Crycet*, or *Grycet Mouse*; and the *Saphan* we have shewed already to be the Cony.

These *Alpine Mice* are in the tops of the *Apennine* hills, and none of the Ancients except *Pliny* make mention thereof, and it is doubtful whether he doth describe it or no. For his words are, *Sunt his Muribus Alpinis pares & in Ægypto, similiterq; residunt in clunibus & binis pedibus gradiuntur, prioribusq; ut manibus utuntur*, that is to say, there are Mice in *Egypt* like to the *Alpine Mice*; for they sit upon their buttocks, and go with their fore-most two feet, which also they use instead of hands, by which we collect, that they are not the same, but like the *Alpine Mice*.

The *Alpine Mouse* is in quantity like a Hare, or at the least betwixt a Hare and a Cony, being more fat, and of a thicker body then a Cat, but shorter legs, in outward appearance most like a Mouse, and therefore it is called an *Alpine Mouse*. The back of it is very broad, and the hair harder and harsher then a Conies. The colour for the most part is yellow, which in some is more clear, and in others more obscure and brown. Their eyes of a reasonable quantity, standing far out of their heads. Their ears very short like cropt ears. The head like a Hares, and their feet with long nails; his fore-teeth like a Squirrels, two above, and two beneath, but long and sharp like a Beavers, in colour yellow; about the nose and upper lips he hath long black bristle hairs like a Cat. The tail is half a cubit long, according to *Stumpsius*, but two palms according to *Agricola*. His legs very short and thick, covered with long deep thick hair, like to the bottom of his belly. The toes of his feet are like a Bears, and his claws long and black, wherewithall he diggeth the earth to make his den; he goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his fore-feet he taketh his meat like a Squirrel and an Ape, sitting in the mean time upon his buttocks. His back is also very fat, although all the other parts of his body be lean, and yet that on his back cannot be said to be fat, but rather like a Cows udder, neither fat nor flesh, and they encrease or grow more in breadth then in length.

Scaliger describeth them in this manner, a *Marmot* (saith he, for so he termeth an *Alpine Mouse* in *French*) is a Beast about the bigness of a Badger, having hair and tail much like it, and after

The quantity of this beast, and the several parts, *Mathæolus*.

The description of the great *Alpine Mouse*.

the same manner short legs, and little or no ears, long, sharp, firm, crooked, strong and black claws, which is numbred amongst the kindes of Mice, with whom it holdeth little correspondence, except that like a Squirrel it taketh his meat in the fore-feet as with hands, and eateth sitting upon his tail. They agree also with the Dor-mouse in their sleep, for they pass over Winter sleeping. Their teeth are like to the teeth of Hares and Mice; after that they are made tame, they are not hurtful to men or children, except they be provoked. Being kept in houses, they will eat and gnaw all linnen and woollen cloth; thus far *Scaliger*. But we have shewed already, that the outward appearance of it is like a Mouse, and that therefore it is safer to follow *Pliny*, *Albertus*, *Mathæolus*, *Stumpsius*, and others, then his sole and singular opinion; they keep as we have said already, in the tops of the Mountains, wherein they make their cave with wonderful art and circumspection, making two different passages into their Den, one above another a poles length, which meet in the middle like a fork, or the conjunction of two Rivers or Path-ways, making the seat of their rest to be very deep in the Mountain, and therein they remain five, seven, nine, or eleven of them together.

The places of their abode, and their singular art in making their cave.

Their observation of watch.

They play many times before the mouth of their Den together, and in their sport or pastime, bark like little Dogs. When they go out of their cave into the Mountains to gather food, or to play, or to fetch in grass; always one of them remaineth like a Watchman near the mouth of the cave upon some high place, looking most diligently and vigilantly, both far and near; and if he see either a man or wilde beast coming towards them, then he suddenly cryeth out; and with his voyce giveth the warning word, whining like the whistling of a pipe, if his fellows be far off; or else barking like a Dog, if they be near at hand. When the residue hear it, they presently repair home, and he which kept the watch, entereth into the Den last of all. And it is reported by a certain *Greek* Writer, that if their speculator do not give them the watch-word, but that they are endangered by any man or beast through his negligence, they tear him in pieces with their teeth. There is no beast so strong as this, considering the quantity; for it hath been seen, that when a lusty young man took one of them by the hinder

Stumpsius.
The strength of this Beast.

leg as it ran into the Den, he could not with all his might pluck it back again. The claws of it are exceeding sharp, and fit to dig; so that it is thought if a man finde them in the earth, and seek to take them by digging unto them, he shall labour in vain, because the Beast diggeth faster from him then he can follow her; they cannot run very fast in the plain ground, but are easily killed by a man, except they get into the earth; with their teeth they bite deep, for they can sheer asunder wood with them like Beavers, they eat or live upon fruits, and especially being tamed when they are young; they refuse not bread, flesh, fish, or pottage, and above all they desire milk, butter, and cheese; for in the *Alpes* they will break into the little Cottages where milk is kept, and are oftentimes taken in the manner sucking up the milk, for they make a noise in sucking of milk like the pig. In the moneth of *May* they are much delighted to eat Hornets, or Horse-flies, also they feed upon wilde Sagapen of the meadow, and seeded Cabages, and while they are wilde in the Mountains, they never drink; the reason is, as I suppose, because in the Summer time they eat moist green herbs, and in all the Winter time they sleep.

Their severall food.

Towards the feast of Saint *Michael* the Archangel, and of *Gallus*, they enter into their Caves; and as *Pliny* saith, they first of all carry provision of Hay, and green Herbs into their Den to rest upon, wherein their wit and understanding is to be admired; for like Beavers one of them falleth on the back, and the residue load his belly with the carriage, and when they have laid upon him sufficient, he girteth it fast by taking his tail in his mouth, and so the residue draw him to the Cave; but I cannot affirm certainly, whether this be a truth or a falsehood. For there is no reason that leadeth the Author thereto; but that some of them have been found bald on the back. But this is certain, when the Snow begins to cover the Mountains, then do they enter into their Dens, and shut up close the passages, with sticks, grass, and earth, both so hard and so thick, that it is easier to break the solid ground, then the mouths of their Caves, and so being safely included both from the fear of the Hunters, from rain, snow, and cold, there they live until the Spring, without all manner of meat and drink, gathered round together like a Hedgehog, sleeping continually; and therefore the people inhabiting the *Alpes* have a common proverb, to express a drowsie and sleepy fellow in the German tongue thus; *Er musse szuzyt geschlafen haben wie ein murmelthier*: in Latine thus; *Necessesse habet certum, dormiendo, tempus consumere, insar muris Alpini*. He must needs sleep a little, like the Mouse of the *Alpes*. They sleep also when they be tamed, but it hath been found by experience, that when a tame one hath been taken a sleep, and laid in a warm barrel upon Hay, the mouth being shut and closed to keep out rain and snow, at the opening thereof it was found dead; and the reason was, because it lacked breath, and therefore this is most wonderful, that in the Mountains, notwithstanding the close stopping of the mouth of their Caves, yet they should not be deprived of refrigeration, that is, fresh air, for expiration, and respiration.

Entrance into their caves.

But this is to be considered, that after they have been long tamed, they sleep not so much as when they are wilde; for I think that their continual eating of raw and green herbs, ingendereth in them so many humors as cannot be dispersed without a long continuing sleep; but afterwards when they are dieted with such meat as is provided for the nourishment of man, they are eased of the cause, and so the effect ceaseth. During the time that they sleep, they grow very fat, and they are not awaked very easily, except with the heat of the Sun or fire, or a Hot-house. Now the manner of their taking while they are wilde, is thus;

Their continual sleep all the Winter time.

Growing fat with sleep.

In the Summer time when they go in and out of their Caves, they are taken with snares set at the mouth thereof; but in the Winter time, when they go not abroad, then also are Inhabitants forced to another devise, for then in the Summer time, they set up certain pillars or perches near the mouth of their Den, whereby they may be directed, when the snow doth cover the Mountains. For the pillars or poles stand up above the snow, although the snow be very deep. Then come the Inhabitants upon round pieces of wood in the midst of the Winter, fastned to their shooe-soles over the deep snow with their pyoners and diggers, and cast away the snow from the den, and so dig up the earth, and not only take the beasts, but carry them away sleeping, and while they dig, they diligently observe the frame and manner of the stopping of the Mouses den. For if it be long and deep, if is a sign of a long and a hard Winter, but if they be shallow and thin, of the contrary: so coming upon them as we have said, they take them and carry them away asleep, finding always an odd number among them; and they diligently observe, that whilest they dig, there be no great noise, or that they bring not their fire too near them. For as *Stumpsius* saith, *Experimenti enim capi non possunt, nam utranq; strenue fodiunt venator, ipsi fodiendo simul & retrocedunt & pedibus quam effoderint, terram rejiciendo fossorem impediunt*. That is to say, If they be once awaked, they can never be taken, for howsoever the Hunter dig never so manfully, yet they together with him, dig inward into the Mountains, and cast the earth backward with their feet to hinder his work.

The taking of these beasts.

Being taken as we have said, they grow very tame, and especially in the presence of their keepers, before whom they will play and sport, and take lice out of their heads with their fore-feet like an Ape. Inasmuch as there is no beast that was ever wilde in this part of the world, that becometh so tame and familiar to man as they; yet do they always live in the hatred of Dogs, and oftentimes bite them deeply, having them at any advantage, especially in the presence of men, where the Dogs dare not resist nor defend themselves. When they are wilde, they are also killed asleep, by putting of a knife into their throat, whereat their fore-feet stir a little, but they die before they can be awaked.

Their taming and conditions in the house.

The

The saving
and use of
their flesh.

Their blood is saved in a vessel, and afterwards the Mouse it self is dressed in hot scalding water like a Pig, and the hair thereof plucked off, and then do they appear bald and white; next to that they bowell them, and take out their intrails: afterwards put in the blood again into their bellies, and so see the them, or else salt them, and hang them up in smoke, and being dressed after they are dried, they are commonly eaten in the *Alpine* Regions with Rapes and Cabbages, and their flesh is very fat, not a fluxible or loose fat like the fat of Lambs, but a solid fat, like the fat of Hogs and Oxen. And the flesh hereof is commended to be profitable for Women with childe; and also for all windiness and gripings in the belly, not only the flesh to be eaten in meat, but also the fat to be anointed upon the belly or navil: And for this cause it is used to procure sleep, and to strengthen decayed and weak sinews: the flesh is always better salted then fresh, because the salt drieth up the overmuch humidity, and also amendeth the gravity and ranckness of the savour: but whether it be salt, or whether fresh, it is always hard to be digested, oppressing the stomach, and heating the body overmuch.

The medicines
of this beast.

The ventricle or maw of the Mouse *Alpine*, is prescribed to be laid upon the belly against the Colic. If the hands of a man be anointed with the fat of this beast, it is said he shall be the better able to endure cold all that day after: Also the same fat being drunk up in warm broth by a woman in travail, are believed to accelerate and hasten her delivery.

Certain Horse-leeches, in the cure of that disease which they call the Worms, which are certain ulcers rising in the body, do mingle this fat with other medicines which are very drying or stiptick. And *Mathæolus* doth prescribe it for the softning and mollifying of contracted nerves and joynts in the body.

The description
of the Em-
ptre or little
Alpine Mouse.

By the discourse aforesaid, it doth appear, that of these *Alpine* Mice there are two kinds, one great like a Badger, and the other in stature of a Hare or Cony: This lesser seemeth to be proper to *Germany*, which there they call *Embdor*, of the *Latine* word *Emptre*, a Mouse of the Mountain.

The story whereof I thought good to express, being short, out of *Stumpsius* and *Agricola*: The males and females say they of this kinde, do gather together wilde corn which groweth among the Rocks in the Summer time against the Winter, and carry the same into the holes of the earth, where their lodging is.

Alberius.

Now the female in this kinde is crafty, and more apt to devour; the male on the other side more thrifty and sparing, wherefore he driveth his female out of the Den in the Winter time, and stoppeth the mouth of his Cave, to forbid her entrance, but she getteth behinde the same, and diggeth a secret hole, whilest the male lyeth at the mouth asleep, she consumeth the whole store behinde him; wherefore in the Spring time she cometh forth very fat and comely, and he very lean. And therefore in my opinion, the makers of emblems may very well describe an unthrifty Wife, that consumeth her Husbands wealth, by the picture of this female, as by the picture of the Ass behinde *Ocnus*, biting asunder the cord that he weaveth, as we have shewed before in the History of the Ass. These beasts give themselves much to sleep, and when they are awake they are never idle, but always carrying into their Den straw, hay, sticks, rags, or pieces of cloth, wherewith they fill their mouth so full, that it may receive no more, and if they meet with any thing which is too big for their mouth, by the help of their feet they draw and rowl it to their own Den.

Whereas they are nourished tame in houses, it is observed, that they are a neat and cleanly kinde of beast, for they never defile their lodgings with their excrements, but seek out some secret corner, wherein they both render urine, and empty their bellies. With their teeth the gnaw wood, and make holes in bords, so large as their bodies may pass through; and while they live, they have a very ranck and strong savour like a Mouse, especially in the Summer time while they are lean, and before they grow fat; for such is the nature of this beast, that in the Summer time they labour and grow lean; but in the Winter time they sleep and grow fat. And thus much for the *Alpine* Mouse.

Of the DORMOUSE.

The names and
reasons there-
of.

THE Dormouse is called in *Latin*, *Glis*; and in *Greek*, *Myoxos*; the reason of the *Latine* name *Glis*, is taken from *gliscere*, which signifieth to grow fat, according to the saying of *Columella*, *Paleis vero quibus fere omnes regiones abundant Asinus gliscit*; that is to say, an Ass groweth fat by eating chaffe which aboundeth in all Countries. This word *Glis*, signifieth not only a beast, but a piece of fat earth, and also a Thistle; whereupon *Sylvesticus* made this verse:

Glis animal, glis terra tenax, glis lappa vocatur.

The *Italians* call it *Lo Galero*, *Lo Gliero*, or *Giero*; the *Spaniards*, *Liron*; the *French* likewise *Liron*, and *Rat*, *Liron*, and *Ungloyer*, and *Vngratuel*; the *Germans*, *Ein greul*; the *Helvetians*, *Ein rell*, or *Rel mus*, or *Gros haselmus*; but our *English*, Dormouse, seemeth to be a compounded word of *Dormiens mus*, that is, a sleeping Mouse. The *Polenians* call him *Scurez*. But concerning his name *Myoxos*, there is some question among the Authors. For *Saint Jerom* writing upon the eleventh chapter of *Leviticus*,

viticus, and the 66. Chapter of Esay, translateth *Akbar* the Hebrew word for a Mouse, *Glirem*, a Dormouse, and he giveth this reason, because all the Countries of the East, meaning *Græcia*, do say, that *Myoxus* is a Dormouse. And this *Myoxus* by *Epiphanius* in his Anchoret is alleadged to prove the resurrection. *Myoxus*, saith he, *Animal semestire moritur, & rursus post tempore suo reviviscit*. The Dormouse at half a year old dyeth, and after her full time reviveth again: And in his Book against Heresies, he speaketh thus to *Origen*; *Tradunt naturæ rerum experti, Myoxum latitare, & fœtus suo simul in eodem loco multos parere; quinque, & amplius: Viperas autem hos venari, & si invenerit totum latibulum ipsa Vipera, quum non posset omnes devorare pro una vice ad sacietatem edit unum aut duos, reliquorum vero oculos expungit, & cibos offert, excaecatosque enutrit, donec voluerit unumquemque eorum devorare. Si vero contigerit, ut aliqui in experti in hos incidant, ipsosque in cibum sumant, venenum sibi ipsis sumunt, eos qui à Vipera veneno sunt enutriti. Sic etiam ô tu Origenes à Græca doctrina mente excaecatus, venenum his qui tibi crediderunt, evomisti, & factus es ipsis in edulium venenatum, ita ut per quæ ipse injuria affectus es, per ea plus injuria afficeris.*

The description of the Dormouse out of *Epiphanius*.

The Philosophers which are cunning in the nature of things do write, that the Dormouse doth lie hid, and bring forth many young ones in the same place where he lyeth, five or more at a time, and the Vipers do hunt these to destroy them: now if the Viper finde their nest, because she cannot eat them all at one time at the first, she filleth her self with one or two, and putteth out the eyes of the residue, and afterwards bringeth them meat and nourisheth them, being blinde, until the time that her stomach serveth her to eat them every one. But if it happen that in the mean time, any man chance to light upon these Viper-nourished-blinde-Dormice, and to kill and eat them, they poyson themselves through the venom which the Viper hath left in them: so fareth it with thee *O Origen*, for thou art blinded with the *Græcians* doctrine, and dost vomit out that poyson into their hearts which do believe thee, that thou art made unto them a venemous meat, whereby thou dost wrong others, as thou hast been wronged thy self.

Py which it is manifest, that *Myoxus* is neither a Toad nor a Frog, but the Dormouse. And the charm which is made for the Asses urine, as we have shewed already in his story, *Gallus bibit, & non meit, Myoxus meit, & non bibit*. The Cock drinketh, and maketh not water, the Dormouse maketh water, and never drinketh. But whether it be true or no that she never drinketh, I dare not affirm: But this is certain, that she drinketh but very seldom; and it ought to be no wonder that she should make water, for tame Conies, as long as they can feed upon green herbs, do render abundance of urine, and yet never drink.

Whether they render urine and drink not.

The *Græcians* also do call this Beast *Elayos*, although that word do likewise signifie a Squirrel. In *Mesia* a Wood of *Italy*, there is never found Dormouse, except at the time of their littering.

They are bigger in quantity then a Squirrel, the colour variable, sometimes black, sometimes grised, sometimes yellow on the back, but alwayes a white belly, having a short hair, and a thinner skin then the Pontique Mouse. They are also to be found in *Helvetia*, about *Clarona*. It is a biting and an angry Beast, and therefore seldom taken alive. The beak or snout is long; the ears short and pricked; the tail short, and not very hairy at the end; the middle of the belly swelleth down betwixt the breast and the loins, which are more narrow and trussed up together, they are always very fat, and for that cause they are called *Lardironi*.

The quantity colour, and several parts.

Buck-mast is very acceptable meat unto them, and doth greatly fatten them, they are much delighted with Walnuts, they climbe trees, and eat Apples, according to some: but *Albertus* saith more truly, that they are more delighted with the juyce then with the Apple. For it hath been of-

Their food.

rentimes found, that under Apple-trees, they have opened much fruit, and taken out of it nothing but the kernels, for such is their wit and policy, that having gathered an Apple, they presently put it in the twist of a tree betwixt boughs, and so by sitting upon the uppermost bough press it asunder. They also grow fat by this means.

Nourishers
and nourishing
of Dormice.

In ancient time they were wont to keep them in coops or tuns, and also in Gardens paled about with board, where there are Beeches or Walnut trees growing, and in some places they have a kinde of earthen pot, wherein they put them with Walnuts, Buckmast, and Chestnuts. And furthermore it must be observed, that they must be placed in rooms convenient for them to breed young ones; their water must be very thin, because they use not to drink much, and they also love dry places.

Titus Pompeius (as Varro saith) did nourish a great many of them enclosed, and so also Herpinus in his Park in Gallia. It is a Beast well said to be *Animal Semiferum*, a creature half wilde, for if you see for them hutches, and nourish them in Warrens together, it is observed, that they never assemble, but such as are bred in those places: And if strangers come among them which are separated from them, either by a Mountain, or by a River, they descry them, and fight with them to death.

Society and
charity in
them.
Pliny.

They nourish their parents in their old age, with singular piety. We have shewed already, how they are destroyed by the Viper, and it is certain, that all Serpents lie in wait for them. Their old age doth end every Winter. They are exceeding sleepey, and therefore Martial saith:

Somniculosi illi porrigit gires.

They grow fat by sleeping, and therefore Ausonius hath an elegant verse;

Dic, cessante cibo, somno quis opimior est? glis.

The means to
take these
Dormice.

Because it draweth the hinder-legs after it like a Hare, it is called *Animal traçile*, for it goeth by jumps and little leaps. In the Winter time they are taken in deep ditches that are made in the Woods, covered over with small sticks, straw, and earth, which the Countrey men devise to take them when they are asleep. At other times they leap from tree to tree like Squirrels, and that they are killed with Arrows as they go from bough to bough, especially in hollow trees: for when the Hunters finde their haunt wherein they lodge, they stop the hole in the absence of the Dormouse, and watch her turn back again: the silly Beast finding her passage closed, is busied hand and foot to open it for entrance, and in the mean season cometh the Hunter behinde her, and killeth her. In Tellina they are taken by this means: The Countrey men going into the fields, carry in their hands burning Torches in the night time, which when the silly Beast perceiveth, with admiration thereof flocketh to the lights, whereunto when they were come, they were so dazled with the brightness that they were stark blinde, and might so be taken with mens hands.

The use of the
flesh of these
Mice.

The use of them, being taken, was to eat their flesh, for in Rhetia at this day they salt it and eat it, because it is sweet and fat like Swines flesh. Ammianns Marcellinus wondereth at the delicacy of his age, because when they were at their Tables, they called for ballances to weigh their fish, and the members of the Dormouse, which was not done (saith he) without any dislike of some present, and things not heretofore used, are now commended daily. Apitius also prescribeth the muscles and flesh inclosed in them, taken out of every member of a Dormouse, beaten with Pepper, Nut-kernels, Parsenips, and Butter, stuffed all together into the belly of a Dormouse, and sewed up with thread, and so baked in an Oven, or sod in a Kettle, to be an excellent and delicate dish. And in Italy at this day, they eat Dormice (saith Calius,) yet there were ancient laws among the Romans, called *Leges censoria*, whereby they were forbidden to eat Dormice, strange birds, Shell-fish, the necks of Beasts, and divers such other things. And thus much shall suffice for the description of the Dormouse.

What is
the use of
the flesh of
these Mice?

Pliny.

Marcellus.

Dormice being taken in meat, do much profit against the Bulimon; The powder of Dormice mixed with Oyl, doth heal those which are scalded with any hot liquor. A live Dormouse doth presently take away all Warts being bound thereupon. Dormice, and Field-mice being burnt, and their dust mingled with Hony, will profit those which desire the clearness of the eyes, if they do take thereof some small quantity every morning. The powder of a Dormouse, or field Mouse rubbed upon the eyes helpeth the aforesaid disease. A Dormouse being stead, roasted and anointed with Oyl and Salt, being given in meat, is an excellent cure for those that are short winded. The same also doth very effectually heal those that spit out filthy matter or corruption. Powder of Dormice or field Mice, or young Worms, being mixed with Oyl doth heal those that have Kibes on their heels, or Chilblains on their hands. The fat of a Dormouse, the fat of a Hen, and the marrow of an Ox melted together, and being hot,

not infused into the Ears, doth very much profit both the pains and deafness thereof.

The fat of Dormice being boiled, as also of field-mice, are delivered to be most profitable for the eschewing of the Palsie. The fat of a Dormouse is also very excellent for those which are troubled with a Palsie, or shaking of the joints. The skins and inward part of a Dormouse being taken forth, and boiled with Hony in a new vessel, and afterwards poured into another vessel, will very effectually heal all diseases which are incident to the ears, being anointed thereupon. The skin of a Dormouse, or a Silkworm being pulled off, and the inward parts thereof being boiled in a new brasen vessel with Hony, from the quantity of twenty seven ounces, even to three, and so kept, that when there is need of a certain bathing vessel, the medicine being made warm and poured into the ears, doth help all pains, deafness, or inflammation of the ears. The fat of a Dormouse is commended to be very medicinable for the aforementioned diseases. The same is profitable for all pains, aches, or griefs in the belly. The urine of a Dormouse is an excellent remedy against the Palsie. And thus much shall suffice concerning the medicinal vertues of the Dormouse.

Sextus.

Pliny.

Marcellus.

Of the Hamster or Cricetus, the first figure taken by Michael Horus.

The second picture taken by John Kentmant, and it is her fashion and protracture to lie thus when she is angry, for so doth her colour appear both on the back and belly.

This Beast is called in Latine, *Cricetus*; and in the German tongue *Hamster*, *Traner*, and The names, *Kornsaerle*, that is, Pigs of the corn. It is a little Beast, not much bigger then a Rat, dwelling in the earth of the roots of corn, she is not drawn against her will out of her Cave at any time, but by pouring hot water or some other liquor. The head of it is of divers colour, the back red, the belly white, and the hair sticketh so fast to the skin, that it is easier to pull the skin from the flesh, then any part of the hair from the skin. It is but a little Beast as we have said, but very apt to bite and fight, and full of courage, and therefore hath received from nature this ornament and defence, that it hath a bony helmet, covering the head and the brain when it standeth up upon the hinder-legs: It resembleth both in colour and proportion a Bear. And for this cause some Writers have interpreted it

The descriptive on.

Of the Arctomys.

to be the Beast called *Arctomys*, thus described by Saint *Jerom*. It is a creature (saith he) abounding in the Regions of *Palestina*, dwelling always in the holes of Rocks and Caves of the earth, not exceeding the quantity of a Hedgehog, and of a compounded fashion, betwixt a Mouse and a Bear.

The voracity of the *Cricetus*.

But we have shewed already, that this is the *Alpine* Mouse, and therefore we will not stand to confute it here. The name *Cricetus* seems to be derived from the *Illyrian* word, which we read in *Gelenius* to be *Skuzeczek*: this Beast, saith he, is common in the Northern parts of the world, and also in other places, in figure and shape it resembleth a Bear, in quantity it never exceedeth a great *Sorex*. It hath a short tail, almost like no tail, it goeth upon two legs, especially when it is moved to wrath. It useth the fore-feet in stead of hands, and if it had as much strength, as it hath courage, it would be as fiercerful as any Bear. For this little Beast is not afraid to leap into the Hunters face, although it can do no great harm either with teeth or nails. It is an argument that it is exceeding hot, because it is so bold and eager. In the uppermost chap it hath long and sharp teeth, growing two by two. It hath large and wide cheeks, which they always fill, both carrying in, and carrying out, they eat with both, whereupon a devouring fellow, such a one as *Stafimus* a servant to *Plautus* was, is called *Cricetus*, a Hamster, because he filleth his mouth well, and is no pinger at his meat.

The making of his den.

The fore-feet are like a Moulds, so short, but not altogether so broad, with them he diggeth the earth, and maketh his holes to his den, but when he diggeth so far as he cannot cast the earth out of the hole with them, then he carryeth it forth in his mouth. His Den within he maketh large, to receive corn, and provision of fruit for his sustentation, whereinto he diggeth many holes, winding and turning every way, that so he may be safe both against Beasts that hunt him, and never be killed in his Den: And also if a man dig the earth, he may finde his lodging with more difficulty. In the harvest time he carryeth in grain of all sorts, and my Author saith, *Neque minus in colligendo industrius, quam in eligendo, conservandoque est astutus, optima enim reponit*. He is no less industrious in the gathering of his provision, then crafty and politick in the choise, and keeping it, for it lays up the best; and lest that it should rot under the earth, it biteth off the fibres and tail of the grain, laying up the residue amongst grass and stubble.

It lies gaping over his gathered grain, even as the covetous man is described in the Satyre sleeping upon his mony bags. It groweth fat with sleep like Dormice, and Conies. The holes into the Cave are very narrow, so that with sliding out and in, they wear their hair. The earth which cometh out of their holes doth not lie on heaps like Mole-hills, but is dispersed abroad, and that is fittest for the multitude of the holes, and all the holes and passages are covered with earth: but that hole which for the most part he goeth out at, is known by a foot path, and hath no hindrance in it, the other places at which she goeth out are more obscure and hid, and she goeth out of them backwards. The male and female do both inhabit in one Cave, and their young ones being brought forth, they leave their old Den and seek them out some new habitation. In the male there is this perfidity, that when they have prepared all their sustenance, and brought it in, he doth shut out the female, and suffereth her not to approach nigh it, who revengeth his perfidiousness by deceit. For going into some adjoining Cave, she doth likewise partake of the fruits which were laid up in store by some other secret hole in the Cave, the male never perceiving it.

So that nature hath wonderfully fore-seen the poverty of all creatures: neither is it otherwise amongst men, for that which they cannot do by equity, they perform by fraud. This also cometh in the speech of the common people, against one that will thrive. The young Country wenches concerning this matter, do chant out a verse not unpleasant, which I am contented to express in Iambicks, consisting of four feet:

*Hamster ipse cum sua
Prudens catuq; conjuge,
Stipat profundum pluribus
Per tempus antrum frugibus,
Possitque solus ut frui,
Lectis acervis hordei
Avarus antro credulam
Extrudit arte conjugem.
Serva, inquit, exiens foras,
Caeli serena & pluvias.
Sed fœminis quis insitam,
Vincant dolis astutiam?*

*Novum parans cuniculum,
Furatur omne triticum.
Egens maritus perfidam
Querit per antra conjugem,
Nec se repellat blandulis
Demulcet inventam finis,
Ille esse jam communia
Servata dum finis bona.
At perfidus multiplices
Opponit intus obices.
Rursus fruuntur mutuis
Antris, cibus, amplexibus.*

His meat and food.

This Beast doth devour all kinde of fruit, and if he be nourished in a house he eateth bread and flesh: he also hunteth the field Mice. When he taketh his meat, he raiseth himself upon his fore-feet: he is also wont with his fore-feet to stroke his head, ears, and mouth, which thing the Squirrel and the Cat do also, and as the Beaver amongst those creatures which live as well by water as by land: but although in his body he seemeth but small, notwithstanding he is by nature apt to fight, and very furious being provoked, with his carriage in his mouth: he beateth away

away with both his feet that which resisteth him, directly invading his enemy: In the spirit and affaulting of his mouth he is wayward and threatening, from whence our Country men were accustomed to say of any one which was angry; he breatheth his wrath out of his mouth like a Hamster: *Du spruest vnie ein Hamster*: neither is he easily affrighted, although he be far unequal unto those in strength with whom he is in combat.

Wherefore some do give it in the place of a Proverb, that our Countrymen do call a man which is madly rash, *Ein tollen Hamster*, as fool-hardy as a Hamster. He flieth from any one that doth sharply resist him, and doth greedily follow after them that flie from him. I my self saw one of these, who by assaulting a Horse gat him by the nose, and would never leave his hold until he was killed with a sword: He is taken by divers means, for he is expelled either by hot water poured into his den, or is choaked within; or being digged up with a mattock or spade he is killed; or by Dogs. He is sometimes pulled out by the Fox, or hurt: or oppressed by some snare, a great weight being put about it: or to conclude, he is taken by Art alive, and that in the night time, when he goeth to seek his prey, for in the day time for the most part he lyeth hid.

Before his usual Cave (as I have said) he is taken by the path which is worn, by a pot which is put into the earth, and afterward made plain about it like other places of the field; there is earth cast into the bottom of the pot to the deepness of two fingers, above every where covering the pot there is placed a stone, which is held up by a piece of wood, to which there is bound below a fragment of bread: In the space between the Cave and the pot there are crumbs of bread scattered, which he following and leaping into the pot, the wood falling, he is taken. Being taken after the manner of other beasts, he toucheth no food. If a broad stone, such an one with which they cover pavements, or of which they make roof tiles, shall be joyned unto the pot, and the beast be taken, he will be very hardly known in the morning; for the spirit of the beast being shut in, and waxing wroth, piercing for thinness doth moisten the stone. The skins of Hamsters are very durable, of which there are certain long coats which come down unto the heels, and divers coloured cloaks made, which the women of *Misena* and *Silesia* do use, and account them very honorable, of a black and red colour, with broad guards or edges of the skins of Otters: the same coats are for the most part valued at the price of fifteen or twenty *Renenian* crowns: for it doth out-wear in length three or four garments made either of linnen or woollen cloath.

In *Turingia* and *Misena* this beast is frequent, notwithstanding not in all places, for in *Turingia* his chieftest abode is about *Esfurdanus*, and *Salcensis* in *Misena*, about *Lipsia*, and the field *Pegensis*, the plentifullest and most fertilest places of both those Regions. In *Lusatia* about *Radeburge*, he is digged out of those places where Painick groweth. At *Mulberge* and *Albia*, he is found in the Vineyards, for he is also fed with ripe Grapes. Our Country men are wont to burn a living Hamster in a pot, being shut, for the medicines of Horses. It hath been seen that one of these hath leaped up and caught a Horse by the nose, never letting go his hold until she was cut off with a sword. The skin is of three or four different colours, besides the spotted sides, and therefore the skin is very pretious. They abound in *Turingia* where the soil is good, and there is also great store of grain.

Of the NORICIAN MOUSE.

THE Norician Mouse is called in *Latine*, *Citellus*, and it keepeth like the wilde Mice in the caves and dens of the earth. The body is like to a domestical Weefils, long and slender, the tail very short, the colour of the hair like to a gray Conies, but more bright. It wanteth ears like a Mole, but it hath open passages in stead of ears, wherewithal it heareth the sound, as you shall see in many birds. The teeth are like the teeth of Mice, and of their skins (although they be not very precious) they use to make garments. In *Germany* they call it *Pile* and *Zisel*, and of this *German* word was the *Latine* *Citellus* feigned; and it appeareth by *Agricola*, that there are two kinds of these; one greater, which are call'd *Zysell* and *Zeiseile*, and another lesser (called *Pile*) which may be the same that is also called *Bilebmuss*, and differeth from other, because it is used for meat. These are bred in *Croatia*, and in the Country about *Venice*. They have a strange smell or savour, which is said to be hurtful to the head: They eat both salted and hung in the smoke, and also fresh and new killed. With their skins they edge the skirts of garments, for it is as soft as the skin of a Hare: and beside the common nature of Mice they are tamed. They also have very large cheeks, whereinto they gather an innumerable quantity of grain, and carry it into their den, as it were in bags against the Winter. They live thirty and forty together in a Cave, and are not driven forth but by infusion of hot water. They gather great store of Nuts into their Caves, and therefore as well as for their flesh do men hunt and seek after them.

Of the MOUSE PONTIQUE.

THE name of this Mouse is given unto it from the Island out of which it was first brought, *Olaus mag.* named *Pontus*, and for this cause it is also called *Venetus*, because it was first of all brought into *Agricola.* *Germany* from *Venice*. It is called also *Varius* by *Idorus*, from whence cometh the *German*

word *Vutreck*, from the diversity of the colour *Grauvuerck*. It is called also *Pundtmust*, as it were *Ponticus mus*, or rather of *Bundt*, because they were wont to be brought in bundles to be sold fifty together, and they were sold for twenty groats, *Volaterranus*, and *Hermolaus* are of this opinion, that the white one in this kinde, be called of the *Italians*, *Armelline*, and the *Germans*, *Hermelin*, but we have promised already to prove that *Hermelin* is a kinde of Weefil, which in the Winter time is white, by reason of extremity of cold, and in the Summer returneth into her colour again, like as do the Hares of the *Alpes*. This *Pontique Mouse* differeth from others only in colour, for the white is mingled with ash colour, or else it is sandy and black, and in *Polonia* at this day they are found red and ash coloured. Their two lowermost teeth before are very long, and when it goeth, it draweth the tail after it like Mice; when it eateth it useth the fore-feet in stead of hands, and feedeth upon Walnuts, Chefnuts, Filbeards, small Nuts, Apples, and such like fruits. In the Winter time they take sleep in stead of meat; And it is to be remembred, that the *Polonians* have four kinds of pretious skins of Mice which they use in their garments, distinguished by four several names. The first of grisel colour, called *Popieliza*. The second is called *Gronostaii*, a very white Beast all over, except the tip of the tail which is all black, and this is the *Hermelin*.

The third is called *Novogrodela*, from the name of a Town, and this is white mingled with grisel, and this is also a kinde of *Pontique Mouse*. The fourth *Uvieuworka*, of a bright Chefnut colour, and this is the Squirrel, for they call Squirrels, Weefils, and Hermelins all by the name of Mice. These *Pontique Mice* have teeth on both sides, and chew the cud. In the Winter time as we have said they lie and sleep, especially the white ones, and their sense of taste doth excel all other, (as *Pliny* writeth) they build their nests and breed like common Squirrels.

Their skins are sold by ten together, the two best are called *Litzschnai*; the third, a little worse, are called *Crasna*, and the fourth next to them *Pocrasna*, and the last and vilest of all *Moloischna*: with these skins they hem and edge garments; and in some places they make Canonical garments of them for Priests, unto which they sew their tails to hang down on the skirts of their garments; of which custom *Hermolaus* writeth very excellently in these words. *Instruxit, & ex muribus, luxuriam suam vita, alios magnis frigoribus, alios medio anni tempore, a septentrionibus petendo, armatus corpora, & debellamus animos.* That is to say; The life of man hath learned to be prodigal, even out of the skins of Mice, for some they use against extremity of cold, and they fetch others out of the farthest Northern parts, for the middle part of the year: Thus do we arm and adorn our bodies, but put down and spoil our mindes.

Beside, there is a flying *Pontique* or *Scythian Mouse*, which we may call the broad Squirrel Mouse, whose skin is here expressed as you may see, and for the description thereof, I have thought good to add an Epistle of *Antonius Schnebergerus* the *Lituanian* of *Vilna* unto *Gesner*, in these words following:

I send unto thee a little skin, the upper place of the hairs thereof being of a white ash colour, but the root of the hair or inner part thereof is a black brown. They call it *Popelycza Lataacza*, that is, a *Pontique* flying Mouse: It is always so moist, that it can never be dressed by the Skinner, or Lether-dresser.

The people use it to wipe sore running eyes, having a perswasion that there is in it a singular vertue for the easing and mitigating of those pains: but I think that the softness was the first cause which brought in the first use thereof, but if the hairs do not cleave hard to the skin, it cannot be done without danger. Also the hairs hanging as it were in a round circle against or above the two former feet, they call wings, wherewithal they

are thought to flie from tree to tree. Thus far *Antonius. Gesner* after the receipt of these skins, being willing to preserve them from moths, because they were raw, for experience sake gave them to a leather dresser, who presently dressed them with Vinegar, and the Lees of Wine, so that it appeareth the Skinners of *Lituania* had not the skill how to dress it.

After they were dressed they were so soft, that they stretched above measure, so that every one of them were square, that is to say, their length and breadth were equal, for they were two palms or eight fingers broad: and no more in length, the head and tail excepted: wherefore it may well be called a square Mouse, or *Sciurus quadratus*, because we are sure of the former, but not of the flying; the tail was as long as four or five fingers are broad, being rough like the tail of other Squirrels, but beset with black and white hairs, the whole colour both of the belly and upper part was whitish, as we have said, but black underneath, the hair is so soft as any silk, and therefore fit for the use of the eyes. The ears shorter and rounder then a Squirrels, the feet did not appear by the skin: the neather part was distinguished from the upper part, by a certain visible line, wherein did hang certain long hairs, which by their roughness and solidity under the thin and broad frame of their body, might much help them to flie, even as broad fishes swim by the breadth of their bodies, rather then by the help of their fins. The *Helvetians* wear these skins in their garments. It is reported by *Ælian*, that the Inhabitants of *Pontus*, by making supplication to their Gods, did avert and turn away the rage of Mice from their Corn-fields, as the *Egyptians* did, as we have said before in the story of the vulgar Mouse.

Of the Mouse called the *Shrew*, or the *Erd shrew*.

The word *Honaka* of the *Hebrews* remembred in the 11. chapter of *Leviticus*, is diversly interpreted by the translators, some call it a reptile beast which always cryeth: some a reptile flying beast; some a Horse-leach, or blond-sucker; some a Hedgehog; and some a Beaver, as we have shewed before in the Hedgehog. But the *Septuagints* translate it *Mygale*; and *S. Jerom*, *Mus araneus*, that is, a Shrew. *Dioscorides* calleth it *Miogale*; the *Germans* and *Helvetians*, call it *Mutzer*; in some parts of *Germany*, from the figure of the snout it is called *Spitzmus*, by some *Zissmus*, from the fiction of his voice; and some *Groß Zissmus*; the *Hollanders* call it *Moll Musse*, because it resembleth a Mole. *Mathæolus* for the *Italians* call it *Toporagno*; that is, a Mole-shrew. The *Helvetians* call it *Bisemus*, that is, a Musk-mouse, because it being dried in a furnace smelleth like Musk. The skin pulled from the flesh, smelleth best by it self, and yet the flesh smelleth well also, and so do the excrements. But to return to the *Greek* name, why it should be call'd *Mygale*, there is not one opinion amongst the learned: but I do most willingly condescend to the opinion of *Actius*, who writeth that it is called *Mygale*, because in quantity it exceedeth not a Mouse, and yet in colour it resembleth a Weevil, and therefore it is compounded of two words, *Mys*, a Mouse, and *Galee*, a Weevil.

Amyntas is of opinion, that it is so called, because it is begot betwixt a Mouse and a Weevil, but this is neither true nor probable. For is it likely that Weevils and Mice will couple together in carnal copulation, whose natures are so contrary, the one living upon the death of another, that is, the Weevil upon the Mouse? And beside the difference of quantity betwixt them, maketh it impossible to have such a generation. The other derivation of *Mygale*, which is made by *Rodolphus* writing upon *Leviticus*, fetching *Mygale* from *Mus gulafut*, that is, a devouring Mouse, it is against the order of all good Linguists, to derive *Greek* words from *Latine*, but rather consonant to learning, to fetch the *Latine* from the *Greek*.

There is no less inquiry about the *Latine* name, why it should be called *Mus araneus*, seeing *Aranea* signifieth a Spider. This Mouse saith *Albertus*, is a red kinde of Mouse having a small tail, a sharp voice, and is full of poyson, or venom: For which cause Cats do kill them, but do not eat them. *Sipontinus* writeth thus, of this Shrew; *Mus araneus, exiguum animal, atq; levissimum est, quod araneæ modo tenuissimum filum, & gladii aciem conscendit*. That is to say, this Shrew-mouse is a little and light creature, which like a Spider climeth up upon any small thread, or upon the edge of a sword: and therefore you see, they derive the *Latine* name from his climbing like a Spider.

But in my opinion it is more reasonable, to derive it from the venom and poyson which it containeth in it like a Spider. For which cause *Silvaticus* writeth thus; *Mugali id est, draco marinus*.

*nus, & animal venenosum, pusillum muri simile: nam & araneum piscem, propter venenum pungentibus insitum spinis, veteres ophim, id est, serpentem nominarunt, & hodie quam vulgo draconem vel draconem. That is to say; There is a fish of the Sea, and a little Beast on the Earth like a Mouse, which by a general word are called *Mugale*, and the Spider-fish called at this day a Dragon, or Dragonist, was in ancient time called a Serpent, because by his prickly fins, he did poyson those which were stricken by him. And concerning the description of this beast, it may be taken from the words of an ancient *English* Physician, called Doctor *William Turner*.*

I have seen (saith he) in *England*, the Shrew-mouse of colour black, having a tail very short, and her snout very long and sharp, and from the venomous biting of this Beast, we have an *English* Proverb or Imprecation, I beshrow thee, when we curse or wish harm unto any man, that is, that some such evil as the biting of this Mouse may come unto him. The *Spaniards* call this Beast *Raton Iquemo*; the *Illyrians*, *Viemed kamys*; and the *Polonians*, *Kerit*. They were wont to abound in *Britany*, as *Hermolaus* writeth.

They are also plentiful in *Italy* beyond the Mountains *Apennine*, but not on this side (as *Pliny* writeth) yet in the hither parts of *Italy* and *Germany*, there are many found, especially in the Country neer *Trent*, in the Valley *Anania*, where this is admirable, that by reason of the coldness of that Country their bitings are not venomous. For the Scorpions there are not venomous, although in other places of *Italy* they poyson deeply. This Beast is much less then a Weevil, and of an ash colour, in most places like a Mouse, although the colour be not always constant.

Samonicus.
Vegetius.

Aetius.

The eyes are so small, and beneath the proportion of her body, that it hath not been unjustly doubted of the Ancients, whether they were blinde or no, but in their best estate their sight is very dull. And for this cause the ancient *Egyptians* did worship it: for as they held opinion, that darkness was before light, so they deemed that the blinde creatures were better then the seeing. And they also believed, that in the wane of the Moon the liver of this beast consumed. It hath a long and sharp snout like a Mole, that so it may be apt to dig. The teeth are very small, but so as they stand double in their mouth, for they have four rows of teeth, two beneath, and two above, which are not only apparent by their dissection or Anatomy, but also by their bitings, for their wounds are Quadruple, wheresoever they fasten their teeth. Their tail is slender and short. But the description of this Beast was better apprehended by *Gesner*, at the sight of one of them, which he relateth on this manner:

The colour (saith he) was partly red, and partly yellow, mingled both together, but the belly white. The hinder-feet seemeth to cleave to the body or loins. It smelleth strongly, and the savour did bewray or signifie some secret poyson. The tail about three fingers long, beset with little short hairs. The residue of the body was three fingers long. The eyes very small and black, not much greater then Moles, so that next to the Mole they may justly be called, the least sighted creature among all four-footed Beasts; so that in old age they are utterly blinde by the Providence of God, abridging their malice, that when their teeth are grown to be most sharp, and they most full of poyson, then they should not see whom nor where to vent it.

They differ as we have said in place and number, from all four-footed Beasts, so that they seem to be compounded and framed of the teeth of Serpents and Mice. The two fore-teeth are very long; and they do not grow single as in vulgar Mice; but have within them two other smal and sharp teeth. And also those two long teeth grow not by themselves, as they do in other Mice, but are conjoyned in the residue, in one continued rank. They are sharp like a saw, having sharp points like needles, such as could not be seen by man, except the tips of them were yellow. Of either side they have eight teeth, whereas the vulgar Mice have but four, beside the two long fore-teeth, which also seem divided into two or three, which except one mark diligently, he would think them to be all one.

Arnoldus.
Ælianus.

It is a ravening Beast, feigning it self gentle and tame, but being touched, it biteth deep, and poysoneth deadly. It beareth a cruel minde, desiring to hurt any thing, neither is there any creature that it loveth, or it loveth him, because it is feared of all. The Cats, as we have said, do hunt it and kill it, but they eat not them, for if they do, they consume away in time. They annoy Vines, and are seldom taken, except in cold; they frequent Ox-dung, and in the Winter time repair to houses, gardens, and stables, where they are taken and killed.

If they fall into a Cart-road, they die and cannot get forth again, as *Marcellus*, *Nicander*, and *Pliny* affirm. And the reason is given by *Philes*, for being in the same, it is so amazed, and trembleth, as if it were in bands. And for this cause some of the Ancients have prescribed the earth of a Cart-road, to be laid to the biting of this Mouse for a remedy thereof. They go very slowly, they are fraudulent, and take their prey by deceit. Many times they gnaw the Oxes hoofs in the stable. They love the rotten flesh of Ravens; and therefore in *France*, when they have killed a Raven, they keep it till it stinketh, and then cast it in the places where the Shrew-mice haunt, whereunto they gather in so great number, that you may kill them with shovels. The *Egyptians* upon the former opinion of holiness, do bury them when they die. And thus much for the description of this Beast. The succeeding discourse toucheth the medicines arising out of this Beast; also the cure of her venomous bitings.

The Medicines of the Shrew.

The Shrew, which falling by chance into a Cart-rod or track, doth die upon the same, being burned, and afterwards beaten or dissolved into dust, and mingled with Goose grease, being rubbed or anointed upon those which are troubled with the swelling in the fundament coming by the cause of some inflammation, doth bring unto them a wonderful and most admirable cure and remedy. The Shrew being slain or killed, hanging so that neither then nor afterwards she may touch the ground, doth help those which are grieved and pained in their bodies, with sores called fellons, or biles, which doth pain them with a great inflammation, so that it be three times invironed or compassed about the party so troubled. The Shrew which dyeth in the furrow of a Cart-wheel, being found and rowled in Potters clay or a linnen cloth, or in Crimson, or Scarlet woollen cloth, and three times marked about the Impostumes, which will suddenly swell in any mans body, will very speedily and effectually help and cure the same.

The tail of a Shrew being cut off and burned, and afterwards beaten into dust, and applyed or anointed upon the sore of any man, which came by the biting of a greedy and ravenous Dog, will in very short space make them both whole and sound, so that the tail be cut from the Shrew when she is alive, not when she is dead, for then it hath neither good operation, nor efficacy in it. The former hoofs of a Horse being scraped, and the same fragments or scantlings thereof being beaten in the dust or earth, which hath been digged up by a Shrew, in four measures of water, poured down the mouth of a Horse which is troubled with any pain or wringing in his bowels, will soon give him both help and remedy. The Shrew being either applyed in drink, or put in the manner and form of a plaister, or hanged upon the sore which he hath bitten, is the most excellentest, and most medicinable cure for the helping and healing thereof. A preservative against poyson, would be an excellent remedy, that neither man nor any other living creature, should be bitten if they should leave or would want that superstition called an enchantment against poyson, being hanged about the neck, whereof we will speak more in the curing of the bites of this Beast.

That the biting of a Shrew is venomous, and of the reason of healing in this kinde.

In Italy the biting of a Shrew is accounted for a very strong poyson, and that except there be some medicine very speedily applyed for the curing and healing thereof, the party so bitten will die. These Shrews are truly so venomous and full of poyson, that being slain or killed by Cats, whose nature is to kill whatsoever Mice they take, they will not offer to touch or eat the least part of them.

But the biting of a female Shrew is most obnoxious and hurtful when she is great with young, but most dangerous of all when she biteth any one which is great with young, either a woman or any other Beast whatsoever, her self being also with young, for then it will hardly be cured.

If a Shrew shall bite any creature while she is great with young, the pusses or biles will in time be broke which they make, and will come unto a very great and malignant wound and sore. If the Shrew do also bite any creature during the time she is with young, she will presently leap off, notwithstanding she biteth more dangerous. There is nothing which do more apparently explain and shew the biting of a Shrew then a certain vehement pain and grief in the creature which is so bitten, as also a pricking over the whole body, with an inflammation or burning heat going round about the place, and a fiery redness therein, in which a black push or like swelling with a watery matter, and filthy corruption doth arise, and all the parts of the body which do joyn unto it seem black and blew with the marvellous great pain, anguish, and grief, which ariseth and proceedeth from the same.

When the push or bile which cometh by the occasion of a Shrew cleaveth, or is broken, there proceedeth and issueth forth a kinde of white flesh, having a certain rinde or skin upon it, and sometime there appeareth in them a certain burning, and sometimes the same is eaten in and falleth out, but in the beginning there is a most filthy green corruption and matter which floweth in the same, afterward it is putrefied, and eaten in, and then the flesh falleth forth: the wringings also of the inward parts, the difficulty of voiding the urine, and a corrupted sweat doth follow and accompany the same.

But Avicenna affirmeth, that in what place soever this Beast shall bite, the sores thereof with great anguish will pant or beat, and that in every hole wherein his venomous teeth have entred, there will a certain fiery redness appear, the skin whereof being broken, there will come a very white and mattery fore, which will breed much pain and trouble in all the parts of the body for the most part. The sores or wounds which are made also by this Beast are very manifestly known by the marks of the fore-teeth standing all in a row together, as also by the blood which issueth from the wound, being at the first pure, clear, and exceeding red, but afterwards corrupt, blackish, and full of putrefaction.

There do also divers bunches arise in the flesh usually after the biting of this Beast, which if any man shall break, he shall see the flesh which lyeth under them corrupted, and divided with certain

Avicenna. certain clefts or rifts in the same. Moreover the nature of this Beast is such, that for the most part he doth covet to bite those whom he can come unto by the stones or genital, not only men, but also all other brute Beasts whatsoever: and thus much shall suffice concerning the biting of this Beast.

Dioscorides. Wormwood being beaten or bruised small, strained in a fine linnen cloth, and mingled in Wine, given to the party, either man or woman, in Wine to drink, who is bitten by a Shrew, will procure him present ease and remedy. The same also is an excellent remedy for the bitings or stings of a Sea-dragon. Vinegar is very medicinable for the bitings of the Shrew, and of Dogs, as also for the fish called by the *Latines*, *Scolopendra*, (which voideth all her bowels out until the hook come forth, wherewith she is taken, and then sucketh them up again) the Scorpion and all other venomous Serpents.

Pliny. But the *Græcian* Physitians affirm, that the same ought to be mingled with other medicines for the helping of the aforesaid diseases, as to take the ashes of the Shrew being burnt, the gum or liquor of the Herb called Fennil-giant, dried Barly beaten into small powder, Mustard-seed pounded small with the Herb called Purple, or Mothmullein, and mingle them all together with Vinegar, and being so applyed they will presently cure the aforesaid stings or bitings.

Avicenna. Garlick being bruised, and the juyce thereof anointed upon the place which was bitten by a Shrew, will presently expel the pain, and wholly cure the sore. For the expelling of the superfluities of the parings of the dead flesh, growing round about the sore, being not cast away but remaining thereon. Take Cummin and cover the wound or biting therewith, then apply Garlick being beaten into Oyl thereunto, and anoint the places about the sore, as also the sore it self very diligently, and in very short space of time it will cause the same to fall away of it own accord.

Aetius. For the healing also of the bites of this Beast: Take Garlick, the leaves of a Fig-tree, and Cummin, mingle them very well all together, till they come to a mollifying or temperate substance; then take the same, and fashion it in the form or manner of a plaister, and it will very speedily and effectually cure the sore.

Dioscorides. The seed or leaves of Coleworts, being beaten together with Vinegar, and the herb call'd *Assa fœtida*, is very good and profitable to be applyed either to the bites of this Beast, or a ravening Dog. The dung of a Dog being taken and anointed upon either Man or Horse which hath been bitten by a Shrew, will be an excellent remedy both for the curing and healing them of the same. The hoof of a Ram being dried, beaten into powder & afterwards mixed with Hony, will be likewise very good for those which are bitten with the same Beast, so that they be first tempered and fashioned in the manner of a plaister, and then applyed thereunto. The little white stalks which proceed from a black Fig, being beaten with the leaves of the herb called Moth-mullein, Wax, and Vinegar, until they come unto a mollifying juyce or salve, will be an excellent remedy against the biting of the Shrew, being anointed thereupon.

Pliny. The young or tender stalks of a wilde Fig-tree, be they never so few or small, being first steeped in Wine, then lapped in a leaf of the same Tree, and so applyed unto the stings and bites of Scorpions, and the Shrew, will in very short time cure and heal the same. Provided always that the wound be well and diligently bathed or washed, before any thing be put or applyed thereunto.

Dioscorides, *Avicenna*, and *Aëtianus*, do affirm, that the excellentest, and medicinablest cure for the bites of a Shrew is this: To take the Spleen of the same Beast, and beat it together with Vinegar, and the Gum called *Galbanum*, then to anoint it or rub it upon the sore, and it will presently expel away all pain, and in some short space altogether heal it. If the red bunches or ulcers which do usually grow about the bites of a Shrew, do fortune to break; take very sharp and strong brine or pickle, and rub it both about, and within the sore, and afterwards apply Barly being burned and beaten into small dust or powder thereunto, which medicine although it seem somewhat grievous and painful, yet it is very good and profitable for the expelling either of the stings of Scorpions, or the bites of the Shrew or ravenous Dog.

Aetius. The genital of a Hare being beaten into powder mingled with Vinegar, and anointed upon the bites of a Shrew, doth speedily cure them. Wilde Mallows being mingled with those Mallows that grow in the Garden, have in them a very effectual force and power to cure all stings or venomous bitings, especially of Scorpions, Shrews, Wasps, and such like stinging creatures.

The Shrew being cut and applyed in the manner of a plaister, doth effectually cure her own bites. The Shrew being killed and anointed all over with Oyl, and dirt or mire, applyed unto the Ulcers or red swellings which come by her venomous teeth, will very speedily procure them to break. The Shrew being cut or beaten into small pieces, dried into powder, mixed with Vinegar, and fashioned in the form of a plaister, will very speedily and effectually cure the bites of a Shrew, whether she be great with young or not, so that they be well applyed thereunto.

But there are some which do think it nothing convenient to mingle the Shrew with any other thing whatsoever, but that it is only after this manner to be applyed by it self, as to take it burned or dry it, and then to pound it in powder, and so to sprinkle it in the wound or sore, which in very short time will easily heal it. The Shrew falling into the furrow of a Cart wheel doth presently die: the dust thereof in the passage by which she went, being taken and sprinkled into the wounds which were made by her poysonsome teeth, is a very excellent and present remedy for the

Ælianus.

the curing of the same. *Mattheolus* alleadgeth out of *Nicander*, that the dirt which cleaveth unto the wheels of a Chariot being scraped off and sprinkled into the bites of a Shrew, will be very medicinable for the healing of them, which thing he himself thinketh a meer fable, and not to be believed. If the pimples or bladders which arise in the bites of a Shrew shall be thought convenient to be broken, for the performing of the same, take the skin of a baked or roasted Pomgranate, and spread it upon the aforesaid red pimples, as hot as possible may be suffered for some small time, and it will cause the ulcers to break, and all the corruption to issue forth.

If it grow unto an Impostume, take the little berries or pellets which are within the Pomgranate, being very well baked, and apply them unto the sore some short time, and they will very easily cure the same. Mustard-seed being mingled with Vinegar, anointed upon the bites of a Shrew, doth very effectually heal them. A Moul being bruised into small pieces, and applyed unto the bites of a Shrew in the form of a plaister, is a very excellent remedy for the curing of them. Pitch and Trifoly being baked, and rubbed very hot upon the bites of a Shrew, is accounted a very medicinable cure: but it is requisite that this fomentation be given unto none but such as are of a strong and powerful body, and are also able to endure pain. The liquor of the Herb called Southernwood being given in Wine to drink doth very much profit those which are troubled, and pained in their limbs with the bites of Shrews. Wormwood being used in the like manner, will cure those which are bitten by a Shrew.

The genital of a Lamb or Kid being mingled with four drams of the Herb called *Aristolochia*, or Hart-wort, and six drams of the sweetest Myrrh, is very good and medicinable for curing of those which are bitten or stung with Shrews, Scorpions, and such like venomous Beasts. The leaves of Coleworts being dried, mingled with flower, and tempered together, until they come into the form of a plaister, will very much help against the venomous bites of the Shrew. The seeds of Coleworts, and the leaves of the same herb being mingled with Vinegar, and the herb called *Asa fatida* beat or pounded together, do very well and speedily cure the bites of the Shrews, as also of a ravenous Dog, if the same in due time be applyed thereunto. The liquor also of the leaves of Coleworts being given in any kinde of drink, is good and wholesome for the curing of the aforesaid bites or wounds. The Nuts of a young Cypress tree being mixed with a certain syrup or potion made of Hony, Water, and Vinegar, and afterwards drunk, doth very speedily procure ease and help for those which are bitten by a Shrew.

The root of a white or black Thistle, being beaten or bruised and given in drink, doth very effectually help or cure those which are bitten by a Shrew. The like vertue hath the herb called Rocket in it, and also the seed thereof being given in any kinde of drink. The gum or liquor which proceedeth from a kinde of Ferula, being given in Wine to drink, doth very much help and cure those which are bitten by a Shrew. The same vertue also in it hath the root of the herb called Gentian or Bitterwort, being given in Wine to drink. One or two drams of the youngest or tendrest leaves of the Laurel tree, being beaten small and given in Wine to drink, doth speedily cure the sores or wounds which are bitten by a Shrew: the same being also used in the said manner, and given in some certain portion unto Horses to drink, doth quickly help and heal them. But there are some which before all other medicines do commend this for the best, and chiefest, that is, to take the juyce which proceedeth from the leaves of the Lawrel tree, and the leaves themselves, being moist and new growing, and to boil them in Wine, and being once cooled, to give it to any which is bitten by a Shrew, and this will in very short space altogether help them. A young Weevil being given in Wine to drink, is accounted very medicinable for those which are bitten by a Shrew, or stung by a Scorpion or any other venomous creature. The herb called Balsamint or Costmary, the herb called Bartram, or wilde Pellito, the herb called Betony, the herb called Water-mint, or Water-creffes; the sweet and delicious gum called Storax, as also the herb called Vervin, being each of them severally by themselves, either given in Wine to drink, or applyed in the manner of a plaister or anointed upon the bites or wounds which come by the venomous teeth of a Shrew, will very effectually cure the pain thereof. The biting of a field Mouse or Shrew, is very troublesome or grievous to all labouring Beasts; for instantly after her bitings there do little red Pimples arise, and there is most danger of death in those Beasts which she biteth when she is great with young; for the aforesaid pimples will then presently break, after which the Beast so bitten will instantly die. The Shrew doth also kill some labouring Beasts with poyson, as chiefly Horses and Males, but especially and for the most part Mares, which are great with young. There are some which do affirm, that if Horses, or any other labouring creature do feed in that pasture or grafs in which a Shrew shall put forth her venome or poyson in, they will presently die. In what place soever a Shrew shall bite in any creature, it will be compassed with an exceeding hard swelling, the Beast also being so bitten, doth expresse his grief or sorrow with much pain, and straining his body doth likewise swell all over, his eyes do in a manner weep, the swelling in his body doth squeeze out matter, or filthy putrefaction, he voideth poyson out of his belly, and doth vomit all sustenance up as soon as ever he receiveth it. If an Ass being great with young be bitten by this Beast, it is a very great chance if she scape death.

But if the Shrew do bite any Beast when she is great with young, it is known by these signes, or marks, there will certain red pimples compass the sore round about, and also spread themselves over all the body of the bitten Beast, and will in short space destroy him, except there be procured

Actius.

Pliny.

Aegineta.

Avicenna.

Albertus.

Abyssinus.

Hierocles.

Vegetius.

some present remedy. The Normans in France, do suppose the Shrew to be a Beast so full of venom, and poyson, that if he shall but pass over either an Ox, or a Horse lying down along upon the ground, it will bring such a dangerous disease upon them, that the Beast over which she shall pass, shall be lame about the loins, or shall seem as if he were immoveable, and that he can be cured by no other means but by the same Shrew, who either of his own accord, or by compulsion must pass over the contrary side of the Beast, and that then he will be cured; which thing I do hold to be very vain and not to be believed.

Hippocrates.

For the curing of Beasts which are bitten by a Shrew, thou shalt boil the seed of Parsly together with Wine and Oyl, and thou shalt cut the place which swelleth with a Pen-knife, by which the poyson may issue forth, and the wound being pointingly pulled or torn may wax raw: if by these the inflammation do wax more fervent and hot, thou shalt eat the sore with Iron instruments burning with fire, taking away some part of that which is whole and sound: then shalt thou renew the wound with the Iron instruments being governed rightly, by which the corruption may issue forth: but if that part do chance to swell by the excruciation, thou shalt sprinkle Barley being burned and dried therein; but before you do this, it is meet to joyn the old fat.

Hierocles.

There is also another excellent medicine for the curing of the Shrew, which *Startonicus* himself doth much commend, which is this: To lance or scarifie the wound as soon as it is bitten, but especially if it be compassed with an inflammation, afterwards to sprinkle Salt and Vinegar upon it, then to encourage or provoke the Beast the next day following by some sweet water or liquor to run or go some little journey, first having anointed the sore with Fullers-earth, being beaten small and mixed with Vinegar, and then daily to nourish or bathe it with water which cometh from bathes where some have washed themselves, and this in very short time being so used, will very well and altogether cure the Beast. Against the biting of a Shrew Garlick is accounted for an excellent remedy being mingled with Nitre; but if there shall be no Nitre to be had, mix it with Salt and Cumin, then to dry and beat them altogether into powder, and with the same to rub the places which are infected with the biting: but if the venomous wounds do chance to break; then to take Barly being scorched or burned, and pound it into small powder, and steep it in Vinegar, and afterwards to sprinkle it into the wound: This medicine *Pelagon* affirmeth, will only heal the bites of a Shrew, and that the grief of the sore, by the use of any other medicines doth rather encrease, then decrease.

Vegetius.

The flowre which is made of red Wheat, the herb called Dill, the liquor or Rozen which runneth out of the great Cedar, and two pound of the best Wine, being mingled all together, given in a potion, and poured down the throat of any labouring Beast which is bitten by a Shrew, will presently ease and cure him of his pain.

Hippocrates.

There is also another potion for the curing of the bites of this Beast; which is this: To take cloves of Garlick being bruised small, Salt, Cumin, and Wine, of each the like quantity; these being given to any Beast to drink, doth presently cure him; as also any man being anointed upon the wound, but not given to drink. The herb called Nard or Pepper-wort, being beaten to the quantity of two ounces and a half, and mingled with some sweet smelling Wine, will presently help any Beast which is bitten by the Shrew, being poured through his Nose, and his sore being at that instant time anointed with Dogs dung: the same is also very medicinable or wholesome for men which are troubled with the said biting.

Pliny.

The bites of a Shrew being pricked with an Aul, and anointed with dust which is found in the furrows of Carts under the marks or signes of the Wheel, being mingled with sharp Vinegar, doth presently assuage the pain, and heal the sore. The earth of the track of a Cart also mingled with stale or urine, being applyed unto the bites of a Shrew, will very speedily cure them either upon Men or Beasts. A Shrew being new killed and rubbed over with Salt, applyed unto the wounds which she shall bite in any Beasts, will instantly cure them: This vertue also hath the gall of a Rere-mouse or Bat, being mixed with Vinegar.

There is a very good remedy against the bitings of Shrews, or to preserve Cattle from them, which is this; to compass the hole wherein she lyeth round about, and get her out alive, and keep her so till she dye, and wax stiffe, then hang her about the neck of the Beast which you would preserve, and there will not any Shrew come near them; and this is accounted to be most certain. And thus much shall suffice concerning the bitings of the Shrews, and of the cures thereof.

Of Wilde FIELD-MICE.

The Epithets
of wilde Mice
describing
their kindes.

THIS wilde Mouse called by the Latines, *Mus agrestis*, *Mus Sylvestris*, *Sylvaticus*, *Subterraneus*, and some say *Nitedula*, (although I rather take that word to signifie a Glare-worm.) It is called also *Exiguus Mus*, and *Rusticus*. The *Gracians* call it *Myss Arourayos*; the *Germans*, Field-mouse, and Erd-mouse, that is, a Mouse of the Earth, and *Nuelmus*, *Nualmus*, *Schormus*, *Schoermowss*, *Stoffmus*, and *Luckmus*, by reason of her digging in the earth like a Mole. The *French* call it *Mullott*. There is of these Mice two kindes, a greater and a lesser. The picture of the greater we have described here, forbearing the lesser, because in all parts it resembleth this, except in the quantity.

This

This greater kinde is not much lesfer then a Rat, having a long broad tail like it. The ears of it are round; the head round and great; and the snout or chaps do not stand out long. They are of two colours in both kindes, some red and some black. They have a beard betwixt their mouth and their eyes; and the lesser Mice have a short tail. A Physitian taking occasion of the writings of *Bassianus Landus*, to dissect one of these Mice, found it to be true which he saith, that their maw and guts lie all straight and upright. We have shewed already, that all kinde of Mice are generated out of the earth, although also they suffer copulation. And in *Egypt* it is very common about *Thebais*, and the places where *Nilus* overfloweth, that in the decrease and falling away of the Waters, the Sun engendereth many Mice upon the slime of the earth; so that it is ordinary to see at one time their fore-parts to have life, flesh, and motion, and the hinder-parts deformed, and nothing but earth.

Their severall parts.

Whether Mice engendered of the earth, can procreate other.

Ælianus.

Pliny.

And about this matter there is some disputation among the Authors, for there be Philosophers which affirm, that every creature as well perfect as unperfect, may be made both by seed and of putrified matter; and from hence came the opinion in the Poets, of the sons and daughters of the earth; and so they say, that things grow by generation in *infinitum*: Some say, that perfect creatures cannot be generated in that manner, but the imperfect ones, such as Mice are, may be ingendered by feed and putrified matter, and afterwards beget more of his one kinde.

But *Aristotle* confesseth the first generation, and denyeth the second, and saith; although they do generate by copulation, yet it is not *Idem sed animal specie diversum, à quo nihil amplius gigni possit*; And therefore *Jeronimus Gabucinus* endeth this controversie, saying; *Mures ex putredine nati, generant quidem & ipsi, sed quod ex eis generatur, nec Mus est, nec sœmina, nec amplius generat*: that is; Mice engendered of putrified matter do also engender, but that which is begotten of them is neither male nor female, neither can it engender any more, that it may not proceed in *infinitum*, like a Mouse engendered by copulation. But concerning the beginning of these wilde Field-mice, and their encrease, *Aristotle* speaketh in this manner: We have received (saith he) the wonderful generation of wilde Field-mice, abounding in every place, and especially in corn-fields, which by their multitude, do instantly eat up and devour a great deal of grain, insomuch as it hath been seen, that divers poor Husbandmen, which have determined to day, to reap their corn on the morrow, in the mean season it was so destroyed by Mice, that when the Reapers came in the morning, they have found no corn at all.

The damage done by wilde Field-mice.

And as the encrease of these Mice was extraordinary, so also was the destruction, for men could not drive them away, as in former times, by smoking them, or else by turning in Swine to root out their nests from the earth, or by sending Foxes, or wilde Cats among them, but their multitude did always prevail; and yet after a few days, the showers of the clouds destroyed them. And *Pliny* saith, that this ought to be no marvail, that there should be so great a harvest and store of these Mice, seeing that men yet never knew how to hinder their generation, or to kill them, being engendered, and yet for all that they are seldom found in the Winter time either alive or dead. And seeing that we have entred into the mention of the damage of these wilde Field-mice, it is profitable to set down some stories out of Authors, recording the place and persons, whom they have very much annoyed.

Pliny writeth, as we have shewed in our former discourse, that the Inhabitants of *Trous*, were driven from their habitation by these Field-mice; because they devoured all their fruits, and when they dyed, there was a worm engendered in their heads. *Diodorus Siculus* in his fourth Book of ancient Monuments recordeth, that there were certain people of *Italy*, which by incursion of Field-

Field-mice were driven to flight, and to forsake their patrimonies, for they destroyed the roots of the corn, like some horrible drought, or some unresistible cold frost. *Cossa* a Town of *Umbria*, in the days of *Pliny*, which at this day is called *Orbitellus*, was destroyed by Field-mice, (as *Volaterranus* writeth.) *Niphus* also saith, that he saw in one night, all the Corn-fields at *Calenum* destroyed by the Mice.

Strabo.

There are such a number of these Mice in *Spain*, that many times their destruction caused pestilent diseases, and this thing hapned amongst the *Romans* when they were in *Cantabria*, for they were constrained to hire men by stipends to kill the Mice, and those which did kill them, scarce escaped with life. The Inhabitants of *Gyarus*, an Island of the *Cyclades*, after they had long resisted the violence of these Mice, yet at length they were fain to yeeld unto them, and forsake their Territory; and the Mice after their departure, through hunger did gnaw the Iron. We have shewed already how the *Philistines* were punished with Mice, before they sent away the Ark of the Lord, and how the *Aeolians* and *Trojans* were annoyed with them, until they had sacrificed to *Apollo Smintheus*, and how the Mice of *Heraclea*, at the time of Grape-gathering, do go out of the Countrey and return again in the Autumn. When *Senacharib*, King of the *Arabians* and *Egyptians*, invaded *Egypt*, it is said by *Herodotus*, that *Vulcan* in the night time sent upon his Army such an innumerable swarm of wilde Mice, that before morning they had eaten afunder their Quivers, Arrows, Bows, and all warlike instruments, so that the next day, for the want of weapons, and fear of their enemies, they were constrained to take their heels and run away. And to conclude, by the same means the *Chalcidians* were driven out of *Elymnium*, a City of the Mountain *Athos*; and thus much shall suffice for the harm of these Mice. They make their dwellings and habitation in the earth, according to this saying of *Virgil*:

Places of
their abode.

—Sæpe exiguus mus
Sub terra posuitq; domos, atq; borrea fecit.

Yet now and then they come out of the earth, although it be but seldom. They heave up hills like Moles, and they eat and devour the roots of corn and herbs. They make not very deep holes, but dig under the turfs, and upper face of the earth, so that when a man walketh upon it, he may perceive it by the sinking in of his foot-steps: if the hole be opened with a Spade, they close it again as a Mole doth, but not so speedily, for they defer it two or three days together; and therefore if it be watched, they may kill her at her return by treading upon her; concerning the manner of taking them, these observations following may be put in practise.

Driving away
of these Mice.

Pliny.

Palladius.

These kinde of Mice are driven or chased away with the ashes of a Weefil, or of a Cat mingled with water, and by sprinkling or scattering seed or corn abroad, or by some things well sodden in water: but the poysoning of those Mice is in the scent or savour of bread: and therefore they think it more profitable to touch the seed or corn lightly with the gall of an Ox. *Apuleius* doth affirm, that to soke the grain or corn in the gall of an Ox before you sprinkle it abroad, is very good against these Field-mice: also (as it is read in *Geopon Græc.*) it doth very much commend the gall of Oxen, where-with as he saith, if the seed or corn be touched, they shall be freed from the molestation or trouble of these Field-mice.

Notwithstanding in the Dog-days Hemlock-seed with the herb Hellebore is better, or with wilde Cowcumber, or with Hen-bane, or being beaten with bitter Almonds, and Bears-foot, and to mingle with them just as much meal or corn, and beat and stamp them in Oyl, and when you have so done, put it into the hollow places of these Field-mice: and they will die as soon as ever they shall tast of it. *Avicen* doth affirm also, that Hen-bane-seed doth kill these kinde of Mice, without the mixture of any other thing. Very many do stop the passages of them with the leaves of *Rhododaphne*, who do perish in the time they are labouring to make their passage, by the gnawing of them.

Apuleius also saith, that the people of *Bithynia* have had much experience of these things, who stopped the passages of these Mice with these *Rhododaphne* leaves, so that they desire to come forth by touching the same often with their teeth: which truly so soon as they shall touch or come unto, they shall presently die. But they use a kinde of incantation which is this that followeth; I do adjure all ye Mice, which do remain or abide here, that ye do not offer me wrong, or suffer me to be wronged of any other. For I do assign and appoint you this field (then he nameth the field) in which if I should surprize you hereafter, I call *Luna* to witness, I will tear every one of you into seven pieces: When as thou hast writ this charm, binde paper fast to the place wherein the Mice haunt, and that before the rising of the Sun: so that the characters or marks may appear on the outside cleaving to a natural stone of that place. I have written this (saith the Author) lest any thing should seem to be overskipped: neither do I allow or prove such things can be done, but I rather counsel all men that they do not set their minde to any of these, which are more worthy of derision then imitation. If thou shalt fill the passages of these rustical or Field-mice with the ashes of an Oak, he shall be possessed with a fervent desire to it, often touching it, and so shall die.

Marcellus.
The medicines
of Field-mice.
Soboliasies.

These Countrey Mice, that is to say, those Mice which are found in the fields, being bruised and burned to ashes, and mingled with fresh Hony, doth comfort or restore the sight of the eyes by diminishing the darkness or dimness thereof, in what field soever you shall finde any thing, dig them up by the roots with a little stake or post.

Of the *WOOD-MOUSE*.

Pliny doth oftentimes make mention of this Wood-mouse, or rather a Mouse belonging to the Wood, but he doth it only in medicines; but that it doth differ from this Countrey or Field-mouse, we have shewen in the chapter going before, because it doth not inhabit or dwell in the Countreys or tilled places, as the Countrey or Field-mice do, but doth inhabit in Woods and Forrests. The Wood-mouse is called in *Greek* as the Countrey-mouse: but I think it to be a kinde of Dormouse, which proceedeth from the kinde of Wood-mouse. *Pliny* truly doth make the same remedy or medicines of a Dormouse, as he doth of a Wood-mouse, as I will a little after rehearse or recite unto you. Also I should have thought that a Sorex had been the same, because it is a Wood-mouse, but that, that one place of *Pliny* did hinder me, where he commendeth the ashes of a Wood-mouse to be very good for the clearness of the eyes, and by and by after did shew or declare that the ashes of the Sorex were good also in the same use, as I will recite or rehearse below in the medicines or remedies of the Wood-mouse. *Agricola*, a man of great learning, doth interpret or judge the Wood-mouse to be that Mouse, to the which they do appoint the name derived from *Avellana*: but he doth account that to be the Sorex, which I will shew or declare beneath to be the Shrew. I do understand that there are properly two kinds of the Wood-mouse spoken of before. The one of them that which *Albertus* doth write, saying that there is a certain kinde of Mouse which doth build or make her habitation in trees, and of a brown or swart colour, and having also black spots in her face, which only is called by the universal name of a Wood-mouse. Of the same kinde *Pliny* doth mean, (if I be not deceived) when he writeth, that the mast of a Beech-tree is very acceptable to Mice, and therefore they have good success with their young ones. The other which is peculiarly named the Sorex, which (saith *Pliny*) doth sleep all the Winter time, and hath a tail full of hair: whose shape or form we propose and set evidently before you. But that I may more distinctly handle those things which *Pliny* hath shewed to us concerning the Wood-mouse; I will write her down separately, or by it self, and afterwards concerning the Mouse which hath her name derived from Fil-birds, which the *Germans* have left in writing, and which I my self have considered or observed; and last of all I will write concerning the Sorex peculiarly and severally from the Ancient Writers.

The ashes of a Wood-mouse being mingled with Hony, doth cure all fractures of bones, the brains also spread upon a little piece of cloth, and covered with wooll is good also; but you must now and then spread it over the wound, and it doth almost make it whole and strong within the space of three or four days: neither must you mingle the ashes of the Wood-mouse with Hony too late: Hony also being mingled with the ashes of Earth-worms, doth draw forth broken bones. Also the fat of these Beasts, being put to Kibes is very good; but if the Ulcers are corrupt and rotten, by adding Wax to the former things doth bring them to cicatrifying. The Oyl of a burned Locust is also very good; and also the Oyl of a Wood-mouse with Hony, is as effectual as the other. They say also that the heads and tails of Mice mixed with the the ashes of them, and anointed with Hony, doth restore the clearness of the sight, but more effectually being mingled with the ashes of a Dormouse or a Wood-mouse.

The description.

The medicines of the Wood-mouse: *Pliny*.*Marcellus*.Of the *Nut-mouse*, *Hasel-mouse*, or *Filbird-mouse*.

THis Beast is a kinde of Sorex, and may be that which the *Germans* tearm *Ein gross Haselmus*, a great Hasel-mouse, so called because they feed upon Hasel-nuts, and Filbirds. The *Flemings* call it *Ein Slaperat*, that is, a sleeping Rat; and therefore the *French* call it by the name *Leror*, where by also we have shewed already, they understand a Dormouse.

For this sleepeth like that, and yet the flesh thereof is not good to be eaten. The colour of this Mouse is red like the Hesel, and the quantity full as great as a Squirrel, or as a great Rat: upon the back and sides it is more like a Mouse, and upon the head more red. His ears very great, and pilled without hair. The belly white, so also are his legs. The neathermost of his tail towards the tip white. His nostrils and feet reddish. The tail wholly rough, but most at the end with white hairs.

The eyes very great hanging out of his head, and all black, so that there is not in them any appearance of white. The beard partly white, and partly black, both above and beneath his ears, and about his eyes, and the upper part of his tail next his body all black. Upon his forefeet he hath four claws or distinct toes, for he wanteth a thumb. But upon his hinder-feet he hath five, I mean upon each severally. The outside of his hinder-legs, from the bending to the tip of his nails is altogether bald without hair. And the savour of all this kinde is like the smell of the vulgar Mice. They live not only in the earth, but also in trees which they climbe like Squirrels, and therefore make provision of nuts and meat against the Winter, which they lodge in the earth.

The Countreymen finding in the Summer their caves and dens, do wisely forbear to destroy them, knowing that they will bring into them the best Nuts and Fil-birds can be gotten, and therefore at one side they stick up a certain long rod, by direction whereof in the Winter time they come and dig out the den, justly taking from them both their life and store, because they have unjustly gathered it together: Some have eaten it, but they were deceived, taking it for the Dormouse.

Of the *LASCITT MOUSE*.

This Mouse is called by the *Germans*, *Lascitts*, and also *Hatnebal*, because of the similitude it holdeth with the *Ermeline Weefil*. The skin of it is very pretious, being shorter then the *Ermeline* two fingers breadth. And forasmuch as else, there is no difference between the *Lascitt Mouse*, and the *Lascitt Weefil*, except in the quantity: My opinion is, that they are all one, and differ only in age.

And I am rather led to affirm thus much, because there are skins annually brought to the *Mart of Franckford*, out of *Polonia* (cal'd *Lascett*) which are no other then the *Weefils* of *Novogrodela*, whose white skins are intermixed with griffeld; And thus much shall suffice to have said of this Mouse.

Of the *SOREX*.

I Am of opinion, that this kinde of Mouse belongeth to the *Hesel Mouse* before spoken of, because it is wilde, hath a hairy tail, and sleepeth in the Winter, all which things are by *Pliny* ascribed to the *Sorex*; only this hindereth, that he maketh the *Sorex* to have rough hairy ears, and the *Sorex* of *Germany* hath bald ears. For answer whereof this shall suffice, that the other three notes being so great and pregnant, there is no cause why the want of one, and that so little as the hairs on the ears, should deprive it of his naturall due and kinde. The *Italians* and the *French* use this word *Sorex*, for a domestical vulgar Mouse, and so peradventure did the *Antients* before them; but it is greater then the domestical Mouse, although *Plinies Sorex* be neither greater nor lesser. The *Spaniards* call a *Sorex*, *Sorace*, or *Raton Pequeno*. The *Illyrians*, *Viemegka Mys*, by which word also they understand a Shrew-mouse. The fibres of the intrails of the *Sorex* do encrease and decrease with the Moon, so that the number of them, do always answer the number of the days of her age.

Her ears as we have said are full of hairs, but in the lowest part or tip thereof. The reason of her name is taken from the skreeching voice she maketh in gnawing. For it is a very harmful biting Beast, cutting asunder with her teeth like a saw. Some do derive the *Greek* word from *Huras*, which anciently did signifie a Mouse, and therefore they call this *Syrax*, and *Saurex*, but I list not to stand any longer upon the name, seeing the Beast it self affordeth little worthy matter to entreat of.

It is reported by *Varro*, that in *Arcadia* there was a Hog so fat, that a *Sorex* did eat into her flesh, and made her nest and brought forth young ones therein, which may very well be; for such is the nature of a fat Swine, that he will hardly rise to eat his meat, or ease himself of his excrements: And besides, fatness stoppeth sense, burying both the Nerves and Arteries very deep: so that in the body of a man, his fattest part is least sensible. *Lycinius* the Emperor going about to restrain the insolency of the Eunuches and Courtiers, called them *Tineas*, *Soricesq;* *palatinos*, that is moths and *Sorices* of the Court.

There was an ancient garment (as *Pliny* writeth) called *Vestis Soriculata*, and this was very pretious in my opinion, because it was garded or fringed with the skins of the *Sorex*. If this Beast fall into any Wine or Oyl, she corrupteth the same, and it is to be recovered by the same means, as we have formerly described in the vulgar Mouse. It should seem there was great store

Of the name
and kinde.

Alumnus.

Egnatius.

of them in the days of *Heliogabalus*, for he commanded (as *Lampridius* writeth) to be brought unto him, not only a thousand of these Beasts, but also a thousand Weefils, and ten thousand vulgar Mice, as we have shewed before in the story of the vulgar Mouse.

When the Sooth-sayers were about their divinations, *Pliny* writeth, that if they heard the squeaking of the *Sorex*, they brake off, and gave over their labour, holding it unprofitable to go any further therein: and it is also reported, that the voyce of this Mouse gave occasion to *Fabius Maximus*, to give over his Dictatorship, and unto *Caius Flaminius*, to give over the Mastership of the Horsemen, such fear of silly Beasts, was begotten in the mindes of gallant and magnanimous spirits, by the unprofitable and foolish behaviour and doctrines of the Magitians.

It is said by *Nigidius*, that these *Sorices* do sleep all the Winter and hide themselves like the Dormouse. They also when they eat any corn, do screech and make a greater noise then other Mice, whereby they bewray themselves in the dark unto their enemies, and are killed, which was the occasion of that proverbial speech of *Parmeno* in Terence, *Egomel meo indicio miser, quasi Sorex perii*. Saint *Austine*, and Saint *Origen*, do also make use of this proverb, the one in his Book of Order, the other in a Homily upon Genesis, which caused *Erasmus* to write in this manner, *Sed videbor ipse meus indicio captus*, that is, I have overthrown my self with my own tale. These *Sorices* do make hollow the trees wherein Emets or Ants breed, and there is perpetual hatred betwixt the Bittors, and these, one lying in wait to destroy the others young.

The Medicines of the Sorex.

Serenus and *Pliny* say, that if a woman with childe do eat the sinews of a *Sorex*, if her eyes be black, so shall the Infants be likewise;

*Si pragnans artus captivi Soricis edit,
Dicuntur fœtus nigrantia lumina fingi.*

The fat of these Beasts or of Dormice, is very profitable against the Palsie. The powder of the heads and tails anointed with Hony upon the eyes, restoreth the clearness of sight, and with Hony At tick, the powder and fat of a *Sorex* burned, helpeth running eyes; and the same powder mingled with Oyl, cureth bunches in the flesh.

There is another Mouse called by *Matheolus*, *Mus Napelli*, that is, a Wolf-bane-mouse: so called, because it feedeth upon the roots of that Herb; although there be some of opinion, that it is not a creature, but another little Herb growing near unto it for a counter-poyson.

And *Marcellus* also maketh mention of *Napellus*, and *Antinapellus*, whereunto I should easily condescend, but that the eyesight of *Matheolus* leadeth me to the contrary. For he writeth that he took one of them in the top of a high Mountain in Italy. And *Sylvaticus* calleth this Mouse *Mus Suring*, or *Sucfinus*, and calleth it a Counter-poyson to Wolf-bane, and that God might shew thus much unto men, he causeth it to live upon the roots, in testimony of his natural vertue destroying poyson and venomous herbs.

Of the Mouse
called *Mus
Napelli*.

The Indian Mouse, and divers other kindes of Mice, according to their Countries.

I Do finde that divers times Mice do take their names from Regions wherein they inhabite, which happeneth two manner of ways: one, because the form of their bodies will somewhat vary: the other, because not only in shape, but also in wit they have some things in them common to Mice, over and above the Mice of our Countries; therefore we will briefly comprehend all their surnames of whatsoever regions they are in one order or Alphabet. In the Oriental parts of the world, there are great Mice, (as *Alexander* writeth) of the quantity of Foxes who do harm both men and Beasts, and although they cannot by their biting kill any man, yet do they much grieve and molest them.

Mice of the
East.

Americus Vespucius writeth, that he found in an Island of the Sea being distant from *Ulisbona* a thousand leagues, very great Mice. The hair of the Egyptian Mice is very hard, and for the most part like a Hedge-hogs: and there are also some which walk bolt upright upon two feet, for they have the hinder-legs longer, and their fore-legs shorter, their procreation is also manifold; and they do likewise sit upon their buttocks, and they use their fore-feet as hands. But *Herodotus* affirmeth these Mice to be of *Africk*, and not of *Egypt*; amongst the *African* or *Carthaginian* pastures (saith he) in *Africk* towards the Orient, there are three kindes of Mice, of the which some are called *Bipedal* or two-footed, some in the *Carthaginian* language *Zetzeries*, which is as much in our language as hills, some Hedge-hogs.

Egyptian Mice.

There are more kindes of Mice in the *Cyrenaican* region: some which have broad fore-heads, some sharp, some which have pricking hair in the manner of Hedge-hogs. It is reported that in *Cyrene* there are divers kindes of Mice both in colour and shape, and that some of them have as broad a countenance as a Cat; some have sharp bristles, and bear the form and countenance of a Viper, which the Inhabitants call *Echenete*, but improperly, as it appeareth by the words of *Aristotle* in his book of Wonders.

Cyrenean Mice.
Pliny.

Herodotus also affirmeth the like of those Mice, to be in shape and colour like Vipers: but *Pliny* and *Aristotle* do both disallow it, and say that in those juice there is nothing common to Vipers, but only to Hedge hogs, as concerning their sharp bristles.

There are also some Mice in *Egypt*, which do violently rush upon pastures and corn: of which things *Ælianus* speaketh, saying in this manner; When it beginneth first to rain in *Egypt*, the Mice are wont to be born in very small bubbles, which wandering far and near through all the fields, do affect the corn with great calamity, by gnawing and cutting asunder with their teeth the blades thereof, and wasting the heaps of that which is made in bundles, do bring great pains and business unto the *Egyptians*: by which it comes to pass, that they endure all manner of ways to make snares for them, by setting of Mice-traps, and to repel them from their inclosures, and by ditches, and burning fires to drive them quite away: but the Mice as they will not come unto the traps, for as much as they are apt to leap, they both go over the hedges, and leap over the ditches. But the *Egyptians* being frustrated of all hope by their labours, all subtil inventions and policies, being left as it were of no efficacy, they betake themselves humbly to pray to their Gods to remove that calamity from them. Whereat the Mice by some fear of a divine anger, even as it were in battel array of observing a squadron order, do depart into a certain Mountain: The least of all these in age do stand in the first order, but the greatest and eldest do lead the last troupes, compelling those which are weary to follow them.

A wonder in
the *Egyptian*
Mice.

Ælianus.

But if in their journey the least or youngest do chance through travail to wax weary, all those which follow (as the manner is in Wars) do likewise stand still, and when the first begin to go forward, the rest do continually follow them. It is also reported, that the Mice which inhabit the Sea, do observe the same order and custom.

Medicine by
African Mice.

The *African* Mice do usually die as soon as ever they take any drink: but this is commonly proper unto all Mice, (as *Ephesus* affirmeth) where it is written above concerning the poisoning of Mice. Mice, (but especially those of *Africa*) having their skins pulled off, boiled with Oyl and Salt, and then taken in meat, doth very effectually cure those which are troubled with any pains or diseases in the lungs or lights. The same doth also easily help those which are molested with corrupt and bloody spittings with retchings.

Pliny.

The *Arabian*
Mice,

The kindes of *African* Mice are divers; some are two footed; some have hair like unto Hedge-hogs; some faces of the breadth of a Weevil: but some call these Mice *Cirenacian*; some *Egyptian*, as I have before declared. In *Arabia* there are certain Mice much bigger then Dormice, whose former legs are of the quantity of a hand breadth, and the hinder of the quantity of the joyn to the end of the finger: I do understand them to be so short, that nothing thereof may seem to appear without the body, except the space of the joints of the finger, as it is in Martinets.

The *Armenian*
Mice.

It is said, that the garments of the *Armenians* are usually woven with Mice which are bred in the same Countrey, or diversly docked with the shape of the same creature. The Author writeth, that *Pliny* maketh mention of the *Armenian* Mouse, but I have read no such thing: therefore he doth perchance take the *Armenian* Mouse for the Shrew. In *Cappadocia* there is a kinde of Mouse which some call a Squirrel. *Ælianus* writing of the *Caspian* Mice; *Amyntas* (saith he) in his Book entituled *De Mansionibus*, which he doth so inscribe, saith that in *Caspia*, there do come an infinite multitude of Mice; which without any fear do swim the floods, which have great and violent currents, and holding one another by their tails in their mouths, (as it is likewise reported of Wolves) have a sure and stable passage over the water.

Of the *Caspian*
Mouse.

But when they pass over any tillage of the earth they fell the corn, and climbing up into trees, do eat the fruit thereof, and break the boughs: which when the *Caspians* cannot resist, they do by this means endeavour to restrain their turbulent incursions; for they remove all things which may hurt birds having crooked talons, who come presently so flying in such great flocks, or companies, that may seem to be clouds to expel the Mice from their borders, and by a proper gift incident unto them by nature, do drive away hunger from the *Caspians*. Neither in quantity are these Mice inferiour to the Egyptian *Ichneumons*: they are also ungentle, and they do no less devour with the strength of their teeth, then the Mice of *Teredon* in *Babylon* do Iron, whose soft skins the Merchants carry to the *Persians*. The *Indian* Mouse, or *Pharaohs* Mouse (as some learned later Writers do write) is no other then the *Ichneumon*. *Antonius musa Brasavolus*, took the before expressed figure of an *Indian* Mouse, (for so he did call it) which before that time was shewn by *Bellonius*, and I guessed it to be an *Ichneumon*; and truly in the snout (if you take away the beard) and in the ears it doth agree, but in the tail it doth differ, which doth rather resemble a Cat; and in many other things, which by conferring them are easie to be marked, and as I conceived it, I have set it down.

Of the Moschatte, or Musk-cat.

This Beasts name is derived from the *Hebrew* word *Bosem*, which signifieth sweet odour, for the *Germans* call the same *Bisem*, and the Beast it self *Bisembier*. And the *Gracians* derive their *Moschos* of *Moo* and *ozo*, to seek, and to smell, and of *Mesou Cheisthai*, to proceed out of their middle; because the true liquor cometh out of the navel, as we shall shew: but I rather think they derive it from the *Arabian* words *Mesch*, and *Misch*, and *Almisch*. The *Italians*, *French*, and *Spaniards* use *Musci* and *Muschi*, which is derived from the later *Latines*; and beside the *Italians* call it *Capriolo del Musco*; and the *French*, *Cheureul du musch*: the Musk it self is called in *Italy*, *Muschio*; of the *Latine*, *Muschum*, and *Muscatum*: the *Illyrians*, *Pizmo*; and the

Germans, *Bisem*. The *Arabians* were the first that wrote any discovery of this Beast, and therefore it ought not to seeme strange, that all the *Gracians* and *Latines* derive the name from them. And although there be an unreconcilable difference amongst Writers about this matter, yet is it certain that they come neereft unto the truth, that make it a kinde of *Roe*: for the figure, colour, stature, and horns, seem to admit no other similitude, except the teeth which are like a *Dogs*, whereof two are like a *Boars* teeth, very white and straight. And there be some (as *Simeon Sethi*, and *Aetius*) which say he hath also one horn, but herein is a manifest error, because no man that

ever saw one of these Beasts doth so much as make mention thereof; and therefore the original of this error came from the words of *Avicen*, who writeth that his teeth bend inward like two horns. *Cardan* writeth, that he saw one of these dead at *Millain*, which in greatness, fashion, and hair resembled a *Roe*, except that the hair was more thick, and the colour more gray. Now the variety of the hair may arise from the Region wherein it was bred. It hath two teeth above, and two beneath, not differing absolutely from a *Roe* in any thing, except in the savour. It is called *Gazella*, they are lesser, thinner, and more elegant creatures then the *Roes* are. *Paulus Venetus* writeth thus of this Beast. The creature out of whom the Musk is gathered, is about the bigness of a Cat, (he should say a *Roe*) having gross thick hair like a *Hart*, and hoofs upon his feet. It

is found in the province of *Cathay*, and the Kingdom of *Cergoth*, which is subject to the great King of *Tartars*.

Brassavolus.

Tame Musk-cats.

Their strength, nimbleness, and quickness.
Alex. Benedicus.

Of the Musk, and the use thereof.

The place where the Musk groweth.

The natural expression of Musk.

Likewise there was a most odoriferous Musk-cat at *Venice*, which a Merchant there had to be seen, brought as he said out of *Cathay*, and for proof whereof he shewed the way that he went, namely through the *Euxine Sea*, *Colobis*, *Iberia*, and *Albania*, even to the entrance of *Scythia*. For the Countrey *Cathay* is a part of *Scythia*, beyond *Imaus*, neither ought this to seem wonderful, for in that place there was a Region, called by *Ptolemeus*, *Randa marcostra*, wherein he placeth the eleventh Table of *Asia*. This Region is watered by the River *Sotus*, and therein aboundeth Spikenard, and the Inhabitants call the Countrey wherein the best Musk-cats are bred, *Ergimul*, and the greatest City of that Countrey *Singuy*. The same Author writeth also, that Musk-cats are brought out of *Egypt*, and out of many places of *Africk*. In *Thebeth* also there are many Cities, and Beasts about those Cities called *Gadery*, which do bring forth the Musk; and the Inhabitants hunt them with Dogs. The Province of *Canicluet*, doth also yeeld many of these Beasts, and likewise *Syria*. *S. Jerom* also writeth thus: *Musculus & Oenanthe, & peregrini muris pellicula*, by which skin of the strange Mouse, he meaneth the little bag, or skin wherein the Musk of the Musk-cat is included. The Princes of *Europe* do nourish these tame, being brought out of the New-found World, and many other rich men especially in *Italy*, be delighted with the odoriferous savour which cometh from it. *Brassavolus* saith, that he saw a Merchant offer one of these to be sold unto *Alphonfus* Duke of *Ferrara*, which had the Navel full of Musk. And *Catherinus Zenus*, an ancient Nobleman of *Venice*, had a Roe of this kinde, which he left after his death unto his heirs; and by this it doth plainly appear, that the Musk-cat is neither like a Cat, nor a Mouse, and that all those which have affirmed so much thereof, have been deceived of their own conjectural derivation of *Mosculus* or *Musculus*, or by the error of some Writer of the ancient Books, which instead of *Magnitudo Capreoli* a Roe, have inserted *Catti*, a Cat. And thus much shall suffice for the description of this Beast, and for the Regions where it is bred, except I may adde the Relation of *Ludovicus Romanus*, who affirmeth, that the Musk-cats of *Calecut* are brought out of the Countrey *Pegus*. These Roes of the New-foundland are wonderful nimble and quick, and so swift, that they are seldom taken alive; but after they are taken, by pulling out their longer teeth they wax tame. When they are prosecuted with the Hunters, and with Dogs, they defend themselves with their teeth. In some places they take them in snares, and in ditches, also kill them with darts; and so having killed them, they cut off the little bag wherein the Musk groweth, for that Musk doth exceed in sweetness of odor all things that were ever made by the art of man, and therefore the use of it is more plentiful then of any other thing, for they carry it about in Garments.

They make perfume of it; they anoint Beads whereupon they tell their prayers; they also make Bals of it, and include it in Gold or Silver, carrying it about, either to be seen, or because they are delicate and wanton; or to shew their riches and abundance; or to preserve themselves from putrified and stinking airs; or else against cold and moist diseases of the brain. With this the luxurious women perfume themselves, to entrap the love of their Wooers: for as the thing it self is a vice or sickness of the Beast; so also by men it is used to vice and wickedness; yet the *Venetian* Matrons will never use it, and he that beareth it about him shall never perceive it himself.

We have shewed already, that it groweth in the navel, or in a little bag neer unto it; and it is true by *Gyraldus* and *Varinus*, that when the Beast beginneth to be luxurious, and prone to the rage of venery and carnal copulation, then the blood floweth to the navel, and there putteth the Beast to pain, because it swelleth above measure. The Beast then abstaineth from all meat and drink, and rowleth himself upon the ground, and so by the waight of his body presseth forth the humor that troubled him, which after a certain time doth coagulate and congeal together, and then rendereth such an acceptable savour, as you see it hath. The relation whereof you shall hear out of the words of *Serapion*. The wilde Roes (saith he) which wander to and fro in the Mountains freely, without the government of man, have in a little bag, certain putrified matter or blood, which of it self groweth to be ripe, whereunto when it is come, the Beast itcheth, and is pained as it were with launcing, therefore he rubbeth himself upon stones, rocks, and trees, a great while together, for it delighteth him, whereby the stones grow white through his rubbing, and therefore in time he weareth the bag asunder, making issue unto it for the corruptible matter to come forth, which presently runneth out upon the sores, no otherwise then if it had been lanced. Then the wound groweth to be whole again, and the Beast departeth, until the like exsuperance of blood come into the same place again. For every year this happeneth them.

The Inhabitants of the Countrey know all the Hunters of these wilde Beasts, and therefore note them where they empty their bellies. For the humor so pressed out as before is declared, through the heat of the Sun congealeth and dryeth upon the stone, growing more commendable and pleasant through the Suns heat; Then come the Inhabitants, and in little bottles made of the skins of these Beasts, which before they have killed, and so put the musk into them.

This they sell for a great price, because it is thought, (and that worthily) to be a gift fit for a King. But if this Musk be taken out of the creature by violence, then will he bring forth no more; yet express it by his own natural art he beareth again and again. The greatest cause of this humor is the sweetness of his food, and the air wherein they are bred; therefore if one of them be brought into this part of the world, with Musk in his cod, it will grow to ripeness in a tempe-
rate

rate air, but if it be brought without Musk in the cod, then it will never yeeld any among us: and besides that it liveth but a little while. And therefore my opinion is, that this excremental humour, is unto it like a menstruous purgation, for the want whereof it dyeth speedily. Every part of this Beast is called Musk, which cometh forth of his ulcerous issue; for although the other parts smell sweet, yet we will shew afterwards more at large, that it is not of themselves, but by reason of this humor.

The pretiousness of this thing deserveth a further treatise, for thy better direction and instruction of the knowledge hereof, both for the choise of that which is best, and for the avoiding and putting away of that which is adulterate. At *Venice* at this day it is sold in the cods, and the *Indian* Musk is better then the *African*. The brown is always better then the black, except it be of *Catha*; for that of *Catha* is black, and best of all. There is some that is yellowish, or betwixt red and yellow, after the very same colour of Spikenard; this also is of the best sort, because the Beasts that render it do feed upon Spikenard.

Therefore this is good to be chosen, because it cannot be adulterated, and besides the tast of it is bitter, and as soon as ever it is tasted, it presently ascendeth to the brain, where it remaineth very fragrant without resistance, and is not easily dissolved. It is not bright within, but muddy, having broad grains, and equal throughout, like the wood of Baulm. But according to the Regions, they chuse Musk in this sort.

Of the *Indian* Musk, that of the Region of *Sceni*, (called *Antebeum*.) they set in the first place, and next unto it, the Beasts of the Sea side; The Musk of *Cubit* is known by the thin bladder of the Beast wherein it is contained; but that of *Gergeri*, is less Aromaticall, and more thick. The Musk of *Carum* is in the middle place betwixt both, wherewithal they mingle powder of Gold and Silver, to increase the waight. The musk of *Salmyndy* is worst of all, because it is taken out of his bladder or cod, and put into a glass. There are some which prefer the *Tumbascine* Musk, and they say, that the odor thereof cometh from the sweet herbs whereupon the Beast feedeth, and the like is said of the Region of *Sceni*; but the odor is not equal to the other. And the *Tumbascines* do not gather the Musk after the fashions of others: for they draw not forth this matter out of the cod, nor yet gather it in calm weather. The *Cenians*, they press forth the matter out of the ventricle, and when they have it forth, mingle it with other things, and that in cloudy and tempestuous weather: afterwards they put them up in glasses, and stop the mouth close, and so they send it to be sold unto the *Sarizines*, and to *Amanus*, and to *Parfis*, and to *Habarac*, as if he were a *Tumbescine*. When this Beast goeth furthest from the Sea, and feedeth toward the Desert upon Spikenard, then is his Musk sweeter, but when they feed neer the Sea, it is not so fragrant, because they feed upon Myrrh. *Avicenna* saith, there is some kinde of Musk like a Citron, but such hath not been seen in this part of the world; for our Musk is most commonly like the colour of Iron, and the savour of it like a *Cyrenian* Apple, but stronger; and consisteth of little pieces, but it is better that hangeth together, and hath a savour of the Wilderness; but if it be adulterated with Snakes or Birds-dung, then will it be lesser pleasant in the savour, and also pinch and offend the nose.

The Hunters of *Tebeth*, and *Seni*, as we have shewed already, do kill their sweet Rose, and afterwards take out from them their bladder of Musk, which Musk being excerpted before it be ripe, smelleth strongly and unpleasantly. And then they hang it up a little while in the open and free air, wherein it ripeneth as it were by concoction in the Sun, and thereby receiveth an admirable sweetness. And the like do divers Gardners use towards Apples, and fruits of trees which are gathered before they be ripe. For by laying them up in a dry place, they wear away their sharpness and become pleasant. But it is to be remembred, that Musk is the best which doth ripen in its own cod, before it be taken out of the Beast, for before it is ripe, it smelleth displeasantly.

There is not much perfect Musk brought into this part of the World, but the strength of it cometh from the vertue of the cod wherein it is put, and so it is brought to us; but the best is brought out of the East, where groweth Spikenard and sweet herbs. *Rodericus Lusitanus* saith, that our Musk is compounded of divers things, the ground whereof is the bloud of a little Beast like a Cony, which is brought out of *Pegun* a Province of *India*. But the means whereby to try it may be this, after it is waighed, they put it into some moist or wet powder, and after a little while they weigh it the second time, and if it exceed the former waight, then do they take it for sound, perfect, and good, but if it do not exceed, then do they judge it adulterate.

Some Merchants when they are to buy Musk stop it to their noses, and holding their breath run half a stones cast, afterwards they pull it from their nose, and if they perceive the savour of the Musk, then do they buy it, and take it for good, but if not, they refuse it for corrupted. In some Churches they make perfumes with Musk, and by mingling *Stirax*, *Aloes*, *Amber*, and juyce of *Roses*, they make a perfume called *Regium Suffumigium*, the Kings perfume; likewise unto sweet waters, drawn out of the furnaces of Chymists, whereunto they add simple *Rose Water*, and for the richer sort of people Musk and Camphory.

Andreas Furnerius, in his *French* Book of adorning mans nature, teacheth a composition to be made of certain Oyls, Sope, and Musk; and also Ointments and musked Oyls. He also sheweth how to make little round Balls of Musk, and other confections, and afterwards to draw a thread through the middle of them, and so wear them about ones neck.

Some put it into Silken wool, through which they first draw a thread, and so dissolve it in *Rose water*, afterward make it up in medicines, and use it as aforesaid. It may be preserved in a vessel of Lead,

The best musk declared by these several Countries.

The preserving of Musk.

Lead, close stopped a long time, for the lead which is cold and moist, agreeth well with the nature of the Musk, and therefore if a leaden vessel be wanting, so as ye be forced to use glass and silver, then must you put two or three pieces of lead into it, for the better preservation, and covering the passage all over with Wax, and above all things you must avoid all kinde of Spices, taking heed that no grain thereof come into it. If while it is in the vessel it lose the savour and be dead, then it is to be recovered by opening the mouth of the Vial, and hanging it over a privy; for when the stink and evill savour cometh unto it, *Contra sorem elucatur*, & *quasi lucando reviviscit*, it striveth against the filthy stink, and as it were reviveth in that contention, saith *Isidorus*, *Albertus*, and *Platearius*.

Benedictus.
The adulterating of Musk, and the means to descry it.

But concerning the adulterating of Musk, I will say more in this place. First of all, the Mountebanks do corrupt it by mingling with it the liver of a Calf. Also by a root called *Makir*, and an herb *Salich*. Many times the dung of Mice is sold for Musk, and so great is the deceit herein, that a man may not trust the outward shape of an intire cod, for there be Imposters which can counterfeit them, and make them in all parts for the outward appearance, and fill them with certain stufte, interposing some little true Musk among it until it have a reasonable savour, and therewithal deceive simple people.

It is also adulterated by mingling with it a little Goats blood fried, or brown Bread fried, so that three or four parts of these, will receive seasonable tast from one part of the Musk. It is also adulterated in the skin by putting pieces of the skin into it, and it may be known from the true Musk, because it will weigh twice so heavy. The *Sarazens* use this shift above all others, and there is one principal way of making counterfeit Musk, which is this; they take Nutmegs, Mace, Cinamon, Cloves, Gilly-flowers, and Spikenard, of every one a handful, all these being beat diligently together, and dried and sifted, they are mingled with the warm blood of a Dove, and afterwards dried in the Sun, then are they seven times sprinkled over, or moistened with the water of Musk-roses, and betwixt every sprinkling they are dried; at length they mingle therewithall a third or fourth part of true Musk, and then sprinkle it over again with Musk-rose-water, so divide it into three or four lumps, and take the white hairs from under the tail of a Roe or Kid, and so put it in a vessel of glass.

Benyvine, white Wax taken out of a new Hive of Bees, the rotten part of Eve-tree, and a little Musk, are mingled all together to make a counterfeit Amber, for it will smell like Civet, or Musk, or else *Stirax*, and the powder of *Lignum aloes*, with Civet, and Rose-water; but the fraud in one and other is easily deprehended, for both the odor and the colour are different from the true Amber, and also it will sooner wax soft in water, then that which is natural.

Some do corrupt their Musk with the seed of Angelica, or rather with the root of it, because the root smelleth sweet like Musk, but the cosenage may be easily discovered, by putting it into water: for the Angelica will sink, and the Musk will swim. The true Musk is sold for forty shillings an ounce at the least. It is also observed by *Arnoldus Villanovanus*, that in the presence of *Asa fetida* or *Castoreum*, the best Musk will have a horrible and intolerable savour, although they touch not one another, which cannot be ascribed to any known reason, but to some secret in nature. The sweetness of the Arabian Musk is described by *Alciatus* in this verse;

Et celebris suavi est unguine Muscus Arabs.

Herbs resembling Musk.

There be divers herbs which smell sweet like Musk, as Angelica, Doris, Musk-gilliflowers, Musk-grapes, the leaves of a Winter Cherry, and an herb growing near *Basil* without a name, like wilde Parsley, the Damasine-rose, and many other. Wilde Cats and Martins do also render an excrement much like Musk; and there are Hares called *Moschie*, which leave such an intolerable smell in the impression of their foot-steps, that the Dogs by touching them grow mad, as we have shewed in the story of the Hare: And thus much for the description of this Beast; now followeth the medicines.

The Medicines of the Musk-cat.

A very little part or quantity of a Musk-cat is of great vertue and efficacy; wherefore it is very sparingly used in medicines or potions, neither is there any part thereof beaten or bruised, as it is of all other Beasts, but it is melted and dissolved in water which proceedeth from the sweetest Roses. It is also a Beast which is very hot and dry, but rather more dry then hot, yet notwithstanding the same his heat is asswaged and allayed by no other thing but only the Gum called Camphire; and his driness is only moistned or mollified with Oyls, and very sweet, as Oyl of Violets, and Oyl of Roses. Amongst sweet smells and savours, the principallest and chiefeft laud and commendation is attributed unto the smell which proceedeth from the Musk-cat: For he doth not only with his odoriferous and delightful savour please and content the scent of men, but also doth strengthen the spirits, and all the parts of mans body, yea and that in a moment, for the slenderness of his parts, which although it doth forthwith penetrate or enter into the scent of man, yet doth it endure longer, and is not so speedily or quickly dissolved as the scent or savour of any other sweet smell whatsoever.

A Musk-

A Musk-cat and the herb called Mercuries-fingers or Dogs-bane, being given in purging medicines to drink, do greatly renew and refresh the decayed strength or force of those which have been before times weakened with divers and continual medicines in their members. The same is also very profitable for those which are effeminate or defective, and eclipsed in their minde or courage, as also for those which are weak and feeble in their joynts, not by any hurt, or any other casualty being enfeebled, but being always so even from their childhood. A Musk-cat is an excellent remedy for those which are troubled with fear in their heart; and also for those which do quiver or shake either for fear of any other thing throughout all the parts of their body. The same is a very profitable and medicinable cure for those which are grieved with any ach or pain in their head, or with any enormity or trouble in their liver, and is also being given simply by it self, without any thing mixed in it, or compounded in Wine, very good and wholesome for the healing and curing of those who have any pain or grief in their stomach, which cometh by the occasion of any cold.

Symeon.

Isidorus.

A Musk-cat being put unto the body of any man in the form or manner of a plaister, doth confirm and make strong both his heart and all the rest of his bowels, or interior parts: it doth moreover encrease both strength and power in all his members, yea and in the very bones, the efficacy thereof is of such and power and vertue. The same being laid or anointed upon the head, is very effectual for the expelling or driving away of the rheume which falleth from the head into the nostrils, and by that means procureth heaviness in the same; and for the amending and curing of the swimming dizziness or giddiness in the head through the abundant humors which remain and stay therein, and also for the bridling and restraining of lust and venery.

Dioscorides.

The same being used in the aforesaid manner doth temperate and confirm the brains of any man, besides it easeth and helpeth those which have pain about their heart, by the which they suppose their very heart to ake. The smell of this Beast is both profitable and hurtful; for unto those which are cold of constitution, the scent is very pleasant in regard that it is hot of it self, and is very delightful in their savours: but unto those which are hot of nature it is very noisome, in regard that the heat and strong scent thereof overcometh their senses, and oftentimes causeth their heads to ake, and be full of pain; and doth also stir up in them that pestiferous disease called the Falling-sickness: but unto women which are of a hot and fiery constitution it is more hurtful and noisome, for it breedeth in them a very pestiferous disease, which choaketh their Matrice or Womb, and causeth them oftentimes to swoond, it is also called by some the Mother. The sneezings of a Musk-cat is an excellent remedy against the resolution of the sinews or the Palsie. A Musk-cat is very good and wholesome for the helping and curing of those which are troubled with any deafness or astonishment in any part of their bodies; as also for the driving away of melancholick and sorrowful passions out of mens mindes, and for the incitating delightful mirth and pleasure in them.

Avicenna.

Rasis.

Brassavolus.

A Musk-cat being mingled with dry plaisters which are used for the healing of the eyes, is an excellent remedy for the expelling and driving away of the white skin which doth usually cover the sight, and for the drying up of moist rheumes and humors, which in the night time do fall from the brains and the head, and by that means doth much hurt and damage the sight of the eyes, as also for the clarifying and healing up of any pain or disease therein.

Platearius.

A Musk-cat is an excellent remedy for those which have a desire to vomit and cannot, it doth also renew an appetite or stomach in those unto their victuals which do loath and abstain from all sustenance, and doth loosen and dissolve all thick puffings or windiness in the interior parts or members of any one.

A Musk-cat being mingled with a caustick medicine, is very profitable and wholesome for the bringing forth of those Womens menses or fluxes which are stopped, and also for moving conception in those women which are hindered in it by the occasion of some great cold.

A medicine or suppository being made of Ambergreese, and mingled with a gum comming out of Syria called *Styrax*, and then mixed both together with a Musk-cat and so beaten, until they come unto a certain salve, and laid unto the secret parts of a woman, is very good for the aforesaid disease. There is a certain juyce or moistness in a Musk-cat which being pressed forth or dissolved, and mixed with the Oyl called Palma Christi, and anointed upon the yard of any man, doth stir him up to lust and venery. If the least part of a Musk-cat be eaten by any one which is troubled with a stinking breath, it will presently expel and take away the stink thereof. And thus much shall suffice concerning the cures and medicines of the Musk-cat.

Avicenna.

Of the MULE.

THE Mule is a Beast, called by the Hebrews, *Pered*, from whence comes the feminine *Pirdah* 3. of King. 1. and there be some that say that the reason of the Hebrew word is, from the separation and sterility of this Beast, for it is *Pered*, *quia non pariat*. The Chaldy word is *Cudana*, the Arabian, *Beal*; but Gen. 36. for the Hebrew word *Femin*, many translate Mules. The Arabians, *Kegal*; but the Græcian Septuagints, *Hemionous*. The Græcians also call a Mule *Astrabe*, from the strength of his body. The Latines call a Mule *Mulus*, and *Semiasinus*, that is, half an Ass, because on the one side he is an Horse, and on the other side an Ass, and therefore in his conditions he more resembleth an

an

Plutarch.

Divers kinds
of Mules.

an Ass then an Horse, whereupon lyeth this tale. A certain *Lydian* Mule seeing his Image in the water, grew to be afraid of the greatness thereof, and thereupon took his heels and ran away as fast as he could; neither could he be stayed by all the wit of his Keepers: At length the Mule remembering that he was the son of an Ass, he stayed his course and came back again neighing. The *Italians* call a Mule *Mulo*, and the female *Mula*, like the *Latines*, and the *Spaniards*. The *French*, *Mulet*, and the female *Mule*, from whence cometh the *English* word Mule. The *Germans*, *Mulbire*, or *Mulefel*. The *Illyrians*, *Mesek*, and the *Flemings*, *Mul*.

There is another kinde of Mules in *Syria*, divers from those which are procreated by the copulation of a Mare and an Ass, and they receive their names from the similitude of their faces. For there is no other cause, why wilde Asses should be called Asses, but only their similitude of tame Asses. And as among wilde Asses some of them are singularly swift, so also among these *Syrian* Mules, there are some excellent speedy Coursers. These Mules procreate in their own kinde, and admit no mixture, which *Aristotle* proved by nine of them which were brought into *Phrygia*, in the dayes of

Pharnacis, the father of *Pharnabazus*. *Theophrastus* also reporteth, that in *Cappadocia*, the Mules engender among themselves, which *Aristotle* remembreth in his wonders, and he might well have spared it, for they are a kinde of Cattel among themselves. There be flocks of Asses and Mares in *India*, where the Mares do willingly admit the Asses in copulation, and bring forth red Mules, the best of all other for running.

But among the *Indian* Phyllians, their Asses, Mules, Oxen, and Horses, are no bigger then Rams. As the Mule is begotten betwixt an Ass and a Mare, so the Burdon is begotten betwixt a Horse, and a shee-ass, wherefore the *Italians* call him *Mulo Bastardo*, that is, a Bastard Mule. For as the Mule more resembleth the Ass then the Horse, so the Burdon more resembleth the Horse then the Ass: the reason is; because all kindes follow the father. The Mule hath some parts proper to the Ass, as long ears, a terrible voyce, a cross upon the shoulders, small feet, a lean body, and in all other things it relembleth a Horse. The length of their ears serveth instead of their fore-top, their color is somewhat brown, but it varieth; for the *Roman* Cardinals have Mules of an ash-colour, and those very great ones with long tails.

They change their teeth, and have in number six and thirty, their neck is like the neck of an Asses, long, but not standing upright, their bellies simple and of one quanty, They want a gall like all four-footed Beasts; and there is a thing in their heart like a bone, as we have shewed before in the story of the Ass.

They eat such food as Horses, and Asses do; but they grow fat by drinking, yet they drink not like a Horse, by thrusting in their noses into the water, but only touch it with their lips.

They love Cucumbers above all other meats, but the flowers and leaves of *Rhododaphne* are poyson to Mules and Asses, and to many four-footed Beasts. Both a Mule and a Horse grow from the first coming forth of their teeth, (by which their age is discerned) and after all their teeth are come forth, it is hard to know their age. The females in this kinde are greater, more lively, and live longer then the males. It hath been found that they have lived to fourscore years of age. Such a one was presented at *Athens*, at what time *Pericles* builded the Temple of *Minerva*, where by reason of his age, he was dismissed from all labour, yet afterwards he would not forsake his companions, but went with them, exhorting them with neighing to undergo the labour cheerfully; whereupon there was a publick decree, that the said Mule should have an ordinary of provender appointed him in *Prytanium*, and that no body should drive him away from their Corn when he eat it, although it were in the Market place.

We have shewed already that this Beast is engendered betwixt an Ass and a Mare, and therefore if a man would create unto himself a notable breed of Mules, he must look to the choice both of his male and female. First of all for the female, that she be of a great body, of sound bones, and of singular good shape, wherein he must not so much expect her velocity or aptness to run, as her strength to endure labour, and especially to bear in her womb a discordant foal, begotten by an Ass, and to confer upon it both the properties of his body, and the disposition. For when Mares do unwillingly receive the genital seed of the Ass, the foal doth not grow to perfection in the Mares belly, until she hath born it thirteen months, whereby it relembleth more the sluggish and dull nature of his father, then the vigor of his mother. But for the helping of their copulation, they pull certain hairs out of the tail of the female, and afterwards binde them together therewith.

There is no lesser regard to be had of the Stallion, lest the want of judgement in the choice of him do frustrate the experiment; seeing therefore they are engendered betwixt a Mare and an Ass, or betwixt a Mare and a wilde Ass, and the Mule, begotten betwixt the wilde Ass and the Mare, doth excel all others, both for swiftness of course, hardness of foot, and generosity of stomach: yet is the tame Ass better for this breed then the wilde Ass, for he will be more beautiful in outward form, and more tractable in disposition; and the Mules engendered by wilde Asses may be compared to these; yet can they never be so tamed, but they retain some qualities of their wilde father; and therefore a Mule begotten betwixt them (I mean betwixt a wilde male Ass and a tame female Ass) are fitter for Nephews then for sons; that is, their foals may beget good Mules, and such as are tameable and tractable, because descent breaketh the corruption of nature, but themselves do never prove profitable.

And therefore it is most commodious and necessary to get such a Stallion Ass to the procreation of Mules, whose kinde by experiment is excellent, and outward parts every way acceptable, such as these are; a long and great body, a strong neck, strong and broad ribs, a wide breast full of muscles, loins full of sinews, strong compacted legs, of colour blackish or spotted, for the Mouse colour is too vulgar, and is not fit in a Mule. For it is but folly in a man to allow and approve every colour he looketh upon, and therefore (*Columella* writeth) when there are spots upon the tongue and palat of a Ram, such also are found in the Wooll of the Lamb he begetteth.

And so also if an Ass have divers coloured hairs upon his eye-brows, or upon his ears, the foal he bringeth forth hath such colours in his skin; And hereunto agree both *Palladius*, and *Abfutus*, saying; he that will have a good breed of Mules, must get an Ass of elegant form, a great stature, square members, a great head not like a Horses, his face, cheeks, and lips not small, his eyes standing out of his head, and not little or hollow, broad nostrils, great ears, not hanging down, but standing upright; a broad and a long neck, a broad breast, rough with the plaights of his muscles,

and strong to endure the kickings of the Mare : great breasts, plates, and other parts under his shoulders, and so down to his legs, which ought to be strong, broad, and corpulent, and standing far asunder, so as he may easily cover the Mare.

A great back, and broad back-bone, neither hollow, nor standing up with bunches, bearing a direct line upon the middle. His shoulders not low, but standing up, the hip-bone full and long, not bending too narrowly nor pinde buttock, nor standing out sharp, and they are best which have the shortest tails.

Furthermore let his stones be great, his knees great and round, standing both alike, his legs bony and without flesh, nothing appearing in them but nerves and skin; not standing awry, nor yet of divers colours, his pasterns not high, nor yet over-low : his feet not low nor bending inward; his hoof thick and hollow within; the inward part of it being clear, according to the saying of Juvenal :

Namq; hic munda nitet ungula Mula.

His voyce clear and not hoarse, for so the Mare will be terrified from copulation. His colour ought to be likewise clear, as all black, having no white belly; or somewhat looking towards purple, and having one black spot upon his mouth, or rather a black tongue, and such as hath been brought up with Horses.

Abstus.

It is the fashion of some to take wilde Asses to tame them, to make Stallions for generation, for they beget the best Mules, if they be liberally fed and not inclosed, and never wax wilde again if they be put among tame Asses. And the young one so gotten by him, will be like the syre : and if any have a desire to make the Mules of strange colours, they must cover the female with a cloth of that colour, wherewithal they desire the young one to be foaled, as we have shewed already in the discourse of Horses, whereby there are raised many excellent kinds and races; or else they bring in their presence at the time of their copulation some great Male Horse or As, by the sight whereof they are made more fruitful, or again, some base and despicable Beast being offered to their view, doth make them to conceive more noble Mules.

If the wilde Asses be at any time heavy, and not willing to cover the Mare, then let there be another female As brought into the presence, by the sight whereof his lust so burneth, that he rageth almost to madness for copulation : And therefore being denyed, the As doth more willingly leap upon the Mare, whom before he loathed. Again, it must be regarded, that the Stallion be tyed and bound fast, so that he may not cover the Mare after she is with foal, nor yet have access unto her, lest by kicking and biting he cause abortment, for many times they break their bonds asunder, and greatly trouble the females with young, therefore they are accustomed to some labour, which taketh down the heat of their lust : yet at the time that they are to cover the Mares, you must use all diligence to awaken the drowsie nature of the Beast, so that with greater spirit the seed of the male and female may meet together.

The Asses of *Lybia* will not cover Mares that have manes until they be shorn off, for it seemeth they disdain that their females should have more ornaments then themselves, which are their husbands.

We have shewed already in the discourse of the As, that Mares do not willingly admit any Stallion As to cover them, except it be such a one as did suck a Mare, which we called a Horse-suckling, or *Equimulcus*. For this cause men that propound unto themselves to nourish races of Mules, take the Colt of an As so soon as it is foaled, and put to it a Mare, giving milk in some dark place, wherein the Mare not doubting any fraud, is deceived, and willingly yeeldeth her udders to the Asses foal; whereunto being accustomed for ten days together, at last she taketh it for her own; and such a Stallion As loveth Mares exceedingly : and on the other side, the Mare refuseth not him. And some say, that although they suck their mothers milk, yet if from the time of their weaning they be brought up among Horse-colts, it is as good as if they had sucked Mares.

If the As be small which is a Stallion, he will quickly wax old, and his issue be the worse, therefore they must provide the largest and strongest Asses, and nourish them with the best Hay and Barly, that so his strength may abound before his copulation. He ought not to be under three years old, nor yet brought unto a Mare which never knew Male, for such a one will beat him away with her heels and mouth, and bring him into perpetual hatred with that kinde; wherefore they use to bring some vile and vulgar As into the presence of the Mare, as it were to woo her, and provoke her to copulation, that so if she beat him away, it may be no hinderance to the Stallion; but if she seem to admit him, and desirous of copulation, then they take him away, and bring the appointed Stallion into his room, and so the Mule is engendered.

For the effecting of their copulation, there must be a place appointed for the purpose, betwixt two walls, having a narrow passage, that so the Mare may not have liberty to fight with the As, and the Mares head must be tyed down to a Manger or Rack, the ground being so fashioned, that her fore-feet may stand much lower then her hinder, and so ascend backward, to the intent that the As may more easily leap upon her back, and she receive the seed more deeply. When the Mare hath brought forth the Mule, she giveth it suck half a year, and then driveth it away, which ought to be brought up in some Mountains, or hard places, that so the hoofs may grow hard and indurable.

Having

Having thus discoursed of the generation of Mules, it now followeth, that we should enquire, whether Mules thus engendered betwixt an Ass and a Mare, do likewise bring forth in their own kinde. *Observatum est* (saith *Pliny*) *è duobus diversis generibus tertii generis fieri, & neutri parentum esse similia, eaq; ipsa quæ ita nata sunt, non gignere, in omni animalium genere, idcirco Mulus non parere.* That is to say; It hath been observed, that out of two divers kindes, a third hath been engendered, and yet like to neither of the parents, and those so engendered did not procreate others in the universal kinde of Beasts, or among all creatures; and therefore Mules conceived betwixt Asses and Mares, do not bring forth young. Whereupon *Camerarius* made this pretty riddle of a Mule:

*Diffimilis patri, matri diversa figura
Confusi generis, generi non apta propago,
Ex aliis nascor, nec quisquam nascitur ex me.*

Democritus is of opinion also, that Mules cannot conceive, and that their secret places are not like other Beasts, and the issue of confused kindes can never engender, but especially in a Mule, because it is made of divers feeds, (I mean divers in quantity, and almost contrary) for the seed of the Ass is cold, and the seed of the Mare is hot.

Aristotle disputing of this matter concerning those kindes that are procreated of divers parents, writeth in this sort: those Beasts joyn in copulation, whose kindes although they are divers, yet are not their natures very disagreeable. If the quantity and stature be alike, and the times of going with young be equal, yet they remain barren that are so begotten, of which cause *Empedocles* and *Democritus* yeeld reason: *Empedocles* obscurely, and *Democritus* more plainly, but neither of them both well; for they alledge the same demonstration about all Beasts out of their kinde. *Democritus* saith, that the passages of the Mules are corrupted in their wombs, because their beginning doth not consist of one and the same kinde; but this is no reason, for that it happeneth also to other Beasts that do engender.

Empedocles he yeelds a reason out of *Plutarch*, about the joyning together of the seeds, and therefore compareth it to a commixtion of Tin and Brasse together, but he saith he doth not understand their meaning, and therefore proceedeth to expresse his own opinion in these words. First (saith he) every one of the Males do beget one of their own kinde, but the females cannot conceive, and this is no great wonder; because that Horses are not always fit for generation, nor Mares to bring forth Colts being covered: and therefore when Asses and Mares do couple together, their issue may be more barren, because they receive the greater hinderance in the diversity of kinde; for besides the coldness of the Asses seed which may be one great cause of his barrenness, they have another property, if they do not breed and engender before the casting of their Colts-teeth, they remain sterile and barren all their life long: for so doth the generative power of the Asses body rest upon a tickle and nice point, apt to rise, or easie to fall away to nothing.

And in like sort, is a Horse prone to barrenness, for it wanteth nothing but cold substance to be mingled with his seed, which cometh then to pass when the seed of the Ass is mixed with it, for there wanteth but very little, but that the Asses seed waxeth barren in his own kinde, and therefore much more when it meeteth with that which is beside his nature and kinde.

This also hapneth to Mules, that their bodies grow exceeding great, especially because they have no menstruous purgation, and therefore where there is an annual breeding or procreation, by the help and refreshing of these flowers, they both conceive and nourish; now these being wanting unto Mules, they are the more unfit to procreation.

The excrements of their body in this kinde they purge with their urine, which appeareth because the male Mules never smell to the secrets of the female, but to their urine, and the residue which is not voided in the urine, turneth to encrease the quantity and greatness of the body, whereby it cometh to pass, that if the female Mule do conceive with foal, yet is she not able to bring it forth to perfection, because those things are dispersed to the nourishment of her own body, which should be employed about the nourishment of the foal: and for this cause, when the *Egyptians* describe a barren woman, they picture a Mule.

Alexander Aphrodisiens writeth thus also of the sterility of Mules. Mules (saith he) seem to be barren, because they consist of Beasts divers in kinde, for the commixtion of seeds, which differ both in habit and nature, do evermore work something contrary to nature, for the abolishing of generation; for as the mingling together of black and white colours doth destroy both the black and white, and produce a swart and brown, and neither of both appear in the brown; so is it in the generation of the Mules, whereby the habitual and generative power of nature is utterly destroyed in the created compound, which before was eminent in both kindes, simple and several. These things saith he.

Alcmaeon, as he is related by *Plutarch*, saith, that the male Mules are barren by reason of the thinness and coldness of their seed, and the females because their wombs are shut up, and the veins that should carry in the seed, and expel out the menstruous purgation, are utterly stopt. And *Empedocles* and *Diocles* say, that the womb is low, narrow, and the passages crooked that lead into it, and that therefore they cannot receive seed, or conceive with young: whereunto I do also willingly

yeeld, because it hath been often found that women have been barren for the same cause. To conclude therefore, Mules bear very seldom, and that in some particular Nations if it be natural, or else their Colts are prodigious, and accounted monsters.

Concerning their natural birth, in hot regions where the exterior heat doth temper the coldness of the Asses seed, there they may bring forth. And therefore *Columella* and *Varro* say, that in many parts of *Africk*, the Colts of Mules are as familiar and common, as the Colts of Mares are in any part of *Europe*.

Mules engender.

So then by this reason it is probable unto me, that Mules may ingender in all hot Countries, as there was a Mule did engender often at *Rome*; or else there is some other cause why they do engender in *Africk*, and it may be that the *African* Mules are like to the *Syrian* Mules before spoken of, that is, they are a special kinde by themselves, and are called Mules for resemblance, and not for nature. It hath been seen that a Mule hath brought forth twins, but it was held a prodigy. *Herodotus* in his fourth Book recorded these two stories of a Mules procreation; When *Darius* (saith he) besieged *Babylon*, the *Babylonians* scorned his Army, and getting up to the top of their Towers, did pipe and dance in the presence of the *Persians*, and also utter very violent & opprobrious speeches against *Darius* and the whole Army, amongst whom one of the *Babylonians* said thus: *Quid istic desidetis o Persæ? quin petius absceditis, tunc expugnaturi nos cum pepererint Mulae.* O ye *Persians*, why do you sit here? wisdom would teach you to depart away; for when Mules bring forth young ones, then may you overcome the *Babylonians*. Thus spake the *Babylonian*, believing that the *Persians* should never overcome them, because of the common proverb, *epean emionoi tekasin*, when a Mule beareth young ones. But the poor man spake truer then he was aware of, for this followed after a yeer and seven months: While the siege yet lasted, it hapned that certain Mules belonging to *Zopirus*, the son of *Megabizus* brought forth young ones, whereat their Master was much moved, while he remembered the aforesaid song of the *Babylonian*, and that therefore he might be made the Author of that fact, communicated the matter with *Darius*, who presently entertained the device; therefore *Zopirus* cut off his own nose and ears, and so ran away to the *Babylonians*, telling them that *Darius* had thus used him, because he perswaded him to depart with his whole Army from *Babylon*, which (he said) was in expugnable and invincible. The *Babylonians* seeing his wounds, and trusting to their own strength, did easily give credence unto him; for such is the nature of men, that the best way to beguile them is, to tell them of those things they most desire, for so are their hopes perswaded, before they receive any assurances. But to proceed, *Zopirus* insinuated himself further into the favour of the *Babylonians*, and did many valiant acts against the *Persians*, whereby he got so much credit, that at last he was made the General of the whole Army, and so betrayed the City unto the hands of *Darius*: Thus was *Babylon* taken when Mules brought forth.

A History of Mules.

Another Mule brought forth a young one, at what time *Xerxes* passed over *Hellepont*, to go against *Græcia*, with his innumerable Troops of Souldiers, and the said Mule so brought forth, had the genitals both of the male and female.

Unto this I may adde another story out of *Suetonius*, in the life of *Galba Caesar*. As his father was procuring Augurisms or divinations, an Eagle came and took the bowels out of his hands, and carried them into a fruit-bearing-oak, he enquiring what the meaning of that should be, received answer, that his posterity should be Emperours, but it would be very long first: whereunto he merrily replied; *Sane cum Mula pepererit*; I sir, when a Mule brings forth young ones: which thing afterwards happened unto *Galba*; for by the birth of a Mule, he was confirmed in his enterprises when he attempted the Empire; so that, that thing which was a prodigy and cause of sorrow, and a wonder to all other people, was unto him an ominous confirmation of joy and gladness, when he remembered his Grand-fathers Sacrifice and saying. Therefore it was not ill said of *Democritus*; *Mula non naturæ opus, sed humane machinationis, adulterinum inventum, & furtum esse videntur.* Mules are not the proper work of nature, but an adulterous invention of humane policy, robbing nature: for (saith he) when a certain *Median* found his Ass covering of his Mare, whereupon afterwards she fell to be with foal, and seeing the young one to communicate with both natures, they drew it into a custom to cover the Mares with their Asses, for the engendering of such a breed.

The invention of Mules. *Ælianus*.

Some are of opinion that Mules first began among the *Paphlagonians*, which before the *Trojan* war were called *Eneti*, and afterwards *Veneti*: but in *Gen. 36.* we finde that *Anab* the son of *Zibeon*, keeping his fathers Asses, did invent *Gemim*, that is, Mules, as some interpret. But rather I believe, that while Asses and Horses ran wilde in the Wilderness among themselves, the wilde Asses first began this race. The male at seven years old may engender, because he is of a hotter nature then the female; and also doth not in his generation confer any part of his bodily growth to the young one, and sometimes he engendereth when he hath lost his foremost teeth, and after the first copulation, he never engendereth more. The young one so generated, is called *Ginnus* and *Pumilio*, for it is a very dwarf, according to the observation of *Martial*:

Aristotle.
The quantity of a Mules foal.

*His tibi de Mulis non est metuenda ruina,
Altius in terris pene sedere soles.*

Such as these were kept in the Court of the Duke of *Ferraria*, and although in all things they resemble the mother, yet are named after the father, and such also are the *Burdones* before spoken of

of in the story of the Horse. Mules are begotten both by Mares, She-asses, and Bulls, but yet those are the best that are begotten betwixt an Ass and a Mare, And thus much for the generation of Mules.

They are nourished with the same meat that Horses and Asses are, annoyed with the same sicknesses, and cured with the same means; generally blood-letting is good for them, and for their diet Bullimung. In *Scythia* they can abide no cold, and therefore the Horses are there used instead of Mules. In some Countries the Horses can abide no cold, but the Asses and Mules bear out (as *Herodotus* writeth,) and as we have shewed before in the story of the Ass: when the *Grecians* were at *Troy*, and were destroyed by a consuming pestilence, the first of all their company that dyed were their Dogs and their Mules, and the reason of it was, because the pestilence arising out of the earth, they by the sense of smelling, which is very quick in both kindes, did first of all draw in that poyson from the earth.

Collumella saith, that the medicines for the Oxen do also cure Mules, yet there are special medicines not to be neglected, which we will expresse in this place. For a Mule that hath a Feaver, give her raw Cabbage; and for one that is short-winded use blood-letting, and for a drink give it a pinte of Wine and Oyl mixed with half an ounce of Frankincense, and half a pinte of the juyce of Horehound. For the scratches or disease in the hoofs, lay to it Barley meal, then make suppuration with a knife, and cure it by laying two linnen clothes, or by a pinte of the best Garum, and a pound of Oyl infused into the left nostril of the Mule, whereunto you may adde, the whites of three or four Eggs separated from the yolks.

The female Mule may be burned in the feet, or let blood after the manner of Horses, and some Countrey men give in their food the herb *Veretrum*, or else the seed of *Hyoscamus* or Hen-bane beaten to powder and drunk in Wine. For the languishing of the chine or leanness, they make this drink; have an ounce of beaten Brimstone, a raw Egg, a penny weight of the powder of Myrrh, mingled all three together in Wine, and so poured down the Mules throat, is a present remedy to cure it. As also for the pain in the belly and all manner of coughs, the herb *Medica* is special good for the said languishing disease. So also to fat the Mule if it be given green, and not dried like Hay, a little at a time for fear the Beast be suffocated with overmuch blood. When a Mule is tired or heated, let the load be taken off, and turn her forth to wallow in some convenient place. If that suffice not, take some fat, and put it into her chaps, that so she may suck it down, and pour Wine after it.

For to keep the necks of Mules from wringing and loosening their skin, use this medicine, Take two pound of Hogs-grease sod three times, or unto the third part two pintes of Vinegar, and therewithall anoint the Mules neck. As we have shewed that the pains of a Horses belly and guts are best of all cured by the sight of a Mallard, swimming in the water, whereby they are speedily delivered from all manner of torment, so the same hath as great or greater operation to cure the pains of the Mules belly. It is reported by *Avicen*, that Mules fall into madness, and in that madness bite their master mortally. They are likewise subject to the Gout, and especially to swellings about the Crown of their pasterns, but they are cured as Horses and Oxen.

They live long, ordinarily to fifty years, and sometimes to fourscore, the reason thereof is given by *Celsus*: *Animalia quae frequenter coeunt brevioris sunt vitae, inde fit, ut Muli equos superent, videndi diuturnitate*; that is to say, Those Beasts and creatures which oftentimes joyn in copulation have but short lives, and from thence it cometh, that Mules live longer then Horses.

The Epithets of a Mule are these; pack-bearer, dirty, *Spanish*, rough, and ill-formed. There is an Adage or proverb called *Mulus Marianus*, and by it is signified a man which is apt both for to obey and to rule; it was taken from *Marius* the great Roman Souldier and Commander, whose fashion was, when he had commanded any of his Souldiers to fetch a burden, or do any wilde service, he himself would put his hand unto it. It signifieth properly a bearing back, or Colt-staffe, as we say in *English*, whereupon poor men carry their burdens, and from thence it was translated into a proverb, to signifie all that do obey commands. There be some which give another reason of this proverb, for they say, that when *Scipio* did besiege *Numantia*, he did not only determine to look into the weapons of his Souldiers, but also to his Horses, Mules, and Chariots. Then *Marius* brought forth an Horse, nourished by himself very delicately: Besides the Horse a Mule of very comely body, far excelling all other Mules both in gentleness and in strength. Therefore seeing the Emperor was delighted with the Beasts of *Marius*, and would now and then make mention of the Mule, at length it came to a common jest, to call a double diligent servant *Mulus Marianus*. The *Italians* do commonly call those men Mules which are base born, and not by lawful marriage.

Concerning the disposition of Mules, it is well observed by *Aristotle*, that Mules are always tame; and if at any time they be more wilde, they abate their untameable nature by drinking of Wine, because by the operation of the Wine, their heels and hard parts do resolve and grow soft; by the same reason that Apes by drinking of Wine loose their nails, and men accustomed to drunkenness fall into palsies: for there is such a dispersing and discussing nature in Wine, that it dissolveth all nerves and hard things in the bodies of Beasts, even as water dissolveth hard fruits and Pease, and Vinegar maketh lead as soft as an Egge, that it may be drawn through a Ring: and such is the nature of Mules, that after they have drunk Wine, they feel themselves disarmed, and therefore give over to resist, because by kicking backwards, they receive more harm then they give,

The inward
disposition of
Mules.

Pliny.

and thus the guiltiness of their own weakness, maketh them gentle against their wills, for otherwise they hate mankind, and are nothing so tractable as Horses. For Varro saith, that they have so much confidence in their heels, that by them alone, they kill Wolves when they come among them.

Use of Mules
in their several
works.
Cardan.

Mules were wont to be used for plowing, and for carrying both of men and burthens; but now in most parts of Europe, Judges and great Princes ride upon them until they be old, and then they sell them to the poor men, who turn them into the Mountains where they suffer them to run wilde, till their hoofs be hardened for long travails, and then they take them up again. They have been also accustomed to ploughing, according to these verses;

*Quantum mularum sulcus praecedit in arvo,
Tantum is praecurrit.*

For the Mules did plough more speedily, and come to the lands end more quickly then either the Ox or Horse. And Martiall saith, that they were used in Carts to draw Timber, according to these verses;

*Vixq; datur longas Mularum vincere mandras,
Quaeq; trahi multo marmora fune vides.*

They were also used in race at the games of Olympus, as we have already shewed in the story of the Horse, but that custom dyed quickly, because that the Arcadians could not endure Mules. The price of Mules was great, for Crispin (saith Juvenal) gave six thousand pieces of money for a Mule, and yet he saith it was not well worth six pound; the verses of Juvenal are these:

*Crispinus Mulum sex millibus emit
Aequantem sane paribus sestertia libris,
Ut perhibent qui de magnis majora loquuntur.*

The Cappadocians payed to the Persians every year besides Silver and Gold, fifteen hundred Horses, two thousand Mules, and fifty thousand Sheep; but the Medians payed twice so much. The dwarfish Mules called Ginni were also much set by, not for use, but only for delight, as dwarfs are kept in Noblemens houses. When Dystistratus the son of Hippocrates first of all affected Tyranny at Athens, and laboured to get the government to himself, as he came out of his Countrey, being drawn with a Chariot by Mules, he wounded himself and his Mules very grievously, and so drave them into the Market place, shewing his wounded body and Beasts unto the Athenians, telling them that so he was wounded by his enemies, and that he escaped death very narrowly; but if it pleased them to grant him a gard of souldiers to defend his body, he would take revenge upon their and his enemies: whereunto they yeilded, and he having gotten a Band of Souldiers under that pretence, presently took upon him the government and Sovereignty.

To conclude this story of Mules, I do read in Aelianus, that Serpents do love to feed on the flesh of dead Mules; and two things are very eminent in the nature of Mules, one of their understanding, and the other of their friendship. Concerning the first, Plutarch relateth this story of a Mule that was accustomed to carry Salt, who upon a season going through a water, fell down underneath his burden, so that the Salt took wet afterwards; the Beast perceived how by that means, his extrem load melted away, and so became lighter and lighter; afterward the Mule grew to this custom, that whensoever he came loaded with Salt over that water, he fell down in it for the easing of his carriage; his Master perceiving his craft, on a day he loaded him with Wool, and Spunges, and so the Beast coming over the water, fell down as he was wont to do with his Salt, and coming out of the water, he felt his load to grow heavier then it was wont to do, instead of lessening, whereat the Beast much mused, and therefore never afterward durst lie down in the water, for fear of the like increase of his load. The other observation of their love and friendship, ariseth from the Proverb, *Mulum Muli scabunt*, that is, Mules scratch one another, and help one another in their extremity; from whence cometh our proverb, One good turn asketh another; and the Latine proverb, *Senes mutuum fricant*, old men rub one another; which did arise upon this occasion: as Adrian the Emperour so passed a long on a day by a bath, he saw an old Souldier in the bath rubbing himself upon a Marble stone for want of a man to help him, whereupon in pity of his case he gave him maintenance for himself and a man: afterwards other old Souldiers seeing how well their fellow had sped, went likewise into the bath before the Emperours eyes, and rubbed themselves upon the Marble, thinking to get as much favour and liberty as their fellow had gotten, but the Emperour seeing them, and perceiving their fetches, bid them rub one another, and thereupon came that proverb. And thus much for the natural discourse of Mules, now followeth the medicinal.

The Medicines of the Mule.

Pliny.

The dust wherein a Mule shall turn or rowl himself, being gathered up and spread or sprinkled upon the body of any one who is ardently and fervently in love, will presently assuage and quench his

his inflaming desire. A man or woman being poysoned, and put into the belly of a Mule or Camel which is new killed, will presently expel away the force of the venom or poyson, and will confirm and make strong their decayed spirits, and all the rest of their members: For as much as the very heat of those Beasts is an Antidote or preservative against poyson. *Ponzeitus.*

The skin or hide of a Mule being put unto places in any ones body which are burned with fire, doth presently heal and cure the same: it doth also heal sores and grievous ulcers which are not come unto Impostumes.

The same is an excellent remedy for those whose feet are worn or wrung together through the pinching of their shoes, to help themselves withall, and for those which are lame, and those which are troubled with those grievous sores called Fistulae. If any man shall take either in meat or drink the marrow of a Mule, to the weight or quantity of three golden crowns, he shall presently become blockish and altogether unexpert of wisdom and understanding, and shall be void of all good nutriment, and manners. The ear-laps or ear-lages of a Mule, and the stones of a Mulet being born and carried by any woman, are of such great force and efficacy, that they will make her not to conceive. The heart of a Mule being dried and mingled with Wine, and so given to a woman to drink after that she is purged or cleansed thirty times, hath the same force and power that the aforesaid medicine hath for the making of a woman barren. The same effect against conception hath the bark of a white poplar tree, being beaten together with the reins of a Mule, then mingled in Wine, and afterwards drunk up. If the herb called Harts-tongue, be tied upon any part of a woman, with the spleen of a Mule, but as some have affirmed by it self only, and that in the day which hath a dark night, or without any Moonshine at all, it will make her altogether barren and not able to conceive. If the two stones of a Mule be bound in a piece of the skin of the same Beast and hanged upon any woman, they will make that she shall not conceive so long as they shall be bound unto her. The left stone of a Weefil being bound in the skin or hide of a Mule, and steeped or soaked for a certain space or time in Wine, or in any other drink, and the drink in which they are so steeped given to a woman to drink, doth surely make that she shall not conceive. The stones of a Mulet being burned upon a barren and unfruitful tree, and put out, or quenched with the stale or urine of either Man or Beast which is gelded, being bound and tyed in the skin of a Mule, and hanged upon the arm of any woman after her menstrual fluxes, will altogether resist and hinder her conception. The right stone of a Mule being burned and fastened unto the arm of a woman which is in great pain and travail, will make that she shall never be delivered until the same be loosened and taken away, but if it shall happen that a Maid or young Virgin shall take this in drink after her first purgation or menses, she shall never be able to conceive, but shall be always barren and unfruitful. *Avicenna.*

The matrix or womb of a female Mule taken and boiled with the flesh of an Ass or any other flesh whatsoever, and so eaten by a woman which doth not know what it is, will cause her never to conceive after the same. The worm which is called a Glowworm, or a Globird, being taken out of the womb or matrice of a female Mule, and bound unto any part of a womans body, will make that she shall never be to able conceive. *Albertus.*

The dust or powder which proceedeth from the hoofs of a male or female Mule, being mixed or mingled with Oyl which cometh from Myrtleberries, doth very much help those which are troubled with the Gout in their legs or feet. The dust of the hoofs of a Mule being scorched or burned, and the Oyl of Myrtle-berries being mingled with Vinegar, and moist or liquid Pitch, and wrought or tempered in the form or fashion of a plaister, and opposed or put unto the head of any one whose hairs are too fluent and abundant, doth very speedily and effectually expel the same. *Æsculapius.*

The liver of a Mule being burned or dried unto dust, and mixed with the same Oyl of Myrtle-berries, and so anointed or spread upon the head, is an excellent and profitable remedy for the curing of the aforesaid enormity. *Sextus.*

The dust or powder of the hoofs of a female Mule is very wholesome and medicinable for the healing and curing of all griefs and pains which do happen or come unto a mans yard, being sprinkled thereupon. The hoof of a Mule being born by a woman which is with childe, doth hinder her conception. The filth or uncleanness which is in the ears of a Mule, being bound in the skin or hide of a little or young Hart, and bound or hanged upon the arm of a woman after her purgation, doth cause that she may not conceive. The same being in like manner mingled or mixed with Oyl which is made of Beavers-stones, doth make any woman to whom it is given to drink, altogether barren. The dirt or dung of a Mule being mixed with a Syrup made of Honey, Vinegar, and Water, and given to any one to drink that is troubled with the heart-swelling, will very speedily and effectually cure the pain thereof. *Pliny.*

The dung of a Mule being burned or dried and beaten small, and afterwards sifted, or seirced and washed or steeped in Wine, and given to any woman to drink, whose menstrual fluxes come forth before their time, will in very short space cause the same to stay. The stale or urine of a male or female Mule being mingled with their dirt or dung, is very good and medicinable for those to use which are troubled with corns and hard bunches of flesh which grow in their feet. *Marcellus.* *Assa fœtida* being mingled with the urine of a Mule to the quantity of a bean, and drunk, will altogether be an impediment and hinderance to the conception of any woman. The stale or urine of a Mule being taken to the quantity of eight pounds, with two pounds of the scum or refuse of silver, and a pound of old and most clear Oyl; all these being beaten or pounded together until they come to the thick-
ness

Aegiheta.

ness of the fat or sweat which falleth from mens bodies and boiled until they come unto so liquid and thin a juyce, that they will speedily and effectually cure and help those which are troubled with the Gout or swelling in the joynts.

Rafis.

Marcellus.

If a woman shall take the sweat which proceedeth from a Horse, and anoint it upon a Woollen cloth, and so apply it as a plaister or suppository unto her secret parts, it will make her altogether barren. There is an excellent remedy for those which are purfie or short winded, which cometh also by the Mule: which is this; To take or gather the froath or some of a Mule, and to put it into a cup or goblet, and give it in warm water, for a certain space or time to be drunk, either to the man or woman which is troubled with this enormity, and the party which do so use it, shall in short space have remedy; but the Mule will without any lingring of time, or consuming of time in pain and sorrow die.

Pliny.

The milt of a male or female Mule, being drunk in a potion or juyce made of Hony, Water, and Vinegar, to the value or quantity of three cruces or cups full, is commended for an excellent cure and medicine, for those which are troubled and grieved with that pestiferous and deadly disease called the Falling-sickness, otherwise Saint Johns Evil. There is an excellent remedy for those which are troubled in the voiding of their water, which is this; To take the Ring-worms or Tettors which do grow upon both the legs of a Mule above their knees, and which do stick thereupon in the manner of a dried thick skin, and to burn or parch them, and afterwards to put or place them upon him which is troubled with the Strangury, or cannot void his water but by drops-meal, so that there be great care had to cover close with cloven or clefted cloaths, or garments, the suffumigation thereof, lest that the smell or fume do fade, and void away, and this being so used will be very effectual for the curing and driving away of the aforesaid disease.

Marcellus.

Trallianus.

The hairs of a Mule and an Ass being mingled together and dried, and put into some certain perfume, and so given to any one to drink which is troubled with the Falling-sickness, will presently expel and drive it quite away. In the place or part of mans body wherein a male or female Mule shall bite, *Ponzettus* affirmeth, there will presently arise, and grow small pushes, or little blisters which are always full of red and pale humors, and filthy corruption, which can almost be healed and cured by no salve, potion, or medicine, by any means applied thereunto. There are some also which do suppose the biting of Mules to be poyson, for truly there doth not only follow those aforesaid pushes and biles, but also an extreame and almost indurable inflammation and burning, through all the parts of the body, which doth greatly distemperate and vex the same.

But it is affirmed by others, that the biting of Mules is to be cured after the same manner as the biting of a Cat, which is thus: First, to wash and clarify the wound or bitings where the corruption is with Vinegar mingled with Oyl of Roses, and then to take Peny-royal, or the herb called Neppe, and boil it, and stroke or rub the wound very softly with it, and it will in time wholly cure it. And thus much shall suffice at this time concerning the cures and medicines of Mules.

Of the Neades, Neides, or Naides.

Heraclides, Cælius, Volaterranus, and Euphron, do all write that once the Isle of Samos was a Desert place, and that there were in it certain Beasts called Neades, whose voyce was so terrible that they shook the earth therewith, and from those strange and great voyces came the vulgar Greek proverb, *Meizoon mia toon Neadon, maius una Neadum*. That is, One of the Neades was a great wonder, for it was used in ostentation, to shew that there was nothing in the whole world comparable to their vast and huge quantity. Of the parts of these Beasts there is no memory but only in *Suidas* and *Ælianus*, who affirm, that their bones were to be seen in their days. And this title I thought good to insert into this History, leaving the Reader to consider, whether he will take them for Elephants, or for any other greater Beast; for my opinion if it be desired, I think them rather (if there ever were any such) that they were Elephants of greater stature then ever since were seen, and not any generation of Beasts now lost and utterly perished.

Of the OUNCE, the description whereof was taken by Doctor Cay in England.

The names of
this Beast.The description
of D. Cay.

There is in Italy a Beast called *Alphæus*, which many in Italy, France, and Germany, call *Ennza*, and some *Unzia*, from whence *Albertus*, and *Isidorus* make the Latine word *Unctia*, and I take it to be the same Beast which is called *Lozanum*, and for the description of it, I can follow no better Author then Doctor Cay, who describeth it in this fashion:

The Ounce (saith he) is a most cruel Beast, of the quantity of a village or mastiffe Dog, having his face and ears like to a Lions, his body, tail, feet, and nails like a Cats, of a very terrible Aspect, his teeth so strong and sharp, that he can even cut Wood in sunder with them: he hath also in his nails so great strength, that he only fighteth with them, and useth them for his greatest defence. The colour of the upper parts of his body being like whitish Oak, the lower being of the colour

of ashes, being every where mixed with a black and frequent spot, but the tail more black then the rest of his body, and as it were obscured with a greater spot then the residue. His ears within are pale without any blackness, without black, without any paleness, if you do but take away one dark and yellow spot in the midst thereof, which is made of a double skin rising, meeting in the top of the ear, that is to say, that which ariseth from the outward part of the jaw on the one side, and cometh from the upper part of the head on the other side, and the same may be easily seen and separated in the head being dried.

The rest of the head is spotted all over with a most frequent and black spot (as the rest of the body) except in that part which is betwixt the nose and the eyes, wherein there are none, unless only two, and they very small: even as all the rest are lesser then the rest, in the extream and lowest parts: the spots which are in the upper parts of the thighs, and in the tail, are blacker and more singular, but framed in the sides with such an order, as if all the spots should seem to be made of four. There is no order in the spots, except in the upper lip, where there are five rows or orders.

In the first and uppermost two which are severed; in the second, six, being joyned in that manner, as if they should seem to be in one line: These two orders are free, and not mingled amongst themselves. In the the third order there are eight joyned together, but with the fourth where it endeth, they are mixed together. The fourth and fifth in their beginning (which they have to the nose) being separated with a very little difference, do forthwith joyn themselves, and run together through all the upper lip, and do not make a spot through all the same, but a broad line. In the Beast being dead the spots do so stand, (as I suppose) for the contraction of the skin. In the Beast being alive, those spots do seem separated every one in their own orders. In the very middle between the lower lip, although they do keep the quantity, do not observe the order. The nose is blackish, a line being softly led through the length, and only through the top of the outside thereof. The eyes are gray, the former teeth are only six, not very unlike to mens teeth, except those which are placed in the middle are lesser, and they in the uttermost part are greater, as also higher then those which are low.

In this Beast the teeth are both great, sharp, and long, being joyned to the rest in the lower jaw, and in the upper severed with so great space, that the lower teeth may be received therein. These when the Beast liveth are covered with his lips, but when he is dead they are otherwise, his lips being through driness shrunk together. His fore-teeth are very big, and as long as two *Roman* fingers, for at the very root thereof it cannot be comprehended in less then two *Roman* fingers and a half compass. In his tooth there is a certain small hollownes through all the length thereof, which notwithstanding doth not appear except the tooth be broken. The lower jaw is very hard and stiffe having three teeth unequal in quantity, as the upper four. Between the great tooth and the first cheek tooth of the under jaw, there is a void space to the quantity of one finger, from which the first is presently placed, lesser then the other two: to this there is another greater close adjoyning: and after this there is also a third greater then the second. In the upper jaw in that middle space (which I said was of one *Roman* finger) between the great tooth and the first cheek-tooth, there is a very little tooth, and without any form, coming so small out of the jaw, that there is no lower tooth which may answer to the same. After that, in the space of half a finger there is a second, to which there is joyn'd a third, and after this a fourth, between themselves the upper and the lower cheek-teeth, and so are joyned together as they agree in the manner of a comb; the two first teeth in the lower jaw, and the second and third in the upper jaw are of the same figure, as the compass of the tops of the Crowns of the Kings of *England* and *France*. The third is of the same figure in the lower jaw, and the fourth of the upper jaw, except that the interior side of both the gums

The meat and
nature,

gums which is nearer to the throat, by nature is taken away. There was no other teeth joyned to these in both the jaws. But I do not know whether there be any more teeth in the gum beyond the reach of ones finger, in the farthest row or behinde the teeth. But this I know, that to all appearance there was none remaining, and it may be that his lips were cut or slit down beyond nature to shew his teeth. It liveth of flesh, and the female is more cruel then the male, though lesser, and one of either sex was brought out of *Mauritania* into *England* in a Ship, for they are bred in *Lybia*. If they have any appointed time of copulation, it is near the month of *June*, for in that month the male covereth the female. We have shewed already that Lions may be tamed, and that also hath been manifest in *London*, both in the Tower and in the City, for there the Lions did play with their Keepers, and kiss them without harm, (as Doctor *Cay* saith he saw them do) but these Beasts were so fierce and wilde as they could never be tamed, for when soever their Keeper should change or remove them from place to place, he was constrained first of all to strike them so hard with a club upon the head, that they should lie half dead, and so put them in a sack or wooden chest made of purpose with holes in it for respiration and expiration, to carry them to and fro from one lodging to another: after an hour they revived again like a Cat, but when they were to be taken out of the hutch or chest, he was constrained likewise to astonish them again with his club; but afterwards they grew to invent an Engine to put the Beast in, and take him out of the hutch with a rope or cord, and so do remove them from place to place. The Keepers affirmed, that they did seem much to disdain the Lions, and oftentimes endeavoured to fight with them, but they were kept asunder with grates: they would not hurt a little Dog when he was put to them but when they were hungry; but if a great Dog were put unto them, they tore him in pieces, although their bellies were never so full. When they are angry, they utter a voyce like an angry Dog, but they double the (*Arr*) twice, and also bigger then any Dogs, proceeding out of a large breast and wide arteries, much like to the howling of a great Mastive, that is shut up in a close room alone against his will. Some say it is longer then a Dog, but it did not so appear in *England*, for we had many Mastive Dogs as long as it, but yet was it every way greater then any other kinde of Dogs. It is but a vain report, that some have said, when a Man or Beast is bitten with an Ounce, presently Mice flock unto him, and poyson him with their urine.

For it was seen in *England*, that two of the Keepers were wounded and shrewdly bitten by one of the Ounces, and there followed them no other harm then that which followeth the biting of an ordinary Dog, or like a small incision with a knife. He never fighteth but at the head, and that treacherously, if he perceive his adversary to be too strong or too great for him, and that by counterfeiting quietness, benevolence and peace, as if he meant no harm: for so he served a great Mastive Dog in *England*, at the first sight he seemed to applaud his coming, looking cheerfully upon him, and wagging his tail, presently he fell down on his belly, as it were to invite the Dog to come near him by his submission; lastly, he got close unto him, creeping as though he would play with him, putting out one of his feet, as Cats do when they play, wherewithal the great Dog grew secure, and began nothing to mistrust the Beast, at length when the Ounce saw his opportunity, he suddenly leaped upon his neck, and took him by the throat, and pulled it out, after he had killed him, with his nails he opened the Dogs breast, and taking out his heart, did eat it before all the people in most cruel manner; thus far Doctor *Cay* speaketh of the Ounce, and beside him no other Author that I know.

The gall of this Beast is deadly poyson, it hateth all creatures, and destroyeth them, especially men; and therefore it may well be said to be possessed with some evill spirit. It loveth none but his own kinde. And thus much for the Ounce.

Of the ORYX.

His Beast in *Pliny* and *Oppianus* is called *Orynx* and *Oryx*, and my conjecture is, that his name is derived from *Oryssein* which signifieth to dig. Saint *Jerom* and the Septuagints for *Theo*, Deut. 14. and Isa. 51. translate *Oryx*: but *David Kimhi*, and the better learned men interpret it a wilde Ox. But the *Hebrew Dischon* may in my opinion be so translated, yet herein I refer it to the learned Reader.

It is certain, that it is of the kinde of wilde Goats by the description of it, differing in nothing but this, that the hair groweth averse, not like other Beasts, falling backward to his hinder parts, but forward toward his head, and so also it is affirmed of the *Aethiopian Bull*, which some say is the *Rhinocerot*. They are bred both in *Lybia* and *Egypt*, and either of both Countries yeeldeth testimony of their rare and proper qualities. In quantity it resembleth a Roe, having a beard under his chin. His colour white or pale like milk, his mouth black, and some spots upon his cheeks; his back-bone reaching to his head, being double, broad, and fat; his horns standing upright, black, and so sharp, that they cannot be blunted against bras or iron, but pierce through it readily.

Aristotle and *Pliny* were of opinion, that this Beast was *Bifulcus* and *Unicornis*, that is, cloven-footed, and with one horn: The original of their opinion, came from the wilde-one-horned-goat, whereof *Schnebergerus* a late Writer writeth thus: *Certum est minimeque dubium in Carpatho monte, versus Rusiam Transylvaniamque reperiri feras similes omnino rupicapris, excepto quod unicum cornu ex media fronte nascitur, nigrum, dorso inflexum, simile omnino rupicaprarum cornibus*, that is to say; It is with-

out all controversie, that there are wilde Beasts in the Mountain *Carpathus*, towards *Russia* and *Transylvania*, very like to wilde Goats, except that they have but one horn growing out of the middle of their heads, which is black and bending backward like the horns of wilde Goats. But the true Oryx is described before out of *Oppianus*, and it differeth from that of *Pliny*, both in stature and horns. *Ælianus* saith, that the Oryx hath four horns, but he speaketh of the *Indian Oryx*, whereof there are some yearly presented to their King, and it may be both there and elsewhere, diversity of regions do breed diversity of stature, colour, hair, and horns. *Simeon Sethi* affirmeth of the Musk-cat, that it hath one horn, and it is not unlikely that he hath seen such an one, and that the Oryx may be of that kinde.

But concerning their horns, it is related by *Herodotus*, *Pollux*, and *Laur. Valla*, that there were made instruments of musick out of them, such as are Citherns or Lutes, upon whose bellies the Musicians played their Musick, by striking them with their hands; and that those Beasts were as great as Oxen; and all this may be true, notwithstanding we have shewed already, that they are as big as Roes, for *Pliny* speaking that by relation, or by sight, it is likely that he had seen a young one.

There be also Sea-beasts called *Oryges*, and *Orcæ*; and there is in *Egypt* an Oryx, which at the rising of *Canis Syrius*, or the little Dog is perpetually sorrowful; and this cause the *Lybians* to mock the *Egyptians* for that they fable, the same day that the little Dog-star riseth, their Oryx speaketh. But on the contrary themselves acknowledge, that as often as the said Star ariseth with the Sun, all their Goats turn to the East, and look upon it; and this observation of the Goats, is as certain as any rule of the Astronomers. The *Lybians* affirm more, that that they do presage great store of rain, and change of weather.

Plutarch.
Ælianus.

The *Egyptians* also say, that when the Moon cometh near to the East, they look very intently upon her, as upon their sovereign Goddess, and make a great noise, and yet they say they do it not for her love, but for her hate, which appeareth by knocking their legs against the ground, and fastening their eyes upon the earth, like them which are angry at the Moons appearance: And the self same thing they do at the rising of the Sun.

For which cause the ancient Kings had an observer, or one to tell them the time of the day, fitting upon one of these Beasts, whereby very accurately they perceived the Sun rising; and this they did by turning their tail against it, and emptying their bellies; for which cause by an Oryx the *Egyptians* discipher an impure or godless wretch: for seeing that all creatures are nourished by the Sun and Moon, and therefore ought to rejoyce at their appearing, only this filthy wretch disdaineth and scorneth them.

The reason why they rejoyce at the little Dog-star, is, because their bodies do perceive an evident alteration of the time of the year, that cold weather and rain are over-passed, and that the vapors of the warm Sun are now descending upon the earth, to clothe it with all manner of green and pleasant herbs and flowers.

There is another kinde of Oryx which according to *Columella*, was wont to be impaled among Deer and Harts, the flesh whereof was eaten, and used for the commodity of his Master: This was impatient of cold. It grew till it was four years old, and afterwards through age decreased, and lost all natural vigor.

But to return to the Oryx intended, from which we have digressed; their horns whereof we late spake, are not only strong and sharp like the horn of the Unicorn, and the Rhinocerot, but also solid, and not hollow like the horns of Harts. The courage and inward disposition of this Beast, is both fearful, cruel, and valiant; I mean fearful to Men and Beasts, but fearless in it self: For saith my Author; *Neq; enim Canis larratum timet, neq; apri effervescentem feritatem, neq; tauri mugitum refugit, neq; Pantherarum tristem vocem, neq; ipsius Leonis vehementem rugitum horret, neq; item hominum robore movetur, ac sepe robustum venatorem occidit*: That is to say; He feareth not the barking of the Dog, nor the foaming wrath of the wilde Boar; he flyeth not the terrible voyce of the Bull, nor yet the mournful cry of the Panthers; no, nor the vehement roaring of the Lion himself; and to conclude, he is not moved for all the strength of man, but many times killeth the valiantest hunter that pursueth him.

When he seeth a Boar, a Lion, or a Bear, presently he bendeth his horns down to the earth, whereby he conformeth and establisheth his head to receive the brunt, standing in that manner until the assault be made: at which time he easily killeth his adversary, for by bending down his head, and setting his horns to receive the Beast, he behaveth himself as skilfully as the Hunter, that receiveth a Lion upon his spear. For his horns do easily run into the breasts of any wilde Beast, and so piercing them, causeth the bloud to issue, whereat the Beast being moved, forgetteth his combate and falleth to licking up his own bloud, and so he is easily overthrown. When the fight is once begun, there is none of both that may run away, but standeth it out until one or both of them be slain to the ground, and so their dead bodies are found by wilde and savage men. They fight with all, and kill one another, also they are annoyed with Linces, I mean the greater Linces: of the cruelty of this Beast *Martiall* made this distichon:

Matutinarum non ultima præda ferarum
Sævus Oryx, constat qui mihi morte canum.

Oppianus.
Pliny.
Albertus.

It is reported of this Beast, that it liveth in perpetual thirst, never drinking by reason that there is no water in those places where it is bred, and that there is in it a certain bladder of liquor, whereof whosoever tasteth, shall never need to drink. This Beast liveth in the Wilderness, and notwithstanding his magnanimous and unresistible strength, wrath, and cruelty, yet is he easily taken by snares and devices of men; for God which hath armed them to take Elephants and tame Lions, hath likewise indued them with knowledge from above, to tame and destroy all other noisome Beasts.

Concerning the picture of this Beast, and the lively visage of his exterior or outward parts, I cannot express it, because neither my own sight, nor the writings of any credible Author, doth give me sufficient direction to deliver the shape thereof unto the world; and succeeding Ages upon my credit: and therefore the Reader must pardon me herein. I do not also read of the use of the flesh, or any other parts of this Beast, but only of the horns, as is already expressed, whereunto I may adde the relation of *Strabo*, who affirmeth the *Æthiopian Silli*, do use the horns of these Beasts in wars instead of swords and spears: for incredible is the hardness and sharpness of them, which caused *Juvenal* to write thus:

*Et Getulus Oryx hebeti lautissima ferro
Ceditur.*

For although of the own length they are not able to match a pike, yet are they fit to be put upon the tops of pikes, as well as any other artificial thing made of steel or iron; and thus I will conclude the story of this Beast.

The SCYTHIAN WOLF.

Of the OTTER.

Of the names
and the reasons
thereof.

There is no doubt but this Beast is of the kinde of Beavers, because it liveth both on the water and on the land, and the outward form of the parts beareth a similitude of that Beast. The *Italians* do vulgarly call this Beast *Lodra*, and the *Latines* besides *Lutra*, *Fluviatilis Canicula*, a Dog of the Waters; and some call them Cats of the Waters; the *Italians* besides *Lodra*, call it also *Lodria*, and *Loutra*; the *French*, *Une Loutre*, or *Ung Loutre*; the *Savoyans*, *Une Leure*; the *Spaniards*, *Nutria*; and the *Illyrians*, *Widra*; the *Gracians*, *Lytra*, because it sheareth asunder the roots of the trees in the banks of the Rivers. Some of the *Gracians* call it *Enhydria*, although properly that be a Snake living in the waters, called by *Theodorus*, and *Hermolaus*, *Lutris*. *Albertus* calleth it *Luter*, and *Anadry* for *Enhydria*. Also *Beatus* by *Silvaticus*; and the *Gracians* call filthy and thick waters *Lutrai*; for which cause, when their Noble ancient Women went to bathe themselves in water, they were bound about with skins called *Oan Loutrida*, that is, a Sheeps skin used to the water. The *French* men call the dung of an Otter, *Espranite de loutres*; the steps of an Otter, *Leise Marches*; the whelps of an Otter, *Cheaux*, by which word they call also the whelps of Wolves, Foxes, and Badgers.

their abode.

Hermolaus.

Olaus.

The several
parts.

Although they be a kinde of Beaver, as we have said already, yet they never go into the Sea, and they abound almost in all Nations, where there are Rivers or Fish-pools, as namely in *Italy*, *France*, *Germany*, *Helvetia*, *England*, and *Scandinavia*. Likewise in all *Sarmatia*, in the Bay of *Borysthenes*. They are most plentiful in *Italy*, where the River *Padus* is joyned to the Sea. Also they abound in *Naples*. Their outward form is most like unto a Beaver, saving in their tail, for the tail of a Beaver is fish, but the tail of an Otter is flesh. They are less then Beavers, some compare them unto a Cat, and some unto a Fox; but I cannot consent unto the Fox. They are bigger then a Cat and longer, but lesser then a Fox, and therefore in my opinion they are well called Dogs of the water. They exceed in length, for in *Swetia*, and all the Northern Rivers they are three times so long as a Beaver. They have a rough skin; and the hair of it very soft and neat, like the hair of a Beaver, but different in this, that it is shorter and unequal, also of colour like a Chest-nut, or brownish, but the Beaver

vers is white or ash-colour. It hath very sharp teeth, and is a very biting Beast, likewise short legs, and his feet and tail like a Dogs, which caused *Bellonius* to write, that if his tail were off, he were in all parts like a Beaver, differing in nothing but his habitation. For the Beaver goeth both to the Salt waters, and to the fresh, but the Otter never to the salt.

Although it live in the waters, yet it doth not suck in water, but air; that is, it doth not breath like fishes through the benefit of water, and therefore it maketh his dens near the water, wherein also they are wont to bring forth their young ones: They make their dens so artificially, even as the Beaver, with bows, and sprigs, or sticks, couching together in excellent order, wherein he sitteth to keep him from wetness. It hunteth fishes, and although it breatheth like another four-footed Beast, yet it will remain a great while under the water without respiration; for the greediness of fishes it runneth many times into nets, which are set by men in waters to take fish, whereinto being entered, it is suffocated for want of breath, before it can shear afunder the nets and make way for himself to come out.

For in the hunting of fish it must often put his nose above the water to take breath: it is of a wonderful swiftness and nimbleness, in taking his prey, and filleth his den so full of fishes, that he corrupteth the air, or men that take him in his den: and likewise infecteth himself with a pestilent and noisome savour, whereupon as the *Latines* say of a stinking fellow, He smels like a Goat; so the *Germans* say of the same, He smels like an Otter. In the Winter time he comes out of the caves and waters to hunt upon the land, where finding no other food, he eateth fruits, and the bark of trees. *Bellonius* writeth thus of him, he keepeth in pools and quiet aters & rivers, terrifying the flocks of fish, and driving them to the bank-sides in great number, to the holes and creeks of the earth, where he taketh them more copiously, and more easie: but if he want prey in the waters, then doth he leap upon the land, and eat upon green herbs: he will swim two miles together against the stream, putting himself to great labour in his hunger, that so when his belly is full, the current of the stream may carry him down again to his designed lodging.

The females nourish many whelps together at their udders, until they be almost as big as themselves, for whom the hunters search, as for the dams among the leaves and boughs, which the over-flowings of waters in the Winter time, have gathered together, and laid on heaps. It is a sharp biting Beast, hurtful both to men and dogs, never ceasing or loosing hold after he hath laid his mouth upon them, until he make the bones to crack betwixt his teeth, whereupon it was well said by *Olaus Mag.* *Lutra mordaces quadrato ore.* Otters are most accomplished biters.

It is a very crafty and subtil Beast, yet it is sometimes tamed, and used in the Nor-

thern parts of the world, especially in *Scandinavia*, to drive the fishes into the Fisher-mens nets:

The framing of their den.

His prey and food.

Agricola.

Albertus.

Taking and
hunting of
Otters.

Albertus.

Use of their
skins.

for so great is the sagacity and sense of smelling in this Beast, that he can directly winde the fishes in the waters a mile or two off, and therefore the Fishers make great advantage of them; yet do they forbear his use because he devoureth more then needeth, for he is never so tamed, that he forgetteth his old ravening; being tamed, on the land he is very full of sport and game. I marvel how it came into the Writers heads to affirm, that the Beaver constraineth the Otter in the Winter time, to trouble the water about her tail, to the intent it may not frieze, which opinion we have confuted already in the discourse of the Beaver, for herein I agree with *Albertus*. *Fiber fortior est lutra, & acutissimis dentibus, quapropter eam vel expellit, vel occidit.* The Beaver is much stronger then the Otter, having also most sharp teeth, and therefore either expelleth her out of the waters, because they live both upon one kinde of food, or else destroys her: wherefore it is unreasonable to believe that he preserveth her to keep his tail from friezing. The flesh of this Beast is both cold and filthy, because it feedeth upon stinking fish, and therefore not fit to be eaten. *Tragus* writeth, that this notwithstanding is dressed to be eaten in many places of *Germany*, and I hear that the *Carthusian* Fryers or Monks (whether you will) which are forbidden to touch all manner of flesh, of other four-footed Beasts, yet they are not prohibited the eating of Otters. These Otters are hunted with special Dogs, called Otter-hounds, and also with special instruments called Otter-speares, having exceeding sharp points: for they are hardly taken, and Beasts do not willingly set upon them, specially in the waters: when they feel themselves to be wounded with the spear, then they come to land, where they fight with the Dogs very irefully, and except they be first wounded, they forsake not the waters: for they are not ignorant how safe a refuge the waters are unto them, and how unequal a combat they shall sustain with Men and Dogs upon the land, yet because the cold water annoyeth their green wounds, therefore they spin out their lives to the length of the thread, chusing rather to die in torments among Dogs, then to die in the waters. There is a kinde of *Assa* called *Benioyn*; a strong herb which being hung in a linnen cloth near fish-ponds, driveth away all Otters and Bevers. The hair of the skin is most soft, neither doth it teese his beauty by age; for which cause as also for that no rain can hurt it, when it is well dressed it is of great price and estimation, and is sold for seven or eight shillings: thereof also they make fringes in hems of garments, and face about the collars of men and womens garments, and the skin of the Otter is far more pretious then the skin of the Beaver; and for this cause the *Swetian* Merchants do transport many into *Muscovia* and *Tartaria* for clokes and other garments.

Thereof also in *Germany* they make caps, or else line other caps with them, and also make stocking-soles; affirming that they be good and wholesome against the Palsie, the Megrin, and other pains of the head. The blood of an Otter is prescribed against the swelling of the Nerves. The Liver dried in an Oven against the Bloudy-flux, and against the Colick being drunk in Wine. The stones are also prescribed to be given against the Falling-sickness, and all pains in the belly. And thus much for the Otter.

There be certain beasts which are kindes of Otters, which because they live in the waters, and yet being unknown to us in *England*, I have thought good to expresse them in this place by their *Greek* and *Latine* names. In the first place that which the *Gracians* call *Latax*, broader and thicker then an Otter, and yet liveth in the waters, or else goeth to the waters for his food, yet breatheth air and not water like Otters. The hair of this Beast is very harsh, betwixt the similitude of a Sea-calf and a Hart, and it hath also strong and sharp teeth, where-withall in the night season they shear asunder small boughs and twigs: It is called also *Fasto*, *Lamyakyz*, and *Noertz*.

There is another called *Satyrion*, and *Fassuron*, and *Chebalus*, whose skin is black, and very pretious, and very much used for the edging of the best garments: these live also in ponds, lakes, and still waters.

There is a third kinde called *Satherium*, *Kacheobon*, and *Kachynen*, and *Martarus*, having a white throat, and being as big as a Cat; and finally unto these may be added *Porcos*, a four-footed beast living in the waters in the River *Isther*: And *Mesolus* another four-footed beast living in some Rivers of *India*, being as big as a Calf.

of

Of the Panther, commonly called a Pardal, a Leopard,
and a Libbard.

THere have been so many names devised for this one beast, that it is grown a difficult thing, either to make a good reconciliation of the Authors which are wed to their several opinions, or else to define it perfectly, and make of him a good methodical History: yet seeing the greatest variance hath arisen from words, and that which was devised at the first for the better explication and description of it hath turned to the obscuration and shadowing of the truth, I trust it shall be a good labour to collect out of every Writer that which is most probable concerning this Beast, and in the end to express the best definition thereof we can learn out of all.

First of all therefore for as much as all the question hath arisen from the Greek and Latine names, it is most requisite to express them, and shew how the different construction began. The Grecians do indifferently call *Pordalis*, *Pardalis*, and Panther: the Latines, *Panthera*, *Pardalis*, *Pardus*, and *Leopardus*, and these names are thus distinguished by the learned. *Pordalis* they say signifieth the male, and *Pardalis* the female, and also *Panthera* among the Latines for the female, and *Pardus* for the male, and these are understood of a simple kinde without commixture of generation. *Leopardus* the Leopard or Libbard, is a word devised by the later writers, compounded of *Leo* and *Pardus*, upon opinion that this Beast is generated betwixt a Pardal and a Lion, and so indeed it ought properly to be taken, if there be any such. *Pliny* is of opinion, that *Pardus* differeth from *Panthera* in nothing but in sex, and other say, that betwixt the Lions and the Pardals there is such a confused mixed generation as is betwixt Asses and Mares, or Stallions and Asses: as for example, when the Lion covereth the Pardal, then is the Whelp called *Leopardus*, a Leopard or Libbard, but when the Pardal covereth the Lioness, then is it called *Panthera* a Panther.

In this controversie the Hebrew and Arabian names which are generally indifferently translated Panthers or Libbards, do take up the strife and almost end the controversie, for *Namer* in Hebrew, and *Albec* or *Alshed* in Arabick, are so translated both in holy Scripture, and also in *Avicen*, as may appear by these places following. *Esa. 11. Habibabit Lupus cum agno, & (Namer) Pardus cum hædo acubabit.* That is to say, The Wolf shall dwell with the Lamb, and the Pardal, Libbard, and Panther shall lie with the Kid. So in the vision of *Daniel*, chap. 7. among the four beasts coming out of the Sea, the Prophet seeth *Namer* a Leopard. In the 13. Revel. of *S. John*, he seeth another Beast rising out of the Sea, having ten horns, and he saith it was like *Pardalei*, which *Erasmus* translateth *Pardo*, a Leopard. *Jer. 5. Pardus (Namer) vigilat super civitatem eorum, ut omnem inde egredientem discerpit.* That is, a Panther or Pardal watcheth at the gates of the City, that he may tear in pieces every one that cometh forth. *Factus sum eis sicut Leo, & sicut Pardus (sicut Namer) directus ad viam suam.* For *Namer* in that place the Grecians translate *Pardalis*, a Pardal. In the 13. *Jer. Si mutare potest Æthiops pellem suam, aut Pardus maculas suas, & vos poteritis bene facere, cum didiceritis malum.* If the Blackmoore can change his skin, or the Leopard his spots, then may you do well which have learned to do ill. *Cant. 4. Coronaberis de vertice Siner, & Hermon, de cubilibus Leonum, de montibus Pardorum.* That is, Thou shalt be crowned from the top of *Siner* and *Hermon*, from the dens of the Lions, and the Mountains of the Leopards. Now according to *Brocardus*, the Mountain of the Leopards is distant from *Tripolis*, in the holy land two leagues.

The several
names of Pan-
thers.

A more exact
definition of
Pardals and
Leopards.

leagues. *Rasis* and *Avicen*, two *Arabians*, do call the Panther and Leopard by one name, *Alpheth*, or *Alphit*, so that by comparing all these together, the Panther, Pardal, Libbard, and Leopard, are but one Beast, called by divers names. For the farther manifesting hereof, it is good to examin what is said of the Pardal and Leopard in particular, that so having expressed that, it may be clear by the discourse succeeding, that there is no difference betwixt them and the Panther, or very small. First of all therefore it is said of the *Pardus*, that it differeth not from the Panther, but only in sex, and that the skin hath received a natural tincture of divers spots. *Aristotle* writeth thus of it, *Cutis Chamæleontis distincta maculis ut Pardalia*. The skin of the *Chamælion* is spotted like a Pardals, and in relation of *Lampridius*, where he sheweth how *Heliogabalus* was wont to shut up his drunken friends, cum *Leonibus*, *Leopardis*, & *ursis*, ita ut exasperati in cubiculo eodem *Leones*, *ursos*, *Pardos* cum luce, vel quod est gravius nocte invenirent, ex quo plerique exanimati sunt, and so forth.

By which words it is apparent, that those which in the first place he calleth Leopards, in the last place he calleth Pardals, and the only difference betwixt the Leopard, Pardal, and Lion, is that the Leopard or Pardal have no manes: and therefore they are called *Ignobiles Leones*. *Isidorus* and *Solinus* write in this manner: *Pardus secundum post Pantheram est genus, varium ac velocissimum, & præcepit ad sanguinem, saltu enim ad mortem ruit, ex ad ulterio Pardi & Leane, Leopardus nascitur, & tertiam originem efficit*. That is to say, the Pardal is the next kinde to a Panther, being divers coloured and very swift, greedy after blood, and catcheth his prey by leaping: the Leopard is bred betwixt the Pardal and the Lioness, and so that maketh a third kinde: by which testimony it appeareth, that these names make three several kinds of Beasts, not distinct in nature, but in quantity, through commixture of generation.

The greatest therefore they call Panthers, as *Belunensis* writeth. The second they call Pardals, and the third, least of all, they call Leopards, which for the same cause in *England* is called a Cat of the Mountain. And truly in my opinion, until some other can shew me better reason I will subscribe hereunto, namely that they are all one kinde of Beast, and differ in quantity only through adulterous generation. For in *Africk* there is great want of waters, and therefore the Lions, Panthers, and other Beasts do assemble themselves in great numbers together at the running Rivers, where the Pardals and the Lions do engender one with another: I mean the greater Panthers with the Lionesses, and the greater Lions with the Panthers; and so likewise the smaller with the smaller, and thereby it cometh to pass that some of them are spotted, and some of them without spots.

Boytius.

Pliny.

The Pardal is a fierce and cruel Beast, very violent, having a body and minde like ravening birds, and some say they are ingendered now and then betwixt Dogs and Panthers, or betwixt Leopards and Dogs, even as the *Lycopanthers* are ingendred betwixt Wolves and Panthers. It is the nature of these Pardals in *Africk*, to get up into the rough and thick trees, where they hide themselves amongst the boughes and leaves, and do not only take birds, but also from thence leap down upon Beasts and Men when they espy their advantage; and all these things do belong unto the Panthers.

Of the Leopard.

Concerning the Leopard, the word it self is new and lately invented, for it is never found among any of the ancients, before *Julius Capitolinus* or *Spartianus*: *Sylvaticus* maketh no difference betwixt *Pardalis* and *Leopardus*, and the *Italians* generally call a Pardal *Leopardo*, and never *Pardo*, except some of the Poets, for brevity sake in a verse. The Leopard is like to a Lion in the head and form of his members, but yet he is lesser and nothing so strong: by the sight of a Leopards skin *Gesner* made this description of the Beast:

The length (saith he) from the head to the tail, was as much as a mans stature, and half a cubit. The tail of it self three spans and a half, the breadth in the middle three spans, the colour a bright yellow distinguished into divers spots, the hair short and mossie.

The price of the skin was about five nobles, or forty shillings, for they differ in price, according to the Regions out of which they are brought, they which come furthest are sold dearest, and they which come less way are sold cheapest. It is a wrathful and an angry Beast, and whensoever it is sick, it thirsteth after the blood of a wilde Cat, and recovereth by sucking that blood; or else by eating the dung of a man. Above all other things it delighteth in the *Camphory* tree, and therefore lyeth underneath it, to keep it from spoil; and in like sort the Panther delighteth in sweet gums and spices, and therefore no marvel if they cannot abide Garlick, because it annoyeth their sense of smelling: And it is reported by *S. Ambrose*, that if the walls of ones house or sheep-coat be anointed with the juyce of Garlick, both Panthers and Leopards will run away from it, but of this matter we shall say more afterwards.

Albertus.

The Leopard is sometimes tamed, and used in stead of a Dog for hunting, both among the *Tartarians*, and other Princes, for they carry them behinde them on Horse-back, and when they see a Deer or Hart, or convenient prey, they turn them down upon them sodainly, who take them and destroy them; yet such is the nature of this Beast, as also of the Pardal, that if he doe not take his prey at the fourth or fift jump, he falleth so angry and fierce, that he destroyeth whomsoever he meeteth, yea many times his Hunter. Therefore the Hunters have always a regard to carry with them a Lamb or a Kid, or some such live thing, wherewithal they pacifie him after he hath missed his game, for without blood he will never be appeased: and thus much shall suffice to have spoken of the difference betwixt Panthers, Pardals, and Leopards, and their several names in *Greek* and *Latine*, from whom almost all Nations do derive their denomi-

denomination, for the *Italians* call it *Leonpardo*; the *French*, *Leopard*, and *Lyopard*; and *Germans*, *Lep-* The names in
pard, and *Lefarad*, and *Pantherthier*; the *Spaniards*, *Leonpardal*, and *Leopardo*; the *Illyrians*, *Leubart*; other lan-
 the *Chaldeans*, *Nimra*; and some make no difference betwixt this and the *Arabian Wolf*: The reason guages,
 of the *Greek* word *Pardalis*, or *Pordalis*, (for they signifie both one) seemeth to me in most probabi-
 lity to be derived from the *Hebrew* word *Pardes*, signifying a *Garden*, because as colours in a Gar-
 den make it spotted, and render a fragrant smell, so the Panther is divers coloured like a *Garden* of
 sundry flowers, and also it is said to carry with him a most sweet savour whither soever he goeth,
 and therefore in ancient time they made their *Ivory* tables standing upon pictures of Panthers,
 whereof *Juvenal* writeth thus in one of his *Satyres*:

*Olim ex quavis arbore mensa fiebat,
 At nunc divinus canendi nulla voluptas
 nisi iustitiae erbes*

*Grande ebur, & magno sublimis Pardus biatu,
 Dentibus ex illis quos mittit porta Syenae
 Jam nimios capitq; graves, &c.*

For the same cause *Pardalis* was the name of a notable Harlot, for as the Panthers by their sweet
 smells draw the Beasts unto them and then destroy them, so also do Harlots deck and adorn them-
 selves with all alluring provocations, as it were with enchanted odours, to draw men unto them, of
 whom they make spoil and rapine: There is a precious stone also called *Lapis Pantherus*, brought out
 of *India*, whereupon if a man look before the Sun-rising he shall see divers colours, namely, black, *Evax.*
 red, green, russet, purple, and Rose colour, and they say it hath as many vertues as it hath colours, *Sylvaticus.*
 but I list not to follow the name any further. *Albertus.*

The Countries breeding Panthers are *Abasia* in the Kingdom of *Melacha*, in the Isle of *Sumatra*. *Vartoman.*
 Likewise in *Asia*, especially *Syria*, for there are none in *Europe*, all *Africk* over they are plentiful, as *Countries of*
 in *Lybia* and *Mauritania*, where abound all store of wilde Beasts. Likewise beyond *Catadupa*; for *Apol-* *Panthers.*
lonius and his companions saw there many Lions and Panthers. In *Arabia* the furthest part, namely
 the Promontory of *Dyra* towards the South, are the strongest Pardals of the world, (as saith *Sirabo*.)
 Likewise in the *Mediterranean* Region beyond *Barygaza* toward the South, unto *Dachinabades*, and to-
 wards the East are all sorts of wilde Beasts, both Tygers and Panthers; and *Diodorus* writeth that
 in that part of *Arabia*, joyning upon *Syria*, there Lions and Pardals are both more in number and
 greater in quantity then in *Lybia*.

Also it is said by *Volaterranus* and *Gillius*, that the Panther of *Lycia* and *Caria* are very long, but yet
 weak and without carriage, being not able to leap far, yet is their skin so hard as no Iron can pierce.
 Betwixt the River *Ganges* and *Hiphasis*, *Apollonius* saw many Panthers. The *Indians* also breed many *Leo Afric.*
 and make them tame, and Leopards do live in the Woods of *Barbaria*.

It is apparent by that which is already said, that the Panther is the name of the greater Pardal, *The several*
 and the Leopard of the lesser, which the *Arabians* call *Alnemur*, and *Alshead*, *Alnemur* is bigger then *parts of Pan-*
 a *Linx*, but like a Leopard, having greater and sharper nails and feet, black and terrible eyes, and *thers.*
 therefore stronger, fiercer, and bolder then the Leopard, for it setteth upon men, and destroyeth
 them. *Oppianus* describeth both kindes in this manner; There are (saith he) two kindes of Par-
 dals, a greater and a lesser, the greater are broader backt, and bigger in quantity, the lesser be-
 ing less in quantity, but not inferior in strength: both of them have the same shape and colour of
 body, except in their tail: for the greater Pardal hath the lesser tail, and the lesser the greater:
 either of them have solid and sound thighs, a very long body, bright seeing eyes, the apples where-
 of do glister under their eye-lids, which are gray and red within like to burning coals, their teeth
 pale and venemous, their skin of divers colours, yet bright and pleasant, the spots standing like so
 many black eyes upon it: thus far *Oppianus*. Such skins are oftentimes sold in the *Marts of Europe*,
 which are brought in bundles twenty or thirty together, and it is not to be forgotten, which *Vol-*
terran citeth out of *Aelianus*, that there is in this kinde of Pardals a Beast called *Bitis*, not unlike to
 the vulgar Leopards in all parts, except that it wanteth a tail; and they say that if this Beast be seen
 by a woman, it will instantly make her to be sick; but to proceed to the residue of the parts of these
 Beasts, we must remember that which *Aristotle* writeth in his *Physiognomy*; as is recorded by *Ada-*
mantius: *Leoparfectissimam maris ideam pra se fert, Pardalis vero femineam formam exprimit, erubus*
tantum exceptis, quibus ad invadendum fortiter utitur, that is to say: Among all Beasts the Lion doth
 most resemble the male, and the Pardal the female, except in the legs which she useth to take her
 prey.

It hath a little face, a little mouth, little eyes, somewhat white, plain, and not much hollow, a long
 fore-head, ears rather round then smooth or broad, a neck very long and slender, the breast not
 well set out with ribs, because they are small; the back long, the buttocks and thighs very fleshy, the
 parts about the small of the belly or loins are more smooth, less hollow and buncy; the colour di-
 vers, and the whole body inarticulate, and not well compounded for the outward sight: and it is
 to be remembered (saith *Cardan*) that all ravening Beasts are like a Cat, as Lions, Panthers, Lincses,
 and Pardals, for they have in common the length and strength of their claws, beautiful party co-
 loured skins; a little head and round face, a long tail, nimbleness of body, and wildeness of nature;
 living upon the meat they get in hunting.

The *Persians* call a Pardal *Barbaet*, and *Scaliger* describeth it thus: In his red or yellow hair he is
 like a Lioness, but set with divers black spots both in length and breadth, as if they were painted.
 It hath a brown face, asperfed with black and white, and it is to be remembered, that as other
 Beasts

Alb. rhus.
Pliny.

Beasts are either all black, or all red, or all white, or all of one colour by nature, so also it is natural to Pea-cocks and Panthers, to have divers colours in them, for there are in *Hircania* Panthers with little round spots like eyes, both black, white, blew, and green, as both *Solinus* and *Claudius* testifie, which caused *Martial* to write thus; *Picto quod juga delicata collo Pardus sustinet*. There is a land called *Terra erembotum*, inhabited by the *Troglodytes* and *Sarazens* in *Lybia*, where the upper face of the earth is compared unto the Panthers skin, because through the heat of the Sun it is burned, and died as it were into divers colours; so that ye shall see divers spots of white, black, and green earth, as if it were done of purpose by the hand of man. The teeth of the Panther are like saws, as are also a Dogs and a Lions: their tongue of such incredible sharpness, that in licking it gratech like a file.

Aristotle.

The females have four udders in the midst of their belly, the heart is great in proportion, because he is a violent Beast, terrifying man. There are many fissures in their feet. Their former feet have five distinct claws or fingers, and their hinder-feet but four, for little ones among four-footed beasts have five fingers upon their hinder-feet: when they go, they hide their nails within the skin of their feet, as it were in sheaths, never bringing them forth but when they are in their prey, to the intent they should never be broken nor dulled. Their tails have no long hairs at the end like a Lions or Oxes; and the Leopard hath a wider mouth then the Pardal.

The food of
Panthers.

The female is oftener times taken then the male, the reason is given by *Volaterran*; because she is inforced to seek abroad for her own meat and her young ones. The place of their aboad is among the Mountains and Woods, and especially they delight in the tree Camphory. They raven upon flesh both Birds and Beasts: for which cause they hide themselves in trees, especially in *Mauritania*, where they are not very swift of foot, and therefore they give themselves to take Apes, which they attain by this policy: when they see the Apes, they make after them, who at their first approaching climbe up into the tops of trees, and there sit to avoid the Panthers teeth, for she is not able to follow them so high, but yet she is more cunning then the Apes, and therefore deviseth more shifts to take them, that where nature hath denied her bodily power, there she might supply that want by the gifts of the minde. Forth therefore she goeth, and under the tree where the Apes are lodged, she lyeth down as though she were dead, stretching out her limbs, and restraining her breath, shutting her eyes, and shewing all other tokens of expiration. The Apes that sit on the tops of the tree behold from on high the behaviour of their adversary, and because all of them wish her dead, they more easily believe that which so much they desire, and yet dare not descend to make tryal. Then to end their doubts, they chuse out one from among them all, whom they think to be of the best courage, and him they send down as it were for an espy, to certifie all the residue: forth then he goeth with a thousand fears in his minde, and leapeth from bough to bough with no great hast, (for dread of an ill bargain) yet being come down, dareth not approach nigh, but having taken a view of the counterfeit, and repressed his own fear, returneth back again: After a little space he descendeth the second time, and cometh nearer the Panther then before, yet returneth without touching him. Then he descendeth the third time, looking into his eyes, and maketh trial whether he draweth breath or no, but the Panther keepeth both breath and limbs immoveable, by that means imboldning the Apes to their own destruction; for the Spie-ape sitteth beside the Panther, and stirreth not: now when those which are above in the tree, see how their intelligencer abideth constantly beside their adversary without harm, they gather their spirits together, and descend down in great multitudes, running about the Panther, first of all going upon him, and afterwards leaping with great joy and exultation, mocking this their adversary with all their apish toys, and testifying their joy for her supposed death: and in this sort the Panther suffereth them to continue a great season, till he perceiveth they are thoroughly wearied, and then upon a sudden he leapeth up alive again, taking some of them in his claws, destroying and killing them with teeth and nails, till he have prepared for himself a rich dinner out of his adversaries flesh. And like as *Ulysses* endured all the contumelies and reproaches both of his maids and Wives suiters, until he had a just occasion given him of revenge, so doth the Panther the disdainful dealing of the Apes: whereupon came the proverb, *Pardi mortem dissimulat*, *Thanaton Pardaleos hypocrinetai*, against a cunning dissembling fellow; such a one as *Brutus* was, who counterfeited madness that he might get the Empire.

Their love of
spices.

So great is the love of this Beast to all Spices and Aromatical trees, that they come over all the Mountain *Taurus* through *Armenia* and *Silia*, when the windes bring the savour of the sweet gum unto them, out of *Pamphilia* from the tree *Storax*: whereupon lyeth this story; There was a certain Panther which was taken by King *Arfaces*, and a golden collar put upon his neck, with this inscription; *Rex Arfaces Deo Niseo*, that is, King *Arfaces* to the God *Bacchus*: for *Bacchus* was called *Niseus*, of a City *Nisa* in *India*. This Beast grew very tame, and would suffer himself to be handled and stroked by the hands of men, until the Spring time that he winded the savour of the Aromatical trees, and then he would run away from all his acquaintance, according to his kinde, and so at last was taken in the neather part of the Mountain *Taurus*, which was many hundred miles distant from the Kings Court of *Armenia*.

The savour or
smell of Pan-
thers.

We have shewed already how they love the gum of Camphory, watching that tree, to the end to preserve it for their own use, and indeed as *Ælian* saith: *Admirabilem quantam odoris suavitatem oiet Pardalis, quam bene olendi præstantiam divino munere donatam, cum sibi propriam plane tenet, tum vero cætera animalia ejus hanc vim præclare sentiunt*: that is to say, The Panther or Pardal smelleth most sweetly,

sweetly, which favour he hath received from a divine gift, and doth only feel the benefit of it himself, but also bewray it unto other Beasts: for when he feeleth himself to be hungry and stand in need of meat, then doth he get up into some rough tree, and by his favour or sweet smell, draweth unto him an innumerable company of wilde Goats, Harts, Roes, and Hindes, and such other Beasts, and so upon a sudden leapeth down upon them, when he espyeth his convenient time.

And Solinus saith, that the sweetness of his favour worketh the same effect upon them in the open fields, for they are so mightily delighted with his spotted skin and fragrant smell, that they will alwayes come running unto him from all parts, striving who shall come nearest him to be satisfied with the sight, but when once they look upon his fierce and grim face, they all are terrified and turn away: for which cause the subtle Beast, turneth away his head, and keepeth that from their sight, offering the more beautiful parts of his body, as an alluring bait to a Mouse, and destroy them: and from hence there are some which are of opinion, that he receiveth his name *Panthera*, of congregating together all kinde of Beasts to look on him, for *Pan* signifieth all, and *Theria* signifieth Beasts. *Albertus* is of opinion, that the report of the Panthers favour or sweet smell is but a fable, because (he saith) it is written as a *Maxim* among Philosophers, that *Cetera animalia præter hominem neq; suaviter neq; moleste odoribus affici*, that is: That no creatures (man excepted) can be said to smell either sweetly or sowrely: and *Theophrastus* writeth, *Animal nullum penitus odoratum est nisi quis dixerit Pardalin, belluarum censui bene olere*, that is: There is no creature that can be said to be so odoriferous, except the Pardal seem to smell well to the scents of other Beasts: for it is certain, that there be some favours and smells which Beasts do follow and refuse, being led thereunto onely for the choise of their meat: for by their noses they choose that which is the convenient and agreeable to their natures, but that they should be drawn by any smells or favours meerly, and for no other cause but the pleasure of the scents, as it is a reasonable part in man, so it is unreasonable, to attribute the very same unto a Beast.

Yet herein by the favour of *Albertus* I dissent from him, for it being granted, which all men yeeld unto, that either the spots of his skin, which seem to be as many eyes as colours, or else the sweet favour which cometh from him is the occasion of the Beasts assembling about him; then it followeth, that when he is from the earth, and lodged in a tree, and so not visible to the eyes of the beasts, if then I say they assemble about the tree wherein he is lodged, there is no cause to draw the Beasts unto him, but the attractive power of his sweet favour: and what want of reason can it be justly deemed, to say that Beasts love sweet favours, seeing both *Albertus*, and all other learned men that I know, do confidently affirm, that many wilde Beasts do forsake their meat to hear musick; and also the Badger doth forsake his own den when he perceiveth the Fox hath emptied his belly therein.

Therefore I will conclude this point with admiration of the work of the Creator, to consider how wisely he hath disposed his goodness, and how powerfully he communicateth the affections of his divinity even unto brute Beasts, who doth not distinguish them asunder only by their outides and exterior parts, nor yet by their insides and qualities of their mindes, but also by the air they draw in, and the favour they send forth.

Among all kindes of Beasts the male is most couragious and fierce, except in Bears and Panthers, for the female Panther is more generous then the male. At the time of their lust, they have very peculiar voices, which caused the Poet to write thus:

Panther caurit amans, Pardus biando felit.

At the sound of those voices other Beasts come about them, as both Lions, Lionesses, Wolves, and Thoes. They never bear above once, because when the young ones begin to stir in the dams belly, and gather strength for birth, they cannot tarry the just time of their delivery, but tear out the womb or bag wherein they lie with the sharpness of their nails, and therefore their dam is forced for the avoiding of pain to cast them forth of the womb both blinde and deformed, which yet she nourisheth tenderly, but afterwards can never conceive again, by reason that her womb is so torn with the claws of her first whelps, that it is not able to retain to perfection the received seed of the male.

Panthers live together in flocks or heards, and greatly delight in their own kinde, but in no other that I know, and therefore I wonder from what Author *Isidorus* wrote. *Panther omnium animalium amicus est excepto Dracone*; That the Panther is friendly to all Beasts except the Dragon. It was not in vain, that the Poets feigned the Nurses of *Bacchus* to be turned into Panthers, and that they devoured *Pentheus* because he railed upon *Bacchus*: for as a Lion doth in most things imitate and resemble the very nature of Man, so after the very self same manner doth the Panther of a Woman, for it is a fraudulent, though a beautiful Beast, or (as *Adamantius* writeth) *anibere ingenium molle est, effeminatum, iracundum, insidiosum, & fraudulentum, timidum simul & audax, his moribus corporis etiam forma respondit*: that is; The disposition of the Panther is wanton, effeminate, outrageous, treacherous, deceitful, fearful, and yet bold: and for this occasion, in holy Scriptures it is joyned with the Lion and the Wolf, to make up the triplicity of ravening Beasts: and therefore also we read, that the wisest among the *Egyptians*, when they will signifie a cunning man covering the secret corruption and evil disposition of his minde, pretending good, and yet intending evil, they picture

The description
of Pan-
thers.

a Panther; for we have shewed already, how he doth cover both his head and his body to take his prey.

The taming of Panthers.

This Beast is never so tamed but that he falleth into his wilde fits again. Their love to their young ones is exceeding great, for if at any time while they are abroad to forage, they meet with Hunters that would take them away, they fight for them unto death, and to save them from blows, interpose their own bodies, receiving mortal wounds, but if they finde their young ones taken out of their den in their absence, they bewail their loss with loud and miserable howling.

Demetrius the Philosopher, relateth this story of a Panther, that lay in the high way to meet with a man to help her young ones out of a ditch or deep pit wherein they were fallen, at length there appeared in her sight the father of *Philius* a Philosopher, who presently began to run away as soon as he saw the Beast, but the poor distressed Panther rowled after him in humble manner, as though she had some sute unto him, and took him lightly by the skirt of his garment with one of her claws: the man perceiving that she gave suck by the greatness of her Udders hanging under her belly, began to take pity upon her, and layed away fear, thinking that indeed which happened, that her young ones were taken from her by one means or other; therefore he followed her, she drawing him with one of her feet unto the cave whereinto her young ones were fallen, out of which he delivered them to the mother as ransom for his own life, and then both she and the young ones did follow him rejoycing, out of the danger of all Beasts, and out of the Wilderness, dismissing him without all manner of harm, which is a rare thing in a man to be so thankful, and much more in a Beast: and unto this story of their love and kindeness to their young ones, I may add another, worthy to be remembered out, of *Aelianus*:

A notable story of a Panther's love to his companion.

There was (saith he) a man which brought up a tame Panther from a whelp, and had made it so gentle, that it refused no society of men, and he himself loved it as if it had been his wife. There was also a little Kid in the House brought up tame, of purpose to be given unto the Panther when it was grown to some stature or quantity, yet in the mean season the Panther played with it every day: at last it being ripe, the Master killed it, and laid it before the Panther to be eaten, but he would not touch it, whereupon he fasted till the next day, and then it was brought unto him again, but he refused it as before; at last he fasted the third day, and making great moan for meat, according to his usual manner, had the Kid laid before him the third time; the poor Beast seeing that nothing would serve the turn, but that he must either eat up his chamber-fellow, or else his Master would make him continually fast, he ran and killed another Kid, disdainig to meddle with that which was his former acquaintance, yea though it were dead; herein excelling many wicked men, who do not spare those that have lived with them in the greatest familiarity and friendship, to undo and overthrow them alive for the advancement of themselves.

The harms of Panthers.

We have said already, that they most of all resemble Women, and indeed they are enemies to all creatures. The Leopards of *Barbary* do little harm to men that they meet, except they meet them in some path way where the man cannot decline the Beast, nor the Beast the Man, there they leap most fiercely into his face, and pull away as much flesh as they can lay hold upon, and many of them with their nails do pierce the brains of a man.

Leo. Afer. Albertus. Avicenna.

They use not to invade or force upon flocks of Sheep or Goats, yet wheresoever they see a Dog, they instantly kill and devour him. The great Panther is a terror to the Dragon, and so soon as the Dragon seeth it, he flyeth to his cave. The lesser Panthers or Leopards do overcome Wolves being single, and hand to hand as we say, but by multitude they over-master and destroy him, for if he endeavour to run away, yet they are swifter and easily overcome it.

Pliny. Orus.

There is also great hatred and enmity betwixt the Hyæna and the Panther, for in the presence of the Hyæna, the Pardal dareth not resist; and that which is more admirable, if there be a piece of an Hyænas skin, about either man or beast, the Panther will never touch it, and if their skins after they be dead be hung up in the presence of one another, the hair will fall off from the Panther; and therefore when the *Egyptians* would signifie how a Superiour was overcome by a Inferiour, they picture those two skins. If any thing be anointed with broath wherein a Cock hath been sodden, neither Panthers nor Lions will ever touch it, especially if there be mixed with it the juyce of Garlick.

The terror of Panthers.

Pliny. Rasis. Esculapius.

Leopards are afraid of a certain tree called *Leopardi-arbor*, Leopards-tree. Panthers are also afraid of the skull of a dead man, and run from the sight thereof: yet it is reported, that two year before the death of *Francis* King of *France*, two Leopards, a male and a female were let escape in *France* into the Woods, either by the negligence or the malice of their Keepers, that is, a male and a female, and about *Orleanse* tore in pieces many men and women; at last they came and killed a Bride, which was that day to have been married, and afterward there were found many carcases of Women destroyed by them, of which they had eaten nothing but only their breasts: Such like things I might expresse many in this place, whereby the vengeance of Almighty God against mankinde for many sins, might seem to be executed by the raging ministry of wilde, savage, and ungentle Beasts.

Laws against Panthers.

For this cause we read in ancient time how the Senators of *Rome* gave laws of punishment against them that should bring any Panthers into *Italy*, especially any *African* Beasts: and the first that gave dispensation against those laws was *Cneius Aufidius* the peoples Tribune, who permitted them for the sake of the *Circensian* games: and then *Staurus* in the office of his aedility brought also in an hundred and fifty: After him *Pompey* the great, four hundred and ten, and lastly *Augustus* that ever remem-

remembred and renowned Emperor, four hundred and twenty. Thus laws which were first made by great men and good Senators, for the safety of the common-wealth, became of no great value, because as great or greater then the Law-makers, had a purpose to advance themselves by the practise of those things which law had justly forbidden: for if those decrees had stood effectual, as the victorious Champions had lost that part of their vain triumphs, so many people had afterward been preserved alive, who by the cruelty of these Beasts were either torn in pieces, or else received mortal wounds.

It was not in vain that the blessed Martyr of Jesus Christ *Ignatius*, who was afterwards torn in pieces by wilde Beasts at *Rome*, did write thus in his Epistle to the *Roman* Christians concerning his handling by the *Roman* Souldiers, as he was brought prisoner out of *Syria* to *Rome*. *A Syria Romani usq; cum bestiis depu. no per terram & mare, die nocteque vincus cum decem Leopardis, hoc est cum militari custodia, qui ex beneficiis deteriores sunt.* From *Syria* (saith he) to *Rome* I have fought with Beasts, being night and day held in bondage by ten Leopards, I mean ten Souldiers, who notwithstanding many benefits I bestowed upon them, yet do they use me worse and worse: and thus much for the cruelty of Panthers and Leopards.

We have shewed already how they become tame, and are used in hunting, unto which discourse (somewhat out of the place) I will adde a true narration of two Panthers or Leopards nourished in *France* for the King, whereof one was of the bigness of a great Calf, and the other of a great Dog, and that on a day the lesser was brought forth for the King to behold how tame and tractable he was, and that he would ride behinde his Keeper upon a cloth or pillow being tyed in a chain: and if a Hare had been let loose in his presence, and he turned down to her, within a few jumps or leaps he would attain and take her. When the Keeper was to take up the Leopard again, he did come to him backward, lest if he should see his face, he should leap upon him and wound him, (for as we have said they are angry being chafed, and are ready to fly into the Hunters face) therefore he turneth his face away from him, and betwixt his legs reacheth him a piece of bread or flesh, and so he gently taketh him into his chain and collar again, leading him away to his house, and as soon as the man was mounted the Beast also knew his seat, and leaped up after him.

And the same party also related, that when as a Lion was turned forth to a Bull, the Lion very quietly without stirring lay down and did no harm, or offer any violence or combat with the Bull: but afterward when as the two Leopards were turned forth to the same Bull, they instantly ran and took the Bull by the throat, and without all doubt they had strangled and pulled out his throat, (had not their Keepers which had long chains tyed about their necks in their hands) restrained and pulled them off again. By this may be conjectured how great is the rage of the wilde and untamed Leopards and Panthers, seeing the tame and gentle are so cruel; and therefore the Lord in the Prophets did most wisely compare the siege of the *Assyrians* about *Jerusalem* to a Leopard, watching at the gates of the City to destroy all that came out thereat.

Having thus discoursed of the nature, parts, kindeness, love, and hatred of these Beasts in general, it now followeth to expresse the best means to avoid and destroy them, that so we may not only know our enemy, but also learn the way to overmatch and curb him.

There is a kinde of Henbane which is called *Pardalianches* or Libbard-bane, which the Inhabitants of *Phrynia*, and the Mount *Ida*, were wont to lay in the Mountains for the destroying of Leopards, Pardals, and Panthers. This herb is not much known at this day, yet I take it to be the same which groweth in many places of *France*, and *Savoy*, and it is called *Tora*, by the root thereof beaten to powder, and stopped up in flesh, not only Beasts, but also Wolves and Swine, as wilde Boars are destroyed if they tast thereof: when the Beast perceiveth himself poysoned, presently he seeketh for mans dung, for without that he cannot be delivered; wherefore the Hunters do also place near unto it some vessel of it hanging in a tree, with the mouth or way open that leadeth into it, whereinto the greedy Beast leapeth, and being in, cannot get forth again, but rather dyeth with hunger, or else is taken and killed; or else the vessel is hanged up so high, that the Beast by straining himself to leap into it, and get his desired medicine, (but all in vain) spendeth out the time of his recovery, till the poyson hath thoroughly corrupted his body, and every part and member, for otherwise so great is the life, spirit, and stomach of this Beast, that he will fight and not yeeld to his adversary, although his guts and intrails hang about his legs out of his belly.

Therefore the Panthers of *Hircania* do more often perish by poyson then by other violence of Swords, Spears, or Dogs: for by this poyson the Beast many times falleth to such a looseness of his belly, and withall such a weakness thereby, that he is taken alive. Likewise in *Armenia* there are certain Fishes which are poyson to Lions, Bears, Wolves, Lynces, and Panthers, the powder of this fish the Inhabitants put into the sides and flesh of their Sheep, Goats and Kys, without all harm to these beasts; but if the Panthers or any ravening Beast come and devoure any of those Sheep so dressed, presently they die by poyson.

When they are hunted and forced in the presence of the Hunters, then they leap directly unto their heads, and therefore the Hunter taketh great care both of his standing and also of holding his spear, for if he receive not the Panther in his leap, and gore him to the heart, or else otherwise wound him mortally, he is gone, and his life is at an end. *Oppianus* also sheweth, that he is taken as Lions are, especially by these means following; for when the Hunters perceive the way or path which he useth to his water, therein they make a deep ditch (but not so great as they make for a Lion) wherein they erect a wooden pillar or great post, unto that they tie certain engines, and

The nature of tamed Panthers.

The taking of Panthers.

Dioscorides.

Pliny.
Aristotle.

withall

withall a male little Dog, whose stones or tender cods they binde with some string or cord, so as the young beast may whine and cry for pain, by which voyce he inviteth and calleth the Panther to his destruction: For the greedy beast winding the voice of the Dog, bestirreth himself to meet with his desired prey or booty; at last finding the ditch, and seeing the Dog down, he leapeth, where the engins take present hold upon him and destroy him; and so he describeth the same means to take great fishes by the sight of little fishes swimming in a Net.

Oppianus.

In hunting of wilde beasts the wary Wood-man must make good choice of his Horse, not only for the metal and agility which are very necessary, but also for the colour, as we have already expressed in the story of the Horse: for the gray Horse is fittest for the Bear, and most terrible to him; the yellow or fire colour against the Bore; but the brown and reddish colour against the Panther.

The *Moors* also use other devises to take Panthers and all such noisome beasts, they enclose in a little house certain rotten flesh, which by the savour thereof when it stinketh, draweth the wilde beasts unto it: For they make a dore, or a gate of reeds unto the said house, through which the filthy smell breaketh out and disperfeth it self into the wide air; presently the wilde beasts take it up, and follow it with all speed they can, for there is not any Musk or other sweet thing wherewithal men are so much delighted, as ravening beasts are with the savour of carrion: therefore like an amorous cup it draweth them to the snare of perdition: for beside the rotten flesh, they erect many engins and unavoidable traps, to snare in the beast when he cometh to raven.

The Christians of *Africk* did institute a general hunting of Leopards, inclosing the ends of the ways through which the beasts were to pass: The Leopard when he was stirred ran to and fro distracted, because in all his passages he found Horse-men ready to resist him, neither left they any way for him to escape: at length wearied with many windings, turnings, and provocations, the Horsemens might easily come unto him and pierce him with their spears: but if it fortuneth that the Leopard escaped, and brake away from the Hunters; then he at whose corner he brake forth, was bound by ancient custome to make the residue a dinner or banquet.

Among the *Chaonians*, there was a certain young Nobleman which loved a Virgin called *Antippe*, the which two lovers were walking together a good season in a Wood; It happened while they were there, that *Cichyrus* the Kings Son prosecuted a Pardal in hunting, which was fled into that Wood, and seeing him, bent his arm against him and cast his Dart; the which Dart missed the mark and killed the Virgin *Antippe*, the young Prince thought that he had slain the beast, and therefore drew neer on Horse-back to rejoyce over the fall of the game, according to the manner of Hunters; but at his approach he found it far otherwise, for instead of the effusion of the blood of a beast, (that which was more lamentable) his right hand had shed the blood of a Virgin: For when he came to them he saw her dying and drawing her last breath, and the young man held his hand in the wound to stanch the blood: for sorrow whereof he presently fell distracted in his minde, and ran his Horse to the top of a sharp Rock, from whence he cast down himself headlong and so perished.

The *Chaonians* after they understood this fearful accident, and the reason of it, compassed in the place where he fell with a wall, and for the honour of their dead Prince builded a City where he lost his life, and called it *Cichyrus* after his own name.

Their love of Wine.

Leopards and Panthers do also love Wine above all other drink, and for this cause both *Bacchus* was resembled to them, and they dedicated to him: *Bacchum tauro assimilant & Pardali, quod homines ebrii belluarum istarum ingenia referant, & omnia violenter agant, quidam enim iracundi sunt Taurorum instar, & pugnaces feriq; ut Pardales*, saith *Plato* in his second Book of laws, they resemble and compare *Bacchus* to a Bull, or Pardal, because drunken men in all their actions do imitate the disposition of these wilde beasts, both in their folly and violence: For some of them are wrathful like Bulls, and some of them wilde apt to fight, like Pardals: *Bacchus* was also called *Nebrides*, because he wore the skin of a Hinde-calf, which is spotted almost like a Panther: and therefore a fearful man, or a drunken, variable and inconstant man, is said to wear a skin of divers colours, but the chief cause why Panthers were dedicated to *Bacchus*, was for their love of Wine; for all Writers do constantly and with one consent affirm, that they drink Wine unto drunkenness: the manner and end thereof is elegantly described by *Oppianus* in this sort: When the Inhabitants of *Lybia* do observe some little fountain arising out of the sand, and falling down again, (as in the manner of small Springs which cannot encrease into great Rivers) whereat the Panthers and Pardals use to drink early in a morning, before it be light; after they have been at their prey in the night time, the Hunters come and pour twenty or thirty pitchers of old sweet Wine into the said Fountain, then a little way from it they lie down and cover themselves with clothes, or with straw, for there is no shelter either of tree or bushes in that Countrey.

In the morning the Panthers ardently thirsting, and being almost dead for want of drink, come unto the same fountain, and tasting of the Wine drink thereof great abundance, which presently falleth to work upon their brains, for they begin first of all to leap and sport themselves, untill they be well wearied, and then they lie down and sleep most soundly, at which time the Hunters that lye in wait for them, come and take them without all fear or perill: Thus far *Oppianus*.

Use of their parts.

Concerning the use of their several parts, I finde little among the ancients, except of their skins, for the foot-men and ancient Souldiers of the *Moors* did not only wear them for garments, but also slept

slept upon them in the night time. The Shepherds of *Æthiopia*, called *Agriophagi* do eat the flesh of Lions and Panthers, although it be hot and dry.

The Medicines of the Panther, or Leopard.

If the skin or hide of a Leopard being taken and flead, be covered or laid upon the ground, there is such force and vertue in the same that any venomous or poysonsome Serpents dare not approach unto the same place where it is so laid. The flesh of a Panther being roasted or boiled at the fire, and smelled by any one which is troubled with the Palsie, or shaking in the joynts, as also by them which are troubled with the beating and continual moving or turning of the heart, is a very profitable and excellent remedy for the same. Avicenna.
Albertus.

The same fat or sewer of a Leopard being mixed or mingled with the Oyl which proceedeth from the Bay-tree, and then mollified both together, and so anointed upon any one which is troubled with the scurfe or mangy, the scabs whereof doth cut or pierce the skin, doth presently and without any grief or pain cure the same. The twigs of a Vine-tree being dried and beaten into small dust or powder, and mingled together with the fat or grease of a Leopard, and so anointed upon the face of any one who is grieved with akings and swelling thereon, will not only cure and heal the same without any pain or sorrow, but also preserve the same free from blemishes in the time of healing. The grease also of a Leopard by it self, being anointed upon the head of any one who doth shed or cast his hair, or is troubled with the Foxes evill, doth immediately help and cure the same. The blood of a Panther being anointed upon the veins or sinews of either man or woman who is grieved with any swelling or akings therein, is very profitable and curable to expel the same away. The brains of a Leopard being mingled with a little quantity of the water which is called a Canker, and with a little Jasmine, and so mixed together and then drunk, doth mitigate the pain or ach of the belly. The brains of the same beast being mixed with the juyce of a Canker, and anointed upon the genital of any man, doth incitate and stir him up to lechery, but the marrow which cometh from this beast, being drunk in Wine doth ease the pain or wringing of the guts and the belly. The gall of a Panther being received into the body either in meat or drink, doth instantly and out of hand kill or poyson him which doth so receive it. The right stone of a Leopard being taken of a woman of a far spent age, doth restore unto her, her menstrual purgation being ceased, and doth make her to purge, if she doth heartily receive her meat more often. Rafis.
Arctem.
Galen.

Of the POEPHAGUS.

There is a beast in *India* called *Poephagus*, because he feedeth upon herbs and grasse like a Horse, whose quantity he doth exceed double, for he is twice so big, his tail is most thick and black, the hairs whereof are thinner then the hairs of a mans head: and therefore *Indian* women make great account of them, for with them they binde up their own hair, platting it, and folding it in curious manner, every hair is two cubits in length, and upon one root twenty or thirty of them grow together: this great beast is one of the fearfullest creatures in the world; for if he perceive himself to be but looked at of any body, he taketh him to his heels as fast as he can go, and yet although his heart be light, his heels be heavy, for saith my Author, *Magis studiose quam celeriter fugam peragit*. That is, He hath a good will to run apace, but cannot perform it: but if he be followed upon good swift Horses, or with nimble Dogs, so as he perceiveth they are near to take him, and he by no means can avoid them, then doth he turn himself, hiding his tail, and looketh upon the face of the Hunter with some confidence, gathering his wits together, yet in fearfull manner, as it were to face out his pursuer or hunter, that he had no tail, and that the residue of his body were not worth looking after: but while he standeth staring on his Hunter, another cometh behinde him and killeth him with a Spear, so they take off the skin and tail, and throw away the flesh as unprofitable, for the other recompense their labour for their pains. *Volaterranus* relateth this a little otherwise, and saith that the beast biteth off his own tail, and so delivereth himself from the Hunter, knowing that he is not desired for any other cause. Ælianus.

Nicolaus Venetus an Earl, writing of the furthest part or Province of *Asia*, which he calleth *Macedonum*, and I think he meaneth *Serica*, because he saith it lyeth betwixt the Mountains of *India* and *Cathay*, there are a generation of white and black Oxen which have Horses tails, but reaching down to their heels, and much rougher. The hairs whereof are as thin as the feathers of flying birds, these he saith are in great estimation; for the Knights and Horsemen of that Countrey do wear them upon the top of their lances and spears for a badge or cognizance of honour, the which I thought fit to be remembred in this place, because I take them to be either the same with these *Indian* beasts, or very like unto them. Æne. Silv.

The *Porcupine* or *Porcupine*.

I cannot learn any name for this Beast among the Hebrews, and therefore by probability it was unknown to them: The Grecians call it *Acanthoceros* and *Hystrix*, that is, *sus setosa*, a hairy, or bristly, or thorny Hog, for their quills which they bear upon their back, are called both *Pili*, *filii*, *pinne*, *aculei*, and *spine*, that is, both hairs, bristles, rough hair, pins, prickles, and thorns. The Arabians call it *Adaldull*, and *Adualbul*, *Adubul*, *Adulbus*, and some *Aherba*, which by Avicen and his Glossographer, is defined to be *Montanus Ericius habens spinas sagittales*, an Hedgehog of the Mountain, having quills or thorns upon his back which he shooteth off at his pleasure. The Grecians at this day call it *Seanzocheros*, which is derived or rather corrupted of *Acanthoceros*. The Italians call him *Porco-spinoso* and *Histice* or *Istrix*, without an Aspiration; the Spaniards, *Puercoespín*; the French, *Porc-épic*; the Illyrians, *Porcospino*, and *Morska szwinia*, imitating therein the Germans, which call a Sea-hog, *Ein Meer-schweyn*: The Germans in some places call it *Laran*, and in other places *Dornschweyn*, that is a Thorny-hog, by a feigned name in imitation of other Nations, and also *Porcopick* following the Italians, Spaniards, French, English, and Illyrians: I will not stand to confute them, who write that this Beast is a Sea-beast, and not a Beast of the land, nor yet those that make question whether it be a kinde of Hedge-hog or not, for without all controversie, as the Arabians, Pliny, Albertus, Bellonius, and other do affirm, the vulgar Hedge-hog, is *Ericius Sylvestris*, and the Porcupine *Ericius Montanus*.

These are bred in India and Africk, and brought up and down in Europe to be seen for money: Likewise about the City Cassem in Tartaria, by the sight of one of these it appeared, that it was three foot long, the mouth not unlike to a Hares, but with a longer slit or opening: so also the head of the same similitude, the ears like to the ears of a man; the fore-feet were like the feet of a Badger, and the hinder-feet like the feet of a Bear: it hath a mane standing up in the upper part right or direct, but hollow or bending before: Upon the bunches of his lips on either side of his mouth, there groweth forth long black bristles. The general proportion of his body is like a Swines, and they never exceed the stature of a Swine of half a year old.

The four formost teeth hang over his lips, and that which is most admirable in him, the Quills or Thorns growing upon his back in stead of hair, he useth for hands, arms, and weapons. The quills and spears.

They first grow out of the back and sides, which are of two colours, that is partly black, and partly white, which whensoever he pleaseth, he moveth to and fro like as a Peacock doth his tail: they grow in length two, three, or four hands breadths, they stand not in any confused order of colours, but in well formed distinguished ranks, being sharp at the points like a knife: When they are hunted the Beast stretcheth his skin, and casteth them off, one or two at a time, according to the necessity upon the mouths of Dogs, or legs of the Hunters that follow her, with such violence, that many times they stick into trees and Wood, wherefore Solinus writeth thus, and also Paulus Venetus; *Cum capiuntur, spinis suis saepe homines, & canes ledunt: nam canes in eos provocati, adeo irritant feras illas, ut simul concurrentes terga sua quibus spina innituntur vehementer commoveant, atque in viciniores homines, & canes vibrent.* That is to say, When they are taken they many times hurt both Dogs and men, for when the Dogs being provoked by them, run upon the backs which bear the quills, they are so far stirred, that they cast them off upon all that stand near them, and therefore they fight flying.

The Hunters to save their Dogs do devise engines and traps wherein to take them; besides the quills that grow upon their backs, they have also some upon their heads and necks, which they never cast off, but keep them on as a Horse doth his mane. The pilgrims that come yearly from Saint James of Compostella in Spain, do bring back generally one of these quills in their Caps, but for what cause I know not. The pace of this Beast is very slow and troublesome unto it, and therefore it is hardly drawn out of his den, which it diggeth like a Badger, from which it never goeth far, but feedeth upon those things which are near unto it: It is a filthy Beast, smelling ranck because it liveth so much in the earth, being wilde it never drinketh, and I think it eateth Apples, Roots, and rindes of trees, and peradventures Snail, and such reptile creatures, but being tamed, it eateth all kinde of fruit, likewise bread, Pie-crust, and such things broken small. It drinketh also water, but above all other, Wine mingled with water: In the day time it sleepeth, and in the night time it waketh, by which we gather, that being wilde it feareth the light, and therefore travelleth in the night time for his meat and living. It is a general live creature, and begetteth other in his own kind: the female bearing the young ones in her belly, as long time as a Bear, that is, thirty days; and also it hideth it self four moneths in the Winter time, like a Bear, but whether for cold or any other cause the Authors do not expresse.

In my opinion for cold rather than for any other reason, although there be some that affirm it lyeth hid in the Summer time, and cometh abroad in the Winter time, contrary to the course of all other Beasts, and therefore such a Paradox doth want the testimony of some credible Writers, which should affirm it upon their own experience, or else it were requisite to bring sufficient reasons to lead their Readers to believe it, but neither of both is discharged by them, and therefore it is safer for us to follow Aristotle and Pliny, who hold the first opinion, then Albertus and Agricola who incline to the later. In all other things, both of their lying hid, of their procreation, of the coming out of their cave and nourishing their young ones, they imitate the manners and conditions of Bears.

The use of the
flesh, and other
parts.

Concerning the use of their parts, I finde none but only of their quills, for with them it is said, if men scrape their teeth they will never be loose, likewise women were wont in ancient time to use them for parting asunder their hair in the top of their crowns.

The flesh of this Beast is like a Hedge-hog, neither very natural for meat and nourishment, nor yet very medicinable: yet it is said to help a weak and over-burthened stomach, to procure looseness of the Belly, and to diminish all Leprosies and scabbed Exulcerations and pustules: Being salted it is good against the Dropsie, and also very profitable, as *Platina* writeth, to be eaten by them that cannot contain urine in their beds: yet the *Grecians* attribute no such quality unto this, but to help the stomach and loosen the belly, they attribute to the Sea-hog, and against the leprosie, scabs, and incontineny of urine to the Hedge-hog, but peradventure the saying of *Pliny*, (*Qua de Herinaceis dicuntur omnia tanto magis valebunt in Histrice*) leadeth them to attribute these things to the Porcupine. The powder of their quills burnt, drunk or eaten in meats or broth, doth promote and help conception: Thus saith *Avicen*, and herewithall I conclude this short discourse of the Hedge-hog.

Of the Keyner, or Rainier.

Of the several
names.

This Beast is called by the *Latines*, *Rangifer*; by the *Germans*, *Rein*, *Reiner*, *Raineger*, *Reinsither*; by the *French*, *Raingier*, and *Ranglier*; and the later *Latines* call it *Reingus*. It is a Beast altogether unknown to the ancient *Grecians* and *Latines*, except the *Ma-chlis* that *Pliny* speaketh of be it: But we have shewed already in the story of the Elk, that *Alcer* and *Mblis* are all one. This Beast was first of all discovered by *Olaus Magnus*, in this Nor-

Northern part of the world, towards the pole Artique, as in Norway, Swedia, Scandinavia, at the first sight whereof he called it *Raingifer*, quasi *Ramifer*, because he beareth horns on his head like the boughs of a tree. The similitude of this Beast is much like to a Hart, but it is much bigger, stronger, and swifter. It beareth three orders or rows of horns on the head, as by the direction of *Valentinus Cravus*, and *Benedictus Martinus* are here expressed.

This Beast changeth his colour according to the time of the year, and also according to the quality of the place wherein he feedeth, which appeareth by this, because some of them are found to be of the colour of Asses, and shortly after to be like Harts. Their breast is full of long bristles, being rough and rigid through the same. The legs hairy, and the hoofs hollow, cloven, and moveable, which in his course he spreadeth abroad upon the deepest snows, without pressing his footsteps far into them: and by his admirable celerity he avoideth all the wilde Beasts which in the Vallies lie in wait to destroy him. He beareth very high and lofty horns, which presently from the root branch forth into two stems or pikes, I mean both the horns severally into two, which again at the top disperse themselves into pikes like the fingers of ones hand; In the middle of the horns there is a little branch standeth out like a knob, or as a huckle in the hinder-part of a Beasts leg, from whence again they ascend upwards a great height, and do grow abroad at the top, where they are divided like the palm of a hand.

The colour and several parts.

The horns are white, distinguished with long apparent veins, differing both from the horns of Elks, and the horns of Harts, from Elks in height, and from Harts in breadth, and from them both in colour and multitude of branches: When he runneth he layeth them on his back, for when he stands still, the lowest branches coming forth of the roots of the horns, do almost cover his face with these lower branches.

In the Winter time when he is athirst, and cometh to the frozen waters he breaketh the ice: being wilde he liveth upon such fruits as he findeth in the Woods, especially the gum that cometh out of the Trees, and also the moss that groweth upon them, making himself shadowed dens and retting places in the Mountains: but in the deepest cold weather he cometh into the Mountains of Norway, towards *Mosiberg*, and other hills. He is taken by the Countrey people for private uses, for he is profitable after he is tamed, both for the plough and travails in journies. The people called *Lappi*, or *Lappones*, do use them in stead of Horses and Oxen, for they have a kinde of Cart made in form and fashion of a fishers boat whereunto they join these Beasts to draw them, and the Carter hath a convenient seat fitted for him on the fore-part thereof, wherein he sitteth with his legs fast tyed to the Cart, to the intent he be not cast off when the Beast runs speedily: he carryeth the reins whereby he governeth them in his left hand, and in his right hand a staffe, wherewithall he sustaineth

The use of their lowest horns.

the Cart when it is in danger of falling, and in this course they will continue indefatigably twenty German miles a day which is more then threescore English miles. At night when the Beasts are unyoaked, of their own accord, without guide or leader they will go to their feeding places, or accustomed stables. It is a very sociable creature, for they do live together in herds above a thousand in a flock, whereunto it may be the Lord alluded in the 50. Psalm, when he said by the mouth of *Asaph*, *All the Beasts of the field are mine, and the flocks of thousands which run wilde on the hills.* The females want horns, and their milk is the greatest part of food to those Northern people: they have been seen at *Auspurge* in Germany saddled and bridled, for in their travails they need not have any provender carryed with them, for if ye turn them out in the midst of the Winter, they finde certain roots and moss under the snow whereof they eat, and content themselves.

Their best food is grafs. They are used both in *Muscovia*, *Polonia*, *Bohemia*, *Scandinavia*, and *Maffovia*, yet they can endure no heat, for being brought into *Bohemia* they dy.

Their Carts which they draw must be made with a sharp edge at the bottom like a boat or ship as we have said already, for they are not drawn upon wheels, but like drays and sleds upon the earth. There was a *Lapponian* which brought one of these into *Germany* in *December*, & he professeth he never felt so much heat of the Sun in all his life, as he did at that time, which is our coldest time in the year, and therefore how great is the cold which both men and Beasts endure in that Countrey?

The horns of these Beasts are to be seen both in *Berne* and at *Auspurge* in *Germany*; the feet are somewhat white, being rounder then a Harts feet, and more cloven or divided, wherefore at some times one part of his hoof may be seen upon a stone, while the other part resteth upon the earth, and in the upper part of the hoof where it beginneth to be cloven near the leg, there is a certain thick skin or membrane, by vertue whereof the foot may be stretched in the division without harm or pain to the Beast.

The King of *Swetia* had ten of them nourished at *Lappa*, which he caused every day to be driven unto the Mountains into the cold air, for they were not able to endure the heat. The mouth of this Beast is like the mouth of a Cow, they many times come out of *Laponia* into *Swetia*, where they are wonderfully annoyed with Wolves, but they gather themselves together in a ring, and so fight against their enemies with their horns. They are also in their own natural Countrey annoyed with Gulons, and generally all Beasts that live upon the spoil of flesh, are enemies unto them, and desire to destroy and eat them. In their pace, both slow and speedy, the articles of their legs make a noise like the cracking of Nuts. There was one of these Beasts given unto the Duke of *Saxony*, in the year of our Lord 1561. In *Scandivania* they use them for the carriage of metals, drawing of Chariots and riding, and the nerves of them when they are dead make bows, and for want of nails, they do fasten planks and boards together.

Of the RHINOCEROS.

A preface to
the succeeding
story.

WE are now to discourse of the second wonder in nature, namely of a Beast every way admirable, both for the outward shape, quantity, and greatness, and also for the inward courage, disposition and mildness. For as the Elephant was the first wonder, of whom we have already discoursed; so this Beast next unto the Elephant filleth up the number, being every way as admirable as he, if he do not exceed him, except in quantity or height of stature; And being now come to the story of this Beast, I am heartily sorry, that so strange an outside, as by figure you may perceive, yeelding no doubt through the Omnipotent power of the Creator, an answerable inside, and infinite testimonies of worthy and memorable vertues comprized in it, should through the ignorance of men, lie unfolded and obscured before the Readers eyes: for he that shall but see our stories of the Apes, of the Dogs, of the Mice, and of other small Beasts, and consider how large a treatise we have collected together out of many Writers, for the illustration of their natures and vulgar conditions, he cannot chuse but expect some rare and strange matters, as much unknown to his minde about the story of this Rhinoceros, as the outward shape and picture of him, appeareth rare and admirable to his eyes: differing in every part from all other Beasts, from the top of his nose to the tip of his tail, the ears and eyes excepted, which are like Bears. But gentle Reader, as thou art a man, so thou must consider since *Adam* went out of *Paradise*, there was never any that was able perfectly to describe the universal conditions of all sorts of Beasts; and it hath been the counsel of the Almighty himself, for the instruction of man, concerning his fall and natural weakness, to keep him from the knowledge of many divine things, and also humane, which is of Birds and Beasts, Fishes and Fowl, that so he might learn the difference betwixt his generation, and his degeneration, and consider how great a loss unto him was his fall in *Paradise*; who before that time knew both God himself and all creatures; but since that time neither knoweth God as he should know him, nor himself as he shall know it, nor the creatures as he did know then.

But

Of the S H E E P.

The several
names.

THe Hebrews have divers names, whereby they signifie a Sheep, and all that kind, as *Zon*, and *Zoneth*, for which the *Septuagins* do always render *Probata*, Sheep or little Cattell. The *Arabs*, *Genas*. The *Chaldeans*, *Ana*. The *Persians*, *Gospand*, also *Rachel* in Hebrew; the plural whereof is *Rechelim*, which signifieth Sheep: *Kebesch*, and *Kabsa*, or *Kibsa*, Isa. 53. *Tabel*, *Nebelamab*, that is, a dumb Sheep, where the Hebrews have *Rachel*, there the *Chaldees* translate *Rachlak*. The *Arabians*, *Akalak*. The *Persians*, *Comefchan thu*. *Kebes* and *Kibsa* signifie a Sheep, male and female under a year old, and *Aiil*, and *Eel*, for a Sheep above a year old, male and female. In *Levit. 22*, the *Chaldees* translate for *Kebii*, *Imar*. The *Arabians*, *Egel*. The *Persians*, *Bara*, and *Keseb* in Hebrew is the same that *Kebesch*. *Seh* also signifieth a Sheep, although it be sometime taken for a Lamb or Kid. Likewise *Thaleb* and *Theleh* *Esaï. 40.* signifieth a Lambe that sucketh. And *Epiphanius* writeth, that by the same word the Hebrew Astronomers signifie the sign *Aries* in the *Zodiack*. The *Sarazens* at this day call a Sheep *Ganeme*, and Cattle *Garien*, and the dung of Cattle *Hara Garien*. The *Grecians* call a Sheep *Ovis*, and *Probaton*; the *Latins* *Ovis*, and by excellency *Pecus*; the *Italians*, *Pecora*, the *French*, *Brebis*; the *Spaniards*, *Oveja*; the *Germans*, *Schaff*; the *Irishians*, *Oweze*, or *Skop*. These and such like I might add more concerning the names of this Beast, and the abundance of the names thereof in the Hebrew tongue, is a notable testimony of the singular account which God himself made of this beast. The *Latines* have so honored it that after it they have named many of their children, and stories make mention of most noble and gallant men, so called. Such was *Ovinus Camillus*, *Severus Ovinus*, *Fabius Maximus Oviculus*, *Oileus*, *Oileus Ajax*, *Oie*, the wife of *Charippus*, and many such other, if it were necessary to this story to relate them, but I will not trouble the Reader with any such unnecessary circumstances. I will therefore first of all begin with a relation of the Sheep of other Countries, and so in the end make a more particular discovery of our own at home. For the difference of Regions do very much enlighten the description or history of Sheep. It is reported that about *Erythrea*, one of the Islands of the *Gades*, there is such abundance of good pasture and Hearbs so gratefull to Sheep, that if they be not let blood once in thirty dayes, they perish by suffocation, and that the milk of those Sheep yeeldeth no whay, wherewithall they make abundance of Cheese, although they powre water into it. The herbage of that Island is dry, yet profitable to Cattle and milch Beasts, and from thence came the original of the fat Cattell of *Geryon*. The Sheep of *Grecia* are lesser then the Sheep of *Egypt*, and the *Ovis Pyrrhica*, were like *Boves Pyrrhica*, namely, of exceeding stature, which name was derived from *Pyrrhus* their master and owner. Among the *Persians* in *India*, their Rams are greater then our Lambs, and *Aechilades* in his books of husbandry affirmeth, that the Sheep of the Isle *Chios*, are very small, and yet their Milk maketh very laudable Cheese. In *Spain* their best Sheep have black fleeces: at *Polentia*, neer the *Alpes*, they are gray or hony-woolled: in *Asia* and *Bætica*, called *Erythrea*, they are red like Foxes, and from thence came the term of *Erythrae Oves*. At *Canusium* the Sheep are yellow, or Lion-tauny, and so also at *Tarentum*. *Istria* and *Liburnia* yeeld Sheep having wooll which is so course and rough, that it may rather seem to be hair then wooll, and therefore never fit for fine garments, nor for any other use, except by the singular art of spinning in *Portugal*. And the like to this is the wool of the Sheep of *Piscene*, and in *Egypt*, of which latter it is said, that if it be dyed again after it is thread-bare, it will endure almost for ever. For the antients (as *Homer* writeth) had the use hereof (although the thread were rough) in their works of Tapestry, and this was dressed divers wayes, for the *French* in *Europe* dresse it one way, and the *Parthians* in *Asia* another way.

The descrip-
tion of di-
vers
kinds of Sheep
according to
their Country.
Strabo.

The Sheep of *Apulia* gave the name to *Lana Italica*, for excellent wool, and yet was it short and course, good for nothing but for clokes to ride in, and wear in rainy weather: unto these I may add the *Catlabrian*, *Milesian*, and *Arentinean* Sheep, yet in the dayes of *Varron* they covered their Sheep with other skins to keep the Wool both from losse, and other infection, so that it might be the better washed, dyed, and prepared, for these were nourished most of all in houses.

The *French* Sheep about *Alinas*, and also those that are scabbed are folded in the plain and barren fields of *Parma* and *Mutina*. The Sheep of *Helvetia* feed in the tops of the Mountains, whiles the Goats keep beneath among the trees and gather fruits on the sides of the hills. The *Flemish* Sheep have a soft and curled hair.

There be in general two kinds of Sheep, one called *Tectum*, the other *Colonicum*, as if you would say house-sheep, and field-sheep, for the *Grecian* Sheep which before we have called *Tarentine*, and were also called *Tarintine*, because of their soft wool, lived in houses, and they were also called *Pelite*, but the field sheep having by nature a greater, courser, and rougher hair, are suffered to lodge abroad in the fields.

Likewise the Sheep of *Miletum* and *Attica*, and the region *Gadiloneæ*, reaching to *Armenia*, have very soft and gentle wool, which thing seldom cometh to passe in *Pontus*, or *Cappadocia*. In *Scotland* also in a place thereof, called by *Hector Boethius* *Buthugubania*, are great store of Sheep, bearing good wool, from whence almost all that Countrey fetch their breed. The Sheep of *Ethiopia* bear no wool at all, but in stead thereof their hair is rough like Camels hair. Amongst the *Abidenes*, and the *Beudiani*, both *Ælianus* and *Nicomachus* the Son of *Aristotle* do testifie, that all their Sheep are black, and that there was never white Sheep bred in those Countries. In *Gortynia* their Sheep are red and have four horns: In the fortunate Islands of the red-sea all their Sheep are white, and none of

of them have crooked horns. In *Bestia* there are four Rivers which work strange effects upon Sheep after they drink of them; namely, *Melas*, *Cephisus*, *Penius*, and *Xanthus*. The Sheep drinking of *Melas* and *Penius* grow black, of *Cephisus* white, and yet *Pliny* saith, that this River cometh forth from the same fountain that *Melas* doth. They which drink of *Xanthus* grow red: I might adde hereunto another special observation of difference betwixt the Sheep of *Pontus* and *Naxos*, for in *Pontus* they have no gaul, and in *Naxos* they have two gauls.

In some parts of *India* their Sheep and Goats are as big as Asses, and bring fourth four Lambs at a time, but never less then three, both Sheep and Goats. The length of their tails reacheth down to their hinder-legs, and therefore the Shepherds cut them off by the secrets; to the intent that they may better suffer copulation, and out of them being so cut off, they express certain Oyl; also they cut asunder the tails of Rams, the ends whereof do afterwards close so nearly and naturally together, that there appeareth not any scar or note of the section. In *Syria* and *India*, the tails of their Sheep are a cubit broad.

There are two kinde of sheep in *Arabia*, which are distinguished by the length and breadth of their tails: the one sort have tails three cubits long, by reason whereof they are not suffered to draw them on the ground for fear of wounding; and therefore the shepherds devise certain engines of wood to support them: the other kinde of sheep have tails like the *Syrian* sheep. All sheep that live in hot and dry Regions have larger tails, and harsher wooll, but those that live in the moist Regions and salt places, have softer wooll and shorter tails. There were two of the *Arabian* Sheep brought into *England*, about the year 1560. whose pictures were taken by Doctor *Cay*, and therefore I have expressed them here with their description.

The Arabian Sheep with a broad tail.

The Arabian Sheep with a long tail.

THis *Arabian* Sheep (said he) is a little bigger then our vulgar Sheep in *England*, but of the same wooll, figure of body, and colour, only the shins, and fore-parts of their face, are a little red: the broad tail in the top was one cubit, but lower it was narrower, and like the end of a vulgar Sheeps tail. They being brought on ship-board into *England*, were taught through famine and hunger to eat not only grasse and hay, but flesh, fish, bread, cheese, and butter.

Hero-

Herodotus saith, that such kinde of Sheep are no where found but in *Arabia*: the long tailed Sheep he calleth *Macrokerkos*, and the broad tailed Sheep *Plateukercos*: yet *Leo Afer* saith, that these are of the *African* Sheep, for thus he writeth: *His arietibus nullum ab aliis discrimen est, præterquam in cauda quam latissimam circumferunt, quæ cuiq; quo opimior est, crassior obtigit, adeo ut nonnullis libras decem, aut vigintipendat, cum sua sponte impinguntur.* There is no difference betwixt these Rams and other, except in their broad tail, which evermore as it grows in fatness groweth in breadth, for if they fat of their own accord, it hath been found that the tail of one of these Sheep have weighed ten or twenty pound, and not only there, but also in *Egypt*, where they cram and feed their Sheep with Barly, Corn, and Bran: by which means they grow so fat, that they are not able to stir themselves, so that their Keepers are forced to devise little engins like childrens Carts, whereupon they lay their tails when they remove their Beasts: and the same *Leo Afer* affirmeth, that he saw in *Egypt* in a Town called *Asiota*, standing upon *Nilus*, a hundred and fifty mile from *Alcair*, a tail of one of these Sheep that weighed fourscore pound, and whilest he wondred at it, scarcely believing that which his eyes saw, there were some present, that affirmed it to be an ordinary thing, for they said according as he writeth; *Se vidisse quæ semi ducentas libras expendissent*: That is, they had seen some of them weigh a hundred pounds: and except in the Kingdom of *Tunis* in *Africk*, and *Egypt*, there are none such to be found in all the world, and by it, it appeareth, that all the fat of their bodies goeth into their tails. Among the *Garamants* their Sheep eat flesh and milk, and it is not to be forgotten which *Aristotle*, *Dionysius*, *Afer*, and *Varro* do write, namely, that all Sheep were once wilde, and that the tame Sheep which now we have, are derived from those wilde Sheep, as our tame Goats, from wilde Goats: and therefore *Varro* saith, that in his days in *Phrygia* there were flocks of wilde Sheep, whereof as out of *Africk*, and the Region of the *Gadites*, there were annually brought to *Rome* both males and females, of strange and admirable colours, and that his great Uncle bought divers of them and made them tame: But it appeareth that these wilde Sheep or Rams were Musmons, of which we shall discourse afterwards: For wilde Sheep are greater then the tame Sheep, being swifter to run, stronger to fight, having more crooked and piked horns, and therefore many times fight with wilde Boars and kill them.

Flocks of
wilde sheep.

Oppianus.

The *Subus* doth also appear to be a kinde of wilde Sheep, for after that *Oppianus* had discoursed of the Sheep of *Creet*, he falleth to make mention of the *Subus*, which he saith is of a very bright yellow colour like the Sheep of *Creet*, but the wooll thereof is not so rough, it hath two large horns upon the fore-head, living both on the water and on the land, eating fish, which in admiration of it in the water gather about it, and are devoured, as we shall shew afterwards in his due place. The *Colus* also spoken of before, and called Snake, seemeth to be of this kinde, for it is in quantity betwixt a Sheep and a Hart. It hath no wooll, and when it is hunted, the Hunters use neither Dogs nor other Beasts to take it, but terrifie it with ringing of little bells, at the sound whereof it runneth to and fro distracted, and so is taken: And thus much I thought good to expresse before the general nature of Sheep, of the divers and strange kinds in other Nations, that so the studious Reader may admire the wonderful works of God, as in all Beasts, so in this, to whom in holy Scripture he hath compared both his Son and his Saints: and for as much as their story to be mingled with the others, would have been exorbitant and far different from the common nature of vulgar Sheep, and so to have been mixed amongst them, might have confounded the Reader: It was much better in my opinion to expresse them al together, and so to proceed to the particular nature of vulgar Sheep.

The several
parts of sheep.

And first of all the description of their outward parts: the Sheep ought to be of a large body, that so their wooll may be the more, which ought to be soft, deep, and rough, especially about the neck, shoulders, and belly, and those that were not so the ancient *Græcians* called *Apoki*, the *Latines*, *Apise*, that is, peild Sheep, for want of wooll, which always they did reject as unprofitable for their flocks: for there is no better signe, as *Pliny* saith, of an acceptable breed of Sheep, *Quam crurium brevitæ, & ventris vestitus*. The shortness of the legs, and a belly well clothed with Wooll.

The female to be admitted to the male after two years old. Till they are five year old they are accounted young, and after seven unprofitable for breed. In your choice of Sheep evermore take those which are rough with wooll even to their eyes, without any bald place upon them, and those females which bear not at two year old utterly refuse, avoid likewise partly coloured or spotted Sheep, but choose them that have great eyes, large tails, and strong legs: let them be young also, and of breed, *Nam melior est ea ætas, quam sequitur spes, quam ea quam sequitur mors, & probata est progenies, si agnos solent procreare formosos* (saith *Petrus Gresce*.) that is, that age is better which hope followeth, then that which death followeth: and it is a good breed of Sheep which bringeth forth beautiful Lambs. And concerning their Wooll, it is to be observed, that the soft wooll is not always the best, except it be thick withall, for Hares have soft but thin wooll, and in Sheep it ought to be contrary, and therefore the most fearful have the softest hair, the Sheep of *Scythia* in the cold Countries have soft wooll, but in *Sauromatia* they have hard wooll. *Florentinus* prescribeth, that the fine wooll of a Sheep is not curled, but standeth upright, for he saith, that curled wooll is easily corrupted or falsified.

The head of the Sheep is very weak; and his brain not fat; the horns of the female are weak if they have any at all, for in many places they have none, like Hindes, and in *England* there are both males and females that want horns: And again the Rams of *England* have greater horns then any other Rams in the world, and sometimes they have four or six horns on their head, as hath

hath been often seen. In *Africk*, their male-sheep or Rams are yeared with horns, and also their females: and in *Pontus* neither males nor females have ever any horns.

Their eyes ought to be great, and of a waterish colour, and all Beasts that want hands have their eyes standing far distant on their heads, especially Sheep, because they had need to look on both sides, and because they are of a simple and harmless disposition, as we shall shew afterwards: for the little eye, such as is in Lions and Panthers, betoken craft and cruelty: but the great eye, simplicity and innocency. Their teeth stand in one continued row or bone, as in a Horse, but in the upper chap there are no fore-teeth: the male having more teeth than the female.

There be some that write, that *Virgil* calleth Sheep *Bidentes*, because they have but two teeth, but they do it ignorantly, for we may read in *Servius*, *Nigidius* and *Nonius*, that Boars are called *Bidentes*, and all Beasts of two years old for they were first of all called *Bidenes quasi Biennes*, by interposition of the letter D, according to the other words, as we do not say *reire*, but *redire*; nor *reamare*, but *redamare*; nor *reare*, but *redare*; and so *Bidenes* for *Biennes*, because sacrifices were wont to be made of Sheep when they were two years old. If ever it happen that a Sheep have but two teeth, it is held for a monster, and therefore a Sheep is called *Ambidens*, and *Bidens*, because he hath teeth both above and beneath. The belly of a Sheep is like the belly of a Beast that chews the cud. The milk proceedeth from the ventricle or maw. The flanks hang down to the hinder-legs. The females have their udders betwixt their thighs, like to Goats and Cows: some of them have galls, according to the ordinary custom of nature, and some of them have none at all, for in *Pontus* where by reason they eat Wormwood they have no gall. Likewise in *Calais*: some we have shewed have two galls, and the *Scythia* Sheep have galls at one time, and not at another, as *Aliaius* writeth, for he saith in the very cold Countries, when snow and winter covereth the earth, there Sheep have no galls, because they keep within doors, and use no change of meat, but in the Summer when they go abroad again to feed in the fields, they are replenished with galls.

There is a Region in *Asia* called *Scythia*, wherein they say their Sheep have little or no milks. The reins of a Sheep are equal, and there is no Beast that hath them covered with fat like unto it. Sheep are also apt to grow exceeding fat, for in the year 1547. there was a fat Sheep given to the King of France in *Pickardie*, whereof the inward hoofs or cloves of his fore-feet were grown to be as long as eight fingers are broad, the tops whereof were recurved backward like the horns of a wilde Goat. Concerning their tails we have spoken already, for the vulgar Sheep have hairy tails like Foxes and Wolves. And thus much shall suffice to have spoken of their several parts.

In the next place we are to consider the food and diet of Sheep, and then their inclination, and the utility that ariseth by them, and lastly the several diseases with their medicines and cures. It is therefore to be remembered, that the Ancients appointed shepherds to attend their flocks, and there was none of great account, but they were called Shepherds, or Neatheads, or Goatheads, that is *Bucolici*, *Opiliones*, and *Epoti*, as we have shewed already in the story of Goats: and the Gentiles do report, that the knowledge of feeding Oxen and Sheep came first of all from the Nymphs, who taught *Asiaram* in the Island of *Co*. The *Gracians* therefore call a shepherd *Paimon*, that is, a feeder, or *Paimaneta* to feed; and the Poets also use *Paimaneta* for a shepherd, and the shepherds Dogs, that keep the flock from the Wolf, *Pominitay kunes*, for the Sheep being not kept well, be overcome by the Wolves, according to the saying of *Virgil*;

The food of
Sheep and in-
stitution of
shepherds,

Nam Lupus infidias explorat ovilia circum.

And *Ovid* likewise saith;

Incusoditum capiat ovile Lupus.

The whole care therefore of the Shepherd must be, first for their food; secondly, for their fold; and thirdly, for their health, that so he may raise a profitable gain, either to himself or to him that oweth the Sheep. To begin with the food. Their diet doth not much differ from Goats, and yet they have some things peculiar which must now be expressed. It is good therefore, that their pastures and feeding places look towards the Sun-setting, and that they be not driven over far, or put to too much labour: for this cause the good shepherd may safely feed his Sheep late in the evening, but not suffer them to go early abroad in the morning. They eat all manner of herbs and plants, and sometimes kill them with their bitings, so as they never grow more. The best is to give them always green meat, and to feed them upon land fallowed or ploughed to be sown with corn: and although by feeding them in fat pastures they come to have a softer wool or hair, according to the nature of their food, yet because they are of a moist temperament, it is better to feed them upon the salt and short pasture: for by such a diet, they both better live in health, and also bear more precious wooll.

In dry pastures they are more healthy than in the ferny, and this is the cause why it is most wholesome for them to keep in ploughed grounds, wherein they meet with many sweet and pleasant herbs, or else in upland meadows, because all moisture breedeth in them rottenness: he must avoid the Woods and shadowy places, even as he doth the fens, for if the Sun come not upon the Sheeps food, it is as hurtfull unto him as if he picked it out of the waters: and the shepherd must not think that there

there is any meat so grateful unto this cattle, but that use and continuance will make them to loath it, wherefore he must provide this remedy, namely to give them salt oftentimes in the Summer when they return from feeding, and if he do but lay it in certain troughs in the folds, of their own accord they will lick thereof, and it will encrease in them great appetite.

In the Winter time when they are kept within doores, they must be fed with the softest hay, such as is cut down in the Autumn, for that which is riper is less nourishable to them. In some Countries they lay up for themselves especially green Ewe leaves, or Elm, three-leaved-grass, fowed-vines, and chaffe or pease, when other things fail: where there are store of Vines, they gather their leaves for Sheep to eat thereof without all danger, and very greedily, and I may say as much of the Olive, both wilde and planted, and divers such other plants, all which have more vertue in them to fat and raise your beast if they be aspersed with any salt humor: and for this cause the Sea-wormwood excelleth all other herbs or food to make fat Sheep. And *Myndius* writeth, that in *Pontus* the Sheep grow exceeding fat by the most bitter and vulgar Wormwood. Beans encrease their milk, and also Three-leaved-grass, for that is most nourishable to the Ews with young. And it is observed for the fault which in *Latine* is called *Luxuria segetum*, and in *English* ranckness of corn, there is no better remedy then to turn in your Sheep in May when the ground is hard, if not before, for the Sheep loveth well to crop such stalks, and also the corn will thrive never the worse, for in some places they eat it down twice, and in the Countrey about *Babylon* thrice, by reason of the great fertility thereabouts, and if they should not do so, it would turn or run all into stalk and idle and unprofitable leaves. The same extasie is reported to follow Sheep when they have eaten *Eringia*, that we have expressed also in the History of Goats, namely, that they all stand still, and have no power to go out of their pastures, till their Keeper come and take it out of their mouths. It is reported that they are much delighted with the herb called *Laserpitium*, which first purgeth them, and then do fat them exceedingly: It is therefore reported that in *Cyrene*, there hath been none of this found for many years, because the Publicans that hire the pastures are enemies to Sheep. For at the first eating thereof the Sheep will sleep, and the Goat will fall a neezing. In *India*, and especially in the Region of the *Prasians*, it raineth many times a dew like liquid Honey falling upon the herbs and grass of the earth: wherefore the shepherds lead their flocks unto those places, wherewithal their cattle are much delighted, and such as is the food they eat, such also is the taste of the milk they render; neither need they to mingle Honey with their Milk, as the *Gracians* are constrained to do, for the sweetness of that liquor saveth them of that charge. Such a kinde of dew the *Hebrews* call *Manna*; the *Gracians*, *Aeromelos*, and *Drosomelos*; the *Germans*, *Himmelhung*; and in *English* Honey-dew; but if this be eaten upon the herbs in the month of May, it is very hurtful unto them. We have shewed already, that in some parts of *Africk* and *Ethiopia*, their Sheep eat flesh, and drink milk, and it is apparent by *Philostratus*, that when *Apollonius* travelled towards *India*, in the Region *Pegades*, inhabited by the *Orite*, they fed their Sheep with fishes, and so also they do among the *Carmanian* Indians, which do inhabit the Sea-coasts: and this is as ordinary with them, as in *Caria*, to feed their Sheep with figs, because they want grass in that Country: and therefore the flesh of the Sheep doth tast of fish when it is eaten, even as the flesh of Sea-fouls. The people of that Countrey are called *Ichthyophagi*, that is fish-eaters: Likewise the Sheep of *Lydia* and *Macedonia*, their Sheep grow fat with eating of fishes. *Ænius* also writeth of certain fishes about the bigness of Frogs which are given unto Sheep to be eaten. In *Arabia* in the Province of *Aden*, their Oxen, Camels, and Sheep, eat fishes after they be dried, for they care not for them when they be green: the like I might say of many other places, generally it must be the care of the shepherd to avoid all thorny and stony places for the feeding of his Sheep, according to the precept of *Virgil*;

Pliny.

Areanus.

*Si tibi lanicium cura, primum aspera sylva
Lappæq; tribulq; absint.*

Because the same thing, as he writeth, maketh them bald, and oftentimes scratcheth their skin asunder, his words are these;

Turpis oves tentat scabies

— cum tonsis illotus ad hæsit

Sudor, & hirsuti secuerunt corpora vepres.

Although a Sheep be never so sound, and not much subject to the Pestilence, yet must the shepherd regard to feed it in choice places: for the fat fields breed strait and tall Sheep, the hills and short pastures broad and square Sheep: the Woods and Mountain places, small and slender Sheep: but the best places of all are the plowed grounds. Although *Virgil* prescribeth his shepherd to feed his flock in the morning, according to the manner of the Countrey wherein he lived, for the middle part of the day was over hot, and not fit for cattel to eat in: yet other Nations, (especially *Germany* and *England* and these Northern parts of the world) may not do so. The whole cunning of shepherds is excellently described, for the ordering of their Sheep in these verses following;

Ergo

Ergo omni studio glaciem, ventosq; nivales;
 Quo minus est illis curæ mortalis egestas
 Avertes: viciumq; feres, & virgea lætus
 Pabula: nec tota claudes fœniliq; bruma.
 At vero Zephyris cum læta vocantibus æstas
 In salus * utrumq; gregem atq; in pascua mittes.
 Luciferi primo cum sydere frigida rura
 Carpatum: dum mane novum, dum gramina canent:
 Et ros in tenera pecori gratissimus herba est.
 Inde, ubi quarta sitim cœli collegerit hora,
 Et cantu querule rumpent arbuta cicada:

Ad puteos, aut alta greges ad stagna jubeto
 Currentem illignis petare canalibus undam.
 Æstibus at mediis umbrosam exquirere vallem,
 Sicubi magna Jovis antiquo robore quercus;
 Ingentes tendat ramos: aut sicubi nigrum
 Illicibus crebris sacra nemus accubet umbra.
 Tum tenues dare rursus aquas: & pascere rursus
 Solis ad occasum, cum frigidus æra vesper
 Temperat: & salus reficit jam roseida luna:
 Littoraq; halcyonem resonant, & acanthida dumi.

The description
 of a shep-
 heard's care
 out of Vir-
 gil.

* Oves & ca-
 pras.

When they return from their feeding, the shepherd must regard that he put them not into the folds hot, and if the time of the year be over hot, let them not be driven to pastures a far off, but feed them in those which are near and adjacent to their folds: that so they may easily have recourse unto the shadow: they ought not also to be turned out clustering all together, but dispersed abroad by little and little, neither must they be milked while they are hot, until they be cold a little, so likewise in the morning, let them be milked so soon as day appeareth, and the little Lambs be turned out unto them which were shut from them. But if there appear upon the grass Spiders-webs, or Cob-webs which bear up little drops of water, then they must not be suffered to feed in those places for fear of poisoning; and in times of heat and rain, drive them to the highest hills for pastures, which do most of all lie open to the windes, for there shall the cattle feed most temperately: They must avoid all sandy places, and in the month of April, May, June, and July, they must not be suffered to feed overmuch, but in October, September, and November, let them have their full, that so they may grow the stronger against the Winter time. The Romans had a special regard to chuse some places for the Summering of their Sheep, and some place for their Wintering, for if they summered them in *Apulia*, they wintered them in *Damnis*; and therefore (*Varro* saith) the flocks of *Apulia* betimes in the morning in the Summer season are led forth to feeding, because the dewy grass of the morning is much better then that which is dry in the middle of the day, and about noon when the season groweth hot, they lead them to shadowy trees and rocks, until the cool air of the evening begin to return, at which time they drive them to their pasture again, and cause them to feed towards the Sun-rising: for this is a general rule among the shepherds: *Quod mane ad solis occasum, & vespere ad solis ortum pascantur oves.* That is, that in the morning they feed their Sheep towards the Sun-setting, and in the evening towards the Sun-rising, and the reason of it is; *Quia infirmissimum pecori caput, averso sole pasci cogendum.* Because the head of Sheep is most weak, therefore it ought to be fed turned from the Sun. In the hot Countries a little before the Sun-setting they water their Sheep, and then lead them to their pasture again, for at that time the sweetness seemeth to be renewed in the grass, and this they do after the Autumnal æquinoctium. It is good to feed them in corn fields after harvest, and that for two causes: First, because they are exceedingly filled with such hearbs as they finde after the plough, and also they tread down the stubble, and dung the land, whereby it becometh more fruitful against the next year. There is nothing that maketh a Sheep grow more fat then drink; and therefore we read in holy Scripture how *Jacob* watered the Sheep, and the Daughters of *Jethro* their Sheep, at what time *Moses* came unto them, therefore it is best oftentimes to mingle their water with Salt, according to these verses;

At cui lactis amor, cytisum lotosq; frequentes;
 Ipse manu salsaq; ferat præsepibus herbas.
 Hinc & amant fluvios magis, & magis ubera tendunt,
 Et salis occultum referunt in lacte saporem.

There be many that trouble themselves about this question; namely, for what cause the Sheep of England do never thirst, except they see the water, and then also seldom drink, and yet have no more Sheep in England, then are in any other Countrey of the world; insomuch that we think it a prodigious thing that Sheep should drink: but the true cause why our English Sheep drink not, is, for there is so much dew on the grass, that they need no other water; and therefore *Aristotle* was deceived, who thinketh that the Northern Sheep had more need of water then the Southern. In *Spain* those Sheep bear the best fleeces of wooll that drink least. In the Island of *Cephalene* as we have shewed in the story of the Goat, all their Cattle for want of water do draw in the cold air; but in the hotter Countries every day once at the least about nine or ten a clock in the morning they water their Sheep; and so great is the operation of drink in Sheep, that divers Authors do report wonders thereof, as *Valerius Maximus*, and *Theophrastus*, who affirm that in *Macedonia*, when they will have their Sheep bring forth white Lambs, they lead them to the River *Aliatmon*; and when they will have them to bring forth black Lambs, to the River *Axius*, as we have shewed already. It is also reported that the River *Scamander* doth make all the Sheep to be yellow that drink thereof: Likewise there are two Rivers in *Antandria* which turn Sheep from black to white, and white to

The reason
 why the sheep
 of England do
 not drink.

black, and the like I might add of the River *Trages*, of the two Rivers of *Beotia*, all which things do not come to pass by miracle, but also by the power of nature, as may appear by the History of *Jacob*, when he served his father in law *Laban*.

For after that he had covenanted with *Laban*, to receive for his stipend all the spotted Sheep, the Scripture saith in this manner: *Then Jacob took rods of green Poplar, and of Hazel, and of the Chestnut tree, and piled white strakes in them, and made the white appear in the rods. Then he put the rods which he had piled into the gutters and watering troughs, when the Sheep came to drink, before the Sheep, and the Sheep were in heat before the rods, and afterwards brought forth young of party colour, and with small and great spots. And Jacob parted these Lambs, and turned the faces of the flock towards these party-coloured Lambs, and all manner of black among the Sheep of Laban, so he put his own flocks by themselves, and put them not with Laban's flock. And in every Ramming time of the stronger Sheep, Jacob layed the rods before the eyes of the Sheep in the gutters, that they might conceive before the rods, but when the Sheep were feeble he put them not in, and so the feebler were Laban's, and the stronger were Jacobs. Upon this action of the Patriarch Jacob, it is clear by testimony of holy Scripture, that divers colours laid before Sheep at the time of their carnal copulation, do cause them to bring forth such colours, as they see with their eyes: for such is the force of a natural impression, as we read in stories, that fair women by the sight of Blackamores, have conceived and brought forth black children, and on the contrary, black and deformed women have conceived fair and beautiful children; whereof there could be no other reason given in nature, but their only cogitation of and upon fair beautiful men, or black and deformed *Moors*, at the time of their carnal copulation.*

So that I would not have it seem incredible to the wise and discreet Reader, to hear that the power of water should change the colour of Sheep: for it being once granted, that nature can bring forth divers coloured Lambs, being holpen by artificial means, I see no cause, but diversity of waters may wholly alter the colour of the elder, as well as whited sticks ingender a colour in the younger: And thus much shall suffice to have spoken concerning the Summering of Sheep. For their Wintering I will say more when I come to entreat of their stabling or housing.

Of the copulation of Sheep.

Now then it followeth in the next place to discourse of copulation or procreation; for there are divers good rules and necessary observations, whereby the skilful shepherd must be directed, and which he ought to observe for the better encrease of his flock. First of all therefore it is clear, that Goats will engender at a year old, and some time Sheep also follow that season, but there is a difference betwixt the Lambs so engendered, and the other that are begotten by the elder: therefore at two year old they may more safely be suffered to engender, and so continue till they be five year old, and all their Lambs be preserved for breeding; but after five year old their strength and natural vertue decreaseth, so that then neither the Dam nor the Lamb is worthy the nourishing, except for the knife, for that is born and bred of an old decayed substance, will also resemble the qualities of his fires.

There be some that allow not the Lamb that is yeaned before the parents be four year old, and so they give them four years to engender and breed, namely till they be eight year old, but after eight years, they utterly cast them off: and this opinion may have some good reason, according to the quality of the Region wherein they live, for the sooner they begin to bear young, the sooner they give over; and herein they differ not from Cows, who if they breed not till they be four year old may continue the longer, and for this cause I will express the testimony of *Albertus*, who writeth thus: *Oves parere usq; ad annum octavum possunt, & si bene curentur vel in undecimum facultas pariendi protrahitur, quod tempus est tota fere vita, oves in quibusdam tamen terris marinis ubi sicca & salsa habent pascua vivunt per viginti annos & pariunt.* That is to say, Sheep may breed until they be eight year old, and if they be well kept until they be eleven, which time is for the most part the length of their days, although in some Countries upon the Sea coasts, they live till they be twenty year old, and all that time breed young ones, because they feed upon dry and salt pastures, and therefore *Aristotle* also saith, that they bring forth young ones all the time of their life.

The time of their copulation, as *Pliny* and *Varro* write, is from *May* till about the middle of *August*, and their meaning is, for the Sheep of those hot Countries. For in *England*, and other places shepherds protract the time of their copulation, and keep the Rams and Ewes asunder till *September*, or *October*, because they would not have their Lambs to fall in the cold Winter season, but in the Spring and warm weather: and this is observed by the ancient shepherds, that if the strongest Sheep do first of all begin to engender and couple one with another, that it betokeneth a very happy and fortunate year to the flock, but on the contrary, if the younger and weaker Sheep be first of all stirred up to lust, and the elder be backward and slow, it presageth a pestilent and rotten year.

Aristotle.
Albertus.

Helps for the copulation of Sheep.

They which drink salt Water are more prone to copulation then others, and commonly at the third or fourth time the female is filled by the male. There is a great similitude and likeness betwixt Sheep and Goats. First, for their copulation, because they couple together at the same time. Secondly, for the time they bear their young, which is five moneths, or a hundred and fifty days: also many times they bring forth twins like Goats, and the Rams must be away so admitted as the Lambs may fall in the Spring of the year, when all things grow sweet and green; and when

when all is performed, then must the males be separated from the females again, that so all the time they go with young, they may go quietly without harm.

In their conception they are hindered if they be over fat, for it is with them as it is among Mares and Horses, some are barren by nature, and others by accident, as by overmuch leanness or overmuch fatness. *Plutarch* maketh mention of an ancient custome among the *Græcians*, that they were wont to drive their Sheep to the habitation of *Agenor*, to be covered by his Rams: And I know not whether he relate it as a story, or as a Proverb to signifie a fruitful and happy Ramming time. I rather incline to the later, because he himself saith in the same place, that *Agenor* was a wise and skilful King, Master of many flocks, whose breed of Sheep was accounted the best of all that Nation, and therefore either they sent their females to be covered by his Rams, or else they signified a happy conjunction of the Rams and Ewes together. *Pliny* writeth, that if the right stone of a Ram be tyed or bound fast when he leapeth upon an Ewe, he will engender a male, but if the left stone be tyed, he will beget a female.

Means to make
the Rams ge-
nerate
males or fe-
males.

Near the City *Patra* there are two Rivers, one of them called *Milichus* and the other *Charadrus*, and the Cattle that drink of this water in the Spring time, do beget males, and therefore shepherds when they bring their Sheep and Goats to that River, they drive them to the farther side of the River, because they would have more females than males: for that vertue lyeth in one of the sides, but their Kine they suffer to drink on that side, because among their herds the male is best, for Bulls and Oxen serve them for sacrifice, and to till the earth, and therefore the male in that kinde, but in all other the female is more acceptable.

Both males and females are begotten as well by the vertues of waters, as by the vertue of the Rams, and likewise by the vertue of the winde: for when the North winde bloweth for the most part males are conceived, but when the South winde females: and therefore *Aristotle* saith: *In admittura tempore observare siccis diebus habitus septentrionales, ut contra ventum gregem pascamus, & cum spectans admittatur pecus, at si fœmina generanda sunt, austrinos flatus captare, ut eadem ratione matrices ineanantur.* That is to say, In the Ramming time you must observe the blowing of the Northern winde in dry days, and not only feed the flock against the winde, but also cause the Ram to leap the Ewe with his face to the North: but if you would engender females, then must you in like manner observe the South winde. Unto this experiment do *Palladius*, *Ælianus*, and *Columella* agree, and these things are necessary to be observed about the engendering of Lambs.

Now after that the Ewe is filled by the Ram, the diligent shepherd must have as great regard to keep her from abortment, or casting of her Lamb: therefore *Aristotle* saith, if presently after copulation there fall a showre, or if when they are great with young they eat Walnuts, or Acorns, they will cast their Lambs: and likewise if in time of Thunder the Ewe with young be alone in the field, the claps of Thunder will cause abortment; and the remedy thereof, for the avoiding of that mischief, is prescribed by *Pliny*: *Tonitrus (saith he) solitariis ovibus abortus inferunt, remedium est congregare eas ut coitu juventur*, that is, to call them together in times of Thunder, is a remedy against abortment. Therefore he requireth of a skilful shepherd a voice or whiffel intelligible to the Sheep, whereby to call them together, if they be scattered abroad feeding, at the first appearance and note of thunder. It is also reported, that there are certain veins under the tongue of a Ram, the colour whereof do presage or fore-shew, what will be the colour of the Lamb begotten by them: for if they be all white, or all black, or all party coloured, such also will be the colour of it that they engender.

Albertus.

Ewes bring forth for the most part but one at a time, but sometimes two, sometimes three, and sometimes four, the reason whereof is to be attributed either to the quality of the food whereof they eat, or else to the kinde from which they are derived: For there be certain Sheep in the *Orcaades*, which always bring forth two at one time, and many of them fix. There are also Sheep in *Magnetia*, and *Africk*, that bring forth twice in the year: And *Aristotle* in his wonders writeth, that the Sheep of *Umbria* bring forth thrice in a year, and among the *Illyrians* there are Sheep and Goats, that bring forth twice in the year, two at a time, yea sometimes three, or four, or five, and that they nourish them all together, with their abundance of milk, and besides some of their milk is milked away from them. *Egypt* is so plentiful in grasse, that their Sheep bring forth twice in a year, and are likewise twice lipped: so likewise in *Mesopotamia*, and in all moist and hot Countries.

The yeaning
of Lambs.
Bathius.

Many times times it falleth out, that the Ewe dyeth in the yeaning of her Lamb, and many times they bring forth monsters: so also do all other Beasts that are *multi para*: betwixt a Goat and a Ram, is a Musmon begotten, and betwixt a Goat-buck and an Ewe is the Beast *Cinirus* ingendered; and among the *Rhetians* many times there are mixed monsters brought forth, for in the hinder-parts they are Goats, and in the fore-parts Sheep: for Rams when they grow strong, old and wanton; leap upon the female Goats, upon which they beget such monsters, but they die for the most part immediately after the yeaning.

Albertus.

Sometimes wilde Rams come to tame Sheep, and beget upon these Lambs, which in colour and wooll do most of all resemble the father, but afterward when they bear young, their wooll be- ginneth to be like to other vulgar Sheep: when the Ewe is ready to be delivered, she travaileth and labourerth like a Woman, and therefore if the shepherd have not in him some Mid- wives skill, that in cases of extremity he may draw out the Lamb when the members stick

Custody of
Ewes and
young Lambs
and means to
encrease their
milk.

cross in the matrix, or else if that be impossible, because it is dead in the dams belly, yet to cut it out without peril and danger to the Ewe, in such cases the *Græcians* call a shepherd *Embronicos*.

Having thus brought the Sheep to their delivery for the multiplication of kinde, it then resteth to provide that the new born Lamb may be secured from Dogs, Woolfs, Foxes, Crows, Ravens, and all enemies to this innocent Beast, and also to provide that the Ewe may render to her young one sufficient food out of her udder; therefore they must be well and extraordinarily fed. We have shewed already the use of Salt, and then also it is very profitable when the Ewe is newly delivered of her Lamb, for it will make her drink and eat more liberally. In the Winter time for the encrease of their milk, in stead of green pastures, and such other things as we have expressed, it is requisite to give them corn, and especially plenty of Beans.

For this cause some prescribe to be given unto their Sheep the herb *Lanaria*, which they affirm to be profitable to be given to encrease milk; some the stone *Galacites* to be beaten to powder, and anointed upon the Ewes udder; and some prescribe to sprinkle water and salt upon them every morning in the house or field, before the Sun rising.

But herein I leave every man to his own judgement, hoping it will not be offensive to any, to relate those things before expressed, and resting in opinion, that both the food that is received inwardly, and also the Ointments that are applyed outwardly, will be sufficient means to procure abundance of milk in the Summer and Winter seasons.

Of the winter-
ing and sta-
bling of sheep.

Now therefore it followeth to entreat likewise of the Wintering of Sheep, for as there is more cost to keep them in cold weather than in warm, so it doth require at our hands some discourse thereof. Then it behoveth you to provide for them warm folds and stables, whereof the Poet writeth in this manner:

*Incipiens, stabulis edico in mollibus herbam
Carpere ovis, dum mox frondosa reducitur æstas:
Et multa duram stipula filicumque manipulis
Sternere subter humum; glacies ne frigida ledat
Molle pecus scabiemq; ferat, turpesq; podagras.*

Whereby it is evident that the cold Winters do beget in Sheep divers and many diseases, and for that cause it was the counsel of a wise and learned man, that our Sheep should not be turned out to feeding neither in cold or warm weather, until the frost were dissolved and thawed, from off the grass and earth.

*Palladius.
Pet. Crescent.*

The *Tarentine*, *Græcian*, and *Asian* Sheep, were wont to be altogether kept in stables within doors, lying continually upon planks and boards bored through, that so their precious fleeces might be the better safe-guarded from their own filth and urine; and three times in the year they let them out of their stables, to wash them and anoint them with Oyl and Wine: and to save them free from Serpents, they burned in their stables, and under their cratches, *Galbanum*, Cedar-wood, Womans hair, and Harts-horns: and of these *Tarentine* and *Græcian* Sheep, *Columella* writeth in this manner: It is in vain for any man to store himself with those *Tarentine* Sheep, for they ask as much or more attendance and costly food than their bodies are worth; for as all Beasts that bear wooll are tender, and not able to endure any hardness; so among all Sheep, there are none so tender as the *Tarentine* or *Græcian* Sheep, and therefore the Keeper of them must not look to have any playing days, nor times of negligence or sluggishness, and much less to regard his covetous minde, for they are cattel altogether impatient of cold, being seldom led abroad, and therefore the more at home to be fed by hand; and if by covetousness or negligence, one withdraw from them their ordinary food, he shall be penny wise, and pound foolish: that is, suffer a great loss in his cattel, for saving from them a little meat.

Every one of them all the Winter long, were fed with three pintes of Barley or Pease, or Beans three times a day, beside dryed Ewe-leaves, or Vine leaves, or Hay late mown, or fitches, or chaff. Besides there cannot be any milk taken from the dams, for at the first yeaning there is no more then to serve the little or least Lambs, and after a few days, even while they smell and taste of their dams belly, they were to be killed for want of suck, that every Lamb which was to be preserved for breed might have two dams or Ewes to suck, and so the poor Ewe was forced to a double miserie; first to loose her young one, and afterward to lend her paps and milk to a stranger. And moreover, they were forced to nourish more males than females, for that at two year old they were gelded, or killed, to sell their beautiful skins to the Merchant, for their wool was most pretious, by reason that never or seldom they went abroad to the fields. Their custody in the house from Serpents and other annoyances, is thus described by the Poets:

*Disce & odoratam stabulis incendere cedrum
Galbaneoq; agitare graves nidore chelydros.
Sæpe sub immotis præsepibus, aut mala tætu
Viperâ delituit, cælumq; exterrita fugit,
Aut tecto assuetus coluber.*

In consideration whereof, and of all the pains about the houting of these tender Sheep, the Poet teacheth the shepherd or Sheep-master to kill the Serpents, and dash out the brains of snakes, saying:

—Cape saxa manu; cape robora pastor
Tollentemq; minas, & sibi colla tumentem
Deice.

Concerning the ancient forms of their Sheep-stables, I finde this to be recorded by the ancients. First, they made them low and not of any high or lofty building, so stretching them out in length, and not in height, that it may be warm in the Winter time, for although there be no creature better cloathed by nature then a Sheep, yet is there not any more impatient of cold, nor more apt to take harm thereby. It must not be over-broad, yet so as the Ewe and her Lamb may lie both together, and the breathing place not left open at the top of the house or the sides, for that will let in too much air, but at the door or porch of their entrance, and that very low, that so the fresh air may quickly and easily come to their low heads and bodies, and also their breath the better avoid out of the stable.

The fashion of
sheep-coats or
stables.

They also had a care to cover all the floor with straw or dry boarded boards, or some such other matter, whereby they might stand continually dry and warm, and also clean and sweet, to the end they might not be annoyed in their own standings; and therefore the floor was made shelving or falling low on the one side, or else of hurdles like baskets to let out their urine, for they often make water: and these were often changed, cleansed, and turned. In this stable there ought to be divisions or partitions wherein in time of necessity and sickness, they may easily abide alone and be parted from the residue, and feed without annoyance of one another, and especially that one may not ride another, and during the time of the Winter, they did not let their cattel drink above once a day.

And these were the cures of the Ancients about their flocks of Sheep. For upon them they lived, they bought and sold, and herein also it is profitable to observe the ancient manner of their bargains about these creatures: for when a man came and bought Sheep, he made this protestation to the seller: *Tanti sunt mihi emptæ?* To whom the seller answereth, *sunt*: Then the buyer draweth his mony with these words; *Sic illasce oves, qua de re agitur, sanas recte esse uti pecus ovillum, quod recte sanum est, extra luscum minam. Venire glabro, neq; de pecore morbofo esse, habereq; recte licere: hac si recte fieri respondes? &c.*

The manner
how in old
time they
bought and
sold sheep.

First, the Buyer saith, shall I buy these Sheep for thus much money? and so draweth his money, to whom the Merchant or seller answereth, you shall: Then saith the chapman or buyer again to him, Do you promise to me, then that these Sheep are as sound as Sheep should be, without fault of winde or limb, without blindeness, without deafness, without pield bellies, not coming out of any infected flock; and so as it shall be lawful for me to enjoy them without all mens contradiction, If these things be true, then I will strike up the bargain: and yet doth not the seller change the property of his sheep, nor lose his Lordship over them until the mony be paid. And hereupon it cometh to pass that the buyer may condemn the seller, if the cattel be not so good as his bargain, or if he do not deliver them; even as the buyer is subject to the same judgement, if he do not deliver the price. And concerning shepherds, and custody of flocks I may adde a word or two more: First of all for the number of the Sheep, how many may safely be kept in every flock.

There is no need that I should give any rules about this business, for the Ancients were wont to set one shepherd over a hundred rough or coarse woolled Sheep, and two shepherds over a hundred fine woolled Sheep: the common flocks were seaventy, or fourscore, and the shepherd that followed them, was charged to be both vigilant and gentle, and therefore his discipline was: *Duci propior esse quam domino, & in cogendis, recipiendisque ovibus, adclamatione, ac baculo minetur, nec unquam telum emittat, neque ab his longius recedat, nec aut recubet, aut concidat, nam nisi procedit, stare debet, quoniam grex quidem custodia officium sublimem celsissimamq; oculorum, veluti speculam, desiderat, ut neq; tardiores, & gravidas dum cunctantur, neq; agiles & fetas dum procurrunt, separari a ceteris finat, ne fur aut bestia hallucinantem pastorem decipiat, saith Collumella: He must rather be a guide unto them then a Lord or Master over them, and in driving them forward, or receiving them home after they have stragled, he must rather use his chiding voice, and shake his staffe at them, then cast either stone or dart at them: neither must he go far from them at any time, nor sit down, but stand still, except when he driveth them, because the flock desireth the direction of their Keeper, and his eye like a lofty watch-tower, that so he suffer not to be separated asunder, either the heavy Ews great with young, because of their slow pace, nor yet the light and nimble ones which give suck, and are delivered of their young, which are apt to run away, lest that some ravening beast or thief deceive the loitering shepherd by taking away from him the hindmost or formost. There may also be more in a flock of Sheep then in a flock of Goats, because the Goats are wanton, and so disperse themselves abroad, but the Sheep are meek and gentle, and for the most part keep round together: Yet it is better to make many flocks then one great one, for fear of the pestilence.*

The general
discipline of
shepherds.

In the story of the Dogs we have shewed already, how necessary a shepherds Dog is to the flock, to defend them both from Woolfs and Foxes, and therefore every shepherd must observe those rules there exprest, for the provision, choice, and institution of his Dog: and to conclude this discourse of the shepherd, when the Lambs are young he must not drive their dams far

to pasture, but feed them neer the Town, Village or House, and his second care must be to pick and cull out the aged and sick Sheep every year, and that in Autumn or Winter time, lest they die and infect their fellows, or lest that the whole flock do go to decay for want of renewing and substitution of others, and therefore he must still regard that when one is dead he supply the place with one or two at the least, and if he chance to kill one at any time for the household, the counsel of *Antiphanes* is profitable to be followed; *Illas tantum maciare debes oves ex quibus nullus amplius fructus, vel casei vel velleris, vel lactis, vel agnorum perveniet.* That is, to kill those Sheep from whom you can never expect any more profit by their Lambs, Milk, Cheese, or Fleeces.

Of the diseases of Sheep, and their causes in general.

Of the diseases
of Sheep.

IN the next place it is necessary for the wise and discreet shepherd to avoid all the means whereby the health of his flock should be endangered, and those are either by reason of their meat and food that they eat, or else by reason of natural sicknesses arising through the corruption of blood, and the third way is by the biting of venomous beasts, as Serpents and Wolves, and such like; and a fourth way, scabs, Gowts, swellings, and such like outward diseases.

Of venomous meats or herbs unto Sheep.

THERE is an herb which the *Latines* call *Herba Sanguinaria*, *Pilosella*, *Numularia*, and by the *Germans* and *English* call Fenugreek, and by the *French* because of the hurt it doth unto Sheep, they use this circumscription of it: *L'herbe qui tue les brebis*. The herb that destroyeth Sheep. (It is called also *Serpentine*, because when Snakes and Adders are hurt therewith, they recover their wounds by eating thereof; when a Sheep hath eaten of this herb, the belly thereof swelleth abundantly, and is also drawn together, and the Sheep casteth out of his mouth a certain filthy spume or froath, which smelleth unsavourily, neither is the poor beast able to escape death, except presently he be let blood in the vein under his tail next to the rump, and also in the upper lip: yet is this herb wholesome to all other cattle except Sheep alone, wherefore the Shepherds must diligently avoid it. It is a little low hearb, creeping upon the ground with two round leaves, not much unlike to Parsley, it hath no favour with it, or smelleth not at all, the flower of it is pale and smelleth strong, and the stalk not much unlike the flower. It groweth in moist places, and near Hedges and Woods.

If in the Spring time Sheep do eat of the dew called the Hony-dew, it is poyson unto them, and they die thereof: Likewise canes in the Autumn do make their belly swell unto death, if they drink presently after they have eaten thereof, for that meat breaketh their guts asunder. The like may be said of Savine, Tamarisk, Rhododendron, or Rose-tree, and all kindes of Henbane.

The female Pimpernel doth likewise destroy Sheep, except as soon as they have eaten of it, they meet with the herb called *Ferus-oculus*, Wilde-eye; but herein lyeth a wonder, that whereas there are two kindes of this herb, a male and a female, they should earnestly desire a male, and eagerly avoid a female, seeing that both of them have the same taste in the palat of a man, for they taste like the raw roots of Beets.

There is an herb in *Normandy* called *Duna*, not much unlike Rubarb, or great Gentian, but narrower leaves, and standing upright, the nerve whereof in the middle is red, and it groweth about the waters, and therefore I conjecture it may be Water-sorrel, or Water-plantain, whereof when Sheep have eaten, they fall into a disease called also *Duna*, for there is bred in their liver certain little black Worms or Leeches, growing in small bags or skins, being in length half a finger, and so much in breadth, wherewithall when the Beast is infected, it is incurable; and therefore there is no remedy but to take from it the life: and that this is true, the Butchers themselves affirm, how many times they do finde such little worms in the Sheeps liver, and they say, they come by drinking of Fenny or Marshy-water. And to conclude, there is a kinde of Pannick also, whereof when Sheep have eaten it destroyeth them, and there be other herbs which every common shepherd knoweth are hurtful unto Sheep; and the Beast it self, though in nature it be very simple, yet is wise enough to chuse his own food, except the vehement necessity of famine and hunger causeth him to eat poysoned herbs.

In cases when their bellies swell, or when they have worms in their belly which they have devoured with the Herbs they eat, then they pour into their bellies the urine of men, and because their bellies presently swell and are puffed out with winde, the shepherds cut off the tops of their ears, and make them bleed, and likewise beat their sides with their staff, and so most commonly they are recovered. If Sheep chance to drink in their heat, so as their greafe be cooled in their belly, which Butchers do finde many times to be true, then the shepherd must cut off half the Sheeps ear, and if it bleed the Beast shall be well, but if it bleed not, he must be killed and eaten, or else he will starve of his own accord. If at any time a Sheep chance to devour a leach, by pouring in Oyl into his throat, he shall be safe from danger.

Of the Colds of Sheep.

Sheep are known to be subject to cold, not only by coughing after they have taken it, but also by their strength before they take it; for the shepherds do diligently observe, that when any frost or ice falleth upon a Sheep, if he endure it, and not shake it off, it is a great hazard but the same Sheep will die of cold, but if he shake it off, and not endure it, it is a sign of a strong, sound, and healthy constitution: Likewise for to know the health of their Sheep, they open their eyes, and if the veins appear red and small, they know they are sound, but if they appear white, or else red and full; they know they are weak, and will hardly live out Winter or cold Weather: also when they are taken in their hands, they press their back bone near the hips, and if it bend not they are sound and strong, but if they feel it bend under their hand, they hold them weak and feeble: Likewise if a man take them by the head or by the skin of the neck, if he follow him easily when he draweth him, it is a sign of weakness and imbecillity, but if it doth strive, and follow with great difficulty, then it is a token of health and soundness.

Of Scabs, and the causes of them.

The true original of Scabs is either as we have said already, leanness, or else cold, or wet, or wounds in the flesh by clipping, or to conclude, by the heat of the Beast in Summer not washed off, by thorns and prickings of bushes, or by sitting upon the dung of Mules, Horses, or Ases. Now when this first of all beginneth, it is easie for the shepherd to observe by these signes and tokens, for the tickling or itching humor, lying betwixt the skin and the flesh, causeth the poor Sheep either to bite the place with his teeth, or to scratch it with his horn, or to rub it upon a tree or wall, or if he can do none of these, stamp hard upon the ground with his fore-feet, for which it is good presently to separate the Sheep so affected from the flock. The description and cure whereof is thus expressed by Virgil:

The original
cause of scabs.

*Turpis oves tentat scabies, ubi frigidus imber.
Altijs ad vivum perdidit, & horrida cano
Bruma gelu: vel cum tonfit illotus adhaesit
Sudor, & hirsuti secuerunt corpora vepres.
Dulcibus idcirco fluvijs pecus omne magistri
Perfundunt, udisq; aries ingurgite villis
Mersatur, missusq; secundo defluit amni.
Aut tonsum tristi contingunt corpus amurca:*

*Et spumas miscent argenti, viciaq; sulphura,
Idaeq; piceae, & pingues unguine ceras,
Scillamq; helleborosq; graves nigrumq; bitumen.
Non tamen ulla magis praesens fortuna laborum est,
Quam si quis ferro potuit rescindere summum
Ulcus os: alitur vitium, vivinq; legendo,
Dum medicas adhibere manus ad vulnera pastor
Abnegat.*

which may be Englished in this manner: When the poor Sheep through wet showers, cold Winter, Summers sweat, or pricking of thorns, doth incur the filthy disease of scabs, then it concerneth his master to wash him in sweet Rivers over head and ears, yea to cast him in to swim for his own life, or else to anoint his body after it is clipped with the spume or froth of Oyl, and of Silver with Brimstone, and soft Idean Pitch, with Wax, Hellebore, Black-earth, or the flesh of Shrimps; or if it be possible to cut off the top of the wound with a knife.

Of the Scabs of Sheep, the first remedy.

This disease the French men call *Letac*, and of all other it is one of the most contagious, for our English proverb justifieth, one scabbed Sheep infecteth a whole flock, and *Textor* writeth thus of it; *Oves frequentius quam ullum aliud animal infestantur scabie, quam facit macies, ut maciem inopia cibi, huic morbo nisi occurratur unica totum pecus coinquinabit, nam oves contagione vexantur.* That is to say, Sheep are more oftentimes infected with scabs then any other creature, whereinto they fall through leanness, as they fall into leanness through want of food; and therefore if a remedy be not provided for this evil, one of them infected will defile all the residue, for Sheep are subject to contagion: for remedy whereof in France they use this medicine: First of all they shear the Sheep, and then they mingle together the pure froath of Oyl and water, wherein Hops have been sod, and the lees of the best Wine, and so let it soak in two or three days together: afterwards they wash them in Sea water, and for want of Sea water in salt water: and this medicine is approved, whereby both scabs and tikes are removed from the Sheep, and also the wooll groweth afterwards better then ever it did before; but it is better if a man can cure them without shearing then by shearing, as *Varro* writeth; and furthermore to wash Sheep oftentimes with this medicine, doth preserve them from scabs before they be infected: and others adde unto this medicine little sticks of Cypress-wood soaked in water, and so wash them therewith; some again make another medicine of Sulphure or Brimstone, Cyprus, white Lead and Butter, mingled all together, and so anoint their Sheep therewith. Some again take earth which is as soft as dirt, being so softened with the stale of an Ass, but evermore they have the scabbed place first of all, and wash it with cold or stale urine, and generally in Arabia they were never wont to use other medicine then the gum of Cedar, wherewithall they purged away by Ointment all scabs from Sheep, Camels, and Elephants:

phants: but to conclude, there is no better medicine for this evill then Urine, Brimstone and Oyl, as *Diophanes* writeth.

Another medicine for the Scabs.

TAke the lees of Wine, the froath of Oyl, white Hellebore mingled with the liquor of sod Hops, also the juyce of green Hemlock, which is expressed out of the stalk before it hath seed, after it is cut down and put into an earthen vessel with any other liquor mingled, with scorched salt, so the mouth of the vessel being made up close, set it in a dunghill a whole year together, that so it may be concocted with the vapour of the dung, then take it forth, and when you will use it, warm it, first of all scraping the ulcerous or scabbed part with an Oyster shell, or else with a sharp pumice stone, untill it be ready to bleed, and so anoint it therewith.

Another medicine of the same.

TAke the froath of Oyl sod away to two parts, I mean three parts into two, put therinto the stale urine of a man, which hath been heated by casting into it hot burning Oyster-shells, and mingle a like quantity of the juyce of Hemlock, then beat an earthen pot to powder, and infuse a pinte of liquid Pitch and a pinte of fryed or scorched salt, all which being preserved together, do cure the scabs of Sheep so often as they are used.

Another medicine.

A Drink being made of the juyce of Hops, and the herb Chamælion, and given unto them cureth them. Likewise the same being sod with the roots of black Chamælion, and anointed warm upon the place, according to *Dioscorides*, have the same operation. Likewise *Pliny* writeth, that the scabs of Sheep may be cured by salt water alone, either taken out of the Sea, or made by art, and forasmuch as there is great danger in the decoction thereof, lest that the water overcome the salt, or the Salt overcome the water, he prescribeth a mean how to know it, namely the equal and just temperament thereof, for (saith he) if it will bear up an Egge then it is well tempered, so that the Egg will swim and not sink, which you shall find by addition of equal and just quantity of water and Salt, that is, two pintes of water, a pinte of Salt, and so less to less, and more to more. But if there be any bunch or great scab which covereth any part of the skin, then open the scab and bunch, and pour into it liquid pitch and scorched salt: and thus much for the disease of the scabs.

Of the Holy fire which the Shepherds call the Pox, or the Blisters, or Saint Antonies fire.

THis evill is incurable, for it neither admitteth medicine nor resecation by knife, and therefore whensoever a Beast is infected therewith, it ought presently to be separated from the residue of the flock, for there is nothing that spreadeth it self more speedily: whensoever you adventure to apply any thing unto it, it presently waxeth angry, and perplexeth the whole body except it be the milk of Goats, and yet my Author speaketh thus of it: *Quod infusum tantum velet, ut blandiatur, igneam sevitiam, differens magis occisionem gregis, quam prohibens.* That is, It seemeth to close with raging fire, as it were to flatter it a little, rather deferring the death of the Beast, then doing away the disease. It is therefore prescribed by the most memorable Author of all the *Egyptians*, that men do oftentimes look upon the backs of their Sheep to see the beginning of this sickness, and when they finde a Sheep affected herewith, they dig a ditch or hole fit for him at the entering in of the Sheep-coat or stable, wherein they put the Sheep alive with his face upward, and back downward, and cause all the residue of the flock to come and piss upon him, by which action it hath been often found (as *Columella* writeth) that this evill hath been driven away, and by no other means.

Of the Warts, and Cratches of Sheep.

THis disease is called by the vulgar shepherds the Hedghog, and it doth annoy the Sheep two manner of ways, First, when some gauling or matter ariseth upon the paring of the hoof, or else a bunch arise in the same place having hair growing in the middle like the hair of a Dog, and under that a little worm, the worm is best drawn out with a knife, by cutting the top of the wound, wherein must be used great wariness and circumspection, because if the worm be cut asunder in the wound, there issueth out of her such a venomous pustulate matter, that poysoneth the wound, and then there is no remedy but the foot must be cut off. But the wound being opened, and the worm taken out alive, presently with a Wax-candle you must melt into it hot burning sewet, and if there be no bunch but only scabs, take Allum, liquid Pitch, Brimstone, and Vinegar, mingled all together, and apply it unto the wound, or else take a young Pomgranate before the grains grow in it, and bake it with Allum, casting upon it Vinegar, sharp Wine, and the rust of Iron fryed all together.

Of the Falling-sickness.

IT cometh to passe sometimes that Sheep are infected with the Falling-sickness, but the cure hereof can never be known, nor yet the sickness well till the beast be dead, and then (as Hippocrates writeth) by opening of the brain it will evidently appear, by the over great moistness thereof.

Of the pains in the Eyes.

IT is reported by Theophrastus and Pliny, that for clouds and other pains in the Eye of a Sheep, horned-poppy and Chamelia are very wholesome.

Of Phlegme in Sheep.

FOR the Remedy of this Disease, take Penyroyal, Marjoram, or wilde Nep made up together in wool, and thrust into the Nose of the Sheep, there turned round untill the Beast begin to neeze, also a stalk of black Hellebor boared through the ear of the Sheep, and there tyed fast for the space of four and twenty hours, and then taken out at the same time of the day that it was put in, by Pliny and Columella is affirmed to be an excellent remedy against the Phlegm.

Of the swelling in the Jaws.

THere is sometimes an inflammation or swelling in the Jaws of Sheep, which the Latins call *Tonsillæ*, coming by reason of a great flux of humors from the head unto that place, which may be cured two manner of wayes, first, by incision or opening the skin where the bunch lyeth, whereby all the watery tumors are evacuated, and the Beast cured; or else if through the coldnesse of the weather or some other accident you list not to cut the skin, then annoint it with liquid Pitch, prepared in such manner as is before expressed for the Scabs, by operation whereof, it will be dissolved and dispersed. When this evill ariseth in the begining of the Spring, many times it is cured without all remedy, because the Beast for the greedinesse of the sweet grasse stoopeth down her head, and stretcheth her neck, by which the straining and sorenesse of her jawes and throat departeth, and this sickness in a sheep is like the Kings-evill in a man. There be some that cure it by putting salt among the meat of these Beasts, or by Juniper berries, and Harts-tongue leaves beaten to powder.

For the Cough, and pain in the Lungs.

Shepherds for these diseases do take the powder of the root of Foal-foot, and mingle it with Salt, so give it unto the Sheep to lick, whereby they are perswaded, that the Lungs of the Beast are much comforted and strengthned, and furthermore against the Cough, they take blanched Almonds, and beat them to powder, and so tempering in them two or three cups of Wine, do infuse it in at the Sheeps Nostrils, and likewise Vervine which is called a kinde of Germander, but falsely, because it hath no good smell, is given by shepherds at this day unto their Sheep against the Cough.

Of sighing and shortness of breath.

FOR Sheep that are affected with much sighing, they use to bore a hole with an Iron through their ears, and remove the Sheep out of the place where they feed to some other place, and if it come from the sickness of the Lungs, then the herb called Lungwort or Crefwort, is the most present remedy in the World: If the root thereof be drunk in water, or a piece thereof tyed under the Sheeps tongue, or (as Celsus saith) give unto it as much Vinegar as the Beast can endure, or half a point of a Mans stale urine warmed at the fire, and infused into the Nostril with a little horn, this also is a remedy against Flegm in the Summer time.

Of the loathing of Sheep, and encreasing of their stomach.

IF at any time the Sheep forsake his meat, then take his tail and pull off from it all the Wool: Afterwards bind it as hard as ever you can, and so he will fall hard to his meat again: and Pliny affirmeth, that the same part of his tail which is beneath the knot will die after such binding, and never have any sense in it again.

Of the Fluxes of Sheep, and looseness of the belly.

For this disease the Shepherds take no other thing but the herb *Tormentilla*, or Set-foyl; where-withall they stop all manner of laxes, but if they cannot get the same herb, then they take salt and give it unto them; and so having increased their thirst, they give unto them black Wine, whereby they are cured.

Of the milt of Sheep.

IN April and May, through the abundance of thick grosse blood, the Milt of Sheep is stopped and filled, then the Shepherds will take two of their fingers, and thrust them within the Nostrils of the Sheep, there rubbing them untill they make them bleed, and so draw from them as much blood as they can.

Of the sickness of the Spleen.

Forasmuch as a Horse, a Man and a Sheep, are troubled with the same diseases, they are also to be cured with the same remedies, and therefore Spleen-wort given unto Sheep, as to a Man and a Horse (as we have already expressed) is the best remedy for this Malady.

Of the Fevers of Sheep.

Sometimes a shaking rage through an incensed and unnatural heat of the blood in the Sheep begeth in him a Fever, the best remedy whereof is to let him blood, according to these Verses;

*Quinetiam ima dolor babantum lapsus ad ossa,
Cum furit, atq; artus depascitur arida febris:
Profuit incensos aestus avertere: & inter
Ima ferire pedis salientem sanguine venam,
Quam procul aut molli succedere sapius umbra*

*Videris, aut summas carpentem ignavus herbas,
Extremamq; sequi, aut medio procumbere campo
Pascentem, & sera solam decedere nocti.
Continuo ferro culpam compece: priusquam
Dira per incautum serpat contagio vulgus.*

In which Verses the Poet defineth the signes of this disease and the cure. The signes he saith are solitariness, and a careless feeding, or biting off the top of his meat, following always the hindmost of the flock, and lying down in the middle of the field, when others be a feeding, also lying alone in the night time, and therefore he wisheth to let them blood under the pastern or ankle bone of their foot, but by often experiment it hath been proved, that to let them blood under the eyes or upon the eares, is as available as in the legs; but concerning the Fever we will say more in the discourse of the Lambs.

Of the Pestilence or Rottensness of Sheep.

His sickness first of all cometh unto Sheep out of the earth, either by some earthquak, or else by some other Pestilent humor corrupting the vitall spirit: for *Seneca* writeth, that after the City *Pompeii* in *Campania* was overthrown by an Earthquak in the Winter time, there followed a Pestilence which destroyed six hundred Sheep about that City in short time after, and this he saith did not happen through any natural fear in them, but rather through the corruption of water and air which lyeth in the upper face of the earth, and which by the trembling of the earth is forced out, poysoning first of all the Beasts because their heads are downward and feed upon the earth; and this also will poyson men if it were not suppressed and overcome by a multitude of good air which is above the earth. It were endlesse to describe all the evils that come by this disease, how some consume away by crying and mourning, filling both fields and hills with their lamentations, leaving nothing behind them, no not their skins or bowels for the use of Man: For the cure whereof, First change the place of their feeding, so that if they were infected in the woods or in a cold place, drive them to the hills or to sunny warm fields; and so on the contrary, if in warm places and clement air, then drive them to more turbulent and cold pastures: remove and change them often, but yet force them gently, weighing their tick and feeble estate, neither suffering them to die through laziness and idleness, nor yet to be oppressed through overmuch labour. When you have brought them to the place where you would have them, there divide them asunder, not permitting above two or three together, for the disease is not so powerful in a few as in a multitude; and be well assured that this removing of the air and feeding is the best Physick. Some do prescribe three-leaved grasse, the hardest roots of Reeds, sand of the Mountain, and such other Herbs for the remedy of this; but herein I can promise nothing certain, only the Shepherd ought oftentimes to give this unto his Sheep when they are found. I will conclude therefore this discourse of the Pestilence with the description of *Virgil*;

Balatu pecorum, & crebris mugitibus amnes,
 Arentesq; sonant ripe collesq; supini,
 Jamq; catervatim dat stragem: atq; aggerat ipsis
 In stabulis, turpi dilapsa cadavera tabo,
 Donec humo tegere, ac foveis abscondere disceunt,
 Nam neq; erat coriis usus, nec viscera quisquam
 Aut undis adolere potest, aut vincere flamma.

Nec tondere quidem morbo, illuvieq; peresa
 Vellera, nec telas possunt attingere putres
 Verum etiam invisos si quis tentarat amicum,
 Ardentes papule, atq; immundus olentia sudor
 Membra sequebatur: nec longo deinde moranti
 Tempore, contactos artus sacer ignis edebat.

It is reported by John Stowe, that in the third year of Edward the first, and in Anno 1275. there was a rich man of France, that brought a Sheep out of Spain (that was as great as a Calf of two year old) into Northumberland, and that the same Sheep fell rotten, or to be infected with the Pestilence, which afterward infected almost all the Sheep of England: and before that time the Pestilence or rottenness was not known in England, but then it took such hold, and wrought such effects, as it never was clear since, and that first Pestilence gave good occasion to be remembered, for it continued for twenty and six years together. And thus much for this disease of the Pestilence caused in England for the most part in moist and wet years.

Of Lice and Tikes.

IF either Lice or Tikes do molest Sheep, take the root of a Maple tree, beat the same into powder, and seethe it in water, afterwards clip off the wool from the back of the Sheep, and powre the said water upon the back, untill it hath compassed the whole body: some use for this purpose the root of *Mandragoras*, and some the roots of *Cypresse*, and I finde by good Authors, that all of them are equivalent to rid the Sheep from these annoyances: To conclude therefore the discourse of Sheeps diseases, it is good to plant near the Sheep-coats, and pastures of Sheep, the herb *Alysson*, or wilde Gallow-grasse, for it is very wholesome for Goats, and Sheep; likewise the flowers of wormwood dried and beaten to powder given unto Sheep with Salt, doth assuage all inward diseases and pains, and also purge them thoroughly.

The juice of Centory is very profitable for the inward diseases of Sheep, and likewise the flowers of Ivy. the Hoom tree hath four kinds of fruit, two proper, the Nut, and the Grain; two improper, the Line, and Hiphear, this Hiphear is very profitable for Sheep, and it is nothing else but a confection made out of the barks of the Hoom tree: the word it self is an *Arcadian* word, signifying no other thing then *viscus* and *stelis*. Sheep also delight in the branches of Maiden-hair, and generally the Wool of Sheep burned to powder and given them to drink, is very profitable for all their inward diseases. And thus much shall suffice to have spoken of the several infirmities and sicknesses of Sheep, which I desire the *English* Reader to take in good part, wondering very much at the manifold wits, and stirring pens of these dayes, wherein I think our times may be compared to the most flourishing times that ever were since the worlds beginning; yet none have adventured to apply their times and wits for the explication of the several sicknesses of Sheep and Cattle.

I know there are many Noblemen, Knights and Gentlemen of the Land, and those also which are very learned, that are great masters of Sheep and Cattle, and I may say of them as the Prophet David saith: *Their Oxen are strong to labour, and their Sheep bringeth forth thousands and ten thousands in their fields*: Whereby they are greatly enriched, and yet not one of them have had so much commiseration, either towards the poor Cattle, in whose garments they are warmed, or Charity to the World.

For the better direction to maintain the health of these creatures, as to publish any thing in writing for the benefit of Adams children, but such knowledge must rest in the breasts of silly Shepherds; and for the masters, either they know nothing, or else in strange visitation and mortality of their Cattle, they ascribe that to Witchcraft and the Devill, which is peculiar to the work of nature.

Horses, Dogs, and almost every creature, have gotten favour in Gentlemens wits, to have their natures described, but the silly Sheep better every way then they, and more necessary for life, could never attain such kindnesse, as once to get one page written or indited for the safeguard of their natures. I do therefore by these presents from my soul and spirit, invite all Gentlemen and men of learning, not only to give their mindes to know the defects of this beast, but also to invent the best remedies that nature can afford, for it is a token of highest mercy unto brute beasts to feed them when they are hungry, and to recover them when they are sick.

Columella and *Varro* two great Romans, and such as had attained to some of the greatest place of the Common-wealth, being men of excellent wits and capacity, yet had their names been forgotten and they never remembered, if they had not written of rustick and countrey matters, and it is no little honour unto them to have left that behind them in Print, or writing, which themselves had observed from following the Plough. Therefore it shall be no disgrace for any man of what worth soever to bestow his wits upon the Sheep; for certainly it is no lesse worthy of his wit, then it is of his teeth; and how necessary it is for the nourishment of man, we all know to this day, and besides there is nothing that so magnifyeth our *English* Nation as the price of our Wool

in all the kingdoms of the World. But what account the antients made of Sheep, I will now tell you; for their greatest men both Kings and Lords were Shepherds, and therefore you which succeed in their places shall bestow much lesse labour in writing of Sheep then they did in keeping: with the picture of a Sheep they stamped their antient money, and it is reported of *Man-drabulus*, that having found a great treasure in the earth, in token of his blind thankfulness to God, did dedicate three pictures of Sheep to *Juno*, one of Gold, another of Silver, and a third of Brasse; and besides the antient *Romans* made the penalties of the lawes to be Oxen and Sheep, and no Man might name an Ox untill he had named a Sheep.

Among the *Troglodytes* they had their Wives common, yet their Tyrants had lawes to keep their wives to themselves, and they thought it a great penalty for the Adultery of their wife, if the Adulterer payed them a Sheep.

The Poets have a pretty fiction, that *Endymion* the Son of *Mercury* fell in love with the Moon, who despised him, and that therefore he went and kept Sheep; afterward the Moon fell in love with his white Sheep, and desired some of them, promising to grant his request, if he would gratifie her choice: whereupon the wise-man (as *Probus* writeth) divided his flock into two parts, the whiter on the one side which had the courser Wool, and the blacker on the other side which had the finer Wool, so the Moon chose the white ones and granted him her love, whereupon *Virgil* thus writeth;

Pan munere niveo luna captum te Luna fefellit.

It may appear also in what great regard Sheep were in antient time, for that their Priests made holy Water and sacrifices for their sanctification, whereof I finde these relations in *Gyraldus*, *Virgil*, and others. At the lustration of Sheep there was another manner of sanctifying then at other times, for the Shepherd rose betimes in the morning, and sprinkled his Sheep all over with Water, making a perfume round about the fold, with Sulphur, Savine, Lawrell, Wine and fire, singing holy verses, and making sacrifice to the God *Pan*, for they did believe that by this lustration the health of their Sheep was procured, and all consuming diseases driven away.

It is reported that when Sheep of strange colours were sprinkled with this water, it signified great happiness to the Princes of the people, and they were gifts for the Emperour, whereupon *Virgil* made these Verses;

*Ipsæ sed in pratis aries jam suave rubenti
Mureæ, jam cræceo mutabit vellera luto.*

When men went to receive answers of the Oracles, they slept all night in the skins of Sheep. There was a Noble sacrifice among the *Pagans* called *Hecatombe*, wherein were sacrificed at one time a hundred Sheep at a hundred several Altars.

It is reported of King *Iosias*, that he sacrificed at one time twelve hundred Oxen and eight and thirty hundred Sheep; so great was the dignity of this Beast, that God himself placed in the death thereof one part of his worship: and whereas it was lawful among the Heathens to make their sacrifices of Sheep, Goats, Swine, Oxen, Hens, and Geese, they made reckoning that the Lamb and the Kid was best of all, for that God was not pleased with the quantity, but with the quality of the sacrifice. The antient *Egyptians* for the honor of Sheep, did neither eat nor sacrifice them, and therefore we read in holy Scripture, that the *Israelites* were an abomination to the *Egyptians*, because they both killed, and sacrificed Sheep, as all Divines have declared.

There is a noble story of *Clitus* who when he sacrificed at the Altar, was called away by King *Alexander*, and therefore he left his sacrifices and went to the King, but three of the Sheep that were appointed to be offered did follow after him, even into the Kings presence, whereat *Alexander* did very much wonder (and that not without cause) for he called together all the Wise-men and Sooth-sayers to know what that prodigy did foreshew, whereunto they generally answered that it did foreshew some fearful events to *Clitus*, for as much as the Sheep which by appointment were dead, that is, ready to die, did follow him into the presence of the King, in token that he could never avoid a violent death: and so afterwards it came to passe; for *Alexander* being displeased with him, because (as it is said) he had railed on him in his drunkenness, after the sacrifice commanded him to be slain, and thus we see how divine things may be collected from the natures of Sheep. These things are reported by *Plutarch* and *Pausanias*.

Another note of the dignity of Sheep, may be collected from the custom of the *Lacedemonians*: When they went to the wars they drove their Goats and their Sheep before them, to the intent that before they joyned battle they might make sacrifice to their Gods: the Goats were appointed to lead the way for the Sheep, for they were drove formost, and therefore they were called *Cateades*, and on a time this miraculous event fell out, for the wolves set upon the flocks, and yet contrary to their ravening nature, they spared the Sheep, and destroyed the Goats; which notable fact is worthy to be recorded, because that God by such an example among the Heathen *Pagans*, did demonstrate his love unto the good in sparing the Sheep, and his hatred unto the wicked in destroying the Goats, and therefore he reserved the Sheep to his own Altar:

Idibus alba Jovi, grandior agna cadit,

So saith *Ovid.*

Nigram hiemi pecudem, zephyris felicibus albam,

So saith *Virgil.*

And again;

Huc castus Hibilla

Nigrarum multo pecudum te sanguine ducet.

To *Jupiter* and to the Sun, they were wont to sacrifice white Sheep or Lambs, but to *Plato* and to the Earth, they sacrificed black Sheep or Lambs, in token of deadnesse: Therefore *Tibullus* writeth;

Interea nigras pecudes promittite Divis

And *Virgil* saith;

Duc nigras pecudes, ea prima piacula Juno.

When the *Grecians* sent their Spies to the tents of the *Trojans*, to discover what order, strength, and discipline they observed: *Nestor* and the antients of *Greece* vowed unto the Gods for every one of the Captains a several gift, that was, *Oin melainan, thelen hyporrenon*; that is, a black Sheep great with young: the reason whereof is given by the *Scholias*, they vowed (saith he) a black Sheep, because the Spies went in the night time, blackness being an emblem of darkness, and a Sheep great with young because of good fortune, for they sped well in *Troy*. In *Apollonia* there were certain Sheep that were dedicated to the Sun, and in the day time they fed neer the river in the best pasture, being lodged every night in a goodly spacious cave neer the City, over whom the greatest men both for wealth, strength, and wit were appointed every night to watch by turns for their better safeguard: and the reason of this custody, and the great account made of these Sheep, was for that the Oracle had commanded the *Apollonians* to do so unto them, and make much of them: Afterwards *Evenius* a noble man among them keeping watch according to his turn, fell asleep, so that threescore of the said Sheep were killed by Wolves; which thing came in question among the common Magistrates to know the reason of that fact, and how it came to pass, whether by negligence or by some other violent incurfion: *Evenius* being no wayes able to defend it, was condemned to have both his eyes put out, that so he might be judged never more worthy to see the light with those eyes, which would not wake over their charge, but wink and sleep when they should have been open. And to conclude, I will but add this one thing more, that whereas the *Egyptians* worshipped the Sheep for a god, God permitted the same unto the *Jews* to be eaten among common and vulgar meats, and also to be burned at the Altar for sacrifice; and whereas the said *Egyptians* did not only eat but sacrifice swines flesh, God himself did forbid his people that they should never eat or tast of Swines flesh as an abominable thing: by which he signifieth how contrary the precepts of men are to his own laws, for that which he forbiddeth, they allow; and that which they allow, he forbideth; and therefore how far the people of God ought to be from superstition, and from the traditions of men, is most manifest by this comparison, for that was never sanctified that came not into the Temple, and that was never lawful which was not approved by God: and those things which in his law have greatest appearance of cruelty, yet are they more just and equall then the most indifferent inventions of men, which seem to be stuffed out with mercy, and gilded over with compassion.

Cælius.

Herodotus.

And these things most worthy Readers, I have thought good to express in this place for the dignity and honorable account which the greatest men of the world in former times have made of Sheep, and thereby I would incite and stir you up, if it were but one noble spirited learned man, which is furnished with wit, means, and opportunity, to dive and pierce into the secrets of *English* Sheep, and Shepherds, and to manifest unto the world, the best and most approved means and medicines, for the propulsing and driving away of all manner of diseases from those innocent profitable beasts, and for their conservation in all manner of health and welfare.

I am sorry that our times are so far poysoned with Covetousness, that there is no regard of God, man, or beast, but only for profit and commodity: for as for the service of God, we see that the common devotion of men, and practise of their Religion, is founded upon a meer hope that therefore God will better prosper them in worldly affairs, and if it were not for the reward in this world, the professors of Religion would not be half so many as now they are; and that is true in them which the Devil slanderously objected to *Job*, namely, that they do not serve God for nothing, and they had rather with *Dives* have the Devils favour in rich garments and delicate fare, then with *Lazarus* with misery and contempt, enjoy the favour of God, and to set up their hopes for an other world. As for Men, we see that the Son loveth his Father but for patrimony, and that one man maketh much of another, for hope to receive benefit and recompence by them; and therefore it is no marvell if the silly beasts have obtained so little mercy, as to be loved, not because they are Gods creatures, but for that they are profitable and serviceable for the necessities of men: for this cause you nourish them, and not like the *Apollonians* aforesaid for the Oracles sake, but

for their fleeces and their flesh. Therefore if you have any compassion, learn how to help their miseries, and publish them to the world for the general benefit; for he cannot be good which is not merciful unto a beast, and that mercy doth easily die which groweth but in one heart of one mortal man.

There were a company of people in Egypt called *Lycopolitæ*, who worshipped a Wolf for a God, and therefore they alone among all the Egyptians did eat Sheep, because the Wolf did eat them; even so I can make no better reckoning of those men that nourish Sheep for their profit only, then I do of the *Lycopolitæ*, which worshipped a Wolf, for such men have no other God but their belly, and therefore I trust these reasons shall perswade some one or other to write a larger discourse of our English Sheep.

Of the several
commodity &
utility coming
by Sheep, and
first of their
flesh.

Now in the next place we are to discourse of the utilities that cometh by Sheep, for as it is the meekest of all other Beasts, so as the reward of meekness, there is no part of him but is profitable to man: his flesh, blood, and milk is profitable for meat, his skin and wool both together and asunder for garments, his guts and intrails for musick, his horns and hoofs for perfuming and driving away of Serpents, and the excrements of his belly and egestion or dung, for the amending and enriching of plowed lands, and for these occasions did the Egyptians worship it for a God, for that they could see no creature in the world, but had some parts altogether unprofitable unto men, but in this they found none at all.

First of all therefore to begin with their flesh, although Physitians have their several conceits thereof, as *Galen* (who saith) that the flesh of Hares is better then the flesh of Oxen and Sheep; and *Simeon Zetbi*, who being forced to confess the goodness of Mutton or Sheeps-flesh in the beginning and middle of the Spring, yet writeth that it is full of superfluities and evill juice, and hurtful to all flegmy and moist stomachs. *Crescentiensis* also writeth, that the flesh of Sheep hath an unpleasant tast through overmuch humidity, and fit for none but for Countrey-labouring men: Indeed I grant the opinion of *Platina*, who writeth thus concerning Rams: *Ovem arietem demibus ne attingas, non modo enim ejus caro non prodest, verum etiam vehementer obest*; that is, That Rams flesh we ought never to touch, for it is not only unprofitable, but it is much hurtful: yet in England the flesh of Rams is usually eaten; either through the craft or subtilty of the Butchers, or else through Covetousness. But in many houses (as I have heard) there is a kinde of Venison made of the flesh of Rams, which is done by this means; First they take the Ram, and beat him with stripes on all parts till the flesh grow red, for such is the nature of the blood, that it will gather to the sick affected places, and there stand to comfort them, so by this means after the Ram is killed, the flesh looketh like Venison: But as in other discourses, namely, Hares and Conies, we have already shewed our hatred of all cruel meats, so also I utterly dislike this, for if it be not sufficient to kill and eat the beast, but first of all put it to Tyrannical torments, I cannot tell what will suffice, except we will deal with beasts, as *PILATE* did with *CHRIST*, who was first of all whipped and crowned with thorns, and yet afterward did crucifie him.

But for the taking away of that Rammy humour and rank moistness which is found in the Male-sheep, they use to geld them when they are young and suck their dams, or else within the compass of a year after their yeaning, whereby the flesh becometh so temperate, sweet, and savory, as any other flesh in the world; and if they passe a year, then do they use to knit them, and so in time their stones deprived of nourishment from the body by reason of knitting, do dry and consume away, or utterly fall off, whereby the whole flesh of the Beast is made very seasonable and wholesome. It is granted by all, that when they are young, that is to say, a year old, their flesh is very wholesome, and fit for nourishment of mans nature, but that they increase much phlegm, which evill is allayed by eating Vinegar and drinking wine unto it. In many places they salt their Muttons when they are killed, and so eat them out of the pickle, or else roast them in the smoak like Bacon. Within the territory of *Helvetia*, there is a publick law whereby the Butchers are forbidden to buy any forain Sheep, after the feast of St. James; that is, the five and twenty day of July, for although that after that time they grow fat, yet is their flesh then lesse wholesome, and their fat more hurtfull, then that which is gotten in the Spring of the year.

It were needless for me to set down the division of a dead Sheep into his quarters, shoulders, legs, loins, racks, heads, and purtinances, for that they are commonly known, and the relation of them can minister small learning to the Reader, but every part hath his use, even the blood that is taken from him when his throat is cut, hath his peculiar use for the nourishment of man, and above all other things the fat of his loins commonly called his sewer wherein it excelleth all other beasts whatsoever, for their reins are covered all over with fat.

Of their milk.

There is no less use of their milk not only for young, but for old persons, and as well for the rich to beautifie their tables, as for the poor to serve their hungry appetites, and there be some people in *Africk* that have no corn in all their Countrey, and therefore in stead of bread, their common food is milk, the goodness whereof is thus expressed by *Fierra*;

Quod præstat? Capra, post? Oves, inde boves.

Evermore the milk of an Ewe is best that is newest and thickest, and that which cometh from a black Sheep is preferred before that which is milked from a white, and generally there is no beast whereof

whereof we eat, but the milk thereof is good and nourishable, therefore the milk of Sheep is preferred in the second place, and there is no cause that it is put in the second place but for the fatness thereof, otherwise it deserved the first, for as the fatness maketh it less pleasant to the palate and stomach of Man, yet is it more pretious for making of Cheese; and we have shewed already that in some places as in the Island *Erythrea*, the milk of Sheep yeeldeth no whay, and that they can make no Cheese thereof, but by mingling abundance of water with it; they make abundance of Cheese in the *Apennine* hills, and in *Lyguria*; the Cheese of *Sicilia* is made of Goats and Sheeps milk, and generally Cheese made of Sheeps milk is the better the more new it is. The nature of a Sheep is to give milk eight moneths together, and in *Italy* they make Butter also of the milk of Sheep, all the Summer time unto the feast of *St. Michael* they milk them twice a day, but after that, untill they cupple with their Rams, they milk them but once a day; the faults of Cheeses made of their milk is either because they are over dry or hollow, and full of eyes and holes, or else clammy like birdlime, the last proceedeth from the want of pressing, the second through overmuch salt, and the third by overmuch drying in the Sun. And thus much shall suffice to have spoken of those things in Sheep which are fit to be eaten.

In the next place we come to discourse of their Wool, and of the shearing or clipping of Sheep, for although their flesh be pretious, yet it is not comparable in value to their fleeces: for that when they are once dead, they yeeld no more profit, but while they live they are shorn once or twice a year, for in *Egypt* they are shorn twice a year, and also in some parts of *Spain*. And it appeareth that in antient times there were great feasts at their Sheep-shearings, as is apparent in the holy Scripture in many places, and especially by the history of *Absalon*, who after he had once conceived malice against his Brother *Amnon*, he found no opportunity to execute the same, untill his Sheep-shearing feast, at which time in the presence of all his brethren the Kings sons (even at dinner) when no man suspected harm, then did *Absalon* give a sign to his wicked servants to take away his life, which they performed according to their Masters malice.

It appeareth by the words of *Pliny*, who writeth thus; *Oves non ubiq; tondentur, durat quibusdam in locis vellendi mos; quietiam nunc vellunt, ante triduo jejunas habent quo languida minus radices lane retinent*; that is, Sheep are not every where shorn, for yet unto this time in many places they do commonly observe the old custom of pulling the wool off from the Sheeps back, and they which do now pull the wool and not shear it, do alwayes cause their Sheep to fast three days before, that so being made weak the roots of the wool may not stick so fast, but come off more easily.

And indeed I am confirmed in this opinion by the *Latine* word *Vellus*, which signifieth a fleece, which can be derived from no other *Radix* or *Theam*, nor admit any other manner or kinde of notation, then a *vellendo*, that is, from pulling.

Cato also in his Book of Originals writeth thus, *Palatini collis Romæ altera pars Velleia appellata fuit, a vellenda lana ante Hetruscum tonsuram incolis monstratam*; that is to say, There was one part of the hill *Palatine* at *Rome*, which was called *Velleia*, from the pulling of wool, for it was their custom there to pull their wool, before the inhabitants learned the *Hetrurian* manner of shearing Sheep; by which testimony we see evidently the great torment that the poor Sheep were put unto when they lost their fleeces, before the invention of shearing, for it is certain by the antient pictures and statues of Men, that there was no use of shearing either hair or wool, from Men or Sheep.

But the hair of Men grew rude, and in length like Womens, and Sheep never lost their fleeces but by pulling off, and therefore *Varro* writeth, that four hundred and fifty years after the building of *Rome* there was no Barber or Sheep-shearer in all *Italy*, and that *Publius Ticinius Menas* was the first that ever brought in that custom among the *Romans*, for which there was a monument erected in writing in the publick place at *Ardea*, which untill his time was there sincerely preserved.

Now concerning the times and seasons of the year for the shearing of Sheep, it is not only hard, but also an impossible thing to set down any general rule to hold in all places. The best that ever I read is that of *Didymus*, *nec frigido adhuc, nec jam æstivo tempore, sed medio vere Oves tondendæ sunt*; That is, Sheep must neither be shorn in extreme cold weather, nor yet in the extreme heat of Summer, but in the middle of the Spring.

In some hot Countries they shear their Sheep in *April*; in temperate Countries they shear them in *May*, but in the cold Countries in *June* and *July*, and generally the best time is betwixt the Vernal Equinoctium, and the Summers solstice, that is, before the longest day, and after the days and nights be of equall length; there be some that shear their Sheep twice in a year, not for any necessity to disburden the beast of the fleece, but for opinion that the often shearing causeth the finer wool to arise, even as the often mowing of the grasse maketh it the sweeter. In the hot Countries the same day that they shear their Sheep, they also anoint them over with Oyl, the lees of old wine, and the water wherein Hops are sod, and if they be near the Sea side, three days after they drench them over head and ears in water, but if they be not near the Sea side, then they wash them with rain water sod with Salt: and hereby there cometh a double profit to the Sheep: First, for that it will kill in them all the cause of scabs for that year, so as they shall live safe from that infection: and secondly the Sheep do thereby grow to bear the longer and the softer wool. Some do shear them within doors, and some in the open sun abroad, and then they chuse the hottest

Columella.

Palladius.

Gelsus.

Shearing time
in England.

and the calmest days, and these are the things or the necessary observations, which I can learn out of the writings of the ancients about the shearing of Sheep.

Now concerning the manner of our *English* Nation, and the customs observed by us about this businesse, although it be needlesse for me to expresse, yet I cannot contain my self from relating the same, considering that we differ from other Nations. First therefore, the common time whereat we shear Sheep is in *June*, and Lambs in *July*; and first of all we wash our Sheep clean in running sweet waters, afterward letting them dry for a day or two, for by such washing all the wool is made the better and cleaner: then after two days we shear them, taking heed to their flesh, that it be no manner of way clipped with the sheares, but if it be, then doth the shearer put upon it liquid pitch, commonly called Tar, whereby it is easily cured and kept safely from the flies. The quantity of wool upon our Sheep is more then in any other Countrey of the world, for even the least among us (such as are in hard grounds) as in *Norfolk*, the uppermost part of *Kent*, *Hertfordshire*, and other places, have better and weightier fleeces then the greatest in other Nations: and for this cause the forain and *Latin* Authors do never make mention of any quantity of wool they shear from their Sheep, but of the quality.

The quantity in the least is a pound, except the Sheep have lost his wool, in the middle sort of Sheep two pounds or three pounds, as is vulgar in *Buckingham*, *Norhampton*, and *Leicester shires*: But the greatest of all in some of those places, and also in *Rumney marsh* in *Kent*, four or five pounds: and it is the manner of the Shepherds and Sheep-masters to wet their Rams, and so to keep their wool two or three years together growing upon their backs, and I have credibly heard of a Sheep in *Buckinghamshire* in the flock of the L. P. that had shorn from it at one time, one and twenty pound of wool. After the shearing of our Sheep, we do not use either to anoint or wash them, as they do in other Nations, but turn them forth without their fleeces, leaving them like meadows new mowen, with expectation of another fleece the next year. The whole course of the handling of our Sheep is thus described by the flower of our *English* Gentlemen husbands Master *Thomas Tusser*:

Wash Sheep for the better where water doth run,
And let him go cleanly and dry in the Sun,
Then shear him and spare not, at two days an end,
The sooner the better his corps will amend,
Reward not thy Sheep when ye take off his coat
With twitches, and slashes as broad as a goat:

Let not such ungentleness happen to thine
Lest flie with her gentles do make him to pine.
Let Lambs go unclipped till June be half worne,
The better the fleeces will grow to be shorne,
The Pye will discharge thee for pulling the rest,
The lighter the Sheep is, then feedeth it best.

And in another place of the husbandry of Sheep he writeth thus:

Good farme and well stored, good housing and dry,
Good corn and good dairy, good market and nigh,
Good shepherd, good till-man, good Jack and good Gill,
Makes husband and buswife their coffers to fill:
Let pasture be stored and fenced about,
And tillage set forward as needeth without.

Before you do open your purse to begin,
With anything doing for fancy within,
No storing of pasture with baggagely til,
With ragged and aged as evill as it:
Let carren and barren be shifted away,
For best is the best, whatsoever you pay.

And in another place speaking of the time of the year for gelding Rams, and selling of wool which he admonisheth should be after *Michaelmas*, he writeth thus:

Now geld with the gelder, the Ram and the Bull,
Sew ponds, amend dams, and sell Webster the wool.

But of the milking of Sheep he writeth thus:

Put Lamb fro Ewe, to milk a few,
Be not too bold, to milke and fold,
Five Ewes allow, to every Cow,
Sheep wrigling tail, hath made without fail.

And thus far *Tusser*, besides whom I finde little discourse about the husbandry of Sheep in any *English* Poet.

The value of
English wool
and the use
thereof.

And for the conclusion or rather farther demonstration of this part, concerning the quality of our *English* wool, I can use no better testimony then that of worthy Mr. *Camden*, in his *Britannia*, for writing of *Buckinghamshire* he useth these words, *Hæc tota fere campestris est, solo item argillaceo, tenaci & fecundo, Pabulis pratis innumeros ovium greges pascit, quarum mollia & tenuissima vellera ab Asiaticis usque gentibus expetuntur*; that is to say, The whole County of *Buckingham* is of a clammy, champaign, fertile soil, feeding innumerable flocks of Sheep with his rich and well-grown pastures or meadows, whose soft and fine fleeces of wool are desired of the people of *Asia*; For we know that such is the trade of Merchandise and transportation of *English* cloth, the rare fineness and smoothness thereof is admired in *Asia*; namely, in *Palestina*, and other Kingdoms of the Turk,

Turk, and therefore they have *English* houses of Merchants, both at *Aleppo*, *Tripoli*, and other places. Again speaking of *Lemster ore*, or *Lemster wool* in *Herfordshire*, he writeth thus: *Sed ei præcipua hodie gloria est a lana in circum vicinis agris (Lemster ore vocant) cui excepta Apula & Tarentina, palmam deferunt Europæi omnes.* The greatest glory of that soil is in their wool, which ariseth from Sheep, feeding in the fields and pastures adjoining thereunto, (which wool they call *Lemster ore*) and all Christendom yeeldeth praise and price unto it next after the *Apulian* and *Tarentinian* wool.

And indeed so sweet is the gain that cometh by Sheep, that in many parts of the Land there is a decay of tillage and people, for their maintenance, and therefore the said Mr. *Camden* saith most worthily, even like himself, that is honest and impartial in all his writings, for in the beginning of his description of *Northamptonshire*, where I think above all parts depopulation and destroying of Towns is most plentiful, (so that for Christians now you have sheep, and for a multitude of good house-holders, you shall have one Shepherd swain and his Dog lying upon forty shillings a year, or little more) he writeth in the words of *Hythodæus* after the commendation of the Sheep and wool of that Countrey: *Ovibus oppleta & quasi obsessa, quæ (ut Hythodæus ille dixit) tam miens esse tamque exiguo ali solebant, nunc (uti fertur) tam edaces atque indomite esse ceperunt ut homines devorent, ipsos agros, domos, oppida vastent, ac depopulentur:* which words I cannot better *English* then in the words of an *Epigrammatarian* in our age, for to this effect, according to my remembrance he writeth;

Sheep have eat up our pastures, our meadows, and our downes,
Our Mountains, our Men, our Villages and Towns;
Till now I thought the common proverb did but jest,
That sayes a black sheep is a biting beast.

Concerning the goodness of *English Wool*, and the difference of it from others, the reason is well given by *Gesner* and *Cardan*: *Lana earum molles & crispæ sunt, ideoq; nunc ut olim Milesia celebratur: nec mirum cum nullum animal venenatum mittat Anglia, & sine luporum metu pecus vagetur: nulli enim in Anglia hodie lupi reperiuntur. Rore celi sitim sedant greges, ab omni alio potu arcantur quod aque ibi ovibus sint exitiales;* that is to say, The wool of *English* Sheep is soft and curled, and therefore it is now commended as highly as ever was the *Milesian* wool in ancient time: and not without just cause, for they are neither annoy'd with the fear of any venomous Beast, nor yet troubled with Wolves, and therefore the strength of their nature and peaceable quiet wherein they live, doth breed in them the better wool; and besides they never drink, but quench their thirst with the dew of heaven. And thus much for the discourse of *English wool*.

I am never able sufficiently to describe the infinite commodities that come unto men by wool, both for gardens, for hangings, for coverings, for hats, and divers such other things, and therefore it shall not be unpleasant I trust unto the Reader, to be troubled a little with a farther discourse hereof, if I blot some paper in describing the quality of the best wool in other Nations. First of all therefore we are to remember these two things, that the best wool is soft and curled, and that the wool of the old Sheep is thicker and thinner then the wool of the younger, and the wool of the Ram followeth the same nature, of whom we will speak more in his story. Only in this place our purpose is to expresse the examination of wool as we finde it related by Authors, according to their severall Countries. Therefore as we have said already out of Mr. *Camden's* report, the *Tarentinian* and *Apulian* must have the first place, because the Sheep of those Countries live for the most part within doors, and besides that, are covered with other skins. In *Spain* they make greatest account of the black wool, and it appeareth by good History, both in our *English* Chronicle and others, that the Sheep of *Spain* were of no reckoning till they were stored with the breed of *England*. There is a little Countrey called *Pollentia* neer the *Alpes*, of the wool whereof *Martial* maketh mention, as also of the *Canusine* red wool, and therefore *Ovis Canusina* was an Emblem for pretious wool, his Verses are these:

Non tantum pullo lugentes vellere lanas,
Roma magis fuscis, vestitur Gallia ruffis,
Canusinatus nostro Syrus asserere sudet.

We have spoken already of the wool of *Istria* and *Liburnia*, which if it were not for the spinning in *Portugal*, and the Websters art thereupon, it were no better for cloth then hair. *Strabo* writeth, that the wool of *Mutina*, whereby he meaneth all the Countrey that lyeth upon the *Scutana*, is very soft and gentle, and the best of *Italy*, but that of *Liguria* and *Millain*, is good for no other use but for the garments of servants.

About *Padua* their wool is of a mean price, yet they make of it most pretious works of *Tapestry*, and *Carpets* for tables, for that which was rough and thick in ancient time was used for this purpose, and also to make garments, having the shags thereof hanging by it like rugs. There is a City called *Feltrum*, and the wool thereof by the Merchants is called *Feltriolana*, *Felt-wool*, they were wont to make garments hereof neither woven nor sewed, but baked together at the fire like hats and caps, whereof *Pliny* writeth thus, *Lana & per se coacta vestem faciunt, & si addatur acetum etiam ferro resistunt,*

resistunt, imo vero etiam ignibus novissimo sui purgamento quippe abenis coquentium extracte indumentis usu veniunt Gallorum ut arbitror invento, certe Gallicis hodie nominibus discernuntur. Wool hath this property, that if it be forced together it will make a garment of it self, and if Vinegar be put unto it, it will bear off the blow of a sword, dressed at the fire and purged to the last, for it being taken off from the brazen coffer whereon it was dressed, it served for clothing, being as he thought an invention of the Gals, because it was known by French names, and from hence we must see the beginning of our felt-hats. The *Betican* wool is celebrated by *Juvenal*, when he speaketh how *Caullus* fearing shipwrack, was about to cast him out into the water;

*Infecit natura pecus, sed & egregius fons
Viribus occultis & Beticus adjuvat aer.*

Of the colours
of Wool.

For the colour of Wool in that Countrey groweth mixed, not by any art, but naturally through their food, or their drink, or the operation of the air. The *Lavoditian* Wool is also celebrated, not only for the softnesse of it, but for the colour, for that it is as black as any Raven, and yet there are some there of other colours, and for this cause the *Spanish* Wool is commended, especially *Turditania*, and *Coraxi* (as *Strabo* writeth) for he saith the gloss of the Wool was not only beautiful for the purity of the black, but also it will spin out into so thin a thread as was admirable, and therefore in his time they sold a Ram of that Countrey for a talent. I may speak also of the Wool of *Parma*, and *Altinum*, whereof *Martial* made this distichon;

*Velleribus primis Appulia; Parma secundis
Nobilis, Altinum tertia laudat ovis.*

We may also read how for the ornament of wool, there have been divers colours invented by art, and the colours have given names to the Wool, as *Simatulis lana*, wool of Sea-water-colour, some colour taken from an *Amethyst* stone, some from brightness or clearness, some from Saffron, some from Roses, from Mirtles, from Nuts, from Almonds, from Wax, from the Crow, as *Color coraxicus*, and from the purple fish, as from the *Colasine*, or the *Tyrian*, whereof *Virgil* writeth thus;

*He quoque non cura nobis levior tuenda,
Nec minor usus erit, quamvis Milesia magno
Vellera mutantur Tyrios incocta rubores.*

From hence cometh the chalke colour, the Lettice colour, the Loot-tree root, the red colour, the Azure colour, and the Star colour. There is an herb called Fullers-herb, which doth soften Wool, and make it apt to take colour, and whereas generally there are but two colours, black and white that are simple, the antients not knowing how to dye Wool, did paint it on the outside; for the triumphing garments in *Homer* were painted garments. The *Phrygian* garments were colours wrought with needle-work, and there was one *Attalus* a King in *Asia*, which did first of all invent the weaving of Wool and Gold together, whereupon came the name of *Vestis Attalica*, for a garment of cloth of gold.

The *Babylonians* and the *Alexandrians* loved diversity of colours in their garments also; and therefore *Metellus Scipio* made a law of death against all such as should buy a *Babylonish* garment, that was carpets or beds to eat upon for eight hundred *Sesterces*. The shearing of cloth or garments made of shorne cloth, did first of all begin in the dayes of *St. Augustine*, as *Fenistella* writeth. The garments like poppies had the original before the time of *Lucilius* the Poet, as he maketh mention in *Tarquanius*.

The lasting of
Wool.

There was a fashion in antient time among the *Romans*, that a distaffe with Wool upon it, was carryed after Virgins when they were going to be married: the reason thereof was this (as *Varro* writeth) for that there was one *Tanaquillus*, or, *Caia Cecilia*, whose Distaffe and Wool had endured in the Temple of *Sangi* many hundred years, and that *Servius Tullus* made him a cloke of that Wool, which he never used but in the temple of Fortune, and that that garment afterwards continued 500 and 60 years, being neither consumed by moths, nor yet growing threadbare, to the great admiration of all which either saw it or heard it. And thus much I thought good to adde in this place concerning the diversity of Wool, distinguished naturally according to several regions, or else artificially after sundry tinctures. Likewise of the mixing and mingling of Wool one with another, and diversities of garments, and lastly of the lasting and enduring of Wool and Garments, for it ought to be no wonder unto a reasonable man, that a woollen garment not eaten by moths, nor worn out by use, should last many hundred years, for seeing it is not of any cold or earthly nature, but hot and dry, there is good cause why it should remain long without putrification: and thus much in stead of many things for the Wool of Sheep.

The use of
Sheep skins.

As we have heard of the manifold use of the Wool of Sheep, so may we say very much of the Skins of Sheep for garments and other uses: and therefore when the Wool is detracted and pulled off from them, they are applyed to Buskins, Brest-plates, Shooes, Gloves, Stomachers, and other uses, for they are also dyed and changed by tincture into other colours, and also when the Wool

Wool is taken off from them, they dresse them very smooth and stretch them very thin, whereof is made writing parchment, such as is commonly used at this day in *England*, and I have known it practised at *Tocetour*, called once *Tripontium* in the County of *Northampton*: and if any part of it will not stretch but remain stiffe and thick, thereof they make writing tables, whereon they write with a pencil of Iron or Brasse; and afterward deface and rase it out again with a sponge or linnen cloth. Hereof also (I mean the skins of Sheep) cometh the coverings of Books, and if at any time they be hard, stubborn, and stiffe, then they soften it with the Sheeps sewer or tallow.

The bones of Sheep have also their use and employment for the hafting of knives. The *Rhetians* of the urine of Sheep do make a kinde of counterfeit Nitre. And *Rassius* saith, that if a man would change any part of his Horses hair, as on the forehead, take away the black hairs and put them into white, let him take a linnen cloth and wet it in boyling milk of Sheep, and put it so hot upon the place that he would have changed, so oftentimes together till the hair come off with a little rubbing, afterward let him wet the same cloth in cold Sheeps milk, and lay it to the place two or three days together, and the hair will arise very white (thus saith he;) and there are certain flies or moths which are very hurtful to gardens, if a man hang up the panch of a Sheep, and leave for them a passage or hole into it, they will all forsake the flowers and herbs, and gather into that ventricle, which being done two or three times together, make a quit riddance of all their hurts, if you please to make an end of them.

The Swallows take off from the backs of Sheep flocks of Wool, wherewithal the provident Birds *Ruellius* do make their nests to lodge their young ones after they be hatched.

With the dung of Sheep they compasse and fat the earth, it being excellent and above all other *Of the dung of* dung necessary for the benefit and encrease of Corn, except Pigeons and Hens dung which is hotter, and the sandy land is fittest to be amended with Sheeps dung, also plants and trees if you mingle therewith ashes.

Now we are to proceed to the gentle disposition of Sheep, and to expresse their inward qualities and moral uses; and first of all considering the innocency of this Beast, I marvel from whence the *Gortynian Cretian* custom proceeded, which caused Adulterers for their punishment to ride throughout the whole City crowned with Wool, except that so they might signifie his tender and delicate effeminacy; and therefore as some are crowned with gold in token of virtue and valiant acts, so vice (especially the wantonness of the flesh) deserveth to be crowned with Wool, for the looseness and beastliness thereof, not because such a crown was a sufficient punishment, for an opprobry and continual badge of ignominy, even as forgerers and perjured persons ride with papers on their heads, upon bare horse backs, and so forth.

By the behaviour of Sheep at their Rutting or Ramming time the Shepherds observe tempests, rains, and change of weather. If they be very lustful and leap often upon their females, but if they be slow and backward, then is the poor naked man glad, for that thereby he conceiveth hope of a gentle Winter, and temperate weather. Also if in the end of Autumn they stamp upon the ground with their feet, it betokeneth hard weather, cold Winter, much Frost and Snow, about the time of the first rising of the *Pleiades* or seven Stars. Which thing is thus Poetically expressed by *Avienus*;

— Si deniq; terram
Langera fodiant caput, aut tendantur in arcton,
 Cum madidus per marmora turbida condit
Pleiadas occasus, cum brumæ in frigora cedit
Frugifer Autumnus, ruet æthera concitus imber.

Concerning the simplicity of Sheep, I must say more, and also of their innocency, yet the simplicity thereof is such, and so much, that it may well be termed folly, or *Animal ineptissimum*, for *Aristotle* writeth thus of it, *Repit in deserta sine causa, hyeme obstante ipsum sepe egreditur stabulo, occupatum a nive, nisi pastor compulerit, abire non vult, sed perit desistens, nisi mares a pastore ducantur, ita enim reliquus grex sequitur*; that is, Without cause it wandereth into desert places, and in the winter time when the air is filled with cold winds, and the earth hardened with hoare frostes, then it forsaketh and goeth out of his warm coat or stable, and being in the cold Snow, there it will tarry and perish, were it not for the care of the Shepherd, for he taketh one of the Rams by the horns, and draweth him in adoors, then do all the residue follow after. They are also very obedient to the voice and call of the Shepherds, and to the barking and cry of their Dogs, and no lesse is their love one toward another, every way commendable, for one of them pityeth and sorroweth for the harm of another, and when the heat of Sun offendeth them, *Albertus* writeth, that one of them interposeth his body to shadow the other.

Their Dam or Ewe loveth her Lamb, and knoweth it by smelling to the hinder parts, and if at any time the Dam do not love or make reckoning of her young one, they give her the herb Pennywort or Water-wall to drink in water, and then as the *Scholias* affirmeth, natural affection increaseth in her. Of the foolishness of Sheep, there was an Emblem to signifie by a man riding upon a golden Fleece, one ruled by his servant or wife;

*Tranat aquas residens pretioso in vellere Phryxus,
Et flavam impavidus per mare scandit ovem.
Ecquid id est? vir sensu habeti sed divite goza,
Conjugis aut servi quem regit arbitrium.*

And therefore *Aristophanes* reproving the stolidity of the *Athenians*, calleth them Sheep: And *Origen* writing upon *Leviticus*, saith; *Ovium immolatio affectuum stultorum, & irrationabilium correctio*. The Sacrificing and killing of Sheep, is nothing else but the correction of our foolish and unreasonable affections. We have shewed already in the story of the Goat, of a Goat that nourished a Wolves whelps, which in the end did destroy her, and the self same is ascribed also to a Sheep.

Love and hatred of Sheep.

Aristotle.

They observe great love and concord with Goats, and live in flocks together, and for this cause it happeneth, that more Goats are destroyed by Wolves then Sheep, for that the Goats forsake their fellows, and straggle abroad for food, but the Sheep very seldom: and it is observed, that if a Wolf kill a Sheep, and afterwards any garments be made of the wooll of that Sheep, they easily and more speedily breed Lice and vermin then any other, and also procure itch in the bodies of them that wear them, whereof *Cardan* giveth this reason; *Haud mirum videri debet ovis pellem a Lupo dilaniate pruritum movere, nam ob vehementem metum, tum etiam ob contrariam naturam mali afficitur, & si mori enim ultimum sit supplicium, magis tamen afficitur corpus in uno quam in altero genere, metuit homo magis in mari fluctuans quam coram hostibus*. It ought not (saith he) move any man to wonder, that the wooll of a Sheep torn asunder by a Wolf should beget and breed itch, for that affection ariseth from both, from the vehemency of fear before it be dead through the sight and sense of the Wolf, and also by reason of a contrary nature that is oppressed and devoured by another, and although death be the last punishment, yet we see divers affections follow dead carcases after death, and as a man is more afraid of the Sea when he is in peril of death therein, then of the face of his enemy, so is it in this case, betwixt the Sheep and the Wolf.

Coelius.

The same *Cardan* affirmeth, that Sheep are afraid of Wolves even after death; for the wooll of a Sheeps skin will fall off in the presence of a Wolf. Unto this subscribeth *Oppianus*, or rather *Albertus* received it from *Oppianus*, and furthermore (it is said) that if the strings of a Sheeps and Wolfs guts be fastened to one and the same Instrument, they will never make good Harmony; and furthermore, if a Drum be made of a Sheeps skin, and another of the Wolfs skin, the Drum of the Sheeps skin will jar, and sound unpleasantly in the presence of the Wolfs skin: but of these things I have no certain grounds, only I say, there may be natural reason from the substance and matter, both of one and other, why this accident may chance without discord and hatred of each other, but from the difference and solidity of the matter; as for example; the guts of a Wolf are strong and hard, and will abide greater strain then the guts of a Sheep; if therefore the Musitian will strain the one like the other, it must needs fly asunder: likewise the skin will give a deeper and louder sound upon a Drum, by reason of the substance, then a Sheeps: and so some may ignorantly ascribe that difference to an antipathy in nature, for as a Candle in the presence of a great Torch or Fire, giveth less light to the eye, so doth a drum made of a Sheeps skin, less sound to the sense of hearing, in the presence of another made of a stronger and harder beasts skin: and to conclude, as a twine thread will not hold stretching in the presence (I mean in comparison) of a silk thread, although it be of the same quantity, even so will not a Lute string made of a Sheeps gut, in comparison of another made out of a Wolf. But all the question is, how it cometh to pass, that one of the skins hanged up in the presence of the other should be consumed before other, that is, a Sheeps skin in the presence of the Wolfs, as a Gooses skin will loose the feathers before the Eagles. The answer is easie, for the dryer that the body is, the less excremental humor it containeth: and so will last the longer, and all wilde silvestrial beasts are dryer then the tame, modern, and domestical; as for example, the Wolf then the Sheep; the Lion then the Dog; the Pheasant then the Cock; the Eagle then the Goose: and for these causes the skins of the one do waste before the other, not for fear or secret opposition, but for want of better enduring substance.

The Poets do ascribe unto their Gods *Lanceos pedes*, feet made of Wooll, for that they come softly and suddenly without noise to take vengeance upon malefactors; and therefore when they describe *Saturn* tyed up a whole year with bands of wooll, their meaning is, to shew how with patience he forbore his wrath and indignation. Bees are enemies to Sheep; and there are no cattel that do so much enrich men as Sheep and Bees.

There is a story in *Suidas* and *Hesychius*, of one *Chrysamis*, who was very rich in Sheep in the Island of *Ceus*, and there came every year an Eel, and stole away his best Sheep among all the flock, at last he met with it and slew it; afterward the ghost of the Eel appeared to him in the night, warning him (for fear of other harm) to see him buried. *Chrysamis* neglected it, and therefore he and all his family perished. By which story I cannot guess any other meaning, but that some man stole away his Sheep, and for that he took upon him a private revenge, most inhumanely suffering him to lie unburied and setting more by a beast then the life of a man, as a just punishment of God he perished: and thus I conclude this natural and moral discourse of the Sheep with that fiction of *Esop*, who writeth, that on a time as the Shepheards were making merry in a Cottage, and eating a Sheep, the Wolf came and looked in, saying unto them: *Atqui ego si tantum facerem, quantum ciceretis tumultum?* If I should eat a Sheep as you do, you would all rise in an uprore: which is fitted against them that make good laws, and observe none themselves.

Of

Of the RAM.

Having thus made a general description of the Sheep, wherein we have spent no more time than was fit and convenient, we are now forced to the several species and kinds, and first of all, order and nature teacheth us to discourse of the male, which in our English language is called a Tup or Ram, derived I do not doubt from the French, *Ran*, although also they call him *Belier*; the Germans, *Hoden wider*, and *Hammell*; the Italians, *Montone*, and *Ariete*; the Spaniards, *Carnero*; the Helvetians, *Ramchen*; the Grecians in ancient time *Krios*, *Ariacha*, *Cerafe*, and now in these days *Kriare*; the Hebrews, *Ail*, or *Eel*; the Chaldees plurally, *Dikerin*; the Arabians, *Kabfa*; and the Persians, *Nerameisch*. Now concerning the Greek and Latine names, there is some difference among the learned about their notation, etymology, or derivation; for although they all agree, that *Aries est dux & maritus pecorum*, yet they cannot consent from what root, stem, or fountain, to fetch the same. *Isidorus* bringeth *Aries ab aris*, that is, from the Altars, because the sacrificing of this beast was among all other Sheep permitted, and none but this except the Lambs. Others derive it of *Arer*, which signifies

The several names of Rams.

nifieth vertue, becaute that the strength and vigor of Sheep lyeth in this above all other, for there is in his horns incredible strength, in his minde or inwards part incredible courage and magnanimity, but the truest derivation is from the *Greek* word *Arneios*. Some *Latines* call him also *Nefrens*, and plurally *Nefrendes*, for distinction from the Weather or gelded Sheep, for the stones were also called *Nefrendes* and *Nebrundines*, and the Epithets of this Beast are, horn-bearer, insolent, violent, fighting, fearful, writhen, swift, wooll-bearer, leaping, head-long, warriour, and in *Greek*, meek, gentle, and familiar, and is not known by the name *Celos*, for that it leadeth the whole flock to the pastures, and back again to the folds. And thus much may suffice for the name and demonstrative appellation of this Beast; now we will proceed forward to the other parts of his story, not reiterating those things which it hath in common with the Sheep already described, but only touching his special and inseparable proper qualities.

The chief of
Rams for
breed.

First of all for the election of Rams fit to be the father of the flock, and to generate and increase issue, and therefore *Varro* and others, call him *Admissarius Aries*, a stallion Ram. They were wont to make choise of such an one from an Ewe that had brought forth twins, for that it is conceived, he will also multiply twins; for first in the choise of a Ram, they look unto his breed and flock from whence he is descended, and then to his form and outward parts: as in Horses, Oxen, Dogs, Lions, and almost all creatures, there are races and stocks preferred one before another, so is it also in Sheep, and therefore require that he be *Boni seminis pecus*, a Ram of a good breed, and next of the form and outward parts, although some never look further then colour; but *Columella* adviseth that his wooll, palate of his mouth, and tongue be all of one colour, for if the mouth and tongue be spotted, such also will be the issue and Lambs he begetteth, for we have shewed you already, that the Lamb for the most part followeth the colour of the Rams mouth, such a Ram is thus described by the Poet.

Palladius.

*Illum autem quamvis aries sit candidus ipse,
Nigra subest udo tantum cui lingua palato,
Rejice, ne maculis infuscet vellera pullis
Nascentium.*

Crescentius.

And therefore for as much as the young ones do commonly resemble the father, and bear some notes of his colour, let your Ram be all black, or all white, and in no case party-coloured; and for the stature and habit of his body let it be tall and straight; a large belly, hanging down and well cloathed with wooll; a tail very long and rough; a broad fore-head; large stones; crooked winding horns toward his snout, having his ears covered with wooll, a large breast, broad shoulders and buttocks; his fleece pressed close to his body, and the wooll not thin nor standing up. And for the horns, although in all Regions Rams have not horns, yet for windy and cold Countries the great horned Beasts are to be preferred, for that they are better able through that defence to bear off winde and weather, yet if the climate be temperate and warm, it is better to have a Ram without horns, because the horned Beast being not ignorant what weapons he beareth on his head, is apter to fight then the pold Sheep, and also more luxurious among the Ewes, for he will not endure a rival or companion-husband, although his own strength and nature cannot cover them all: but the pold Ram on the other side is not ignorant how naked and bare and unarmed is his head, and therefore like a true coward, sleepeeth in a whole skin, being nothing so harmful to his corrivals, nor to the females, but well indureth partnership in the work of generation.

Columella.

Albertus.
The resemblance
betwixt
the Sun and
the Ram.
Macrobius.

There is no Beast in the world that so much participateth with the nature of the Sun as the Ram, for from the Autumnal *Equinoctium* unto the Vernal, as the Sun keepeth the right hand of the Hemisphere, so doth the Ram lie upon his right side; and in the Summer season as the Sun keepeth the other hand of the Hemisphere, so doth the Ram lie upon his other side. And for this cause the *Lybians* which worshipped *Ammon*, that is the Sun, did picture him with a great pair of Rams horns. Also, although in the heavenly or celestial sphere or Zodiack there be nothing first or last, yet the *Egyptians* have placed the Ram in the first place, for their Astronomers affirm, that they have found out by diligent calculation, that the same day which was the beginning of the worlds light on the face of the Earth, then was the sign *Aries* in the midst of Heaven, and because the middle of Heaven is as it were the crown or upper-most part of the World, therefore the Ram hath the first and uppermost place, because it is an Equinoctial sign, making the days and nights of equal length, for twice in the year doth the Sun pass through that sign, the Ram sitting as it were judge and arbiter twice every year, betwixt the day and night.

Cælius.
The sign of
the Ram in the
Zodiack.

Poetical fictions
& riddles.

There be Poetical fictions how the Ram came into the Zodiack; for some say, that when *Bacchus* led his Army through the Deserts of *Lybia*, wherein they were all ready to perish for water, there appeared to him a goodly Ram, who shewed him a most beautiful and plentiful fountain which relieved and preserved them all; afterward *Bacchus* in remembrance of that good turn erected a Temple to *Jupiter Ammonius*, also in that place for so quenching their thirst, placed there his Image with Rams horns, and translated that Ram into the Zodiack among the Stars, that when the Sun should pass through that sign, all the creatures of the world should be fresh, green and lively, for the same cause that he had delivered him and his Host from perishing by thirst, and made him the Captain of all the residue of the signes, for that he was an able and wise Leader of Souldiers. Other again tell the tale somewhat different, for they say; At what time *Bacchus* ruled *Egypt*, there came to him one

Ammon,

Ammon, a great rich man in *Africa*, giving to *Bacchus* great store of wealth and cattel to procure favour unto him, and that he might be reckoned an inventor of some things: for requital whereof *Bacchus* gave him the land of *Thebes* in *Egypt*, to keep his Sheep and Cattel, and afterward for that invention he was pictured with Rams horns on his head, for remembrance that he brought the first Sheep into *Egypt*; and *Bacchus* also placed the sign of the Ram in Heaven: These and such like fictions there are about all the signes of Heaven, but the truer observation and reason we have shewed before out of the *Egyptians* learning, and therefore I will cease from any farther prosecution of these fables.

They ought to be two year old at least before you suffer them to joyn in copulation with the Ewes, and for two months before to be separate and fed more plentifully then at other times, that so at their return they may more eagerly and perfectly fill the Ewes: and then also before copulation, and at the time that they are permitted in some Countries they give them Barly, and mix Onions with their meat, and feed them with the herb *Salomons* seal, for all these are vertuous to stir up and inchease their nature. And likewise one kinde of the *Satyrium* and salt water, as we have said in the discourse aforegoing.

Now, at the time of their copulation they have a peculiar voice to draw and allure their females differing from the common bleating, whereof the Poet speaketh, *Blaterat hinc aries, & pia balat ovis*: This Beast may continue in copulation, and be preserved for the generation of Lambs till he be eight year old; and it is their nature the elder they be, to seek out for their fellows the elder Ewes or females, forsaking the younger by a kinde of natural wisdom.

Now concerning the time of their admission to copulation, although we have touched it in the former Treatise, yet we must add somewhat more in this place. In some places they suffer them in *April*, and some in *June*, that so they may be past danger before *Winter*, and be brought forth in the *Autumn*, when the gras after harvest is sweet, but the best is in *October*, for then the *Winter* will be over-passed before the Lamb come forth of his dams belly. Great is the rage of these Beasts at their copulation, for they fight irefully till one of them have the victory; and for this cause *Arietat* among the Writers is a word to expresse singular violence:

Arietat in portas & duros objice postes.

And *Silvin* of *Dioxippus*,

Arietat in primos objicitq; immania membra.

And so *Seneca* in his book of Anger, *Magno imperatori antequam acies inter se arietarent, cor exiluit*: And indeed great is the violence of Rams, for it is reported that many times in *Rhetia* to try their violence, they hold betwixt the fighting of Rams a stick, or bat of Corn-tree, which in a bout or two they utterly diminish and bruise in pieces.

There is a known fable in *Abstenius*, of the Wolf that found a couple of Rams, and told them that he must have one of them to his dinner, and bad them agree betwixt themselves, to whose lot that death should happen, for one of them must die; the two Rams agreed together, that the Wolf should stand in the middle of the close, and that they twain should part one into one corner, and the other into the other corner of the field, and so come running to the Wolf, and he that came last should lose his life to the Wolfs mercy; the Wolf agreed to this their device, and chose his standing, while the Rams consented with their horns, when they came upon him to make him sure enough from hurting any more Sheep: forth therefore went the Rams, each of them unto his quarter, one into the East, and the other into the West, the Wolf standing joyfully in the midst, laughing at the Rams destruction; then began the two Rams to set forward with all their violence, one of them so attending and observing the other, as that they might both meet together upon the Wolf, and so they did with vengeance to their enemy; for having him betwixt their horns they crushed his ribs in pieces, and he fell down without stomach to Rams flesh. This invention, although it have another moral, yet it is material to be inserted into this place to shew the violence of Rams; and from this came so many warlike inventions called *Arietes*, wherewithal they push down the walls of Cities, as the Readers may see in *Vitruvius*, *Valtuinus*, and *Ammianus*, for they say that the warlike Ram was made of wood, and covered over with shels of *Tortoyes*, to the intent it should not be burned when it was set to a wall, and it was also covered with the skins of sack-cloth by rows artificially contrived, within the same was a beam which was pointed with a crooked Iron, and therefore called a Ram, or rather because the front was so hard that it overthrew walls, when by the violent strength of men it was forced upon them; and whereas it was shaped over with *Tortoise* shels, it was for the true resemblance it bare therewith; for like as a *Tortoise* doth sometime put forth his head, and again sometime pull it in, so also doth the Ram sometime put forth the sicle, and sometime pull it in, and hide it within the frame, so that by this engine they did not over-turn the walls, but also they caused the stones to flie upon the enemies like thunder-bolts, striking them down on every side, and wounding with their fall or stroke like the blows of an armed man; and against these forces there were counter-forces devised on the part of the besieged, for because the greatness thereof was such as it could not be moved without singular note and ostentation, it gave the besieged time to oppose against it their instruments of war for their safeguard, such were called

Didymus.

Aristotle.

The best time of copulation.

Their rage in Ramming time.

Martial and warlike inventions called Rams.

Cyloitra,

Culcitra, Laquei, Lapi ferrum, made like a pair of tongs, whereby as *Polyænus* writeth, many times it came to pass, that when the wall was overthrown the enemies durst not enter, saying: *Certe hostes sponte ab obsessis destructa moenia metuentes ingredi in urbem non audebant.* And thus much for the force of Rams both their true and natural strength, and also their artificial imitation by men.

Now on the other side the wise shepherds want not devices to restrain the wrath of these impetuous Beasts. For *Epicharmus* the *Syracusan* saith, if there be a hole bored in the backer part of his crooked horn neer his ear, it is very profitable to be followed, for seeing that he is a Captain of the flock, and that he leadeth all the residue, it is most necessary that his health and safe-guard be principally regarded, and therefore the ancient shepherds were wont to appoint the Captain of the flock from the prime and first appearance of his horns, and to give him his name, whereof he took knowledge, and would lead and go before them at the appointment and direction of his Keeper.

When he is angry he beateth the ground with his foot, and they were wont to hang a board of a foot broad, wherein were droven many sharp nails with the points towards the head, so that when the Beast did offer to fight, with his own force he woundeth his fore-head. They were wont also to hang a shrimp at the horn of the Ram, and then the Wolf will never set upon their flocks.

Moral uses of
Rams horns,
Ælianus.

And concerning their horns which are the noblest parts of their body, most regarded, yet I must speak more, for there was wont to be every year amongst the *Indians* a fight betwixt men, wilde Beasts, Bulls, and tame Rams: and a murtherer in ancient time was wont to be put to death by a Ram, for by art the Beast was so instructed, never to leave him till he had dashed out his brains.

And the story of
Plutarch.

It is reported of a Rams horns consecrated at *Delos*, brought from the coast of the red Sea, that weighed twenty and six pounds, being two cubits, and eight fingers in length. There was a Ram in the flocks of *Pericles*, that had but one horn, whereupon when *Lampon* the Poet had looked, he said: *Ex duabus quæ in urbe vigerent factionibus, fore ut altera obscurata ad unum Periclem, apud quem visum foret portentum resideret civitatis potentia.* That whereas there were two contrary raging factions in the City, it should happen that *Pericles*, from whose possessions that monster came, should obscure the one, and take the whole government of the City.

Cælius.

Cardan.

It is reported by *Rafis* & *Albertus*, that if the horns of a Ram be buried in the earth, they will turn in to the herb *Spirage*; for rottenness and putrefaction is the mother of many creatures and herbs. There was, as *Aristotle* reporteth in his *Wonders*, a childe born with a Rams head: and it is affirmed by *Ovid*, that *Medea* inclosed an old decrepit Ram in a brazen vessel, with certain kinde of medicines, and afterwards at the opening of the said vessel, she received a young Lamb, bred upon the Metamorphosis of his body.

The story of
Phryxus and
the Ram with
a golden
fleece.
Apollonius.

Concerning *Phryxus*, whereof we have spoken in the former part of our discourse of the Sheep, there is this story. He was the son of *Athaman*, and *Nepheles*: Afterward his mother being dead, he feared the treachery of his mother in law, and step-dame *Inus*, and therefore with his sister *Helle*, by the consent of their Father, he swam over a narrow arm of the Sea upon the back of a Ram, carrying a golden fleece, which before that time his Father had bestowed upon him. His sister *Helle* being terrified with the great roaring of the water, fell off from the Rams back into the Sea, and thereof came the name of *Hellepont*, of *Helle* the Virgin, and *Pontus*, the Sea, but he came safely to *Colchis* to King *Aetes*, where, by the voyce of a Ram, who spake like a man, he was commanded to offer and dedicate him to *Jupiter*, surnamed *Phryxus*, and also that golden fleece was hanged up and reserved in the Temple of *Colchis*, until *Jason* by the help of *Medea* aforesaid, did fetch it away, and the Ram was placed among the Stars in his true shape, and was called *Phryxus*, of *Phryxus*, who was the Father of the *Phrygian* Nation.

Hermolaus.

Of this fabulous tale, there are many explications and conjectural tales among the learned, not unprofitable to be rehearsed in this place. *Cælius* and *Palephatus* say, that the Ram was a ship, whose badge was a Ram, provided by *Athaman* for his son to sail into *Phrygia*: and some say, that *Aries* was the name of a man that was his foster-father, by whose counsel and charge he was delivered from his step-mother *Inus*.

Apollonius.
Gyraldus.
The fleece of
Colchis.

Other say, that there was a Book of parchment made of a Rams skin, containing the perfect way to make gold, called *Alchimy*, and thereby *Phryxus* got away. But in *Athens* there was reserved the Image of this *Phryxus*, offering the Ram (upon which he was born over the Sea) to the God *Laphystius*: and whereas there are in *Colchis* certain Rivers out of which there is gold growing, and oftentimes found, whereupon some of them have received their name, as *Chrysorrhoa*, and the men of that Countrey said to be greatly enriched thereby, they gave occasion of all the Poetical fictions about the golden fleece. There are in some places of *Africk* certain Sheep, whose wooll hath the colour of gold, and it may be, that from this occasion came the talk of golden fleeces. It is said, that when *Atræus* reigned in *Peloponnesus*, he vowed to *Diana* the best whatsoever should be brought forth in his flock, and it fortuneth that there was yeared a golden Lamb, and therefore he neglecting his vow, did not offer it, but shut it up in his chest. Afterward when he gloryed and boasted of that matter, his brother *Thyestes* greatly envied him, and counterfeiting love to his wife *Aerope*, received from her the golden Lamb. Then being in possession thereof, he contradicted *Atræus* before the people, affirming that he that had the golden Lamb ought to be King, and to reign among them, and so laid a wager of the whole Government or Kingdom thereof with *Atræus*, where-

Tzetzes.

whereunto he yeelded, but *Jupiter* by *Mercury* discovered the fraud, and so *Thyestes* took him to flight, and the Lamb was commanded to be offered to the Sun, and so I conclude this discourse with the verses of *Marial*:

*Mollia Phryxæi secuisti colla mariti,
Hoc meruit tunicam qui tibi saepe debet.*

And seeing that I have entered into the discourse of these Poetical fables, or rather riddles, which seem to be outwardly cloathed with impossibilities, I trust that the Reader will give me leave a little to prosecute other Narrations, as that *Neptune* transforming himself into a Ram, deceived and deflowered the Virgin *Bisaltis*, and the Ancients when they swore in jest and merriment, were wont to swear by a Ram, or a Goose. When the Gyants waged war with the Gods, all of the Gods (as the Poets write) took unto them several forms, and *Jupiter* the form of a Ram, whereof *Ovid* writeth, he was called *Jupiter Ammonius*:

*Unde recurvis
Nunc quoque formatis Lybis est cum cornibus Ammon.*

There be some that say that at what time *Hercules* desired very earnestly to see *Jupiter*, whereunto he was very unwilling, yet he cut off a Rams head, and pulled off his thick woolly rough skin, and put it upon him, and so in that likeness appeared to *Hercules*, and for this cause the *Thebanes* to this day do not kill rams, but spare them like sanctified things, except one once in a year, which they sacrifice to *Jupiter*, and say, that *Jupiter* was called *Ammonius aries*, because that his answers were mystical, secret and crooked, like a Rams horn.

Now concerning the sacrificing of Rams, we know that God himself in his Word, permitted the same to the people of the *Jews*, and therefore it cannot be but material for us to adde something also to the discourse before recited in the story of the Sheep. The *Gentiles* when they sacrificed a Ram, they roasted his intrails upon a spit or broach, and there were certain days of Sacrifice called *Dies Agonales*, wherein the principal Ram of every flock after combate or fighting was slain and sacrificed for the safeguard of the residue to *Janus*, and others by the King:

*Ita rex placare sacrorum
Numina lanigeræ conjuge debet Ovis.*

There was at *Tanagrum* a statue of *Mercury*, carrying a Ram (and therefore he is called the *Kriophoros Hermes*, and by that name was worshipped of all the *Tanagreans*. Now there was a cunning workman of *Calamis* that made that statue, for they say, that when the City was grievously afflicted with a pestilence, *Mercury* by carrying a Ram about the walls, delivered the same, and therefore they did not only procure that statue for *Mercury*, but also ordained that every year one of their most beautiful young men should carry a Sheep on his shoulder round about the walls. In *January* they sacrificed to *Jupiter* a Ram, and in *February* a Weather. *Pliny* writeth a strange Riddle, which is this; *Cinnamonum in Æthiopia gignitur, neque matitur nisi permiserit Deus*. There is Cinamon growing in *Æthiopia*, and yet it is not reaped by men, except the God thereof gave permission or leave, whereby some understand *Jupiter*, whom they called *Sabin*, and the *Latines*, *Assabinus*. Now *Pliny* saith, that if they had sacrificed forty and four Oxen, Buck-goats and Rams, with their intrails, they purchased leave to gather that Cinamon.

When the *Romans* observed their *Soli-Taurilia*, they sacrificed a Bull, a Goat, a Ram, and a Bore; but unto *Jupiter* they held it not lawful to offer a Ram. *Ulysses* offered to *Neptune* a Ram, a Bull and a Boar; and to conclude this discourse of the Rams sacrifices, I finde a story worthy the noting, recorded by *Paulus Venetus*, although it be altogether superstitious and full of humane blindness and error.

There is a City of *Tartary* called *Sachion*, the Inhabitants whereof are *Mahometans* and Idolaters; as soon as any of them have a son born, he presently commendeth him to one Idols tuition and protection or other: and that year together with his young Son he nourisheth a Ram tamed in his own house: at the years end, he offereth his Son and the Ram at the next festival day of that Idoll which he hath chosen; that is, he presenteth his childe and killeth his Ram, with great solemnity and ceremony in the presence of all his kindred, friends, neighbours, and acquaintance, and maketh earnest request to that Idoll to protect his son, and to guide and govern him all the time of his life, and therefore he hangeth up the flesh of that Ram in his presence, and afterward they take away again the same flesh, and carry it to another private place, wherewith the said Father and all the Kindred assembled do make a great and rich feast, reserving the bones for religions sake: And thus we see how miserable men beguiled with error, do not only make shew of false Religion, but also play the hypocrites in that which is erroneous, thinking it an easie thing to deceive Almighty God.

Concerning other things of Rams, they concur with that which is said already of Sheep in general, except their medicinal parts, which I will reserve to the due place: And herein adde one thing more of the horns of the *Rhetian* Rams, and in some places of *Italy*, namely, that after

they be five, six, or seaven year old, they bring forth under their great horns two other little horns, and that these Rams are weak of body, and have but rough and course wooll. In other places, if at any time they chance to bear more horns then two, it is prodigious and unnatural. And thus much of the Ram.

Of the WEATHER-SHEEP.

Although this Beast have all things in common with the Ram aforesaid, for he is a male-sheep, and in nature differeth not from him, but only by the art of man, I might very well have con-founded and conjoyned his story with the precedent: but seeing that all Nations do distinguish him from the Ram, because of one property or defect of him, for that he is not fit for generation, I will follow the stream, and not strive against my Authors, nor swarve from their method. Therefore in Latine it is call'd *Vervex quasi versa natura*, for that his natural seed is changed and turn'd in him, for his stones are taken away, and so he remaineth libbed and gelded, being an Eunuch among Beasts. The Grecians call him *Krion Tomian*, that is, a gelded Ram, for they have not one word to express him. The Latines do also call him *Seclarius*; and *Festus* rendreth this reason thereof, *Quia eum sequantur agni*, because the little Lambs love his company and follow him: and indeed by reason of his unaptness to generation, the Ewes forsake his company, and the Rams cannot endure him, therefore in stead of other he associateth himself with the Lambs. In some parts of Germany they call him *Frischling*, and also *Hammel*, which word seemeth to be derived from the Arabian word *Lesan Alhamel*, a Rams tongue. The Italians call him *Castrone*, *Castrato*, and *Montone*; the French *Mouton*; and the Illyrians, *Beram*.

Concerning the gelding of Rams or making of Weathers, I have not much more to say, then that which is already expressed in the general tractate of the Sheep, and for the manner I do refer the Reader, not only to that part, but also to the discourse of the Calf and Oxe, wherein I trust he shall finde satisfaction for this point, whether he will do it by a knife, by reed, by finger, or by hammer, for all those ways are in differently proponed. The best time for the gelding of Rams, ought to be in the wane or decrease of the Moon, at five months old, so as he may neither be troubled with extremity of cold or heat. And if it be not libbed at that age, but prolonged till two, three or four year old; we have shewed already the English manner for knitting of Rams.

Being thus libbed or knit, their horns grow not so great as the other males ungelded, but their flesh, and lard, or sewet, is more acceptable then of any other Sheep whatsoever, except they be over old, for that it is neither so moist as a Lambs, nor yet so ranck as a Rams or Ewes, whence *Baptista Fiera* made these verses;

*Ammiculus placeat, vel si sine testibus agnus,
Pinguior est hædo quin calet olla, vores.
Hunc amo si duri per pascua montis anhelat.
Malnero, si auri veliere dives erit.*

Platina also writeth thus of the flesh of Weathers, *Verecun caro satis salubris est & melior quam agnina, calida enim & humida habetur, ad temperamentum tendens, illa vero plus humiditatis quam calidi aia habet.* That is to say; The flesh of Weathers is wholesome enough, and better then the flesh of Lambs, because it is hot and moist, but that hath in it more moisture then heat, and therefore this tendeth to a better temperament. *Munster* writeth, that the Inhabitants and people of *Valis* take this flesh of Weathers, and salt it, afterward dry it in the air where no smoke may come unto it; afterward they lay it up in straw, and so hold it much more delicate then that which is raised in the smoke.

As the flesh of these Beasts groweth the better for their gelding, because they live more quietly and peaceably, for that their fore-heads grow weak and tender, and their horns small, so also it is reported that their tails grow exceeding large and fat. In some Regions, as in *Arabia Felix*, and other places, and because the report should not seem feigned by me, I will describe it in the Authors own words, *Paulus Venetus* writeth thus of the Weathers of *Scythia*, and in the Region *Camandu*, subject to the great *Tartar*. In *Tartaria Regione Camandu* arietes non minores asinis sunt, caudæ tam longæ & late, ut triginta librarum pondus æquent. In *Camandu* a Territory of *Tartaria* there are Rams like Asses in stature and quantity, whose tails are so long and broad, that they ballance in weight thirty pound. *Vartoman* writeth; In ædibus regis *Arabum* fuisse præpinguem vervecem, cujus cauda adeo obesa fuit, ut libras quadraginta appenderet, & prope Reame urbem *Arabia felix*, vervecum genera reperiuntur, quorum caudam animadverti pondo esse librarum quadraginta quatuor, carent cornibus, adeoque esse obesi & pingues ut vix incedere possunt. Circa *Zeclam urbem Ethiopia* verveces non nulli ponderosissimas trahunt caudas, ut pete pondo sedecim librarum. His caput & collum nigricant, ceteris albi sunt. Sunt etiam verveces profusus albicantes, quorum cauda cubitalis est longitudinis modo elaborata vitis, palearia ut tubus à mento pendent, quæ humum prope verrunt. That is to say, In the house of the King of *Arabia*, there was a Weather very fat, whose tail weighed forty pound, and near unto *Reamia*, a City in *Arabia Felix*, there are a breed or race of Weathers, whose tails for the most part weighed four and forty pound. They want horns, and are so fat that they can scarcely go. Also about the City *Zecla* in *Ethiopia*, the Weathers draw long tails, weighing sixteen pound. Whereof some have their heads and neck black, and all the other parts of their body

body white, some of them again all white, having a tail but of a cubit long, like a curious and planted Vine, their crests and hair hanging from their chin to the ground. Thus far of the *Arabian Weathers*. Of the *Indians* he writeth thus in another place: *Circa Tanasuri urbem Indie tanta est pecudum copia ut duodeni vervecis singulo aureo veneunt. Conspiciuntur illic vervecis alii, cornua haud absimilia damus habentes, nostris longe majores ferocioresque. Cauda vervecum in peregrinis regionibus tante sunt, quantus nullus apud nos vervex. Contingit hoc quia humidissimum hoc animal, & inter quadrupedia frigidissimum, cumque cetera ossa extendi nequeant, ne pinguedine immensa, extensis etiam ossibus & nervis non parum, quae humida natura velut pisces semper incremento apta sunt.* That is, About the City *Tanasur* in *India*, there is such great plenty of Cattel, that they sell twelve Weathers for a noble, and yet there are Weathers which have horns like to the horns of Deer, being longer, greater, and fiercer then our Rams, and their tails in forein and strange Countries are fatter then any Weathers among us; and the reason hereof is, because it is the moistest and coldest creature among all four-footed Beasts: and because the bones cannot be enlarged to receive that moisture, and lest that it should destroy the Beast by exuperance and abundance, therefore nature hath provided this remedy to send it forth into the tail, whereby in flesh and fat it groweth exceedingly, the bones and nerves whereof are not a little extended, for they are also of a moist nature like fishes, and therefore apt to encrease and grow immeasurably.

Thus much say they of the tails of Weathers, now I know such is the solidity of divers Readers and people, that for these reports, they will presently give both these Authors and me the Whet-stone for rare untruths and fictions: I do not marvel, for such (I dare assure myself) do not believe all the miracles of Christ, having short and shallow concepts, measuring all things by their own eyes, and because they themselves are apt to lye for their profit, therefore they are not ashamed to lay like imputations upon honest men, yet I could shew unto them as great or greater wonders in our own Nation (if they were worthy to be confuted) for which other Nations account us as great liars (nay as these Infidel fools) do them, and yet they are common among us.

The use of the several parts of this Beast, is no other then that which is already reported of the Sheep and Ram, and therefore I will not stand to repeat that which is so lately related, and for the remedies or medicinal vertues, I finde few that are special except those which are common between this and other of his kinde. It seemeth by *Plautus*, that a Weather Sheep is accounted the most foolish of all other, a coward and without courage, for speaking of a mad dotish fellow, he writeth thus: *Ego ex hac statua vervecis volo erogitare, meo minore quod sit factum filio.* That is, I will demand of this blockish Weathers picture, (meaning his foolish servant) what is become of my younger son.

These were among the Pagans sacrificed, but not among the *Jews*, for they have not so much as a name for it, and it is probable, that seeing it is an unperfect Beast, God forbade it into his sanctuary: when the *Gentiles* brought a Lamb at the side of a Weather to be sacrificed, they called them *Ambegni*, and so also a Lamb and an Ox. *Aciatus* maketh this pretty emblem of a Weather which with a Hedge-hog is the Arms of *Millain*, wherewithal I will conclude this discourse;

*Bituricis vervecis, Hædus dat sacula signum.
At populis patriæ debita origo meæ est.
Quam Mediolanum sacrum dicere puella
Terram: nam vetus hoc Gallica lingua sonat.*

*Culta Minerva fuit, nunc est ubi numine Tecla
Mutato matris virginis ante domum.
Laniger huic signum suus est, animalq; bisforme.
Acribus hinc setis, lanitio inde levi.*

Festus.

Of the LAMB.

THE Lamb is diversly tearmed by the *Hebrews*, as is already shewed in the story of the Sheep, (in some part) and now more particularly, *Seb* signifieth a Lamb, *Keseb* and *Kebe*, a Lamb of a year old, also *Gedi*, according to the opinion of *David Kimb*; in *Greek*, *Arniou*, and *Arna*, and *Amnos*, and at this day *Arni*; the *Italians*, *Agna*, *Agno*, *Agnello*; the *Spaniards*, *Cordero*; the *French*, *Agneau*, and *Agnelet*; the *Germans*, *Lamb*, and *Lamblein*, and as the first year we call it in *English* a Lamb, so the second year a Hog, Lam-hog, or Teg if it be a female, the third year Hoggrils and Theives: the *Latines* call it *Agnus*, of the *Greek* word *Agnos*, castus quia est hostia pura & immolationi apta. That is chaste, for that a Lamb is pure and clean, and fit for sacrificing.

And the common Epithets expressing the nature of this Beast are these, rough, yeaneling, weak, unripe, sucking, tender, butting, fat, milk-eater, merry, sporting, bleating, affable or gentle, field-wanderer, horn-bearer, horn-fighter, unarmed, vulgar, wooll-skinned, wooll-bearer, wanton, meek, delicate and fearful: and all these are the Epithets of a male Lamb, but of the female I finde these following: dumb, snow-white, neat, young, fearful, black, tame, humble, and tender, and the *Grecians*, *Hedynous*, because of the sweet smell that is found in them when they are young and suck their dams.

We read that the Lambs of *Africa*, both males and females, are yeaned with horns, the reason whereof is shewed in another place, and it is a common and natural thing to them all as soon as they are fallen out of their dams belly, they presently leap and run about their dams, and also learn to know them by whom they are nourished, according to the saying of *Lucretius*:

*Aristotle.
Ælianus.
Of the meek
disposition of
Lambs.
Præterea*

*Præterea teneri tremulis in vocibus hædi,
Corniferas norunt matres, agniq; petulci.*

S. Ambrose writeth thus of the inclination of a Lamb to his mother, and the love of her milk. *Ag-nus simplicissimus ovium recognoscit vocem parentis, cum a matre quandoq; aberrat, frequenter eam balatu exci-tat, multisq; licet versetur in millibus ovium, festinat ad eam: nam quamvis cibi & potus desiderio te-neatur transcurrit tamen aliena ubera, licet humore lactis grävda exundent, soliusq; materni lactis fontes re-quirat.* The Lamb is a most simple Beast, and erreth many times from his mothers sides, having no other means to provoke his mother to seek him out but by bleating; for in the midst of a thousand Sheep it discerneth the voyce of his parent, and so hasteneth to her when it heareth her; for such is the nature of this poor Beast, that although there be many other Ewes which give suck, yet they pass by all their udders to taste of their mothers fountains, and the Ewe knoweth her young one by smelling to the backer part: the Lamb all the while it sucketh waggeth and playeth with the tail. When the Lamb is newly fain, in some Countries they put them up close into a stable for a day, or two, or three, till they grow strong, and are well filled with Milk, and know their Dams, and so long as the Rams feed with the females they keep in the Lambes, that so they may be clear day and night from all violence of the Rams, for at night they lodge single and alone by their dams sides. The like regard is to be had if they do not suck their mothers, they must anoint their lips with butter or Hogs-grease and milk, and for two months after their yeaning it is not good to rob them of any milk, but suffer them to suck all that their Dams can breed, for so their Lambs will grow more strong, and also their wooll more fine. And when they are to be weaned, they must first of all be brought out of love of their mothers milk, lest after their separation they languish, and lose all natural joy, whereby they are never likely to come to good: afterward let them be herded or drove to field, but after their yeaning it is profitable when they are a week old to give them Salt, and so the second time after they be fifteen days old. It is never good to nourish the firstling or first Lamb of an Ewe, for that commonly they are weaker and more tender then any other, but the best to be nourished are twins.

Didymus.

Varro.

Pliny.

Democritus.

They are also the best and strongest which are bred in the Spring time, and much fatter, and more able then those which are yeaned in the Autumn. And yet there are some that affirm, that they which are bred in the Winter are fatter then those which are bred in the Summer, for if strength of nature be able to live out the Winter at the first yeaning, much more will they be able to endure when they are elder: in the first sucking of a Lamb, the beestings must be milked out, for they are apt to fall into many diseases, such as are already mentioned in the discourse of the Sheep: generally to preserve them in health, they give them Ivy when they are vexed with an Ague, and separate them from the Ewes, lest by sucking they infect their mothers, then must they be milked alone, and their milk mixed with rain water, and so given to the sick Lamb, and if they will not take it willingly, then infuse it into her throat with a horn, and if they be troubled with Scabs, take Hysop and Salt, of each an equall quantity; and if the mouth be broken out and blistered, then rub the afflicted place therewith, afterward wash them with Vinegar, and then anoint them with liquid Pitch and Hogs grease; there must be also a care had to keep them from Lice.

Concerning the use of their several parts, we have already shewed in the story of Sheep, and therefore we need not prosecute it in this place. Their skins are fitter to clothe men, then the skins of their dams, and therefore the Hebrews say that they are fittest for the garments of young men, for they encrease their strength and natural vigor. The Skinners make great account of these Lamb-skins, and use them for the linings of many garments, such as are killed they call the skins of slaughter-lambs. The best are brought out of Italy and Apulia, and all those parts which are beyond Rome; Narbon, and Spain, yeeld plentiful store of black Lambs, and their skins are sold by Merchants; and white skins are plentiful in England.

Their flesh is nourishable and convenient for food, but yet inferiour to Weather Mutton, for that it containeth more moisture then heat. To conclude this discourse of the Lamb, the greatest honour thereof is, for that it pleased God to call his blessed Son our Saviour by the name of a Lamb in the Old Testament, a Lamb for Sacrifice, and in the New Testament, styled by John Baptist, *The Lamb of God that taketh away the sins of the world.* There is a proverb in Greek, *Arneia soi lelaleken agnus tibi locutus est,* A Lamb hath spoken this unto you, and it was a proverbial speech to express a divine Revelation of some business, that men cannot attain unto by ordinary and common means, because either it is concealed, or else it concerneth things to come. For it is reported by Suidas, that once in Egypt there was a Lamb that spake with a mans voice, upon the Crown of his head was a regal Serpent having Wings, which was four cubits long, and this Lamb spake of divers future events.

The like is said of another Lamb that spake with a mans voice, at what time Romulus and Remus were born, and from these miraculous events, came that common proverb: and so for this story I will conclude with the verse of Valerius: *Aspera nunc pavidos contra ruit agna leones.* There is in Moscovia near Volga, a certain Beast of the quantity and form of a little Lamb, the people call it Boranz, and it is reported by Sigismundus, in his description of Moscovia, that it is generated out of the earth

earth like a reptile creature, without seed, with dam without copulation, thus liveth a little while and never stirreth far from the place it is bred in, I mean it is not able to move it self, but eateth up all the grasse and green things that it can reach, and when it can finde no more, then it dyeth.

Of the MUSMON.

I Have thought good to reserve this Beast to this place, for that it is a kinde of Sheep, and therefore of natural right and lineage to this story, for it is not unlike a Sheep, except in the wool which may rather seem to be the hair of a Goat; and this is the same which the antients did call *Pliny*. *Umbrice oves*, *Umbrian Sheep*, for that howsoever it differeth from Sheep, yet in simplicity and other inward gifts it cometh nearer to the Sheep. *Strabo* calleth it *Musmo*, yet the *Latins* call it *Musmon*. This beast by *Cato* is called an *Asse*, and sometimes a *Ram*, and sometimes a *Musmon*. The picture which here we have expressed, is taken from the sight of the Beast at *Caen* in *Normandy*, and was afterwards figured by *Theodorus Beza*. *Munster* in his description of *Sardinia* remembreth this beast but he saith that it is speckled, whereat I do not much wonder, seeing that he confesseth that he hath all that he wrote thereof, by the Narration of others.

Some say it is a Horse or a Mule, of which race there are two kinds in *Spain*, called by the *Latins*, *Asurcones*, for they are very small; but I do not wonder thereat, seeing that those little Horses or Mules are called *Musmones*, because they are brought out of those Countries where the true *Musmones* (which we may interpret wilde Sheep, or wilde Goats) are bred and nourished. There are of these *Musmons* in *Sardinia*, *Spain*, and *Corfica*, and they are said to be gotten betwixt a *Ram* and a *Goat*, as the *Cinirus* betwixt a *Buck-goat* and an *Ewe*. The form of this Beast is much like a *Ram*, saving that his breast is more rough and hairy: his horns do grow from his head like vulgar *Rams*, but bend backward only to his ears: they are exceeding swift of foot, so as in their celerity they are comparable to the swiftest Beast. The people of those Countries wherein they are bred, do use their skins for breastplates. *Pliny* maketh mention of a Beast which he called *Ophion*, and he saith he found the remembrance of it in the *Grecian* books, but he thinketh that in his time there was none of them to be found in the world: herein he speaketh like a man that did not know *GOD*, for it is not to be thought, that he which created so many kinds of beasts at the beginning, and conserved of every kinde two, male and female at the generall deluge, would not afterward permit them to be destroyed till the worlds end, nor then neither: for seeing it is apparent by holy Scriptures, that after the world ended, all creatures and beasts shall remain upon the earth, as the monuments of the first six days works of Almighty God, for the farther manifestation of his glory, wisdom, and goodness, it is an unreasonable thing to imagine that any of them shall perish in

general in this world. The *Tadinians* call these beasts, *Muffo*, and *Erim Muffo*, which may easily be derived from *Ophion*, therefore I cannot but consent unto them, that the antient *Ophion* is the *Musmon*, being in quantity betwixt a Hart and a Sheep, or Goat, in hair resembling a Hart, and this Beast at this day is not found but in *Sardinia*. It frequenteth the steepest mountains, and therefore liveth on green grasse and such other hearbs. The flesh thereof is very good for meat, and for that cause the inhabitants seek after it to take it. *Helior Boethius* in his description of the *Hebridian* Islands saith, that there is a Beast not much unlike to Sheep, but his hair betwixt a Goats and a Sheeps, being very wilde and never found or taken but by hunting, and diligent inquisition. The name of the Island is *Hierbe*, and the reason of that name is from his breed of Sheep called *Hierth* in the Vulgar tongue, yet those Sheep agree with the *Musmon* in all things but their tails, for he saith, that they have long tails reaching down to the ground, and this name cometh from the German word *Herd* a flock, and thereof *Hirt* cometh for all Sheep in general. Now followeth the conclusion of their story with their medicinal virtues.

The medicines of the Sheep in general.

Galen.

The bodies of such as are beaten, and have upon them the appearance of the stripes, being put into the warm skins of Sheep when they are newly puld off from their backs, eateth away the outward pain and appearance, if it continue on a day and a night. If you seethe together a good season the skin of the feet, and of the snowt of an Ox or a Sheep till they be made like glew, and then taken forth of the pot and dryed in the windy air, is by *Silvius* commended against the burstness of the belly.

Pliny.

The blood of Sheep drunk, is profitable against the falling sickness: Also *Hippocrates* prescribeth this medicine following, for a remedy or purgation to the belly, first make a perfume of Barly steeped in oyl upon some coles, and then seethe some Mutton or Sheeps flesh very much, and with decoction of Barley set it abroad all day and night, and afterward seethe it again and eat or sup it up warm, and then the next day with Hony, Frankincense, and Parsely, all beaten and mingled together, make a Suppository, and with wool put it up under the party, and it shall ease the distress. The same flesh burned and mixed in water by washing, cureth all the maladies or diseases arising in the secrets, and the broth of Mutton, Goose, or Veal, will help against the poison by biting if it be not drawn out by cupping glasse nor by horse-leach. The sewet of a Sheep melted at the fire, and with a linnen cloth anointed upon a burned place, doth greatly ease the pain thereof.

The Liver with the sewet and *Nitre* causeth the scars of the flesh to become of the same colour that it was before the wound, it being mixed with toasted Salt, scattereth the bunches in the flesh, and with the dust of womens hair, cureth fellons in fingers, or any part of the bodies. The sewet of Sheep or Goats, being mingled with the juyce of Rhenish wine grape, and shining horse flies, doth without all scruple or doubt, ease the pain of the milt, if it be anointed thereupon. The fat of Sheep doth very easily expell the roughneis of the nails.

Marcellus.

The sewet of Sheep or any other small beast, being mixed with the herb called *Melander*, and pounded with Alum, afterward baked together, and wrought into the manner of a Sear-cloth, doth very much ease those which are burned by fire in any parts of their body, being well applyed thereto. The sewet of a Sheep being also applyed to those which have kibes in the heels, or chilblanes in their feet, will presently heal them.

Pliny.

The sewet of a Sheep mixed with womens hair which is burnt to powder, doth very effectually cure those which have their joynts or articles loose, being anointed thereupon. The fat of Goats or Sheep moistned with warm water, and boiled together, being anointed upon the eyes, doth speedily cure all pains, spots, or blemishes in the same whatsoever. The fat of a Sheep boyled and drunk with sharp wine, is an excellent remedy against the cough. The same medicine is also effectually used for the expelling of horses coughes. The sewet of a Sheep being boyled with sharp wine, doth very speedily cure the obstruction of the small guts, bloody flux, and any cough of what continuance soever.

Marcellus.

The same being in like manner drunk while it is hot, is accounted for an excellent remedy against the Colick passion. The sewet of a Sheep, or of a Male goat, being mingled with the fime or dung of a Female-goat, and Saffron, doth very effectually cure those which are troubled with the Gowt or swelling of the joynts, being anointed upon the place so grieved. It is also reported that the outward sewet of Sheep (between the flesh and the skin) between the hinder legs, is very wholesom for the curing of sundry pains and diseases.

Dioscorides.

Sheeps sewet or the fat of any other small beast being gathered from the reins, mixed with salt, and the dust of a pumice stone, being applyed unto the yard of any man, doth speedily cure all pains, aches, or swellings therein. The fat of Sheep which is gathered from the caul or cell, being mingled with the aforesaid medicines do heal all other pains in the privy members of man or woman whatsoever. The same sewet doth stay the great excess of bleeding in the nose, being anointed thereupon.

Sheeps sewet being mixed with Goose grease and certain other medicines, being taken in drink, doth help abortments in women. The liver of a Sheep is accounted an excellent remedy against the shedding of the hair on the eye lids, being rubbed thereupon. The same being also baked or boyled,

is accounted very profitable for Sheeps eyes, if it be well rubbed thereon. The marrow of Sheep is very good to anoint all aches and swellings whatsoever.

The horns of Sheep or of Goats pounded to powder, mingled with parched Barley which hath been well shaled, and altogether mixed with Oyl, being taken in a certain perfume, doth help Women of their seconds, and restoreth to them their menstruell fluxes. Sheeps hornes burned and beaten in wine untill they be tempered like a pill, the right foot being anointed with the right horn, and the left foot with the left, will mitigate the sorrow of those which are very fore pained and troubled with the gowt. *Hippocrates.*

Rheumatick, or watry eyes, being anointed with the brains of Sheep are very speedily and effectually cured. The brains of the same beast is exceeding profitable for the breeding of young childrens teeth, being anointed upon the gums. The lungs or lights of small beasts, but especially of a Ram, do restore the true skin and colour of the flesh, in those whose bodies are full of chops and scars. *Rasis.*

The lungs or lights of the same beast concocted upon the uppermost skin of any man, and applyed very hot thereunto, do diminish the black or blew places therein, which have been received by the occasion of any stripes or blows. *Pliny.*

The lungs of Sheep being new taken out of their bellies, and applied while they are hot unto beaten or bruised places, doth quite abolish the signes thereof, and in short space procure remedy. The lungs of Sheep or small Cattle being roasted and taken by any man before he drinketh, will resist all kind of drunkenness. *Marcellus.*

The lungs of Sheep taken out of their bellies, and bound about the heads of those which are phrensie while they are hot, will very speedily ease them of their trouble. The lungs of Sheep being hot and bound to the head, is accounted very profitable for those which are troubled with the pestiferous disease called the Drowfie evill.

The lungs of Sheep being boiled with Hemp-seed, so that the flesh be eaten, and the water wherein it is sod be drunk, doth very effectually cure those which are grieved with excoriations in their bellies, and the bloody flux. The lungs of Sheep being applyed while they are hot, doth heal the Gowt.

The liver of white Sheep well boiled, made moist with water, thoroughly beaten and applyed unto the eye-lids, doth purge Rheumatick eyes, and cause them to be of a more clear and ample sight. If a woman bearing young, shall be puffed up with winde, give her the liver of a Sheep or Goat beaten into small powder while it is hot, being pure and without mixture for four dayes together to eat, and let her drink only wine, and this will very speedily cure her. *Hippocrates.*

The gall of a Sheep mingled with hony, healeth the Uicers of the ears, and procureth easie hearing. The gall of a Sheep mingled with sweet wine, if it be tempered in the manner of a glyster, and afterwards rubbed upon the ear-laps, the ulcers being quite purged, will procure a speedy cure and remedy. The gall of the same beast distilled with a womans milk, doth also most certainly heal their eares which are broken within, and full of matter corruption. *Pliny.*

The gall of a Sheep being mixed with common oyl, or oyl made of Almonds, doth also heal the pains of the ears, being powred therein to. Cankers, or the corrosion of the flesh, being anointed with the gall of a Sheep, is very speedily and manifestly cured. The Dandraffe or scurfes of the head being anointed with the gall of a Sheep mixed with fullers-earth which is hardned together while the head burneth, are very effectually abolished, and driven quite away. *Albertus.*

The gall of little cattle, but especially of a Lamb, being mixed with hony is verily commended for the curing of the Falling evill. The milt of a Sheep new taken out by magicall precepts is accounted very good for the curing of the pain in the milt, he saying which may be healed that he maketh a remedy for the milt. After these things the Magicians command that the grieved party be included in his Dotor or Bed-chamber, and that the doors be sealed up, and that a verse be spoken thrice nine times. The milt of a Sheep being parched and beaten in wine, and afterward taken in drink, doth resist all the obstructions or stopping of the small guts. The same being used in the like manner is very medicinable for the wringing of the guts. *Pliny.*

The dust of the uppermost of a Sheeps thigh, doth very commonly heal the looseness of the joints; but more effectually if it be mixed with wax. The same medicine is made by the dust of Sheeps jawes, a Harts horn, and wax mollified or asswaged by oil of Roses. The upper parts of the thighs of Sheep decocted with Hemp-seed, do refresh those which are troubled with the bloudy flux, the water whereof being taken to drink. For the curing of a Horse waxing hot with weariness and longitude of the way; mingle Goats or Sheeps sewet with Coriander, and old dill, the Coriander being new gathered, and diligently pounded in the juice of Barley, and so give it thoroughly strained for three dayes together. *Marcellus.*

The huckle-bone of a Sheep being burned and beaten into small dust, is very much used for the making of the teeth white, and healing all other pains or aches therein.

The bladder of a Goat or Sheep being burned and given in a potion to drink, made of Vinegar and mingled with water, doth very much avail and help those which cannot hold their water in their sleep. The skins which cometh from the Sheep at the time of their young, doth very much help very many enormities in women, as we have before rehearsed in the medicines arising from Goats. *Galeus.*

The milk of Sheep being hot, is of force against all poysons, except in those which shall drink a venomous fly called a Wag-leg, and Libbards bane. Oatmeal also doth cure a long lingring disease, a pinte of it being sodden in three cups of water, until all the water be boyled away: but afterwards you must put thereunto a pinte of Sheeps milk or Goats, and also Hony every day together.

Some men do command to take one dram of Swallows dung in three cups full of Goats milk or Sheeps milk before the coming of the quartern Ague. Goats milk, or Sheeps milk being taken when it is newly milked from them, and gargarized in the mouth, is very effectual against the pains and swellings of the Almonds. Take a pinte of Sheeps milk, and a handful of sifted Aniseeds, and let them seethe together, and when it is somewhat cold let it be drunk, and it is very good to loosen the belly. Medicines being made of Goats milk and Sheeps milk, and so being drunk, is very good for the shortness of breath.

Pliny.

Marcellus.

Furnerius.

Crescentien.

Pliny.

A hot burning gravel stone being decocted in Sheeps milk, and so given to one that hath the Bloudy flux, is very profitable to him. Goats milk or Sheeps milk given alone luke-warm, or sodden with Butter, is very profitable to those that are brought very weak with the passions of the stone, and fretting of the guts. To wash ones face with Sheeps milk, and Goats milk, is very good to make it fair and smooth. Evenings milk of Sheep, that is, the last milk that they give that day, is very good to loosen the belly, and to purge choler. The hairs of the head of a Dog burned into ashes; or the gut of the privy place sodden in Oyl, is a very good and soveraign remedy for the looseness of the flesh about the nails, and for swelling of flesh over them, being anointed with Butter made of Sheeps milk and Hony. An Oyl sodden in Hony, and Butter made of Sheeps-milk, and Hony melted therein, is very profitable to cure ulcers. Old Cheese made of Sheeps milk, is very good to strengthen those which have been troubled and made weak with the Bloudy flux. Again, old Cheese made of Sheeps milk, taken in meat, or scraped upon it, and being drunk with Wine, doth ease the passion of the Stone.

Marcellus.

There was a certain Physitian being skilful in making medicines, dwelling in Asia by Hellespont, which did use the dung of a Sheep washed and made clean in Vinegar, for to take away Warts and knots rising on the flesh like Warts, and kernels, and hard swellings in the flesh. Also he did bring Ulcers to cicatrizing with that medicine which were blasted or scalded round about, but he did mingle it with an emplaister made of Wax, Rosin, and Pitch.

Dioscorides.

Pliny.

Vegetius.

The dung of Sheep also doth cure pushes rising in the night, and burnings or scaldings with fire, being smeared over with Vinegar without the commixture of any other things. The dung of Sheep being mixed with Hony, doth take away small bumps rising in the flesh, and also doth diminish proud flesh: and also it doth cure a disease called an emmor, as Rasis and Albertus say. The dung that is new come from the Sheep being first worked in thy hands, and applied after the manner of an emplaister, doth eat away any great warts growing in any part of thy body. The dung of a Sheep being applied to thy feet, doth consume or waste away the hard flesh that groweth thereon.

Sheeps dung doth also cure all kinde of swellings that are ready to go into Carbuncles. It is also good being sodden in Oyl and applied after the manner of an emplaister, for all new wounds made with a sword, as Galen saith:

Pliny.

*Aut si conclusum servavit tibia vulnus,
Stercus ovis placide junges, adipemq; vetustos,
Pandere quæ poterunt bulcus, patuloq; mederi.*

The dung of Sheep and Oxen being burned to powder, and smeared with Vinegar, is very good against the bitings and venomousness of Spiders; And again it is very effectual being new come from them, and sodden in Wine against the stings of Serpents. Sheeps dung being mixed with Hony, and applied to Horses whose hoofs are broken, is very effectual.

The dung of Oxen and Sheep being burned to powder, and intermixed therewith, is very effectual against Cankers, and also the bones of the Lambs thighe, being burned into ashes, is very profitable to be applied to those ulcers which cannot be brought to cicatrife. Also Sheeps dung being made hot in a Gally pot, and kneaded with thy hands, and afterwards applied, doth presently cease the swellings of wounds, and doth purge and cure Fistulas, and also diseases in the eyes.

The Oyl of Cypress and Hony, is very effectual against Alopecia, that is, the falling off of the hair. An emplaister made of Sheeps dung, and the fat of a Goose and a Hen is very effectual against hair rising in the root of the ear, as Rasis and Albertus say. Sheeps dung being applied hot, is very effectual against the swellings of womens paps or dugs.

Obscurus.

Rasis.

Pliny.

Albertus.

Sheeps dung being put into the decoction of Wood-bine, or Hony and water, and so drunk, is very profitable against the Yellow-jaunders. If the Spleen be outwardly anointed with Sheeps dung and Vinegar, it doth lessen the rising of it. The dung of Oxen and Sheep which is very moist, doth ease all manner of Gouts. The thin or outmost skin which is taken from the privy part of Sheep, is very profitable against the disease called the flowers in Women. The dung also hath the same operation. The Urine of Sheep is very profitable against the Hydropsie being mixed with Hony. But Rasis saith otherwise, which is, that the dung being drunk with Hony is available against the Dropsie.

To take the weight of a penny of Ox dung and Sheeps dung, and a grain of Myrrh, and two ounces and a half of Wine, doth stay or resist the coming of the Kings evill. The filth which is *Pliny*. taken out of the ears of these beasts is said to be very effectual against the flowers. It doth make a barren woman to conceive with child also, as *Serenus* saith in these Verses:

*Pendentem spumam molli deducet ab ore,
Aut ovis in stabulis fractus cum ruminat herbas,
Atq; illam memini misto potare falerno.*

The sweat of a Horse being made warm and mixed with Vinegar, is very convenient against *Sylvaticus*. the Falling sicknes, and is used against venomous bitings. And also the sweat of Sheep is very much profitable unto it. If the hoof or ankle-bone of an Ox chance to be cut with a Plough-*Columella*. share, Pitch and fat with Sulphur is very good, but you must roul round about the wound Wool.

Unwashed Wool doth very much profit those that are frenzie being applyed with a fume that stoppeth humors from coming down from the head. Unwashed Wool being bound upon the forehead, is very good for the waterish humor that floweth out of the eyes. Unwashed Wool being heated in Vinegar, and pressed into the ear, and afterwards the top of the ear being stopped with that Wool, will by little and little ease the pains in the ears. Unwashed Wool dipped in Oyl of Roses and put into the Nostrils doth stay bleeding at the Nose. Unwashed Wool being plucked from the privy parts of Sheep and moistned in Oyl of Roses, is very good to stop the fluxes of blood in any part of mans body.

Unwashed Wool being tyed on the outside of the knuckles or joynts, doth stop the bloud or *Marcellus*. humors from running to and fro. It is also said to be very good being dipped in Hony (and so rubbed upon the teeth or gums) for to make one breathe or gaspe easier. Unwashed Wool being smeared over with Hony, and rubbed upon the teeth, doth make them look white presently after. Unwashed Wool with a little salt put to it and tyed close in a linnen cloth, and so scorched and beaten to powder, is very good to keep the teeth from pain, being rubbed upon them.

Unwashed Wool being mixed with Niter, Brimstone, Oyl, Vinegar, and with Tar, being ap-*Galen*. plied twice a day, doth ease all pains of the knuckles and ankles. Sheeps dung and other things with unwashed Wool is very effectually against the stone in the bladder, as it is spoken above in the cure and remedies of Sheeps dung. Unwashed Wool doth cure all the diseases in the privy parts of men or women being applyed thereunto. The black Wool of Sheep, is very profitable for all swellings in the stones or cods of men. The gall of Bulls put upon unwashed Wool, is very profitable for the flowers of women. Unwashed Wool being applyed unto those parts that are dead, doth very much good unto them.

White fleeces of Wool being either applyed alone, or with Brimstone, is very good for hidden pains and griefs. Fleeces of Wool given in a fume with Brimstone, is very good for the remedy of the Kings evill. Wool being dyed of a purple colour, and so applyed, is very good against the pains of the ears. There are moreover very many remedies made against diseases by unshorn Wool, besides the expelling of cold, being taken in Oyl, Wine, or Vinegar, for as much as the same being applyed to the members which are out of joynt, or to any pains in the Nerves, doth very speedily and tenderly heal the same.

Sheeps Wool being mixed with Herbgrace and Sheeps greafe, is very much applyed unto those which are bruised, or have hard swellings in any parts of their body. Unwashed Wool being often put into the sores which are bitten by mad Dogs, doth perfectly cure them in seven dayes.

Sheeps wool in cold water doth bring remedy unto those whose skin is loose about the Nails. *Pliny*. The same being steeped in hot Oyl may be well applyed unto moist or running sores: but mingled with Hony is very medicinable for old sores or festers: and steeped in Wine, Oyl, Vinegar, or cold water, doth heal any new wound which seemeth to bring the wounded party in danger of death. *Dioscorides* doth also affirm that Sheeps wool being unwashed is curable for all kinds of wounds whatsoever.

The same is very much applyed unto those whose bones are bruised or broken, if it be mixed with the brains of a wanton Dog, and bound hard upon the grieved place in a linnen cloth. The *Carthagi-* *Serenus*. *nian* Shepherds do use the unwashed Wool of Lambs of the age of four years, for the curing of the Temples, or the crown of the head. If the plough share chance to hurt the huckle-bone or hoof of an Ox, take hard Pitch and Bacon greafe mingled with Brimstone, and rowled in unwashed Wool, and mark the wounded place with all these together with a fiery hot iron, and it will bring present help and remedy.

Unwashed Wool being taken in some certain perfume doth cure those which are Frantick, and restore them to their former wits. Spleen-wort being boyled in Hony and mixed with unwashed Wool which was steeped in Oyl or Wine, is very good for the aforementioned disease, being bound about the forepart of the head in a broad linnen cloth. Sheeps wool being also applyed in the same manner, is an excellent cure for those which are troubled with a certain watery rheum running in the eyes, as also the ach in the forepart of the head.

Unwashed

Galen.

Unwashed wool boyled in Vinegar and applyed unto the eares, doth expell all filth or moisture therein, and the issue thereof being afterwards stopped with the same kind of wool, is very speedily cured. Sheeps wool is also very good and effectual for the curing the pains of the ears which are but new coming upon them. Unwashed wooll being mixed with Oyl of Roses and put into the Nostrils of any man, the ears being stopped close with the same kind of wool, will stay the issuing of the blood at the Nose, how fluent soever it be.

The same being also steeped in Oyl and put in the Nose, doth restrain the bleeding thereof. Wool being plucked or wrested from the back of Sheep, and kept unwashed, doth cohibite the abundance of blood, being steeped in pure liquid Oyl of Roses. The same being taken from the back of a Ram, doth stay over much bleeding at the Nose, the joynts of the fingers being bound as hard as possible can be suffered. Unwashed wool steeped in Hony and rubbed upon the teeth or gums, doth make the breath of any man more sweet and delightful then it hath been accustomed. The same being used in the said manner, doth procure a very great whiteness and cleanness in the teeth.

Unwashed Wool being parched and bound in a linnen cloth, a third part or portion of salt being afterwards added thereunto, and all beaten together in small dust or powder, and rubbed upon the teeth, will keep them from any pain or grief therein. Unwashed Wool being dipped in Nitre, Brimstone, Oyl, Vinegar and Liquid Pitch, being all boyled together, doth assuage all pains in the hanches or loins whatsoever, being twice a day as hot as possibly may be suffered applyed thereunto. Sheeps dung mingled with unwashed wool and certain other things, is very much applyed against that troublesom and painful disease called the stone or gravel.

Unwashed wool in cold water, doth cure diseases in the privy parts of any man or woman whatsoever. The wool of black Sheep is commonly reported to be very commodious and helpful for those whose Cods or stones are much swelled. The gall of an Ox being mixed with unwashed wool, doth help the purgation or menstrual fluxes of women; but *Olympius the Theban* affirmeth, that Hyssop and Nitre ought to be mixed with this wool for the helping of the same. Unwashed wool being applyed unto the secret parts of women, doth cause a dead childe to come forth. The same doth also stay the issues of women. The pure or clear fleeces of Sheep either applyed by themselves, or mingled with Brimstone, do cure all hidden or secret griefs whatsoever: and *Pliny* commendeth them above all other medicines whatsoever. Fleeces of wool mingled with quicksilver, are very profitable to be taken for the same diseases in certain perfumes. The root of a Mallow being digged up before the rising of the Sun, and wrapped in undyed wool, doth cure the Wens or mattry impostumes of those Sheep which have lately brought forth young. Sheeps wool being dyed in purple colour, doth very much profit the ears: but some do steep it in Vinegar and Nitre, to make the operation more effectual.

Serenus.

Pliny.

The dust of wool being burnt, doth bring forth the matter or corruption lying hid under scabs, restrain the swellings in the flesh, and bringeth all Ulcers to a scar. Wool being burnt hath a sharp force, and likewise hot together with the slenderness of the parts, it doth therefore very speedily cleanse and purge the sores in the flesh, which are moist and too much full of matter. It is also put in drying medicines. It is burned as if there were many other things in it, filling a new pot, which may be covered with a cover which is bored through with many holes like unto a sieve. The powder of unwashed Wool is anointed upon divers sores and is very curable for them as bruised, new wounded, and sores half burnt, and it is used for the curing of the diseases in the eyes, as also in the easing of the Fistulaes and corrupt mattery sores in the ears. The power of the powder of unwashed wool is cleansing, and it doth very effectually purge the eye-lids or cheek-bals. It doth also cleanse and cure for the most part all diseases, as *Serenus* saith in these Verses;

Galen.

Succida cum tepido neſcitur lana Lyco,

Ambuſtave cinis complebit vulneris ora,

Aut tu ſuccoſe cinerem perducito lane.

The hairs which grow about the secret hole of Sheep being burned, beaten and drunk in sweet wine, doth help the shortness of the breath, and ease the purfiness of the stomach. The wool of a little sheep being pulled from betwixt his thighs and burnt, and afterwards dipped in Vinegar, doth very speedily cure those which are troubled with the head ach, being bound about the temples. The dust of Sheeps fleeces is very medicinable for the curing of all diseases in the genital parts whatsoever. The dust of Sheeps wool, doth heal all passions in Cattle. The *Grecians* Plaster (called *Enneapharmacum*) consisted of nine several things, and amongst the rest of unwashed wool. The filth which sticketh to the Sheeps wool and groweth thereunto, from which the thing which the *Grecians* call *Oesypon* is made, hath the force of digestion like unto Butter, and also a like ability of concoction.

Marcellus.

In a certain medicine of *Andromachus*, for the curing of the disease of the secret parts, unwashed wool is added to the rest: but *Lepas* (as *Galen* saith) for unwashed wool doth add Goose grease in the same quantity. Some do also for unwashed wool use the marrow of a young calf, and apply it in the aforesaid manner; but this unwashed wool is termed of the *Grecians*, *Aeypus*, and therefore being by divers Authors set down diversly concerning the making and virtue thereof,

of, I have thought good to set down the truest and excellentest way to make the same (as *Dioscorides*) whom in this I suppose best to follow, reporteth; First to take new shorn wool which is very soft, and not trimmed with sope-weed, and wash it with hot water, then to presse all the filth forth of the same, and cast it into a Cauldron which hath a broad lip, and afterwards to pour the water in; and to stir it up and down with a certain instrument with such great force as it may foam again, or with a wooden rod still greatly to turn and trouble it, so that the filthy froath or spume may more largely be gathered together; afterwards to sprinkle it over with Sea water, and the fat remaining which did swim upon the top, being gathered together in an earthen vessel, to powr the water into the Cauldron: then must the froath be powred again into the Sea water; and lastly, taken out again: this is so often to be done, that the fat being consumed, there will not any froath be left remaining: the *Aesopus* then being gathered together, is to be mollified with mens hands, and if there be any filth therein, it must out of hand be taken away, and all the water by little and little excluded, and being fresh poured in, let it be mingled with ones hands, until the *Aesopus* being touched with the tongue of any one, may lightly bind it, but not savour either sharp or tartly, and the fat may seem very white, and then let it be hid in an earthen vessel, but let there be great care had they be done in the hot sun. But there are some which use another manner of way to make the same, which is this, to cleanse the fleeces, and wash away all filth, and presse it forth of the same, and boyl them in water over a soft fire in a brazen vessel, then to wash the fat which swimmeth on the top being gathered together with water, and being strained in another platter which may have some hot water in it to hide or overcast it with a linnen cloth, and lay it forth in the sun until it be very white and thick enough.

Some also do use another way, as this, to wash the fat being strained with cold water, and to rub it with their hands, not much otherwise then women do a sear-cloth, for by that means it is made more white and purer.

There is yet another kinde of way to make *Aesopus*, described by *Aetius* in these words, Take (saith he) the greasie Wool which groweth in the shoulder pits of Sheep; and wash them in hot water, being thick and soft, and squeeze all the filth forth of the same, the washing whereof you shall put in a vessel of a large mouth or brim, casting afterwards hot water in the same, then take the water in a cup, or in some other such like instrument, and pour it in and out, holding it up very high until there come a froath upon it, then sprinkle it over with Sea water, if you shall get any, if not, with some other cold water, and suffer it to stand still; when it shall wax cold take that which shall flow on the top away with a ladle, and cast it into any other vessel, afterwards having put a little cold water in it, stir it up and down with your hands, then having poured out that water, put new hot water in it, and repeat again the same thing all-together, which we have now taught, until the *Aesopus* be made white and fat, containing no impure or filthy thing in it at all, then dry it in the sun, being hid for some certain days in an earthen vessel and keep it. But all these things are to be done when the Sun is very hot, for by that means it will be more effectual and whiter, and not hard or sharp.

There are moreover some which gather it after this manner; They put new shorn wool which is very filthy and greasie in a vessel which hath hot water in it, and burn the water that it may somewhat wax hot, afterwards they cool it, and that which swimmeth above in the manner of fat, they scum it off with their hands, and put it away in a vessel of Tin, and so do fill the vessel it self with rain water, and put it in the Sun covered with a thin linnen cloth, and then we must moisten it again, and put up the *Aesopus*, for it hath strength mollifying and releasing with some sharpness, but it is counterfeited with wax, sewer, and Rozen, and it is straight ways perceived, and forasmuch as the true *Aesopus* reserveth the scent of the unwashed wool, and being rubbed with any ones hands is made like unto Ceruse, or white lead.

Even the filth and sweat of sheep, cleaving to their wool, hath great and manifold use in the world, and above all other that is most commended which is bred upon the *Athenian* or *Grecian* Sheep, which is made many ways, and especially this way; First they take off the wool from those places where it groweth, with all the sewer or filth there gathered together, and so put them in a brazen vessel over a gentle fire where they boyl out the sweat, and so take of that which swimmeth at the top, and put it into an earthen vessel, seething again the first matter, which fat is washed together in cold water, so dried in a linnen cloth is scorched in the Sun until it become white and transparent, and so it is put in a box of Tin. It may be proved by this, If it swell like the favour of sweat, and being rubbed in a wet hand do not melt, but wax white like White lead, this is most profitable against all inflammation of the eyes, and knots in cheeks, or hardness of skin in them.

Of this *Aesopus* or unwashed Wool the *Grecians* make great account, and for the variety of dressing or preparing it, they call it diversly, sometime they call it *Oesupon Pharmacon*, sometime *Oesupon Kerotoeide*, or *Keroten*, sometime *Oesupon Hugron*, and such like. Of it they make Plaisters to assuage the *Hypochondriacal* inflammations and yentosity in the sides. Some use *Aesopus* for *Oesopus*; but ignorantly, and without reason, it is better to let it alone, but in the collection hereof it must be taken from the sound and not from the scabby Sheep. But when we cannot come by the true *Oesopus*, then in stead thereof we may take that which the Apothecaries and Ointment-makers do ordain; namely, *Meliloti* unc. 4. *Cardamomi* unc. 2. *Hysopi* herb. unc. 2. with the unwashed Wool taken from the hams or flanks of a Sheep. *Myrrhus* used this *Oesopus* against all Gowts and aches in the legs or articles.

articles, and hardness of the spleen. *Galen* calleth it *Jus lane*, and prescribeth the use of it in this sort; Make (saith he) a Plaister of *Oesyphus* or *Jus lane* in this sort, Take Wax, fresh grease, *Scammonie*, old Oyl, one ounce of each, of Fenny-greek six ounces, then seethe or boyl your oyl with the *Jus lane*, and Fenny-greek very carefully, until it equal the oyl, and be well incorporated together, and then again set it to the fire, with the prescription aforesaid; and also he teacheth how to make this *Jus lane*, for (saith he) take unwashed Wool and lay it deep in fair water until it be very soft, that is by the space of six days, and the seventh day take it and the water together, that seethe well, taking of the fat which ariseth at the top, and put it up as is aforesaid: these things saith *Galen*.

Dioscorides.

The use of this by reason it is very hot, is to display Ulcers and tumors in wounds, especially in the secrets and seat, being mixed with Melilot and Butter, and it hath the same vertue against running sores. The same also with Barly meal and rust of iron, equally mixed together, is profitable against all swelling tumors, Carbuncles, Tetters, Serpigoes, and such like, it eateth away all proud flesh in the brims of Ulcers, reducing the same to a natural habit and equality, also filling up the sore and healing it, and the same vertue is by *Dioscorides* attributed to Wool burnt, also in bruises upon the head when the skin is not broken, a Poultice made hereof, is said by *Galen* to have excellent force and vertue. The same mingled with Roses, and the oar of brasse (called *Nil*) cureth the holy fire, and being received with Myrrh steeped in two cups of wine, it encreaseth or procureth sleep, and also is very profitable against the Falling-sickness. And being mixed with Corlick Hony, it taketh away the spots in the face, because it is most sharp and subtile, whereunto some add Butter; but if they be whealed and filled with matter, then prick and open them with a needle and rub them over with a dogs gall or a Calfs gall mingled with the said *Oesyphus*, also being instilled into the head with oyl, it cureth the Megrin, and furthermore it is used against all soreness of the eyes, and scabs in their corners, or upon the eye-lids, being sod in a new shell: and the same vertue is attributed to the smoke or foot thereof, if the eye-brows or eye-lids be anointed therewith; mixed with Myrrh and warmed, it is thought that it will restore the hair that is wanting and fallen off: but *Marcellus* prescribeth it in this manner, You must take *Oesyphus* or sweat of Sheep from under the wool of their shoulders, and adding unto it a like quantity of Myrrh, beat them together in a mortar, and with a warm cloth anoint the bare places.

Marcellus.

If there be any bruise in the eyes, then you must anoint them first with Goose grease, and the blood of a Mallard, and afterward with the sweat of a Sheep, and the same cureth all Ulcers in the mouth, ears, and genitals, with Goose-grease. This is also mixed with a Sear-cloth, and laid against the Phthisis (as *Actius* writeth) with a moist cloth against the Plurisie, also a Plaister made hereof with Goose grease, Butter, Allum, and the brain of a Goose, is very profitable against the pains in the reins, and all other infirmities of the back, and for the same cause it is applyed to women, for it provoketh their monthly courses, and also causeth an easie deliverance in childe-birth, it healeth the Ulcers in the secret and privy parts of men and women, and all inflammation in the seat, especially being mixed with butter, Goose grease, and Melilot: and some add thereunto the oar of Brasse and Roses. If there be a Carbuncle in the privy parts, take this *Oesyphus* with Hony and the froath of lead, also white lead, womens milk, and this Sheeps sewer, cureth the Gout, at the least marvellously asswageth the pain thereof, and some Physitians for this evill take Grease, Goose grease, and the fat of Buls, added to *Oesyphus*, also unwashed wool with the gall of a Bull laid to a womans secrets, helpeth her monthly purgation, and *Olimpias* added thereunto *Nitre*. The dung which cleaveth to Sheeps tails made into small bals, and so dried, afterward beat into powder and rubbed upon the teeth, although they be loose, falling out, or overgrown with flesh, yet *Pliny* saith, they will be recovered by that fricassing. If he which is sick of a Dropie drink this sweat or *Oesyphus* in wine with Myrrh of the quantity of a Hasel nut, Goose grease, and Mirtle oyl, it will give him great ease, and the same virtue is ascribed to the sweat of an Ewes udder, which is and hath been said of all the former *Oesyphus*.

Pliny.

The medicines of the Ram.

Even as the skins of other Sheeps newly plucked from their backs and applyed warm, do take away the ach, swelling, and pains of stripes and blowes from bodies, so also have the skins of Rams, the same property. *Arnoldus* commendeth a plaister made of a Rams skin for bursting and falling down of the guts, and this is found ready prepared in many Apothecaries shops, and the happy success thereof is much commended by *Alysius*. If a man take the stones of a fighting cock, and anoint them with Goose grease, and so wear them in a piece of a Rams skin, it is certain that it will cohibite and restrain the rage of venereal lust, and a woman wearing about her the right stone of a dunghil cock in a Rams skin shall not suffer abortment. The washed fleece of a Ram wet in cold Oyl, putryfieth the inflammation of the secrets; and likewise the black wool of a Ram wet in water, and then in oyl, and so put to the sick places, keepeth the fundament from falling, and also asswageth the pain. Also the wool of a fighting Ram taken from betwixt his horns, and perfumed into a smoke, easeth the pain, and some take the powder thereof in Vinegar for that Malady. They say that *Lais* and *Salpe* cure the bitings of mad Dogs, and also Tertian and Quartan Agues, with the menstruous purgation taken in a piece of Rams wool, and included in a bracelet of silver. Also they write that a woman shall have an easie travail if she wear in the wool of a Ram.

seed

seed of wilde Cucumber about her loins, not knowing thereof, so as it be presently after the delivery cast out of doors. Also *Marcellus* saith, that if one take the wool from a Rams fore-head, and burn in the cover of a new pot, and afterward beat it to powder in a mortar, and so put it into Vinegar, and therewithal the forehead being anointed, it easeth the head-ach. Also the dust of Rams wool mixed with water, cureth the pain in the yard. The matter of the Liver sod, hath the same operation: and *Sextus* writeth, that if the wool be taken from the head, ribs, and cods, and also worn by him that hath a Tertian Ague, it perfectly cureth him, and if a mans fingers ends and toes be tyed with the unwashed wool of a Ram, it will stanch the bleeding at any part, especially the Nose. Also if you burn the greasie wool of a very fat Ram, and in water wash the same, it will help all evils in the yard of man, if it be rubbed therewithal.

The broath of the rump of a Ram is commended against blisters. The flesh of a Ram being burnt and anointed upon the body of any leproous person, or any whose body is troubled with Ring-worms or itches is very effectual to cure them. The same force hath it against the bites of Scorpions, and stings of Serpents, and Algerat: it also being taken in wine, is good for the bitings of mad dogs, and healeth the white skins in the eyes. The fat of a Sheep or Weather hath the same in it, as Pork grease, and cureth the suffocation of the womb, and all other diseases incident unto the secret parts, and also helpeth places in the body being burnt by fire. The fat of a Ram being mingled with red Arsenick and anointed upon any scall or scab, the same being afterward pared or scraped, doth perfectly heal it. It doth also being mixed with Allum, help those which are troubled with Kibes or Chilblanes in their heels.

The sewer of a Ram mingled with the powder of a pumice stone and salt, of each a like quantity, is said to heal fellons and inflammations in the body. The Lungs of smal Cattle, but especially of a Ram, doth restore chaps or scars in the body to their right colour. The same vertue hath the fat of a Ram being mingled with Nitre. The gall of a Ram mingled with his own sewer, is very good and profitable for those to use who are troubled with the Gowt or swelling in the joynts. The horn of a Ram being burned, and the dust of the same mixed with oyl, and so pounded together, being often anointed upon a shaven head, doth cause the hair to frisse and curl. A comb being made of the left horn of a Ram, and combed upon the head, doth take away all pain upon the left part thereof, if likewise there be pain in the right side of the head, the right horn of a Ram doth cure it. For the curing of the losse of ones wits springing from the imperfection of the brain, take the head of a Ram never given to venery, being chopped off at one blow, the horns being only taken away, and seethe it whole with the skin and the wool in water, then having opened it, take out the brains, and add unto them these kinds of spices, Cinamon, Ginger, Mace, and Cloves, of each one half an ounce: these being beaten to powder, mingle them with the brains in an earthen platter diligently tempering of them by a burning cole, not very big, for fear of burning, which might easily be done, but there must great care be had that it be not too much dried, but that it might be so boyled that it be no more dried then a Calfs brains being prepared for meat.

It shall be sufficiently boyled when you shall well mingle them at the fire, then keep it hid, and for three days give it dayly to the sick person fasting, so that he may abstain from meat and drink two hours after. It may be taken in bread, or in an Egge, or in whatsoever the sick party hath a desire unto: but there must be regard that he be not in a clear place, and that he use this forty days space, which they are wont to use whose blood is withdrawn or fled away: and let him abstain from wine assaying his head.

There are those which are holpen in a short space, some in six or eight weeks by this Medicine being received. But it is convenient that it be required for three moneths, and then it will have the more power therein. The Lungs of a Ram while they are hot applyed unto wounds wherein the flesh doth too much increase, doth both repress and make it equal. The Lungs of smal Cattle, but especially of Rams being cut in small pieces and applyed while they are hot unto bruised places, do very speedily cure them and reduce them to the right colour.

The same doth cure the feet of such as are pinched through the straightness of their shooes. The Lungs of a Ram applyed unto Kibed heels or broken Ulcers in the feet; doth quite expel away the pain, notwithstanding the exceeding ach or pricking thereof. One drop of the liquor which is boyled out of a Rams lungs put upon the small nails upon the hand, doth quite expel them. The like operation hath it to expel Warts being anointed thereupon. The corrupt blood of the Lungs of a Ram unroasted, doth heal all pains in the privy members of man or woman; as also expel Warts in any place of the body. The juyce of the Lungs of a Ram while they are roasted upon a Gridiron being received, doth by the unction thereof purge and drive away the little black Warts which are wont to grow in the hair or privy parts of any man.

The liquor which distilleth from the Lungs of a Ram being boyled, doth heal Tertian Agues, and the disease of the reins which grow therein. The Lungs of a Lamb or Ram being burned, and the dust thereof mingled with Oyl, or being applyed raw, do heal the soreness of Kibes, and are accounted very profitable to be bound upon Ulcers. The Lungs of a Ram being pulled forth and bound hot unto the head of any one that is frenzie, will presently help him. Against the pestilent disease of Sheep, take the belly of a Ram and boyl it in wine, then being mixed with water, give it to the Sheep to drink, and it will bring present remedy.

Avicenna.

Sextus.

Marcellus.

Marcellus.

Sextus.

Æsculapius.

- Marcellus.* The gall of a Ram is very good for the healing of those which are troubled with any pains in the ears, coming by the casualty of cold. The gall of a Ram mingled with his own sewer, doth ease those which are troubled with the Gowt. The gall of a Weather mingled with the wool and placed upon the navel of young children, doth make them loose in their bellies. The stones of an old Ram being beaten in half a penny weight of water, or in three quarters of a pint of Asses milk, are reported to be very profitable for those which are troubled with the falling sickness. The stones of a Ram being drunk in water to the weight of three half pence, cureth the same disease.
- Pliny.* The dust of the inward parts of a Rams thigh being lapped in rags or clouts, washed very exactly before with womens milk, doth heal the ulcers or runnings of old sores. The dust of the hoof of a Ram mingled with hony, doth heal the bitings of a Shrew. The dung of Weathers mingled with Vinegar and fashioned in the form of a Plaister, doth expel black spots in the body, and taketh away all hard bunches arising in the flesh. The same being applyed in the like manner, cureth St. *Antonies* fire, and healeth burned places.
- Sextus.* The filth or sweat which groweth between the thighs of a Ram being mingled with Myrrh and the Herb called Hart-wort, and drunk of each an equal part, is accounted a very excellent remedy for those which are troubled with the Kings evil. But *Pliny* commendeth the filth of Rams ears mingled with Myrrh, to be a more effectual and speedy remedy against the said disease.

The medicines of the Lamb.

- Actius.* The best remedy for bitings of Serpents is this, presently after the wound to apply some little creatures to the same, being cut in small pieces, and laid hot unto it, as Cocks, Goats, Lambs, and young Pigs; for they expel the poison and much ease the pains thereof. An ounce of Lambs blood being fresh before that it doth congeal mixed with Vinegar, and drunk for three dayes together, is an excellent remedy against the vomiting or spitting of blood. The like force in it hath the blood of a Kid. The blood of a Lamb mingled with wine, doth heal those which are troubled with the Falling sickness, as also those which have the foul evil. For the conception of a Woman, take the yard and gall of a Buck, a Kid, and a Hare, with the blood and sewer of a Lamb, and the marrow of a Hart, and mix them all together with Nard and Oyl of Roses, and after her purgation, let them be laid under her, and this without all doubt will make her apt to conceive.
- Pliny.* The skins of Serpents being anointed with water in a bath, and mingled with lime and Lambs sewer, doth heal the disease called St. *Antonies* fire. The marrow of a Lamb melted by the fire, with the Oyl of Nuts and white sugar, distilled upon a clean dish or platter, and so drunk, doth dissolve the stone in the bladder, and is very profitable for any that pisseth blood. It also cureth all pains or griefes of the yard, bladder or reins. The skin of a Lamb being dawbed or anointed with liquid pitch, and applyed hot unto the belly of any one that is troubled with excoriations of the bowels or of the Bloody flux, will very speedily cure him, if he have any sense or feeling of cold in him.
- Hippocrates.* If a Virgins menstrual fluxes come not forth at the due time, and her belly is moved, it is convenient to apply Lambs skins being hot unto her belly, and they will in short space cause them to come forth. A garment made of Lambs skins is accounted very good for the corroborating and strengthening of young men. The skins of Lambs are more hot then Kids skins, and are more profitable for the confirming of the back and the reins. The little bone which is in the right side of a Toad being bound in a young lambs skin being hot, doth heal both Quartain and all other Fevers being applyed thereunto. The dust of Lambs bones is very much and rightly used for Ulcers which have no chops, or stars in them. The dust of small Cattles dung being mingled with Nitre, but especially of Lambs, hath in them great force to heal Cankers: the dust of Lambs bones, is very much commended for the healing and making of green wounds sound and solid, which thing by the *Saracens* is much verified in regard that at all times they go to war, they never forget to take of the same along with them.
- Marcellus.* The Lungs of Lambs do very effectually cure those whose feet are wrung or pinched by their shoo-soles. The Lungs of Lambs or Rams being burned, and the dust thereof mingled with Oyl, is very profitable for the curing of kibes or ulcers, being applyed thereunto. It hath the same virtue being raw and bound upon the sore.
- Pliny.* The runnet of a Lamb is of very great force against all other evil medicines. The runnets of small Cattle, but especially of a Lamb, is very effectual against all kinds of poyson. The runnets of a Kid, a Lamb, and a hind-calf are conveniently taken against Wolf-bane drunk in wine. The runnet of a Hare, a Kid, or a Lamb taken in wine to the weight of a dram is very effectual against the Fork-fish, and cureth the bites or strokes of all Sea-fishes. The runnet of a Lamb drunk in wine is an excellent cure for the bitings of a Shrew. The runnet of a Lamb drunk in water is accounted for a safeguard to young children who are vexed with thick and concrete milk: or if the default shall happen by curded milk, it will be soon remedied by a Lambs runnet given in Vinegar. A Lambs runnet hid or powred into water, doth speedily cohibit the bleeding of the nose, when nothing else can stay it. The gall of small Cattle, but especially of a Lamb being mixed with hony, are thought to be very medicinable for the curing of the Falling sickness.

The places which are infected by Cankers, being anointed over with the gall of a Lamb are very speedily and effectually healed.

There is also by the Magitians delivered unto us a speedy means for the curing of the milt; which is this, to take a Lamb new born, and instantly to pluck him in pieces with ones hands, and when the milt is pulled out to put it hot upon the milt of the party so grieved, and bind it on fast with swadling cloathes, and continually to say, I make a remedy for the milt; then in the last day the same being taken from his body to put it to the Wall of the bed wherein the diseased party is wont to lie, it being first daubed with durt, that it might the better stick, and to sign the durt with seven and twenty marks, saying at every mark, I make a remedy for the milt: this remedy being done three times it will heal the diseased party, although he be very weak and full of danger. But this is the opinion of the Magitians, which I here set down that they should rather see their folly then believe, knowing them to be meer fopperies. For making the wool to grow flower, the gelders of Cattle anoint the blood which cometh from the stones of gelded Lambs, which being anointed, doth profit very much for hairs being pulled away, as also against poison. The dung of Lambs before they have tasted of any grasse, being dried in the shadow, and rubbed to powder and applied in the manner of a plaister, doth heal and ease all kinds of pain in the chaps or jawes. And thus much for the medicines of the Sheep. Marcellus. Pliny.

Of the *STREPSICEROS*.

There is in *Crete* neer the Mountain *Ida*, a kinde of Sheep called by the Shepherds *Strepsiceros*, which is not different from the vulgar Sheep, except only in the horns, for they bend not like other, but stand straight and upright like the *Unicorn*, and besides are circled about with certain round speers like a Goats horn. This liveth in flocks, and we have here besides the figure of the beast, expressed a double form of their horns, and fore part of their head, the figure of a Harpe being fastned to one of them as it was presently drawn. The description whereof was taken by Doctor *Cay* of *England*, in these words following. Belonius.

The horns of this *Strepsiceros* are so lively expressed by *Pliny*, and so fitly fitted to bear Harps, that they seem not to aske any further narration of words. I will therefore only add this, they are hollow within, and long, about two *Roman* feet and three palms if you measure them, as they are straight; but if you take their scantling and length as they crook a little, then are they about three foot long, they are in breadth where they joyn to the head, three *Roman* fingers and a half, and their whole compass in that place is about two *Roman* palms and a half. In the top they are smooth and black, but at the root they are more dusky and rugged, growing lesser and lesser to a sharp point. They with the dried face did weigh seven pounds and three ounces, and the face which remaineth is joyned to the horns, and likewise the hair of the neck and face. It is said that this Beast is as great as a Hart, having a red hair like a Hart.

But whether his nostrils were so also I could not conjecture, by reason that the age and long use of the piece had defaced the nose which was dried up, and also the hair was worn away, so as it was bald, but by that which was most apparent unto it, I rather inclined that it resembled a Hart, from

hence it was that the drawer made the nostrils lesse then might answer the proportion of the face, and that which is seen betwixt the horns it is a piece of the neck, by which relation I cannot believe that the *Cretian* or *Idean* Sheep is a *Strepficeros*, because the horns thereof do not bend at all, although it answereth not the name, but the true horns of the *Strepficeros* do as I have said resemble the ancient fashion of harps, among our fore-fathers, especially the handle being taken away, and the face of the beast placed in stead thereof.

Unto this I may add another horn, which is to be seen in the Castle of the L. *William Wernbere* Count of *Cimbria*, being black, hollow, and of the length of ones arme, and as thick as a great staffe, and it was said, that the beast beareth two of them, which are to be seen among the rare monuments of *Ferdinandus* the Emperor.

Of the *SQUIRREL*.

THe name of this Beast is by the *Grecians* called *Sciuros*, and it was given them from the fashion and proportion of their tail, which covereth almost the whole body, for that which is fabulously said of the *Sciapodes* to have feet that cover their whole body, is more truly verified of a Squirrels tail, for in the day time being out of her nest, she hideth her self there under both from sun and rain.

The first Author that ever wrote of this Beast was *Oppianus*, who lived in the days of *Antoninus Caesar*, and the *Latins* have no proper or native name for it, but borrow from the *Grecians*, although some of the latter writers call it *Pirolus*, and *Spiurus*, I think they would say *Sciurus*, for so it is vulgarly termed in *Latin*: some also call it *Sculurus a currendo*, because of his nimble running upon boughs. But all the Nations of the world derive their several denominations from the *Grecians*, as the *English* Squirrel from *Sciurus* is not far fetched; the *French* words *Escurieu*, and *Escuriau*, from whom the *Germans* borrow their words *Eychorn*, or *Eichorn*, or *Eych horn*, or *Eich hermlin*, that a Weasel of the tree, and *Das Eychorn*.

The *Italians* call it *Schirivolo*, and the *Venetians* (as *Massarius* testifieth) *Schiriati*; the *Spaniards* *Harda*, and *Esquilo*, and some do interpret *Coma dreia* for a Squirrel; the *Itlyrians*, *Weweeka*, and some of the *Polonians*, *Wije Wijerka*, and so they turn the Mouse *Varius*, as we have said else where in that story, and some of the *Germans* call it *Werck*, and *Veck*, and *Fech*.

Now *Albertus* and *Agricola* say, that there is no difference betwixt the Mouse *Varius* and the Squirrel, but only in the Region which altereth the colour, and therefore we have expressed the same figure thereof, remitting the Reader to that which is said in that History, for this (say they) in *Germany* is red after it be a year old, but before that time it is blackish, that is till it be a year old: In *Polonia* it is of a red-ash colour, or branded grysell, in *Russia* of an ordinary ash colour, and for the quantity, food, and manner, or natural inclination, it hath the same in all parts with the mouse *Varius*.

Varinus and *Hesychius* say, that the *Grecians* call this beast also *Campsouros*, and *Hippouros*, and some call the *Cappadocian* Mouse *Nexis* a Squirrel; the *Jewes* at this day call a Squirrel *Coach*, for it is apparent that in antient time till they came into these parts of the world into *Grecia* and *Europe*, they never knew or saw this beast. And this shall suffice to have said of the name.

A Squirrel is greater in compass then a Weasel, but a Weasel is longer then a Squirrel, the back parts and all the body is red, except the belly which is white. In *Helvetia* they are black and branded, and they are hunted in the Autumn at the fall of the leaf, when the trees grow naked, for they run and leap from bough to bough in a most admirable and agile manner, and when the leaves are on, they cannot be so well discerned. They are of three colours, in the first age black, in the second of a rusty Iron colour, and last of all when they be stricken in age, they are full of white hoar hairs. Their teeth are like the teeth of Mice, having the two under teeth very long and sharp, their tail is always as big as their body, and it lyeth continually upon their back, when they sleep or sit still; It seemeth to be given them for a covering as we have said already. The maw-gut differeth from all other, for it is *Cocum*, that is, as I take it without a passage out of it into any other part then the other guts, or like a mans bladder; and it is as great as their ventricle, which in dissection hath been found full stuf with excrements. The genital is like a bone, as *Vesalius* writeth.

They use their forefeet in stead of hands, for they sit upon their buttocks, and move their meat to their mouth with them, in this point resembling every little vulgar Mouse, yet being put to the mouth, they hold it in their teeth. They will eat Nuts and Almonds very greedily, and also Apples, Buckmafts, Acorns, and sometimes herbs, especially Lettice, and all other sweet fruits. Their feet are cloven like Mice, and their hinder parts very fleshy to sit upon. In the summer time they build them nests, (which in our Countrey are called *Drayes*) in the tops of the trees, very artificially of stickes and mosse, and such other things as woods do afford them.

The mouth of their nest is variable, sometimes at the sides, and sometimes at the top, but most commonly it is shut against the winde, and therefore I think that she maketh many passages, stopping and opening them as the winde turneth. In Summer time they gather together abundance of fruits and Nuts for winter, even so much as their little *Dray* will hold and contain, which they carry in their mouths, and they lodge many times two together, a male and female (as I suppose.) They sleep a great part of the Winter like the *Alpine* Mouse, and very soundly, for I have seen when no noise of hunters could awake them with all their cries, beating their nests on the outside, and shooting bolts and arrowes thorough it, until it were pulled asunder, wherein many times they are found killed before they be awaked.

They are of incredible agility and motion, never standing still, as it appeareth by them which are tamed. When they leap from tree to tree, they use their tail in stead of wings, which is most apparent, because many times they leap a great distance and are supported without sinking to mans appearance.

And again I have seen them leap from the top of very high trees down to the ground in such an ordinary pace as Birds flie from trees to light on the earth, and receive no harm at all: for when they are hunted, men must go to it with multitude, for many men cannot take one with bowes and bolts with Dogs, and except they start and rouse them in little and small slender woods, such as a man may shake with his hands, they are seldom taken.

Bowes are requisite to remove them when they rest in the twists of trees, for they wil not be much terrified with all the hollowing, except now and then they be struck by one means or other. Well do they know what harbour a high Oak is unto them, and how secure they can lodge therein from Men and Dogs, therefore seeing it were too troublesome to climb every tree, they must supply that business or labor with bowes and bolts, that when the Squirrel resteth, presently she may feel the blow of a cunning Archer, he need not fear doing her much harm, except he hit her on the head, for by reason of a strong back-bone and fleshy parts, she will abide as great a stroak as a Dog; yea, I have seen one removed from a bough with a shot to the ground.

If they be driven to the ground from the trees to creep into hedges, it is a token of their weariness, for such is the stately minde of this little Beast, that while her limbs and strength lasteth, she carryeth and saveth her self in the tops of tall trees, then being descended, she falleth into the mouth of every Cur, and this is the use of Dogs in their hunting.

The admirable wit of this Beast appeareth in her swimmig or passing over the Waters, for when hunger or some convenient prey of meat constraineth her to passe over a river, she seeketh out some rinde or small bark of a Tree which she setteth upon the water, and then goeth into it,

and holding up her tail like a sail, letteth the winde drive her to the other side, and this is witnessed by *Olaus Magnus* in his description of *Scandinavia*, where this is ordinary among Squirrels, by reason of many rivers, that otherwise they cannot passe over, also they carry meat in their mouth to prevent famine whatsoever befall them, and as Peacocks cover themselves with their tails in hot Summer from the rage of the Sun, as under a shadow, with the same disposition doth the Squirrel cover her body against heat and cold.

They grow exceeding tame and familiar to men if they be accustomed and taken when they are young, for they run up to mens shoulders, and they will oftentimes sit upon their hands, creep into their pockets for Nuts, go out of doors, and return home again; but if they be taken alive, being old, when once they get loose, they will never return home again, and therefore such may well be called *Semiferi* rather than *Cicures*.

They are very harmful, and will eat all manner of woollen garments, and if it were not for that discommodity, they were sweet-sportful beasts, and are very pleasant playfellows in a house.

It is said, that if once they tast of Garlick, they will never after bite any thing, and this is prescribed by *Cardan* to tame them, their skins are exceeding warm, and well regarded by skimmers, for their heat is very agreeable to the bodies of men, and therefore they are mixed also with the skins of Foxes. Their flesh is sweet, but not very wholesome, except the Squirrel were a black one. It is tender and comparable to the flesh of Kids or Conies, and their tails are profitable to make brushes of.

The medicines are the same for the most part which are before expressed in the Dormouse, saving that I may add that of *Archigenes*, who writeth, that the fat of a Squirrel warmed on a rubbing cloth, and so instilled into the ears, doth wonderfully cure the pains in the ears. And so I conclude this history of the Squirrel with the Epithets that *Martial* maketh of a Peacock, a Phoenix, and a Squirrel, in a comparison of a beautiful Virgin *Erotion*.

Cui comparatus indecens erat pavo,

Inamabilis sciurus, & frequens Phœnix.

Of the *Getulian Squirrel*, described and figured by *Doctor Cay*.

THis *Getulian* or *Barbarian Squirrel*, is of mixt colour, as it were betwixt black and red, and from the shoulders all alone to the tail by the sides, there are white and russet strakes or lines, which in a decent and seemly order stand in ranks or orders; and there be some of these Squirrels which have such lines of white and black, with correspondent lines in the tail, yet they cannot be seen except the tail be stretched out at length, by reason there is not much hair upon it. The belly seemeth to be like a blew colour upon a white ground. It is a little lesse then the vulgar Squirrel, and hath not any ears extant or standing up as that, but close pressed to the skin round, and arising a little in length by the upper face of the skin. The head is like the head of a Frog, and in other things it is very like the vulgar Squirrel, for both the outward shape, the manner, and behaviour, the meat and means of life agree in both, and she also covereth her body like other Squirrels. This picture and description was taken by him from one of them alive, which a Marchant of London brought out of *Barbary*.

They are very pleasant and tame, and it is very likely that it is a kinde of *Egyptian* or *African Mouse*, whereof there are three sorts described by *Herodotus*, the first called *Bipedes*, the second *Zegeries*, and the third *Echines*, of which we have already spoken in the story of divers kinds of Mice, and therefore I will here end the discourse of this Beast.

of a Wilde Beast in the New-found World called *Su*.

There is a Region in the New-found World, called *Gigantes*, and the Inhabitants thereof are called *Pantagones*; now because their Countrey is cold, being far in the South, they clothe themselves with the skins of a Beast called in their own tongue *Su*, for by reason that this Beast liveth for the most part neer the waters, therefore they call it by the name of *Su*, which signifieth water. The true Image thereof as it was taken by *Thevetus*, I have here inserted, for it is of a very deformed shape, and monstrous presence, a great ravener and untamable wilde Beast. When the Hunters that desire her skin set upon her, she flyeth very swift, carrying her young ones upon her back, and covering them with her broad tail: now forso much as no Dog or Man dareth to approach neer unto her, (because such is the wrath thereof, that in the pursuit she killeth all that cometh neer her:) the Hunters dig several pits or great holes in the earth, which they cover with boughs, sticks, and earth, so weakly that if the Beast chance at any time to come upon it, she and her young ones fall down into the pit and are taken.

This cruel, untamable, impatient, violent, ravening, and bloody beast, perceiving that her natural strength cannot deliver her from the wit and policy of men her hunters, (for being inclosed, she can never get out again,) the Hunters being at hand to watch her downfall, and work her overthrow, first of all to save her young ones from taking and taming, she destroyeth them all with her own teeth; for there was never any of them taken alive; and when she seeth the Hunters come about her, she roareth, cryeth, howleth, brayeth, and uttereth such a fearfull, noysome, and terrible clamor, that the men which watch to kill her, are not thereby a little amazed, but at last being animated, because there can be no resistance, they approach, and with their darts and spears wound her to death, and then take off her skin, and leave the carcass in the earth. And this is all that I finde recorded of this most savage Beast.

of the *SUBUS*, a kinde of wilde Water-sheep.

This Beast is called by *Oppianus Soubos*, and thereof the Latines call it *Subus*. *Bodine* in his interpretation of *Oppianus*, doth make it one beast with the *Strepsiceros*, but because he expresseth no reason thereof, I take it that he was deceived by his conjecture, for we shall manifest, that either the colour or feat of living, cannot agree with the *Strepsiceros*, for he saith only it is the same Beast which *Pliny* calleth a *Strepsiceros*.

But we know by the description of *Oppianus*, that this Beast is of a red-gold-colour, having two strong armed horns on the head, and liveth sometimes in the Sea, and Water, sometime on the land. Of all kinds of Sheep this is the worst and most harmful, ravening after life and blood; for it goeth to the water, and therein swimmeth: when the silly simple fishes see this glorious shape in the waters, admiring the horns, and especially the golden colour, they gather about him in great flocks, and abundance, especially Shrimps, Lobsters, Mackarel, and Tenches, who follow him with singular delight on either side, both the right and the left, pressing who shall come nearest, to touch and have

have the fullest sight of him; so they accompany him in ranks for love of his so strange proportion. But this unkinde and ravening Beast, despising their amity, society, and fellowship, maketh but a bait of his golden outside and colour, to draw unto him his convenient prey, and beguile the innocent fishes, for he snatcheth at the nearest, and devoureth them, tarrying no longer in the water then his belly is filled, and yet these simple foolish fishes seeing their fellows devoured before their faces have not the power or wit to avoid this devourers society, but still accompany him, and weary him out of the waters till he can eat no more, never hating him, or leaving him, but as men which delight to be hanged in silken halters, or stabbed with silver and golden bodkins, so do the fishes by this golden-coloured-devouring-monster. But such impious cruelty is not left unrevenge in nature, for as she gathereth the fishes together to destroy them, so the Fishermen watching that concourse, do entrap both it and them, rendering the same measure to the ravener, that it had done to his innocent companions. And thus much shall suffice for the *Subus* or Water-sheep.

Of the *SWINE* in general.

The several names.

Being to discourse of this beast, although the kinds of it be not many as is in others, yet because there are some things peculiar to the Bore, and therefore he deserveth a special story by himself, I will first of all deliver the common properties in a general Narration, and afterward descend to the special. For the names of this beast, there are many in all languages, and such as belong to the several sex and age of every one. For as in *English* we call a young Swine a Pig, a Weaning Pig, a Sheat, a Yealk, and so forth: likewise a Hog, a Sow, a Barrow, a Libd-hog, a Libd-sow, a Splayed Sow, a Gelt Sow, a Bafs, for the elder Swine, so in other Nations they observe such like titles. The *Hebrews* call a Bore *Chasir*, and a Sow *Chaserah*, the *Chaldees*, Deut. 4. for *Chasir* translate *Chasira*; the *Arabians*, *Kaniser*; the *Persians*, *Maran-buk*; the *Septuagints*, *Hus*; and *S. Hierom*, *Sus*; the *Arabians* also use *Hazir*, and *Acanthil*, for a Hog, *Achira*, and *Scrofa*.

Sylvaticus.

The *Grecians* do also use *Sus*, or *Zus*, *Choiros*, and *Suagros*. The wilde Hog is called *Kapron*, from hence I conjecture is derived the *Latine* word *Apex*; the *Italians* do vulgarly call it *Porco*; and the *Florentines* peculiarly *Ciacco*; and also the *Italians* call a Sow with Pig *Scrofa*, and *Troiata*, or *Porco fatrice*. The reason why that they call a Sow that is great with Pig *Trojata*, or *Trojaria* is for the similitude with the *Trojan Horse*, because as that in the belly thereof did include many armed men, so doth a Sow in her belly many young Pigs, which afterward come to the table and dishes of men. A Barrow hog is called *Majali* in *Latine*, and the *Italians*, *Porco castrato*, and *Lo Majale*. The *French* call a Swine *Porceau*, a Sow

Alumnus.
Erythraeus.

True Cooche, a Bore Verrat, a Pig Cochon Porcelet, and about Lyons, Cajon. The barrow Hog they call Por-chastre. The Spaniards call Swine Puerco; the Germans, Saw, or Suw, Su, schwin, Schwin, a Sow they call Ma and Loofs, a Bore Aker, which seemeth to be derived from Aker, a Barrow Hog Borg, a splayed Sow Gultz, a Pig Earle, and Seuwle, and a sucking Pig Spanfoerle. In little Britain they call a Hog Houch, and thereof they call a Dolphin Merhouch. The Illyrians call Swine Swinge, and Trase; the Latines, Sus, Porcus, and Porcellus, and Scrofa; and these are the common and most vulgar tearms of Swines: If there be any other, they are either devised or new made, or else derived from some of these.

Concerning the Latine word *Sus*, *Isidorus* deriveth it from *Sub*, because these Beasts tread under-foot grafs and grain, and indeed for this cause the Egyptians kept their Swine in the hills all the year long, till their seed time; for when their corn was sown, they drove them over their new plowed lands, to tread in the grain, that the Fowls and Birds might not root it or scrape it forth again; and for this cause also they spared Swine from Sacrificing. But in mine opinion it is better derived from *Hus*, the Grek word: For the Latine, *Porcus*, is thought to be fetched from *Porreus*, because his snout is alway stretched forth, and so he feedeth, digging with it in the earth, and turning up the root of trees: but I better approve the notation of *Isidorus*, *Porcus quasi spurcus, quia ceno & limo se volutat*. That is, because it rowleth and walloweth in the mire. *Porcetra* or *Porceta* for a Sow that hath had but one farrow, and *Scropha* for a Sow that hath had many. The Grecians *Hus* is derived from *Thuein*, which signifieth to kill in sacrifice, for great was the use of sacrificing this beast among the Paynims, as we shall shew afterward. The ancient Grecians did also tearm Swine *Sika*, and when the Swine-herds did call the Beasts to their meats, they cryed *Sig, Sig*: as in our Countrey their feeders cry *Tig, Tig, Chirois*, of their feeding and nursing their young ones. And indeed from Swine we finde that many men have also received names, as *Scipio Suarius*, and *Tremellius Scrofa*, whereupon lyeth this history, as he writeth: when *Licinius Nerva* was Prætor, his great Uncle was left Questor in his absence for *Macedonia*, untill the Prætor returned. The enemies thinking that now they had gotten opportunity and advantage against their besiegers or assaylants, caused an onset to be made, and a fight to be offered, then his Uncle exhorting the Roman Souldiers to arms, told them, *Se celeriter hostes discedit ut Scrofa porcellas*, That he would as easily cast them off and scatter them, as a Sow doth her Pigs sucking her belly, which he performed accordingly, and so obtained a great victory, for which *Nerva* was made Emperor, and he was always evermore afterward called *Scrofa*.

Macrobius telleth the occasion of the name of the family of *Scrofa* somewhat otherwise, yet pertaining to this discourse. *Tremellius*, saith he, was with his family and children, dwelling in a certain Village, and his servants seeing a stray Sow come among them, the owner whereof they did not know, presently they slew her, and brought her home. The neighbour that did owe the Sow called for witnesses of the fact or theft, and came with them to *Tremellius*, demanding his *Scrofa* or Sow again. *Tremellius* having understood by one of his servants the deed, laid it up in his Wives bed, and covering it over with the clothes, caused her to lie upon the Sows carcase, and therefore told his neighbour he should come in and take the *Scrofa*, and so had brought him where his wife lay, and swore he had no other Sow of his but that, shewing him the bed, and so the poor man was deceived by a dissembling oath, for which cause (he saith) the name of *Scrofa* was given to that family. There was one Pope *Sergius*, whose christen and first name was *Os porci*, Hogs face, and therefore he being elected Pope, changed his name into *Sergius*, which custom of alteration of names, as that was the beginning, so it hath continued ever since that time among all his successors. Likewise we read of *Porcellus* a Grammarian, of *Porcellius*, a Poet of Naples, who made a Chronicle of the affairs of *Frederick* Duke of *Urbine*, *Porcius*, *Snillus*, *Verres* the Prætor of *Sicilia*, *Syandra*, *Sybotus*, *Hyas*, *Hyagnis*, *Gryllus*, *Porcilla*, and many such other give sufficient testimony of the original of their names from Swine, and not only men, but people and places; as *Hyatæ*, *Suales*, *Chorreata*, three names of the Dori in Greece: *Hyia* a City of *Locris*, *Hyamena* a City of *Messene*, *Hyamajon* a City of *Troy*, *Hyampolis* a City of *Phocis*; whereby to all posterity it appeareth, that they were Swineherds at the beginning; *Exul Hyantænos invenit regna per agros*. *Hyope*, *Hyops* a City in *Iberia*, *Hyfia* a City of *Bœotia*, and *Pliny* calleth the tall people of *Ethiop*, which were eight cubits in height *Sybotæ*, and the like I might adde of many places, Cities, People, Fountains, Plants, Engins, and devises, plentiful in many Authors; but I will not trouble the Reader any longer with that, which may be but thought to be unnecessary. Only I cannot contain my self from the fiction of a Swines name and Testament, or last Will, for the mirth and wit thereof, as it is remembred in *Cælius*, and before in *S. Jerom*, and lastly by *Alexander Braccianus*, and *Geo. Fabritius*, I will express both in Latine and English in this place.

M. Grutinius *Corocotta Porcellus testamentum feci, quod quoniam manu mea propria scribere non potui, scribendum distavi. Magirus cocus dixit, veni huc everfor domi, soliverfor fugitive porcelle, ego hodie tibi vitam addamo. Corocotta porcellus dixit, si qua feci, si qua peccavi, si qua vascula pedibus meis confregi, rogo domine coque, vnam peto, roganti concede. Magirus coquus dixit, transi puer, adfer mihi de culina cultroem, ut hunc porcellum cruentum faciam. Porcellus comprehenditur à familia ductus sub die 16. Cal. Lucerninus, ubi abundant cyme, Clibanato & Piperato consulibus, & ut vidit se moriturum esse, hora spaciū petiit, coquum rogavit, ut testamentum facere posset. Inclamavit ad se suos parentes, ut de cibariis suis aliquid dimitteret eis, qui ait, Patri meo Verrino Lardino, do, lego, dari glandis modios 30. & matri mee Veturina Scrofae do, lego*

The etimology of the Greek and Latine names.

A history of the family of *Scrofa*.

Cælius. Names of men taken from Swine.

Alex. ab Ale.

A fiction of a Hogs will and testament.

lego, dari Laconicae filiginis modios 40. & sorori meae Quirinae, in cuius votum intercesse non potui, do, lego, dari hordei modios 30. & de meis visceribus dabo, donabo sutoribus setas, rixatoribus capitinas, surdis auriculas, caudicibus & verbosis linguam, bubularis intestina, esiciariis femora, mulieribus lumbulos, pueris vesicam, puellis caudam, cinedus musculos, cursoribus & venatoribus talos, latronibus ungulos, & nec nominando coquo, do, lego, ac dimitto popam & pistillam, quae mecum detuleram à querceto usq; ad haram, liget sibi collum de reste. In English without offence I may translate it thus; I, M. Grunter Hog-son little Pig have made this my last Will and Testament, which because I could not write with my own hand, I have caused it to be endited by other. Magirus the Cook said unto me, come hither thou underminer of houses, thou rooter up of land, fearful, fugitive little Pig, I must this day take away thy life. To whom Hog-son made this answer; If I have done any harm, if I have offended, if I have trod in pieces any vessels of worth under my feet, then I intreat thee good M. Cook pardon me, and grant me my request. But Magirus the Cook said, Run (sir Kitchen-boy) and bring me a knife out of the Kitchen, that I may let this little Pig bleed: presently I the little Pig was taken by the servants, and by them led the xvi. day of the Calends of Torch-light into the place of Cool-worts, when Fiery-furnace and Pepper-spice were Consuls, and when I saw no remedy but that I must die, I entreated the Cook but an hours space to make my Will. Which when I had obtained, I call'd my Parents and Friends about me, and made my Will in manner following: Of all my meat and provision left behinde me, first I give unto Bore-brown my father 30 bushels of Buck-mast. Item I give to my mother Town-fow, 40 bushels of the best Wheat. Item I give my sister Whine-pig 30 bushels of Barly, and for my bowels I bestow them in manner following; I bequeath my bristles to the Coblers and Shoemakers, my brains to Wranglers, my ears to the deaf, my tongue to Lawyers and Pratlers, my intrails to the Tripe-makers, my thighs to the Pye-makers, my loins to women, my bladder to boys, my tail to young maids, my muscles to shameless Dancers, my ankle-bones to Lackyes and Hunters, my hoofs to Thieves. Item I give unto this (unworthy to be named) Cook the Knife and the Pestle, that I brought out of the spinny of an Oak, into my sty, and so let him tie his neck with a halter. Also my Will is, that there be made for me a monument, wherein shall be ingraven in Golden Letters, this inscription or title, M. Grunter Hog-son, Little-pig, lived nine hundred ninty nine years and a half, and if he had lived but one half year longer, he had lived a thousand years. And you my Lovers and best Counsellors of my life, I beseech you do good to my dead carcase, salt it well with the best season of Nutmegs, Pepper, and Hony, that so my name and memory may remain for evermore. And you my Masters and Kindred which have been present at the making of my Will, I pray you cause your marks to be put thereunto.

Witnesses;

Mountain-hogs mark, Bacon-hogs mark, Swill-hogs mark,
Marsh-hogs mark.

The epithets of
Swine.

I have expressed this discourse for no other purpose but to shew the Reader, what proper feigned names have been or may be given to Swine, and so not to hold him any longer in this discourse, I will proceed from the names to the natures of this Beast. And first of all to begin with the common and vulgar epithets, which are as so many short definitions as they are words, as that of Horace, *Amica sus luto*, a dirt-lover, cloven-footed, beastly, clamorous, Acron-eater, rough, horrible, fearful, sluggish, filthy, unclean, impatient, loud, glad of food, miry, fat, wet, follower, moist, greedy, tender, and milk-sucker, according to the Poets sayings;

Lacte mero pascum pigra mihi matris alumnus,
Ponat: & Aetolo de sue dives edat.

Countries
wherein Swine
do not breed.

Swine are in the most Countries of the world. Yet Aristotle and Aelian report, that there are none in India, and Arabia Scen: and moreover there is in the people of those countries such a detestation of them that they cannot endure to eat their flesh, which is not wrought in them by any instinct or opinion of Religion (as it is in the Jews) but rather by a natural inclination of the place and Region wherein they live, for it is said also, that if Swine be brought thither from any other place, they die within short space.

Pliny affirmeth, that there are Boars among some of the Indians which have horns, and the like is affirmed of the Ethiopians. The Swine of Sicily are accounted the best of all other for food. In Bavaria they are lean, but in Burgundy, or the neather Germany, they are fierce, strong, and very fat. Those which are carried into Hispaniola, are said to grow to the stature of Mules.

Pet Martyr.

Now concerning the several parts of Swine, it is most certain that inwardly they do more resemble

a mans body then an Ape, for as all writers do affirm, that outwardly the proportion of Apes comé nearest to men, according to the Poets verse;

Simia quam similis turpissima bestia nobis.

So on the other side a Swines Anatomy doth more lively express the inward members and seat of life, and therefore our predecessors did first of all dissect a Swine, and then a Man, for the Swine was an example or Introduction to the other; and in Swine they chuse a lean Hog, because that all the vessels and instrumental parts do better and more clearly appear to the sight then in a fat Hog. There is not according to *Aristotle*, much marrow in their bones, and their skin is all over rough and hairy, and yet the hair not so thick as an Oxes, yet much longer and stiffer, standing up upon the ridge of the back; the colour of Swine is uncertain, and varieth not only after the diversity of the Countrey, but in every Countrey it is divers in it self, some are white, some branded, some sanded, some red, some black, some pyed, some none of these, and some all of these; yet in *Germany* for the most part red, and in *France* and *Italy* black.

The anatomy
and several
parts.

Betwixt the skin and the flesh there lyeth a fat called *Lardo*, *larde*, and *Arquina*. Their brain is very fat, and in the wane of the Moon it is less then any other beasts. Their eyes are hollow, and stand very deep in their heads, and therefore cannot by Art of man be taken out without danger of death, and if one of them be at any time perished, it is a hazzard but the Swine dyeth.

Their eye-brows move more downward toward their noses, and are again drawn up toward their temples, and their fore-head is very narrow, by which in ancient time they judged or deemed a fool or foolish unwise disposition, as by standing up of the lips about the canine teeth, betokeneth a contumelious and clamorous rayler, and thick lips, and a round mouth standing forth, the disposition of a Hog.

The snout is long and strong, and yet broad to cast up the earth for food, having on the tip a rising gristle round, and more piked, at the top betwixt the nostrils, wherewithal it first entereth the earth by digging. Upon their under chap there are teeth which grow out of their head, and the Boars have some which the females have not; For even as the Elephant hath two teeth growing downward, so hath the Boar two growing upward. The male as we have said, hath more then the female, and neither of both do lose or change them by any course of nature. As the Horse hath his mane, so hath a Swine certain bristles on his neck (called therefore by the *Grecians*, *Lophia*) this neck is broad and thick, and in it lyeth the strength of the beast, and therefore it is observed by the Physicians, that a man with such a neck is an angry fool.

Aristotle.

The collop next to the neck called vulgarly *Callasum*, ought to be broad and stiffe. It is said of sore Harts, that they have their gall in their ears, and indeed in the ears of Swine there is found a certain humor not much unlike to a gall: yet less liquid, and therefore by reason of the density or thickness thereof, comparable to the humor of the Spleen. The ventricle is large to receive much meat, and to concoct it perfectly, we call it vulgarly the Buck, and there are in it but few smooth ribs or crests, and in the liver parts which are very great, there is a certain hard thing white like a stone. The females have twelve udders or dugs under the belly, but never less then ten, if they want of twelve; and the Boars have their stones on their seat behinde them joyned together, which being taken off, are called by the *Latines*, *Polimenta*.

But in the female there is a great miracle of nature, for the place of conception is only open to the udders, or downward, but when her lust cometh on her, by often tickling and striving she turneth it about to meet with the Boars instrument in generation. And this bag is called *Apria*, which hangeth in the female inward, as the stones of the Boar do outwardly.

Aristotle.

In some places there are Swine which are not cloven-footed, but whole hoofed like a Horse, yet this is very seldom or accidental, for the most part all are cloven-footed, *Aristotle* affirmeth, that there are Swine whole hoofed in *Illyria*, *Pæonia*, and *Macedonia*, and *Albertus* saith, that he hath been informed of some such seen in *England*, and also in *Flanders*.

The Ankles are doubtful, as it were in proportion betwixt the Ankle of a whole and of a cloven hoof. Now by this that hath been said and shall be added, we must make up the description of a perfect Swine, for the better knowledge of the Reader, which may be this, of a straight and small head. The best form is to have large members, except the head and feet, and of one uniform colour, not parted or variable, not old, but of a good race or breed.

There be some that for the choice of their Swine do make this observation, they chuse them by their face, by the race, and by the Region; by the face, when the Boar and Sow are of good and beautiful aspects; by the race, if they bring forth many and safely, not casting Pigs; by the Region, when they are not bred where they be of a small, slender, or vile stature, and especially this is observed in the male, because that in all beasts they are oftentimes more like the sire then the dam; therefore it is better in Swine to have a thick, round, and well set Hog, then a long sided one, howbeit some approve Hogs with long legs. The buttocks ought to be fleshy, the belly large and prominent, and the snouts short and turning upward, yet the Sow is best, that hath the largest sides, if all the other members be correspondent.

The choice
or outward
marks of the
best Swine.

Likewise in cold Countries they must chuse their Swine with rough and thick hair, but in warmer and more moderate Climats, any hair be it never so small will serve the turn, especially if it be black. And thus much shall serve in this place for their several parts and members: Now we will proceed on to their nourishment and copulation.

It

The food of
Swine.

It is most certain that Swine are of a hot temperament, and for that cause it cometh to pass that they do not loose their Winter hair, for by reason of the fat neer to their skin, there is abundance of heat which keepeth fast the roots of the hair. Their food therefore and nourishment is easily digested in every part, for that which is so strong in the nouriture of the hair, must needs be of correspondent power in other parts. Some have thought that Swine care not for grasse or herbs, but only roots, and therefore hath a peculiar snout to attain them, but I finde by experience, that they will eat grasse above the earth, as well as roots beneath, and they love to feed in herds together. They love above measure Acorns, and yet being given to them alone they are hurtful, and bring no less damage to them then to Sheep, (though not so often) especially to Sows that be with Pig. The best time for gathering of Acorns is in November, and it is a work for women and children. The Woods of Italy are so full of Acorns, that they nourish abundance of Swine, and that therewith are fed the greatest part of the Roman people.

Nigidius.

They delight also in Buck-mast, and that meat maketh the Swines flesh light, easie of digestion, and apt for the stomach: In some Countries Haws have the same vertue to fat Hogs, that is in Acorns, for they make them waighty, straight, neat, and sweet. The next unto this Holm-berries do fat Hogs, saving that they procure looseness, except they be eaten by little and little. There is a tree which hath such bitter fruit (called *Haliphlocus*) whereof no beast will taste, hereof Hogs will tast, but in extreame famin and hunger, when they are without all other food and meat.

Pliny.

The fruit or Apples of Palm-trees (especially such as grow in salt grounds near the Sea sides, as in Cyrene of Africa, and Judea, and not in Egypt, Cyprus, Syria, Helvetia, and Assyria) do fatten and feed Hogs: And indeed there is scarce any food whereof they do not eat, as also no place wherein they pick not out some living, both in Mountains and Fens, and plain fields, but best of all near waters, wherein by the banks sides they gather many sweet and nourishable morsels.

Places of their
abode.

There are no better abiding places for Hogs then are the Woods, wherein abound either Oakes, Beeches, Cork-trees, Holm, wilde Olives, Tamarisk, Hasels, Apples, or Crab-trees, white Thorn, the Greek Carobs, Pine-trees, Corn-trees, Lote-trees, Prune-trees, Shrubs, Haws, or wilde Pears, or Medlers, and such like; for these fruits grow ripe successively one after the other, for there is no time of the year wherein some of them are not to be gathered soft and nourishable, whereby the herds of Swine may be maintained.

But if at any time this food cease, and not to be found, then must there be some other provision out of the earth, such as is corn, or grains, and turn your Hogs to moist places, where they may pick up worms, and suck up fat fenny water, which thing is above all other things grateful to this beast; for which cause it pleased the holy Ghost in Scripture, to compare the pleasure that beastly men take in sinning, to the wallowing of Swine in the mire. *The Dog (saith S. Peter) is returned to his vomit, and the Sow that was washed to wallow in the mire.* For this cause also you must suffer them to dig in the water, and to eat Canes and wilde Bulrushes, likewise the roots and tops of Water-creffes; and you must provide to lay up for them in water Acorns, and not spare corn to give it them by hand, as Beans, Pease, Fitches, Barly, and such like. And *Columella* (from whom I have taken these instructions) addeth moreover, that in the Spring time before your Hogs go abroad to bite at the sweet and fresh growing herbs, lest they provoke them to looseness, you must give them some sodden drink, wash or swill, by vertue whereof that mischief must be avoided, for if it be not, such leanness will follow, that it will overthrow and kill them.

Varro.

In some Countries they also give them the scapes or refuse Grapes of Vintage, and moreover the fruits of yew tree, which is poyson to Dogs. *Aristomachus* the Athenian by many and sundry praises advanceth three-leaved-grass, and among other, for that as when it is green it is commodious for Sheep, so being dried it is wholesome to Swine. They love green corn, yet it is reported, that if Swine eat of it in the Isle of *Salamine*, their teeth by the law of the Countrey are beaten out of their mouths. It is wholesome to give them crude or raw Barly, especially to a Bore when he is to couple with a Sow, but unto a Sow with Pig fod.

Ælianus.

There is in *Bavaria* a kinde of Scallion which beareth a red purple-flower, like to the flower of the Lilly of the Vallies, which is greatly sought after and devoured by Swine. They also seek after wilde Vines, and the herb called Hogs-bread, and the root of wilde rapes, which beareth leaves like unto Violets, but sharper, and a white root without milk: By some it is called Buchspick, because it groweth in Woods among Beeches. They eat also flesh, and abstain not from fat Bacon, and herein they differ from most of the ravening creatures, for Dogs will not taste of Dogs flesh, and Bears of Bears, yet will Hogs eat of Swines flesh, yea many times the dam eateth her young ones: And it is found that Swine have not abstain'd from the flesh of men and children, for when they have been slain by theeves, before they could be found, the greatest part of their body was torn in pieces and eaten by wilde Swine: And indeed as we see some Hens eat up the Eggs that they themselves have laid, so shall we observe some Sows to devour the fruits of their own wombs, whereat we ought not to marvel as at a monstrous prodigious thing, but rather acknowledge a natural voracity, constrained in them through famine and impatience.

Albertus.
Ælianus.

They also eat Snails and Salamanders, especially the Boars of the Mountains in *Cilicia*, and although there be in Salamanders a very deadly poyson, yet doth it not hurt them at all, but after-

afterward when men or beasts tast of such a Swines flesh, the operation of the poyson worketh upon them mortally: neither is this any marvel, for so it is when a Frog eateth of a Toad: and whereas if a man eat Hemlock, presently all his blood congealeth in his body and he dyeth, but if a Hog eat thereof, he not only not dyeth, but thriveth and groweth fat thereby. *Aristotle* reporteth one great wonder of a place about *Thracia* (as he saith) wherein for the compass of twenty paces there groweth Barly, whereof men eat safely, but Oxen and Sheep, and other creatures avoid it as mortal poyson, and Swine will not vouchsafe to tast of mens excrements that have eaten thereof, but avoid them carefully.

As Swine delight in meat, so also they delight more in drink, and especially in the Summer time, and therefore they which keep sucking Sows, must regard to give them their bellyful of drink twice a day, and generally we must not lead them to the waters as we do Goats, and Sheep, but when the heat of Summer is about the rising of the Dog-star, we must keep them all together by water sides, that so they may at their own pleasure, both drink and lie down to wallow in the mire, and if the coasts be so dry that this cannot be obtained or permitted, then must they have water set in troughes and vessels, whereof they may tast at their own pleasure, for otherwise through want of water they grow Liver and Lung sick.

The miery water doth most quickly make them fat, and they will drink Wine or Beer unto drunkenness, and in those Countries where Grapes grow, if the Swine come into the Vintage, they grow drunk with eating of Grapes. Also if the Lees of Wine be mingled with their meat, they grow fat above measure and senseless in their fat, whereby it hath been seen that a Mouse hath eaten into the sides of a fat Hog without the resistance of the beast: and the like is reported by *Pliny* of the son of *L. Apronius* who had been a Consul, for his body grew so fat that it was taken from him, his body remaining immoveable. And in the Spring time Swine of their own accord grow so fat, that many times they cannot stand on their legs their bodies be so heavy, nor go any whit, so that if they are to be removed, they are not to be droven but to be carryed in a Cart.

Varro and *Crescentienfis*, do report admirable things of the fatness of Swine. For first *Varro* saith, that he received knowledge from a credible honest man in *Portugal*, of a Swine that there was killed, the offall whereof with two ribs was sent to *Volumnius* a Senator, which weighed twenty and three pounds, and the fat betwixt the skin and the bone, was a foot and three fingers thick. Unto this he addeth the story of the *Arcadian* Sow, who suffered a Mouse to eat into her fat, and breed young ones therein, after she made a nest: which thing he likewise affirmeth of a Cow. And *Crescentienfis* reporteth of an other *Lusitanian* Swine, which after the death, weighed five hundred seventy and five pounds, and the Lard of that Hog was one foot and three fingers broad. And the like may be said of a Hog at *Basil*, nourished by a certain Oyl-man, in whose Lard or fat, after his death were found many passages of mice to and fro, which they had gnawed into his body without the sense of the beast. Hogs grow fat in short time. In antient days (as *Pliny* writeth) they put them up to fattening threescore days, and first of all they made them fast three days together, after six days they may sensibly be perceived to grow fat. There is not any beast that can better or more easily be accustomed to all kinds of food, and therefore doth very quickly grow fat, the quantity and stature of their body considered; for whereas an Ox or Cow, or Hart, and such like Beasts aske long time, yet a Swine which eateth of all sorts of meat, doth very quickly even in a moneth or two, or three at the most, prove worthy the knife and also his Masters table, although in some places they put them up to fattening a whole year together, and how much they profit & gather in their feeding, it is very easie for them to observe that dayly keep and attend them, and have the charge and overseeing of them.

And there must be had great care of their drink. In *Thracia*, after they put up a Hog to fattening, they give him drink the first day, and then let him fast from drink two days, and so give him drink by that proportion till the seventh day, afterward they observe no more diet for their Swine, but give them their fill of meat and drink till the slaughter day. In other Countries they diet them in this sort; After Beans and Pease they give them drink abundantly, because they are solid and hard; but after Oats and such like, as meal, they give them no drink, lest the meal swim up and down in their belly, and so be ejected into the excrements without any great profit. There is nothing whereon it liveth, but thereby it will grow fat except grazing, and therefore all manner of grain, Millet seed, Figs, Acorns, Nuts, Pears, Apples, Cucumbers, Roots, and such things cause them to rise in flesh gratefully, and so much the sooner if they be permitted to root now and then in the mire.

They must not be used to one simple, or unmingled, or uncompounded meat, but with divers compounds, for they rejoyce in variety and change like other beasts, for by this mutation of food, they are not only kept from inflammation and windiness, but part of it alway goeth into flesh, and part into fat.

Some use to make their sty wherein they are inclosed to be very dark and close, for their more speedy fattening, and the reason is good, because the beast is more apt to be quiet. You shall have Bakers that will fat their Hogs with Bran; and in *Elfaia* a Countrey of *Germany*, they fat them with Bean-meal, for thereby they grow fat very speedily, and some with Barly-meal wet with flat milk. And in the *Alpes* they fat them with Whay, whereby their fat and flesh groweth more white and sweet then if they were fatted with Acorns; yet Whay is very dangerous: for such is the ravening intemperancy of this beast, to swill in whatsoever is pleasant to his tast, that many times in drinking of Whay their bellies grow extended above measure, even to death, except that they be dieted by a wise keeper, and driven up and down not suffered to rest till it flow forth again backward.

Y y

Barly

Columella.

The great fatness of Swine.

The meat and best manner to fatten Hogs.

Ælianus.

Barly is very nourishable to them, whether it be sod or raw, and especially for Sows with Pig, for it preserveth the young ones till delivery, and at the farrowing causeth an easie and safe pigging. And to conclude this part, Millers and Bakers eat with Meal and Bran, Brewers with Ale, or Barly steeped in Ale, Oyl-men with the refuse of Nuts and Grapes.

Albertus.

Some again there be that grow fat with the roots of Fern. When a Sow is very fat she hath alway but little milk, and therefore is not apt to make any good tidy Pigs, and yet as all other beasts grow lean when they give suck, so also doth Swine. All swine in hot Regions by reason of a viscous humor, grow more fat then in the cold regions. In that part of *Frisia* neer *Germany*, they fat Oxen and Swine with the same meat, for there you shall have in one stable an Ox and a Hog tyed behind him at his tail, for the Ox being tyed to the rack eateth Barly in the straw and chaffe, which he swalloweth down without chewing, and so the softest thereof is digested in his belly, and the other cometh forth whole in his dung, which the Hog licketh up and is therewithal fatned. And it is to be remembered, that Swine gelded or splaid, do sooner fatten then any other.

To conclude, they love the dung of men, and the reason thereof is, because the seat of their lust is in their Liver which is very broad and insatiable, and there is nothing that hath a duller sense of smelling then this Beast, and therefore it is not offended with any carrion or stinking smell, but with sweet and pleasant ointments, as we shall shew afterwards.

Of the copulation and breed of Swine.

Concerning their generation or copulation, it is to be noted, that a Boar or male Swine will not remain of validity and good for breed past three year old, by the opinion of all the antient, for such as he engendereth after that age, are but weak and not profitable to be kept and nourished. At eight moneths old he beginneth to leap the female, and it is good to keep him close from other of his kinde for two moneths before, and to feed him with Barly raw, but the Sow with Barly sodden. One Boar is sufficient for ten Sows; if once he hear the voice of his female desiring the Boar, he will not eat untill he be admitted, and so he will continue pining, and indeed he will suffer the female to have all that can be, and groweth lean to fatten her; for which cause *Homer* like a wife husbandman prescribeth, that the male and female Swine be kept asunder till the time of their copulation. They continue long in the act of Copulation, and the reason thereof is, because his lust is not hot, nor yet proceeding from heat, yet is his seed very plentiful. They in the time of their copulation are angry, and outrageous, fighting with one another very irefully, and for that purpose they use to harden their ribs by rubbing them voluntarily upon trees. They choose for the most part the morning for copulation; but if he be fat and young, he can endure it in every part of the year and day, but when he is lean, and weak, or old, he is not able to satisfy his females lust, for which cause she many times sinketh underneath him, and yet he filleth her while she lyeth down on the ground, both of them on their buttocks together.

They engender oftentimes in one year, the reason whereof is to be ascribed to their meat or some extraordinary heat, which is a familiar thing to all that live familiarly among men, and yet the wilde Swine couple and bring forth but once in the year, because they are seldom filled with meat, endure much pain to get and much cold; for *Venus* in men and beasts, is a companion of satiety, and therefore they only bring forth in the spring time, and warm weather, and it is observed that in what night soever a wilde Hog or sow farroweth, there will be no storm or rain. There be many causes why the tame domestickall Hogs bring forth and ingender more often then the wilde; first because they are fed with ease; secondly because they live together, without fear, and by society are more often provoked to lust; on the other side the wilde Swine come seldom together, and are often hungry, for which cause they are more dull and lesse venereous, yea many times they have but one stone, for which cause they are called by *Aristotle* and the antient *Grecians* *Chlunes* and *Monorchis*.

The times of a Sows Boaring.

But concerning the Sow, she beginneth to suffer the Boar at eight moneths of age, although according to the diversity of Regions and air, they differ in this time of their copulation, for some begin at four moneths, and other again tary till they be a year old: and this is no marvel, for even the male which engendereth before he be a year old, begetteth but weak, tender, and unprofitable Pigs. The best time of their admision is from the Calends of *February* unto the Vernal Equinoctial, for so it hapneth that they bring forth the young in the Summer time, for four months she goeth with young, and it is good that the Pigs be farrowed before harvest, which you purpose to keep all the year for store. After that you perceive that the Sows have conceived, then separate them from the Boars, lest by the raging lust of their provoking, they be troubled and endangered to abortment. There be some that say, a Sow may bear young till she be seven year old, but I will not strive about that whereof every poor Swineherd may give full satisfaction. At a year old a Sow may do well, if she be covered by the Boar in the moneth of *February*. But if they begin not to bear till they be twenty moneths old, or two years, they will not only bring forth the stronger, but also bear the longer time even to the seventh year, and at that time it is good to let them go to rivers, fens, or miery places, for even as a Man is delighted in washing or bathing, so doth Swine in filthy wallowing in the mire; therein is their rest, joy, and repose. *Albertus* reporteth that in some places of *Germany* a Sow hath been found to bear young eight years; and in other till they were fifteen years old; but after fifteen year it was never seen that a Sow brought forth young Pigs. If the Sow be fat, she is always the lesse prone to conceive with young, whether she be young or old. When first of all they begin to seek the Boar, they leap upon other Swine, and in process call forth a certain purgation called *Aprya*, which is the same in a Sow which *Hippomanes* is in a Mare, then they also leave their herd-fellows, which kinde of behavior or action, the *Latins* call by a peculiar Verb *Subare*, and that is applied to Harlots and wanton Women, by *Horace*;

Jamq;

*Jamq; subando,
Tenta cubilia teſtaq; rumpit.*

We in English call it Boaring, because she never reſteth to ſhew her deſire till ſhe come to a Boar, and therefore when an old Woman luſteth after a man, being paſt luſt by all natural poſſibility, ſhe is cald *Anus ſubans*. And the Beaſt is ſo delighted with this pleaſure of carnal Copulation, that many times ſhe falleth aſleep in that action, and if the male be young or dull, then will the female leap upon him and provoke him; yea in her rage ſhe ſetteth many times upon men and women, eſpecially if that they do wear any white Garments, or if their *Apria* and privy place be wetted and moiſtned with Vinegar. They have their proper voices and cries for this time of their Boaring, which the Boar or male underſtandeth preſently.

They are filled at one Copulation, and yet for their better ſafeguard, and to preſerve them from abortment, it is good to ſuffer the Boar to cover her twice or thrice; and moreover, if ſhe conceive not at the firſt, then may ſhe ſafely be permitted three or four times together, and it is obſerved that except her ears hang down ſlacking, and careleſſly, ſhe is not filled but rejecteth the ſeed, but if her ears fall downward, and ſo hang all the time that the Boar is upon her, then is it a moſt certain token that ſhe is filled, and hath conceived with young.

After four moneths (as we have ſaid) the Sow farroweth her Pigs, that is to ſay, in the fifth moneth, as it were in the ſeventeenth week: For ſo is this beaſt enabled by nature to bear twice in the year, and yet to ſuck her young ones two moneths together. And there is no cloven-footed beaſt that beareth many at a time except the Sow, except in her age, for then ſhe beginneth to loſe her *Apria* or purgation, and ſo many times miſcarryeth, and many times bear but one. Yet this is marvailous that as ſhe beareth many, ſo ſhe engendereth them perfect without blindneſs, lameſſe, or any ſuch other diſtreſſe, although as we have ſaid before, that in ſome places you ſhall ſee Swine whole hoofed like a Horſe, yet moſt commonly and naturally their feet are cloven, and therefore is the wonder accounted the greater of their manifold multiplication: and the reaſon thereof may ariſe from the multitude and great quantity of their food, for the humor cannot be ſo well avoided and diſperſed in ſo little a body as Swine have, as in Mares and Cowes, and therefore that humour turneth to multiply nature and natural kinde, and ſo it cometh to paſs, that by overmuch humour turned into a natural ſeed, it breedeth much young, and for little humor it bringeth forth a few Pigs, and thoſe alſo are not only perfect, but alſo ſhe is ſufficiently furniſhed with milk to nourish them, till they be able to feed themſelves. For as a fat ground or ſoil is to the plants that groweth on it, even ſo is a fruitful Sow to the Pigs, which ſhe hath brought forth.

Their ordinary number which they bring forth and can nourish is twelve, or ſixteen at the moſt, and very rare it is to ſee ſixteen brought up by one Sow. Howbeit it hath been ſeen that a Sow hath brought forth twenty, but far more often ſeven, eight or ten. There is a ſtory in *Fæſtus* of a Sow that brought forth thirty at a time, his words be theſe; The Sow of *Aeneas Lavinus* did bring forth thirty white Pigs at one time, wherefore the *Lavinians* were much troubled about the ſignification of ſuch a monſtrous farrow, at laſt they received answer that their City ſhould be thirty years in building, and being ſo they called it *Alba*, in remembrance of the thirty white Pigs. And *Pliny* affirmeth, that the images of thoſe Pigs and the Sow their dam, were to be ſeen in his days in publick places, and the body of the Dam or Sow preſerved in Salt by the Priests of *Alba*, to be ſhewed to all ſuch as deſired to be certified of the truth of that ſtory.

But to return to the number of young Pigs which are ordinary and without miracle bred in their dams belly, which I finde to be ſo many as the Sow hath dug for, ſo many ſhe may well nourish and give ſuck unto, and not more, and it ſeemeth a ſpecial work of God which hath made this tame beaſt ſo fruitful, for the better recompence to man for her meat and cuſtody. By the firſt farrow it may be gathered how fruitful ſhe will be, but the ſecond and third do moſt commonly exceed the firſt, and the laſt in old age is inferior in number to the firſt.

Juvenal hath a compariſon betwixt a white Sow and an Heifer, *Scropha ſecundior alba*, more fruitful then a white Sow; but belike the white Sowes do bring more then any other colour. Now the reaſon of the Poets ſpeech was, becauſe that there was an Heifer in the days of *Ptolmy* the younger, which at one time brought forth ſix Calves; whereupon came the proverb of *Regia Vacca*, for a fruitful Cow, for *Helenus* telleth this to *Aeneas*. Upon the Sow and thirty Pigs there is this answer of the Oracle to the *Lavinians* concerning *Alba*;

*Cum tibi ſollicito ſecreti ad fluminis undam,
Littoreis ingens inventa ſub ilicibus ſus,
Triginta capitum fetus enixa jacebit,
Alba ſolo recubans, albi circum ubera nati,
Is locus urbis erit, requies ea certa laborum.*

And *Juvenal* ſaith thus of it;

*Conſpicitur ſublimis aper, cui candida nomen,
Scropha dedit letis Phrygibus mirabile ſemen,
Et nunquam viſis triginta clara mamillis.*

Y y 2

When

When the young one cometh forth of the dams belly wounded or imperfect, by reason of any harm therein received, (it is called *Metacherum*) and many times Swine engender Monsters, which cometh to pass oftner in the little beasts then in the greatest, because of the multitude of cels appointed for the receipt of the seed, by reason whereof, sometimes there are two heads to one body, sometimes two bodies and one head, sometime three legs, sometime two before and none behinde; such were the Pigs without ears, which were farrowed at that time that *Dionysius* the Tyrant went to war against *Dion*, for all their parts was perfect but their ears, as it were to teach how inconsiderately against all good counsel, the Tyrant undertook that voyage; such are commonly found to be bred among them, also now and then of an unspeakable smallness like Dwarfs, which cannot live, having no mouth nor ears, called by the *Latines* *Aporcelli*. If a Sow great with Pig do eat abundantly of Acorns, it causeth her to cast her farrow and to suffer abortment; and if she grow fat, then is she less fruitful in Milk.

Now for the choice of a Pig to keep for store, it must be chosen from a lusty and strong dam bred in the Winter time, (as some say) for such as are bred in the heat of Summer are of less value, because they prove tender, small, and overmoist, and yet also if they be bred in the cold Winter they are small, by reason of extreme cold, and their dams forsake them through want of milk: and more over because they through hunger pinch and bite their dugs, so as they are very unprofitable to be nourished and preserved in the Winter time, rather they are fit to be killed and eaten young.

But this is to be observed for reconciliation of both opinions, namely, that in hot Countries such Hogs are preferred that be bred in the Winter, but in cold, such as are bred in *March* or *April*: within ten days after their farrowing they grow to have teeth, and the Sow ever offereth her foremost Dug to the Pig, that cometh first out of her belly, and the residue take their fortune as it falleth, one to one, and another to another, for it seemeth she regardeth the first by a natural instinct, not so much to prefer it, as that by the example thereof the residue may be invited to the like sucking by imitation, yet every one (as *Tzetzes* saith) keepeth him to his first choice. And if any of them be taken away from his Dug that is killed or sold, that dug presently dryeth, and the milk turneth backward, and so until all be gone, one excepted and then it is nourished with no more then was ordained at the beginning for it. If the old Sow want milk at any time, the supply must be made by giving the young ones fryed or parched corn, for raw corn or drink procureth looseness; and it is best for them to be suckled in the place where their Dam usually abideth.

For weaning of them it is not good to let more then five or six suck of her at one time, for although every one suck but his own Dug, yet by the multitude, the milk is dried up: After two months old they may safely be disjoined from their Dam and weaned, so as every year the Sow may breed eight months, and give suck four: it is best to let them feed asunder from their dams, till they have utterly forgotten to suck. And thus much for the procreation and nourishment of old and young Swine.

The office and first institution of Swine-herds.

This beast loveth society, and to live in herds or flocks together, and therefore the Ancients have invented Hog-keepers, whom they call Swine-herds, wherein there was wont to be considered these instructions, first he accustomed them to the sound of his horn, for by that he called them abroad out of their folds to their feedings, for they never suffered above twelve together at the trough or parcel of meat. It becometh a Swine-herd (saith *Collumella*) to be vigilant, diligent, industrious, and wise, for he must carry in his head the state of all that he nourisheth, both old and young, barren and fruitful; and consider the time of their farrowing, whether they be near at hand, or far off; that so none may be lost through the want of his observation; being farrowed, he must consider and look upon them to see which are fit for store, and which are not, what are their natures and probabilities; how much milk their dam is able to afford them, and how many she is to bring up, especially to regard that every Sow bring up no more then her own Pigs; for Swine being out of the sty do mingle one with another, and lose their own young ones, and when she lyeth down to give them suck, she lendeth her paps as well to strangers as to her own, and therefore herein must the care and wit of the herdsman appear, for if there be many, he must shut up every Sow with her young; and if that cannot be, then with a little Pitch or Tar let him give several marks to the several farrows, that so his memory may not be confounded. Another remedy to avoid the confusion of young Pigs one among another, is so to frame the threshold of the sty, that the Pigs may not be able to go in and out; for the Sow can more easily go over, and so she may be eased of their company, and they safely included at home, and so shall no stranger break into them; but every one in their own nest expect the return of their dam, which ought not to exceed the number of eight; for although the fecundity of Swine be great, yet it is better to kill off two or three, if their number be above eight, then to permit them to suck their dam; for this multitude of suckers do quickly draw away all nourishment from the dam: and when they are but eight at the most, regard must be had that the Sow be well fed with fod Barly, or such like, lest through a covetous pinching of the beast, leanness follow to her overthrow and destruction. Another point of a good Swineherd, is to sweep oftentimes the sty, for although such be the nature of the Beast, that it defileth all things, and will be wallowing in the mire, yet will she also be very desirous of a clean lodging, and delight much in the same; and when they be shut up, they must not be enclosed like other beasts altogether, for one of them will throng

throng and ly upon another, but there must be severall porches and hatches to sever and distinguish their lodgings, so as the great with Pig may lie in one place, and the other ready to be delivered by themselves, free from all incursion and violence. These divisions or separations ought to be some 3. or 4. foot high, so as they may not be able to leap over to one another, and not covered, to the intent that every Swineherd both man and boy may freely look over to them, and tell them if any chance to be missing, or else help a poor Pig when it is overlaid by his dam. *Columella. Palladius.*

Whensoever the Swineherd cleneth the sty, then let him cast in sand or some other drying thing into it, that all the moisture and wetness may be drunk up. The dam ought not to be permitted for the first ten days to go forth of the stable, except to drink, and afterward let her go abroad into some adjacent pasture, not far off, that so by her often return she may the better give suck to her young ones. When the little ones are a fortnight or three weeks old, they desire to follow their parent, wherefore they must be shut up from their mother, and feed alone in her absence, that they may better endure it afterward when they shall be weaned. They must be fed in the Summer time in the morning, before the heat be strong, and in the heat of the day led into some watry or shadowy place, that so they may be freed from extremity till the cool of the day return again, where in they must be suffered to feed. In the Winter time they are not to be led abroad till the frost and ice be thawed and dissolved. Ten Boars are sufficient for an hundred Sows, and although some keep five or six hundred in a herd, as we may read in Scripture of the great herds of Swine, into which our Saviour Christ permitted the Devils to enter, yet is it not safe or wholesome to keep above an hundred together, for a less flock or herd requireth less cost, charge, and attendance. There is a speech of *Tremellius Scrofa*, tending to the commendation of the custody or nourishing of Swine, for thus he writeth: *Agricultura ab initio sui studiosa, nec de pecore suillo mihi minor cura est, quam vobis magnis pecuariis. Cui enim earum non est communis? quis enim nostrum fundum colit quin sues habeat? & quis non audierit patres nostros dicere ignavum & sumptuosum esse, qui succidiam in carnario suspendit potius ab lanario quam ex domestico fundo?* That is to say, I have been long given to follow husbandry, and I have alway had as great care of my Swine, as other men of greater cattel. For what is there, whereunto Swine are not profitable? who tilleth land, and keepeth not hogs? and who hath not heard our fathers say, that he is an idle ill husband which hangs up all his provision in the shambles, and liveth rather upon the Butchers, then upon his own ground? Thus far *Tremellius*.

Another part of a good Swineherd is, to look to the gelding of his Swine, and splaying of the females, for if all be suffered to procreate and engender, it is more danger that Swine would in short time eat up men, rather then men Swine. The Latines call such a Hog gelded *Macalis*, and *Porcastrus*, *Pliny*, that is *Porcus castratus*, the Germans, *Ein barg*, or *Batz*, from whence seemeth to be derived our English Barrow-hog (for so we call a gelded male-hog) and a female Bais. The best time therefore to geld them is in the old Moon, or as we say in the wane of the Moon, but *Hesiod* prescribeth, that an Ox and a Boar should be gelded in the second quarter, and first day thereof, and *Aristotle* is of opinion that it skilleth not what age a Boar be when he is libbed; but it is clear by the best experienced among these beasts, there are two times of gelding them; one in the Spring, and the other in the Autumn, and this is to be done after a double manner; First, by making two incisions or wounds upon his stones, out of which holes the stones are to be pressed forth.

The second way is more perillous, yet more cleanly; for first of all at one wound or incision they take out one stone, then that being forth, with their knife they cut the small skin which parteth the stones in the cod, and so press forth the second stone at the first wound, afterward applying to it ordinary medicines, such as we will describe in the treatise of their diseases.

And the opinion of *Varro* is, that it is good to lib them at half a year old, or at a year old, or at three or four year old, for their better fattening; but best at a year, and not under half a year. When the stones are taken forth of an old Boar, suppose two, or three, or four year old, they are called by the Latines *Polimma*, because with them they polished and smoothed garments.

The female also is gelt or splayed, (although she often bore Pigs) whereof they open the side (neer her loins) and take away from her *Apris*, and receptacles of the Boars seed, which being sewed up again, in short time is enclosed in fat; this they do by hanging them up by their fore-legs, and first of all they which do it most commodiously, must cause them to fast two days before; and then having cut it, they sew up and close fast again the wound or incision, and this is done in the same place of the female, that the stones are to be taken out in the male (as *Aristotle* writeth) but rather it appeareth by good examination and proof, that it is to be cut out on the right, against the bone (called *Os sacrum*.) And the only cause of this Sow-gelding is, for their better growth and fattening; which in some Countries they use, being forced thereunto through their penury and want of food; but whereas is plenty of food, there they never know it: and the inventors hereof were the *Grecians*, whose custom was to cut out the whole matrix. And thus much for libbing, gelding, and splaying of Swine. *Festus. Adamantius. Pliny.*

This beast is a most unpure and unclean beast, and ravening; and therefore we use (not improperly) to call *obscæne* and filthy men or women, by the name of Swine or Sows. They which have foreheads, eye-lids, lips, mouth, or neck, like Swine, are accounted foolish, wicked, and wrathful: all their senses (their smelling excepted) are dull, because they have no Articles in their hearts, but have thick blood; and some say, that the acuteness and ripeness of the soul, standeth not in the thickness of the blood, but in the cover and skin of the body, and that those beasts which have

the thickest skins, are accounted the most blockish and farthest from reason, but those which have the thinnest and softest, are the quickest of understanding: an example whereof is apparent in the Oyster, Ox, and Ape. They have a marvellous understanding of the voice of their feeder, and as ardent desire to come at his call, through often custom of meat, whereupon lyeth this excellent story.

Ælianus.

When certain Pirates in the *Tyrrhene sea*, had entred a Haven, and went on land, they came to a Swines stie, and drew out thereof divers Swine, and so carried them on Shipboard, and loosing their Anckers and tacklings, do depart and sail away. The Swineherds seeing the Pirats commit this robbery, and not being able to deliver and rescue their Cattle, because they wanted both company and strength, suffered the Theeves in silence to ship and carry away their Cattle; at last, when they saw the Theeves rowing out of the Port, and lanching into the deep, then they lift up their voices, and with their accustomed cries or cals, called upon their Swine to come to their meat; as soon as the Swine heard the same, they presently gat to the right side of the Vessel or Bark, and there flocking together, the ship being unequally ballanced or loden, overturned all into the Sea, and so the Pirates were justly drowned in reward of the theft, and the stolne Swine swam safely back again to their Masters and Keepers.

The nature of this Beast is to delight in the most filthy and noisome places, for no other cause (as I think) but because of their dull senses. Their voice is called *Grunnitius* gruntling; *Sordida sua pascens ruriis gramina grunmit*; which is a terrible voice to one that is not accustomed thereunto, (for even the Elephants are afraid thereof) especially when one of them is hurt or hanged fast, or bitten, then all the residue as it were in compassion condoling his misery, run to him and cry with him, and this voice is very common in Swine at all hands to cry, except he be carryed with his head upwards towards heaven, and then (it is affirmed) he never cryeth, the reason whereof is given by *Aphrodisian*: because it is alway accustomed to look downward, and therefore when it is forced to look upwards it is suddenly appaled and afraid, held with admiration of the goodly space above him in the heavens, like one astonished, holdeth his peace (some say that then the artery of his voice is pressed) and so he cannot cry aloud. There is a fish in the river *Achelous* which grunteth like a hog, whereof *Juvenal* speaketh, saying; *Et quam remigibus grunuisse Elpenora porcis*. And this voice of Swine is by *Cæcilius* attributed to drunken men. The milk of Swine is very thick, and therefore cannot make whay like a Sheeps, howbeit it suddenly coagulateth and congealeth together.

Among divers males or Boars when one of them is conqueror, the residue give obedience and yeeld unto him, and the chief time of their fight or discord is in their lust, or other occasions of food, or strangeness, at which time it is not safe for any man to come neer them, for fear of danger from both parties, and especially those which wear white garments. And *Strabo* reporteth in general of all the *Belgian* Swine, that they were so fierce, strong, and wrathful, that it was as much danger to come near them as to angry Wolves. Nature hath made a great league betwixt Swine and Crocodiles, for there is no beast that may so freely feed by the banks sides of *Nilus*, as the Swine may, without all hurt by the Crocodile. Other Serpents, especially the smaller Serpents, are oftentimes devoured by Swine. *Aristotle* saith, that when many of them are together they fear not the Wolf, and yet they never devour any Wolf, but only with their scaring and gruntling noise fear them away. When a Wolf getteth a Swine, he devoureth him, and before he can eat him draggeth him by the ears to some water to cool his teeth in his flesh (which above measure burn in devouring his flesh.) It hath been seen that a Lion was afraid of a Sow, for at the setting up of his bristles he ran away.

It is reported that Swine will follow a man all the day long which hath eaten the brain of a Crow in his pottage: and *Nigidius* affirmeth, that Dogs will run away from him that hath pulled off a tick from a Swines back. The people of *Mossynacum* did engender Man with Woman publicly like Swine; and *Stobæus* writing against Women saith, that some of them are derived from one beast, and some from another, and namely a woman descended of a Sow sitteth at home, and doth neither good nor harm: but *Simonides* writeth otherwise, and namely that a Woman born of a Sow sitteth at home suffering all things to be impure, unclean, and out of order, without decking, dressing or ornament, and so she groweth fat in her unwashed garments. And there are many fictions of the transforming into Swine. *Homer* faigneth that the companions of *Ulysses* were all by *Circe* turned into Swine, which is interpreted in this manner, *Circe* to signifie unreasonable pleasure, *Ulysses* to signifie the soul, and his companions the inferior affections thereof, and so were the companions of *Ulysses* turned into Swine by *Circe*. When unreasonable pleasures do overcome our affections and make us like Swine in following our appetites: and therefore it was the counsell of *Socrates*, that no man should at banquet eat more then sufficient, and those which could not abstain from them, should forbear their company that perswaded them to eat when they were not hungry, and to drink when they were not thirsty, and therefore he supposed that it was said in jest that *Circe* turned men into Swine. When as *Ulysses* by his own abstinence and *Mercury* his counsell, was delivered and saved from that most savage transformation, which caused *Horace* thus to write;

Xenophon.

*Ulysses si bibisset pocula Circes—Cum sociis
Vixisset canis immundus vel amica luta suis.*

And

And from this came the original proverb of *Porcellus Acarnanius* for a tender and delicate person, used so to fulness, that all penury is death unto him. Sweet favours as we have shewed already, are very hurtful to Swine, especially the sweet oyl of Marjoram. Whereupon came the proverb *Nil cum amaracino sui*; and *Lucretius* speaketh hereof in this sort;

*Deniq; amaracinum fugitat sus, & timet omne
Unguentum: nam setigeris subus acre venenum est.*

And for this cause *Tullius Cicero* saith, *Illi alabastrus putet unguenti plena*; that is, a box of Alabastr full of ointments is displeasing to this Beast, for as the *Scarabee* or *Horse* flie forsaketh sweet places to light and sit upon *Horse* dung, even so doth Swine. There be many of the antients that have delivered merrily *Anima suis pro sale*, that the Swines soul is in their body but in stead of salt to keep the flesh from stinking, even as for no other purpose many among men seem to live and retain soul in body. They are very clamorous, and therefore are used for talking and prating fellows, whereupon the *Greek* Poet *Lucilius* translated by *Erasmus* alludeth, when he saith in this manner, under *Alia Meneclis, alia porcellus loquitur*;

*Sucula, bos, & capra mihi periire Meneclis,
Ac merces horum nomine persa tibi est.
Nec mihi cum Oshryade quicquam estive fuitve negoti,
Nec fures ullos huc cito Thermopylis.*

*Sed contra Eutychidem nobis lis: proinde quid hic mi
Aut Xerxes facit, aut quid Lacedamonii?
Ob pactum & de meloquere, aut clamavero clare,
Multo aliud dicit sus, aliud Meneclis.*

And to conclude, in *Latin* they say *Sus Minervam*, when an unlearned dunce goeth about to teach his better or a more learned man, then doth the Hog teach *Pallas*, or as we say in *English*, the foul Sow teach the fair Lady to spin.

There are in Swine many presages and foretokens of foul weather, as Swineherds have observed: as first if they lie long wallowing in the mire, or if they feed more greedily then they were accustomed, or gather together in their mouths, hay, stubble, or straw, as *Aratus* writeth; or if they leap and dance, or frisk in any unwonted sort: and for their copulation, in years that will prove moist, they will ever be boring, but in dryer years they are lesse libidinous.

The greatest harm that cometh by Swine is in rooting and turning up of the earth, and this they do in Corn fields, for which we have shewed that the *Cyprians* made a law to beat out the teeth of such Swine: for this cause *Homer* writeth that *Irus* threatneth *Ulysses*, because his companions eat up all his corn, to knock out their teeth: yet sometimes the husbandmen admit them of purpose, both into their land before it be plowed, and also into their vineyards. It is said that the *Egyptians* forbear to sacrifice them, because they tread in their Corn in their fields after it is swelled out of the earth, so as the Birds cannot gather it up again, as we have shewed before. The *Jews* and the *Egyptians* accounted this Beast most unclean. The *Jews*, not as the vain *Gentiles* imagined, because they worshipped it, for that it taught men to plow the earth, but for the Law of God. And the *Egyptians* hold it a profane thing, and therefore they had an antient law, that no Swineherd should come into their Temple, or that any Man should give him his Daughter in Marriage. It is very certain that they were wont to be used in sacrifices. The said *Egyptians* never sacrificed them to the Moon and to *Bacchus*, and at other times it was unlawful, either to offer them, or to eat them: but it seemeth by many Authors, that their first sacrifices were of Swine, for we read of antient customs in *Hetruria*, that at their marriage feasts they offered and sacrificed a Sow to *Venus*, and at other times, especially in Harvest, they did so to *Ceres*. The *Latins* do hold a Swine very grateful and sacred to *Jupiter*, because as they believed that a Sow did first of all lend her paps to him, and therefore all of them worship a Sow, and abstain from her flesh. Likewise in *Mysia* and *Phoenicia*, there were Temples of *Jupiter*, wherein it was forbidden to sacrifice or kill Swine by a publick Law, like as it was amongst the *Jews*. When the Kings of *Sparta* were first of all chosen into that royal place, they were permitted to execute the Priests office, and to the intent that they might never want sacrifices, there was a priviledge granted them to take a Pig of every Sow: and when they sacrificed to *Jupiter* a Swine, it must be after or at a triumph: they were also sacrificed to *Neptune*, because they were impetuous and ranging Beasts; and a Boar was holy to *Mars*, according to this saying of *Pomponius* in *Attellana*, *Mars tibi facturum, si unquam rediero, bidente verre*. And there was a custom among the *Athenians*, when a Man had slain an hundred enemies, he was permitted to offer up to *Mars*, some part of a man at *Lemnos*, and afterward they grew out of liking of this vain custom, and in stead thereof sacrificed a Barrow or gelded Hog, and when they houlded their army, they did it with Hogs, Sheep or Buls, and nothing else, and they compassed it about three times with pomp and stately procession, and at last slew and offered them to *Mars*. They were wont to sacrifice a Hog for a Man that had recovered his wits after he had been mad, and also they sacrificed Swine to *Silvanus*, according to these Verses;

*Cedere Silvano porcum quadrante lavari:
And again;
Tellurem porco Silvanum lacte piabant.*

Their

Their Pagan God *Terminus*, had an Ewe and a young Sow offered to him (as *Ovid* writeth) although by the laws of *Numa*, all sacrifices of living things were forbidden unto him. To *Ceres* and *Bacchus*, we have shewed already how they were offered, and the reason of their sacrificing was, because they were hurtful to all green Corn and Vines.

*Prima Ceres avidi gavisæ est sanguine porci,
Ultæ suas merita cede nocentis opes,
Nam sata vere novo teneris lætæntia succis,
Erit ætærigæ comperit ore suis.*

And again in another place he writeth thus ;

*Prima putatur hostia Sus mervisse mori,
— quia semina pando
Eve ruit rostro, spemq; interceperit anni.*

The time of their sacrificing to *Ceres* was in *April*, wherein the Priests with Lamps and Torches, and apparelled in white garments, did first of all kill a female Swine, and then offer her; and sometime this was a Sow with farrow, because thereby in a mystery they prayed for the fruitfulness and fecundity of the earth: and for these and such like causes we read of titles put upon them, as *Porca præcidanea*, for the Sow that was slain before the reaping, and *Porca præsa*, for the Sow that was offered at a Funeral for the safety of all the family, wherein the dead man lived. They also sacrificed a barren Sow to *Proserpina*, because she never bore children, and to *Juno* in the Calends of every moneth: And thus much for their sacrificing.

Now we are to come to the use of Swine and their several parts; first of all it is certain that there is no Beast lesse profitable being alive then a Hog, and yet at his latter end he payeth his Master for his keeping. *Cicero* said well, *Sus quid habet præter escam, cui quidem ne putresceret, animam ipsam pro sale datam esse dicit Chrysippus*. A Hog hath nothing in him besides his meat, and that therefore the soul thereof was given to it in stead of salt to keep it from stinking: for indeed in Lions, Dogs, Bears, Horses, and Elephants, all their virtues lyeth in their minds, and their flesh is unprofitable and good for nothing, but the Swine hath no gifts at all in the minde, but in the body, the life thereof keeping the flesh and body from putrefaction. And there is no beast that God hath ordained for domestical provision of food and meat to man, except Hares and Conies, that is so fruitfull as Swine are. God (as we have touched already) *Levit. 11. Deut. 14.* forbade his people of *Israel* to eat hereof, because it was an unclean Beast not chewing the cud; and furthermore the observation of *Procopius* is memorable, that whereas the *Egyptians* did worship with divine worship, both Oxen, Kine, and Sheep, and would not eat of their flesh or kill them in sacrifice, yet did eat, and kill, and sacrifice Swine.

The *Jews* were permitted and commanded to eat Oxen and Sheep, and abstain from the flesh of Swine; thus manifesting how different his ways and thoughts are from the ways and thoughts of men. The Lord doth not this for policy, but to try the obedience of his people, placeth therein one part of his worship, and therefore by his Prophets, *Esa. 65. and 66.* calleth the eating of Swines flesh abomination, and threatneth thereunto a certain unavoidable judgement and damnation. The woman and her seven sons which were apprehended by King *Antiochus*, and by him tempted to eat Swines flesh which they refused to do (being against the law of their God) are remembred as most worthy Martyrs of his Church, that endured, cutting off their hands and feet, pulling out their tongue, and seething in a boyling Caldron with other exquisite torments incident to such death, as is recorded by *Jason 2. Macab. 6.* We read that *Helio-gabalus* did abstain from Swines flesh, because he was a *Phenician*, and they forbore to eat it. The women of *Bracea* in *Africk*, do never tast of Cowes flesh or Swines flesh.

The *Arabian Scenites* never eat hereof, and Swine cannot live in their Countries. (*Ctesias* and *Ælianus* affirme) that in *India* there are no Swine, either tame or wilde, and that the *Indians* do as much forbear to eat of Swines flesh, in detestation thereof, as they do of Mans flesh.

Now concerning the flesh of Swine, many opinions are held about the goodness and evill thereof, yet *Hippocrates* writeth, that *Porcine carnes præve sunt quum fuerint crudiores & ambusæ, magis autem choleram generant, & turbationem faciunt, Suiile carnes optime sunt omnium carniū*; that is, The flesh of a Boar being raw or roasted, is worst of all other, because it engendereth Choler and wilde windy matter in the stomach; but the flesh of a Sow is the best of all flesh, with this proviso, that it neither exceed in fatness, leanness, or age.

There is a merry and witty answer of a memorable Noble man to an old Gentlewoman (if not a Lady) who dispraised Bacon at the Noble mans table, and said it was a churlish, unpleasant meat. The Lord understanding a privy Emphasis in that speech against himself, (for his name was written with those Letters and syllables) answered her: you say truth, if the Bacon be a piece of an old Sow (as peradventure she seemed to be at that time.)

The best opinion about the concoctive quality of this flesh is, that then it is best when it is in middle age, neither a Pig, nor an old Hog, for a Pig is over moist, like the Dam which is the moistest of all other earthly Beasts; and therefore cannot but engender much flegme: and for this cause

cause the fattest are reprov'd for a good diet, for that it cannot digest well through over much humidity.

And the old Swine are most hard of Concoction, (yea though they be scorched or findged at the fire) because thereby is increased in their flesh much acrimony and sharpness, which in the stomach of men turneth into Choler: for they bite all the vessels reaching to the stomach, making a derivation of all those ill humors into the belly and other parts.

I do not like their opinion, which think that it is better cold then hot, for fear of inflammation; this rule is good in the flesh of Goats (which are exceeding hot) but in Swine, where is no predominancy but of moisture, it is better to eat them hot then cold, even as hot Milk is more wholesome then cold. Hippocrates doth prescribe the eating of Swines flesh in the sickness of the Spleen; and Celsus Aurelianus forbiddeth the same in the Palsie or Falling sickness.

Galen is of opinion that *Caro porcina potentissime nutrit*, nourisheth most strongly, and potently; whereof he giveth an instance for a reason taken from Champions, Combatants, or Wrestlers; if the day before they wrestle or fight, they feed on an equall quantity of any other flesh, they feel themselves weak and feeble in comparison of that is gathered from Swines flesh: and this (he saith) may be tryed in Laborers, Mioners, Diggers, and Husbandmen; which retain their strength as well (if not better) by eating of Swines flesh or Bacon as any other meat: For as Beef in thickness and solidity of substance to the eyes appearance, excelleth Pork or Bacon, so Pork and Bacon excelleth and is preferred before Beef, for a clammy nourishing humor. And this comparison betwixt Pork and Beef, Galen amplyfieth farther in these words, Of Swines flesh, those are best for men in their middle and ripe age, which are of Hogs of an answerable age, and to other which are but growing to a ripeness and perfection, Pigs, Sheates, and young growing Swine, are most nourishable. And on the contrary, young growing Oxen are most nourishable to men of perfect years and strength, because an Ox is of a far more dry temperament then a Hog.

A Goat is lesse dry then an Ox, and yet compared to a Man or a Swine, it excelleth both of them; for there is a great resemblance or similitude betwixt a Mans flesh and Swines flesh, which some have proved in tast, for they have eaten of both at one Table, and could finde no difference in one from the other: for some evill Inn-keepers and Hoasts have so deceived men, which continued a great while, not descryed or punished, untill at last the finger of a man was mixed therewith, and being found, the Authors received their reward. Swines flesh also is lesse excremental then Pigs flesh, and therefore more nutritible, for the moisture that the flesh is, the sooner it is dispersed, and the vertue of it avoided, and old Swine notwithstanding their primitive and natural moisture, yet grow very dry, and their flesh is worst of all, because in nature humidity helpeth the concoction thereof.

All Swines flesh being concocted engendereth many good humors, yet withal they contain a kind of glutinous humor, which stoppeth the liver and reins; especially in those which by nature are apt to this infirmity. And although some are of opinion, that the wilde Boar is more nourishable then the tame Swine, because of his laborious course of life, and getting his prey; yet it appeareth that the tame Swine by their resty life, and easie gathering of their meat, are made more fit for nourishment of man, for they are more moist: and Swines flesh without convenient moisture (which is many times wanting in wilde Boars) is poyson to the stomach, and yet for a man that hath propounded to himself a thin extenuating diet, I would wish him to forbear both the one and the other, except he use exercise, and then he may eat the ears, or the cheeks, or the feet, or the haster, if they be well sod or dressed: provided they be not fresh, but sauced or powdred; And it is no marvel that Swines flesh should so well agree with ours, for it is apparent that they live in dirt, and love to muddle in the same.

And if any man ask, how it cometh to passe, that Swine which both feed and live so filthily, should be so nourishable to the nature of man; some make answer, that by reason of their good constitution of body, they turn ill nutriment to a good flesh: for as men which be of a sound, perfect, and healthy disposition or temperature, are not hurt by a little evill meat, which is hard of digestion; even so is it with well constituted and tempered Swine, by continual feeding upon evill things, they grow not only to no harm, but also to a good estate, because nature in process of time draweth good out of evill: But if men which have moist stomachs, do eat of Swines flesh, then do they suffer thereby great harm, for as water powred on wet ground, increaseth the dirt; so moistness put upon a moist stomach, increaseth more feebleness: but if a man of a dry and moist stomach do eat hereof, it is like rain falling into a dry ground, which begetteth and engendereth many wholesome fruits and hearbs. And if a Swine be fatted with dried figs or nuts, it is much more wholesome. With Wine all Swines flesh is most nourishable, and therefore the University of Salernum, prescribed that in their verses to the King of England, and also they commended the loines and guts:

Ilia porcorum bona sunt, mala sunt reliquorum.

And Fiera describeth the eating of Hogs-flesh in this manner;

*Sus tibi cænofo sit cæna domesticus ore,
Grata ferat nobis mensa hyemalis aprum.*

*Ille licet currat de vertice montis, aquose
Carnis erit, pluri sed tamen apta cibo est.
Hinc feritas silvæq; domant, & inania saxa,
Post melius posita rusticitate sapit.*

And whereas *Hippocrates* commended Swines flesh for Champions and Combatants; it is certain, that *Bilis* the Champion through eating of Swines flesh, fell to such a height of choler, that he cast it upwards and downwards.

When the womb of a Woman is ulcerated, let her abstain from all Swines flesh, especially the eldest and the youngest. It is not good for any man to taste or eat this flesh in the Summer time, or any hot weather, for then only it is allowed when extreme frosts have tempered it for mans stomach, and the stomach for it: the flesh of wilde Swine is most of all hurtful to them that live at ease, without exercise, because that they are immoderately given to sleep. Some are of opinion that a sow which is killed immediately after the Boar hath covered her, is not so wholesome as other: *Helioabalus* observed this custom, to eat one day nothing but Pheasant Hens, another day nothing but Pullen, and the third day nothing but Pork.

Erasmus.

Macrobius.

There was in antient time a dish of meat called *Trojanum*, the *Trojan Hog*, in imitation of the *Trojan Horse*, for as that was stuffed within with many armed men, so was this with many severall meats, and whole Beasts, as Lambs, Birds, Capons, and such like, to serve the appetites of the most strange belly-gods, and Architects of gluttony: and therefore *Cincius* in his oration, wherein he perswaded the Senators and people to the law *Fannia*, reproveth this immoderate riot in banquets, *In apponendo mensis porcum Trojanum*: and indeed it wanted not effect, for they forbad both *Porcum Trojanum*, and *Callum Aprugnum*.

There was another Raven-monster-dish (called *Pinax*) wherein were included many Beasts, Fowles, Egges, and other things which were distributed whole to the guests: and no marvell, for this Beast was as great as a Hog, and yet gilded over with silver. And *Hippolocus*, in his Epistle to *Lyncæus*, speaking of the banquet of *Caramis*, saith thus, *Allatus est nobis etiam porcus dimidia parte diligenter assus sine tostus, & dimidia altera parte tanquam ex aqua molliter elixus, mira etiam coqui industria ita paratus, ut qua parte jugulatus esset, & quomodo variis deliciis refertus ejus videri non appareat*. There was brought to us a Hog, whereof the one half was well roasted, and the other half or side well sod, and this was so industriously prepared by the Cook, that it did not appear where the Hog was slain or received his deadly wound, nor yet how his belly came to be stuffed with divers and sundry excellent and delicate things. The Romans had a fashion to divide and distribute a Hog, which appeareth in these Verses of *Martial*;

Vobiscus.

*Iste tibi faciet bona Saturnalia porcus,
Inter spumantes ilice pastus apros.*

And of the eating of a sucking Pig, *Martial* also writeth in this manner;

*Lacte mero pastum pigra mihi matris alumnus
Ponat, & Ætolo de sue dives edat.*

I might add many other things concerning the eating and dressing of Swines flesh, both young and old, but I will passe it over, leaving that learning to every Cook, and Kitchen-bôy.

Concerning Bacon, that which is cald by the *Latins*, *Perna*, I might add many things, neither improper, nor impertinent, and I cannot tell whether it should be a fault to omit it in this place. The word *Perna* after *Varro*, seemeth to be derived from *Pede*, but in my opinion, it is more consonant to reason, that it is derived from the Greek word *Pterna*, which is the ribs and hips of the Hog hanged up and salted, called by *Martial* *Petaso*, and by *Plautus* *Ophthalmia*, *Horæum*, *Scombrum* and *Laridum*.

Palladius.

Quanta pecus pestis veniet, quanta labes larido.

The time of the making of Bacon, is in the Winter season, and all the cold weather, and of this *Martial* writeth very much in one place;

*Musteus est, prope, charos ne differ amicos.
Nam mihi cum vetulo sit petasone nihil.*

And again,

*Et pulpam dubio de petasone voras.
—Cretana mihi fiet, vel massa licebit
De menapis lauti, de petasone vorant.*

Strobo in his time commended the Bacon of the *Gaules*, or of *France*, affirming that it was not inferiour to the *Asian* or *Lycian*, an old City of *Spain* (called *Pompelon*) neer *Aquitania*, was also famous for

for Bacon. They first of all killed their hogs, and then burned or scalded off all their hair, and after a little season did slit them assunder in the middle, laying them upon salt in some tub or deep trough, and there covering them all over with salt, with the skin uppermost, and so heap fitch upon fitch, till all be salted, and then againe they often turned the same, that every part and side, might receive his season, that is, after five daies, laying them undermost which were uppermost, and those uppermost which were undermost. Then after twelve days salting, they took all out of the tub or trough, rubbing off from it all the salt, and so hanged it up two days in the winde, and the third day they all to anoint it with oyl, and did hang it up two days more in the smoak; and afterward take it down again, and hang it or lay it up in the larder, where all the meat is preserved, still looking warily unto it, to preserve it from Mice and Wormes: And thus much shall suffice at this time for the flesh of Hogs, both Pork and Bacon.

The milk of a Sow is fat and thick, very apt to congeal, and needeth not any runnet to turn it; it breedeth little whay, and therefore it is not fit for the stomach, except to procure vomiting, and because it hath been often proved, that they which drink or eat Sow milk fall into scurfs and Leprosies, (which diseases the *Asians* hate above all other) therefore the *Egyptians* added this to all the residue of their reasons, to condemn a Sow for an unclean and filthy beast. And this was peculiarly the saying of *Manethon*.

With the skins of Swine which the *Grecians* did call *Phorine*, they made shoo-leather, but now a days by reason of the tenderness and looseness thereof, they use it not, but leave it to the Sadlers, and to them that cover Books, for which cause it is much better then either Sheep or Goats skins, for it hath a deeper grain, and doth not so easily fall off. Out of the parings of their skins they make a kinde of glew, which is preferred before *Taurocolum*, and which for similitude they call *Cherocolum*. The fat of Swine is very pretious to liquor shooes and boots therewithal. The Amber that is in common use groweth rough, rude, impolished, and without clearness, but after that it is sod in the grease of a Sow that giveth suck, it getteth that nitour and shining beauty, which we finde to be in it.

Some mix the blood of Hogs with those medicines that they cast into Waters to take fishes, and the Hunters in some Countries when they would take Wolves and Foxes, do make a train with a Hogs liver sod, cut in pieces and anointed over with hony, and so anointing their shooes with Swines grease, draw after them a dead Cat, which will cause the beast to follow after very speedily. The hairs of Swine are used by Cobblers and Shoemakers, and also with them every Boy knoweth how to make their Nose bleed. The dung is very sharp, and yet it is justly condemned by *Columella* for no use, no not to fatten the earth, and Vines also are burned therewithal, except they be diligently watered, or rest five years without stirring.

In *Plinies* time they studied to enlarge and make their Lettice grow broad, and not close together, which they did by slitting a little the stalk, and thrusting gently into it some Hogs dung. But for trees there is more especial use of it, for it is used to ripen fruit and make the trees more plentiful. The Pomegranats and Almonds are sweetned hereby, and the Nuts easily caused to fall out of the shell. Likewise, if Fennel be unfavory, by laying to the root thereof either Hogs dung, or Pigeons dung, it may be cured; and when any Apple tree is affected and razed with Worms, by taking of Swines dung, mixed and made soft like mortar with the urine of a man layed unto the root, it is recovered, and the Wormes driven away: and if there be any rents or stripes visible upon trees, so as they are endangered to be lost thereby, they are cured by applying unto the stripes and wounds this dung of Swine.

When the Apple trees are loose, pour upon their roots the stale of Swine, and it shall establish and settle them, and wheresoever there are Swine kept, there it is not good to keep or lodge Horses, for their smell, breath, and voice, is hateful to all magnanimous and perfect spirited Horses. And thus much in this place concerning the use of the several parts of Swine, whereunto I may add our *English* experiments, that if Swine be suffered to come into Orchards, and dig up and about the roots of the Apple trees, keeping the ground bare under them, and open with their noses, the benefit that will arise thereby to your increase of fruit will be very inestimable. And here to save my self of a labor about our *English* Hogs, I will describe their usage out of Mr. *Tussers* husbandry, in his own words, as followeth: and first of all for their breeding in the Spring of the year he writeth in general;

Let Lent well kept offend not thee,

For March and April breeders be.

And of September he writeth thus:

To gather some mast it shall stand thee upon,
With servant and children yet mast be all gone.
Some left among bushes shall pleasure thy Swine,
For fear of a mischief keep Acornes fro kine.
For rooting of pasture ring Hogye have need,
Which being well ringled, the better doth feed.
Though young with their elders will lightly keep best,
Yet spare not to ringle both great and the rest.

Take seldome thy swine, while shackle time doth last,
For divers misfortunes that happen too fast,
Or if you do fancy, whole eare of the Hog,
Give ear to ill neighbor, and ear to his Dog.
Keep hog I advise thee from meadow and Corne,
For out aloud crying, that ere he was borne.
Such lawlesse so haunting both often and long,
If dog set him chaunting he doth thee no wrong.

And

And again in *Octobers* husbandry he writeth;

Though plenty of *Acornes*, the *Porkelings* to fat
Not taken in season may perish by that,
If rattling or swelling get once in the throat,
Thou lovest thy porkling a *Crown* to a *Groat*.

What ever thing fat is, again if it fall,
Thou ventrest the thing and the fatnesse withall.
The fatter, the better, to sell or to kill,
But not to continue, make proof if you will.

In *November* he writeth again;

Let Hog once fat, lose none of that;
When mast is gone, Hog falleth anon,
Still fat up some, till *Shrovetide* come,
Now *Porke* and *sowce* bears tacke in a house.

Thus far of our *English* husbandry about *Swine*. Now followeth their diseases in particular.

Of the diseases of *Swine*.

Pliny.
Ælianus.

Hemlock is the bane of *Panthers*, *Swine*, *Wolves*, and all other beasts that live upon devouring of flesh, for the *Hunters* mix it with flesh, and so spread or cast the flesh so poysoned abroad in bits or morsels to be devoured by them. The root of the white *Chamelion* mixed with fryed *Barly* flour. Water and oyl is also poyson to *Swine*. The black *Ellebor* worketh the same effect upon *Horses*, *Oxen*, and *Swine*, and therefore when the beasts do eat the white, they forbear the black with all wearisomeness. Likewise *Henbane* worketh many painful convulsions in their bellies; therefore when they perceive that they have eaten thereof, they run to the waters and gather *Snails* or *Sea-crabs*, by vertue whereof they escape death, and are again restored to their health. The hearb *Goosefoot* is venomous to *Swine*, and also to *Bees*, and therefore they will never light upon it, or touch it. The black *Night-shade* is present destruction unto them, and they abstain from *Harts* tongue, and the great bur, by some certain instinct of nature. If they be bitten by any *Serpents*, *Sea-crabs*, or *Snails*, are the most present remedy that nature hath taught them. The *Swine* of *Scythia* by the relation of *Pliny* and *Aristotle*, are not hurt with any poyson except *Scorpions*, and therefore so soon as ever they are stung by a *Scorpion*, they die if they drink. And thus much for the poyson of *Swine*. Against the cold (of which these beasts are most impatient:) the best remedy is to make them warm sties, for if it be once taken, it will cleave faster to them, then any good thing, and the nature of this beast is, never to eat if once he feel himself sick; and therefore the diligent Master or keeper of *Swine*, must vigilantly regard the beginnings of their diseases, which cannot be more evidently demonstrated, then by forbearing of their meat.

Of the Measels.

The Measels are called in *Greek*, *Chalaza*; in *Latin*, *Grandines*; for that they are like hailstones spread in the flesh, and especially in the leaner part of a *Hog*, and this disease, as *Aristotle* writeth, is proper to this Beast, for no other in the world is troubled therewith: for this cause the *Grecians* call a Measly *Hog*, *Chaluros*, and it maketh their flesh very loose and soft. The *Germanes* call this disease *Finnen*, and *Pfinnen*; the *Italians*, *Gremme*; the *French*, *Sursame*, because the spots appear at the root of the tongue like white seeds, and therefore it is usuall in the buying of *Hogs* in all Nations to pull out their tongue and look for the Measels, for if there appear but one upon his tongue, it is certain that all the whole body is infected. And yet the Butchers do all affirm that the cleanest hog of all, hath three of these, but they never hurt the *swine* or his flesh, and the *Swine* may be full of them, and yet none appear upon his tongue, but then his voice will be altered and not be was wont.

These abound most of all in such *Hogs* as have fleshy legs and shoulders very moist, and if they be not over plentiful, they make the flesh the sweeter; but if they abound, it tasteth like stock-fish or meat over-watered. If there be no appearance of these upon their tongue, then the chap-man or buyer pulleth off a bristle from the back, and if bloud follow, it is certain that the beast is infected, and also such cannot well stand upon their hinder legs. Their tail is very round. For remedy hereof divers days before their killing, they put into their wash or swill some ashes, especially of *Hasel* trees. But in *France* and *Germany* it is not lawful to sell such a *Hog*, and therefore the poor people do only eat them. Howbeit they cannot but engender evill humors and naughty bloud in the body.

The roots of the bramble called *Ramme*, beaten to powder and cast into the holes, where *Swine* use to bath themselves, do keep them clear from many of these diseases, and for this cause also in ancient time they gave them *Horse-flesh* sodden, and *Toads* sodden in water, to drink the broath of them. The *Bur* pulled out of the earth without *Iron*, is good also for them, if it be stamped and put into milk, and so given them in their wash. They give their *Hogs* here in *England* red-lead, red-oker,

Oker, and in some places, red loam or earth. And *Pliny* saith, that he or she which gathereth the afore said Burre, must say this charm :

*Hæc est herba Argemon
Quam Minerva reperit,
Suis his remedium
Qui de illa gustaverint.*

At this day there is great praise of Maiden-hair for the recovery of Swine, also holy Thistle, and the root of *Gunban* and Harts-tongue.

of leanness or pining.

Sometime the whole herd of Swine falleth into leanness, and so forsake their meat, yea although they be brought forth into the fields to feed, yet as if they were drunk or weary, they lie down and sleep all the day long. For cure whereof, they must be closely shut up into a warm place, and made to fast one whole day from meat and water, and then give them the roots of wilde Cucumber beaten to powder, and mixed with water, let them drink it, and afterward give them Beans pulse, or any dry meat to eat, and lastly warm water to procure vomit, as in men, whereby their stomachs are emptied of all things both good and bad: And this remedy is prescribed against all incertain diseases, the cause whereof cannot be discerned; and some in such cases do cut off the tops of the tails, or their ears, for there is no other use of letting these beasts blood but in their veins.

Of the Pestilence.

These beasts are also subject to the Pestilence, by reason of earth-quakes and sudden infections in the air, and in such affection the beast hath sometime certain bunches or swellings about the neck, then let them be separated, and give them to drink in water the roots of *Dassadill* :

*Quatit egros tussis anhelæ suæ
Ac faucibus angit obesis tempore pestis.*

Some give them Night-shade of the wood, which hath great stalks like cherry twigs, the leaves to be eaten by them against all their hot diseases, and also burned snails, or Pepper-wort of the Garden, or *Lactuca fœtida* cut in pieces, sodden in water, and put into their meat.

Of the Ague.

IN ancient time (*Varro* saith) that when a man bought a Hog, he covenanted with the seller, that it was free from sicknesse, from danger, that he might buy it lawfully, that it had no maungie or Ague.

The signs of an Ague in this beast are these.

WHen they stop suddenly, standing still, and turning their heads about, fall down as it were by a Megrim, then you must diligently mark their heads which way they turn them, that you may let them blood on the contrary ear, and likewise under their tail, some two fingers from their buttocks, where you shall finde a large vein fitted for that purpose, which first of all we must beat with a rod or piece of wood, that by the often striking it may be made to swell, and afterwards open the said vein with a knife: the blood being taken away, their tail must be bound up with Osier or Elm twigs, and then the Swine must be kept in the house a day or two, being fed with Barly meal, and receiving warm water to drink as much as they will.

Of the Cramp.

WHen Swine fall from a great heat into a sudden cold, which hapneth when in their travel they suddenly lie down through wearinesse, they fall to have the Cramp, by a painfull convulsion of their members, and the best remedy thereof, is for to drive them up and down, till they wax warm again, and as hot as they were before, and then let them be kept warm still, and cool at great leisure, as a horse doth by walking, otherwise they perish unrecoverably, like Calves which never live after they once have the Cramp.

Of Lice.

They are many times so infested and annoyed with Lice, that their skin is eaten and gnawn through thereby; for remedy whereof, some annoynt them with a confection made of Cream, Butter, and a great deal of Salt: Others again annoynt them, after they have washed them all over with the Lees of wine, and in England commonly the Countrey people use Staves-aker, red Oaker, and grease.

Of the Lethargy.

By reason that they are much given to sleep in the Summer time, they fall into Lethargies, and die of the same: the remedy whereof is, to keep them from sleep, and to wake them whenever you finde them asleep.

Of the head-aches.

This disease is called by the Grecians, *Scotomia*, and *Kraura*, and by *Albertus*, *Frattia*. Here with all Swine are many times infected, and their ears fall down, their eyes are also dejected, by reason of many cold humours gathered together in their heads, whereof they die in multitudes, as they do of the pestilence, and this sicknesse is fatall unto them, if they be not holpen within three or four dayes. The remedy whereof (if there be any at all) is to hold Wine to their nostrils, first making them to smell thereof, and then rubbing it hard with it, and some give them also the roots of white Thistles, cut small and beaten into their meat, but if it fall out that in this pain they lose one of their eyes, it is a sign that the beast will die by and by after, as *Pliny* and *Aristotle* write.

Of the Gargarisme.

This disease is called by the Latines, *Rauedo*, and by the Grecians, *Branchos*, which is a swelling about their chaps, joyned with Feaver and Head-ache, spreading it self all over the throat, like as the Squinancy doth in a man, and many times it begetteth that also in the Swine, which may be known by the often moving of their feet, and then they die within three dayes, for the beast cannot eat being so affected, and the disease creepeth by little and little to the Liver, which when it hath touched it, the beast dieth, because it putrieth as it passeth. For remedy hereof, give unto the beast those things which a man receiveth against the Squinancy, and also let him blood in the root of his tongue, (I mean in the vein under the tongue) bathing his throat with a great deal of hot water mixed with Brimstone and Salt.

This disease in Hogs is not known from that which is called *Struma*, or the Kings evil at the first appearance, as *Aristotle* and *Pliny* write: the beginning of this disease is in the Almonds, or kernels of the throat, and it is caused through the corruption of water which they drink; for the cure whereof, they let them blood, as in the former disease, and they give them the Yarrow with the broadest leaves. There is a Hearb called *Herba impia*, all hoary, and outwardly it looketh like Rosemary, some say it is so called because no beast will touch it, this being beaten in pieces betwixt two tiles or stones, groweth marvellous hot, the juice thereof being mixed in milk and Wine, and so given unto the Swine to drink, cureth them of this disease, and if they drink it before they be affected therewith, they never fall into it, and the like is attributed to the hearb *Trinity*, and *Viola Martia*, likewise the blew flowers of Violets are commended for this purpose by *Dioscorides*.

Of the Kernels.

These are little bunches rising in the throat, which are to be cured by letting blood in the shoulder, and unto this disease belongeth that which the Germans call *Rangen*, and the Italians, *Sidor*, which is not contagious, but very dangerous, for within two dayes the beast doth die thereof, if it be not prevented: This evil groweth in the lower part or chap of the Swines mouth, where it doth not swell, but waxing white, hardeneth like a piece of horn, through pain whereof the beast cannot eat, for it is in the space betwixt the fore and the hinder teeth; the remedy is to open the Swines mouth as wide as one can, by thrusting into it a round bar, then thrust a sharp needle through the same sore, and lifting it up from the gum, they cut it off with a sharp knife; and this remedy helpeth many if it be taken in time: Some give unto them the roots of a kinde of Gentian to drink, as a speciall medicine, which the Germans for that cause call *Rangen crute*; but the most sure way is the cutting it off: and like unto this there is such another growing in the upper chap of the mouth, and to be cured by the same remedy: the cause of both doth arise from eating of their meat over hot, and therefore the good Swineheard must labour to avoid that mischief: The mischief of this is described by *Virgil*:

*Hinc canibus blandis rabies venit, & quatit egros
Tussis anibela sues, ac faucibus argit abess.*

Of the pain in their Lungs.

For all manner of pain in their Lungs, which come by the most part for want of drink, are to have Lung-wort stamped and given them to drink in water, or else to have it tyed under their tongues two or three dayes together, or that which is most probable, because it is dangerous to take it inwardly, to make a hole in the ear, and to thrust it into the same, tying it fast for falling out: and the same vertue hath the white Hellebor. But the diseases of the Lungs are not very dangerous, and therefore the Butchers say, that you shall seldom finde a Swine with sound Lungs or Livers: sometimes it falleth out that in the Lights of this Beast there will be apparent certain white spots as big as half a Walnut, but without danger to the Beast, sometimes the Lights cleave to the ribs and sides of the Beast, for remedy whereof you must give them the same medicines, that you give unto Oxen in the same disease. Sometimes there appear certain blathers in the Liver of water, which are called water-gals; sometimes this is troubled with vomiting, and then it is good to give them in the morning, fryed pease mingled with dust of Ivory, and bruised Salt fasting, before they go to their pastures.

Of the diseases in the Spleen.

By reason that this is a devouring Beast, and through want of water, it is many times sick of the Spleen, for the cure whereof you must give them Prunes of *Tamariske* pressed into water, to be drunk by them when they are a thirst; this disease cometh for the most part in the Summer, when they eat of sweet and green fruits, according to this verse;

Strata jacent passim sua quaq; sub arbore poma.

The vertue of these Prunes of *Tamarisk* is also very profitable against the diseases of the Milt, and therefore it is to be given to Men as well as to Beasts, for if they do but drink out of pots and cups made out of the wood of the tree *Tamariske*, they are easily cleared from all diseases of the Spleen; and therefore in some Countries of this great tree they make Hog troughes and mangers, for the safeguard of their Beasts, and where they grow not great, they make pots and cups. And if a Hog do eat of this *Tamarisk* but nine dayes together, at his death he shall be found to be without a Spleen, (as *Marcellus* writeth.) When they become loose in their bellies, which happeneth to them in the Spring time by eating of green Herbs, they either fall to be lean, or else to die. When they cannot easily make water, by reason of some stoppage, or sharpness of Urine, they may be eased by giving unto them spurge-feed. And thus much for the diseases of Swine. For conclusion whereof I will add hcreunto the length of a Swines life, according to *Aristotle* and *Pliny*, if it be not cut off by sickness or violent death; for in their dayes they observed that Swine did live ordinarily to fifteen years, and some of them to twenty; And thus much for the nature of Swine in general.

The medicines of the Hog.

The best remedy for the bitings of venomous Serpents is certainly believed to be this, to take *Aetius*. some little creatures, as Pigs, Cocks, Kids, or Lambs. and tear them in pieces, applying them whiles they are hot to the wound as soon as it is made, for they will not only expell away the poyson, but also make the wound both whole and sound. For the curing of Horses which are troubled with the inflammation of the Lungs; Take a sucking Pig and kill him neer unto the sick Horfe, that you may instantly pour the blood thereof into his jawes, and it will prove a very quick and speedy remedy. The panch of a sucking Pig being taken out and mingled with the yolk which sticketh to the inner *Marcellus*. parts of the skin, and moistned both together, doth very much ease the pain of the teeth being poured into that ear, on which side the grief shall lie.

The liquor of Swines flesh being boyled, doth very much help against the *Buprestis*. The same is also a very good antidote against poyson, and very much helpeth those which are troubled with the Gowt. Cheese made of Cowes milk being very old, so that it can scarce be eaten for tartness, being in the liquor or decoction of Swines flesh which is old and salt, and afterwards thoroughly tempered, doth very much mollifie the stiffness of the joynts, being well applyed thereunto.

The *Indians* use to wash the wounds of the Elephants which they have taken first with hot water, *Ælianus*. afterwards if they see them to be somewhat deep, they anointed them with Butter: then do they assuage the inflammation thereof, by rubbing of Swines flesh upon them, being hot and moist with the fresh blood issuing from the same. For the healing of the wounds of Elephants, Butter is chiefly commended, for it doth easily expell the iron lyrage hid therein, but for the curing of the Ulcers, there is nothing comparable to the flesh of Swine. The blood of Swine is moist, and not very hot, being in temper most like unto mans blood, therefore whosoever saith that the blood of men is profitable for any disease, he may first approve the same in Swines blood: but if it shew not the same, it may in a manner shew the like action.

Galen.

For although it be somewhat inferiour unto mans blood, yet at the least it is like unto it; by knowledge whereof, we hope we shall bring by the use thereof, more full and ample profit unto men. For although it do not fully answer to our expectation, notwithstanding there is no such great need that we should prove mens blood. For the encouraging of a feeble and diminished Horse, *Eumelinus* reporteth, the flesh of Swine being hot, mingled in wine, and given in drink, to be exceeding good and profitable. There also ariseth by Swine another excellent medicine against divers perillous diseases, which is this, to kill a young gelded Boar Pig, having red hairs, and being of a very good strength, receiving the fresh blood in a pot, and to stir it up and down a great while together with a stick made of red Juniper, casting out the clots of the blood, being gathered while it is stirring.

Then to cast the scrapings of the same Juniper, and stir the berries of the Juniper in the same to the quantity of seven and twenty, but in the stirring of the same, let the clots be still cast out. Afterwards mingle with the same these hearbs following, Agrimony, Rue, Phu, Scabious, Betony, Pimpernel, Succory, Parsly, of each a handfull. But if the measure of the blood exceed three pints, put unto it two ounces of Treacle: but if it shall be bigger, for the quantity of the blood you shall diminish the measure of the Treacle. (But all things ought to be so prepared that they may be put to the blood coming hot from the Boar.) These being mixed all together, you must draw forth a dropping liquor, which you must dry in the sun, being diligently kept in a glasse-vessell for eight dayes together, which you must do once every year, for it will last twenty years. This medicine is manifestly known to be a great preservative against these diseases following, namely the Plague, impostumes in the head, sides, or ribs, as also all diseases whatsoever in the Lungs, the inflammation of the Milt, corrupt or putrified blood, the Ague, swellings in the body, shaking of the heart, the Dropsie, heat in the body above nature, evill humors, but the principal-est and chiefest vertue thereof is in curing all poysons, and such as are troubled with a noysome or pestilent Fever.

Let him therefore who is troubled with any of the aforesaid diseases, drink every morning a spoonfull, or four or five drops of the same liquor, and sweat upon the same, and it will in very short time perfectly cure him of his pain. Some also do use Almonds pounded or beaten in the blood against the Plague, the liquor being extracted forth by the force of fire. A young Pig being killed with a knife, having his blood put upon that part of the body of any one which is troubled with warts being as yet hot come from him, will presently dry them, and being after washed, will quite expell them away. The blood of a Sow which hath once pigged being anointed upon women, cureth many diseases in them.

Marcellus.

Pliny.

The brains of a Boar or Sow being anointed upon the sores or Carbuncles of the privy members, doth very effectually cure them, the same effect also hath the blood of a Hog. The dugs of a woman anointed round about with the blood of a Sow, will decrease lesse and lesse. A young Pig being cut in pieces, and the blood thereof anointed upon a Womans dugs, will make them that they shall not encrease.

Concerning the grease of Swine, it is termed diversly of all the Authors, for the *Grecians* call it *Stear Choirion*, and *Oxungion*, for the imitation of the *Latin* word *Axungia*; but *Marcellus* also applyeth *Axungia* to the fat of other creatures, which among the ancient Authors I do not finde: for in our time those which in *Latin*, do call that fat *Axungia*, which encreaseth more solid between the skin and the flesh, in a Hog, a Man, a Brock or Badger, a Dor-mouse, a Mountain-mouse, and such like.

The fat of Swine they commonly call Lard which groweth betwixt the skin and the flesh, in expressing the vertues of this, we will first of all shew how it is to be applied to cures outwardly, and then how it is to be received inwardly; next unto Butter, it hath the chiefest commendations among the antients, and therefore they invented to keep it long, which they did by casting some salt amongst it, neither is the reason of the force of it obscure or uncertain, for as it feedeth upon many wholesome herbs which are medicinable, so doth it yeeld from them many vertuous operations; and besides the physick of it, it was a custom for new married wives when they first of all entred into their husbands house, to anoint the posts thereof with Swines grease in token of their fruitfulness while they were alive, and remainder of their good works when they should be dead.

The Apothecaries for preparation of certain Oyntments, do geld a male sucking Pig, especially such a one as is red, and take from his reins or belly certain fat, which the *Germans* call *Schmer*, and the *French*, *Oing*, that is, *Unguentum*: the husbandmen use Swines grease to anoint the axle trees of their Carts and carriages, and for want thereof they take putrified Butter, and in some Countries the gum that runneth out of Pine trees, and Fir trees, with the scum of Butter mingled together: and this composition taketh away scabs and tetter in Men: but it is to be remembered that this grease must be fresh, and not salted, for of salt grease there is no use, but to skowre those things that are exulcerated.

The antients deemed that this is the best Grease, which was taken from the reins of the Hog washed in rain water, the veins being pulled out of it, and afterwards boyled in a new earthen pot, and so preserved. The fat of Swine is not so hot and dry as the fat of other beasts, the chief use of it is to moisten, to fasten, and to scatter, and herein it is most excellent when it hath been washed in Wine, for the stale salt grease so mixed with Wine, is profitable to anoint those

that

that have the Plurisie, and mingled with ashes and Pitch, easeth inflammations, fistulaes, and tumors, and the same virtue is ascribed to the fat of Foxes, except that their fat is hotter then the Swines, and lesse moist: likewise ashes of Vines mingled with stale greafe of Hogs, cureth the wounds of Scorpions and Dogs, and with the spume of Nitre, it hath the same vertue against the bitings of Dogs. It is used also against the French disease (called the French pox) for they say if the knees of a Man be anointed therewith, and he stand gaping over it, it will draw a filthy matter out of his stomach, and make him vomit.

By *Serenus* it is prescribed, to be anointed upon the knees, against the stiffness of the Neck. Mingled with Quicksilver and Brimstone, it is soverain against the itch and scabs. This Lard being sod with the fat, and applyed to the body, doth mightily expell corruptions that cleave to the skin. The fat of Swine with Butter and Oyl of Roses, is infilled into the broken skins of the brain for the cure of them.

Likewise Buglosse plucked up by the root, and the roots cut off, and curiously washed, beaten and pounded into a Ball, and mixed with Swines greafe, is good to be laid to any incurable wound. It is also profitable for the wounded Nerves of the body, beaten together with Wormes of the earth, according to these Verses of *Serenus*:

— *Terræ lumbricos indere tritos,*
Quæ vetus & raris sociari axungia debet.

When bones are broke, if they be anointed with the sod greafe of Swine, and so bound up fast together, after they be well set and closed, grow wonderfull fast, sure and solid again: *Serenus* writeth thus of it;

Si cui forte lapis teneros violaverit artus,
Necesse adipem vetulos, & tiliam chamæsson.

By the fat (he meaneth the fat of Swine) because presently after he maketh mention of the dung of Swine to be good for the same cure. Being mingled with Pitch, it scattereth all bunches and fellons. The hardness of the breasts, Ruptures, Convulsions and Cramps, and with white Hellebor, it closeth up cliffs and chinks in the flesh, and maketh the hard skin to be soft again. It is very profitable against inflammations of Ulcers, especially the fat of the Boar Pig, mixed with liquid gum.

Women do also use the fat of a Sow that never bore Pig to cleare their skin, and to mix it with Pitch, and one third part of Asses greafe against the scabs. The same mixed with white Lead, and the spume of silver maketh the scars of the body to be of the same colour with the residue; and with Sulphur, it taketh away the spots in the Nails, mingled with the powder of Acorns: if the greafe be salt, it softneth the hardness of the flesh. Rue mixed with Swines sewer or Buls greafe, taketh away spots and freckles out of the face, and it is also profitable against the Kings evill, being mixed with the powder of a Sea Oyster shell, and being anointed in a Bath, it taketh away the itch and blisters. Featherfew and stale Swines greafe, is also prescribed against the Kings evill. This same alone or with Snow, easeth the pain of burnings in the flesh, and when there is an Ulcer, by reason of the burning, mix it with toasted Barly, and the white of an Egge, according to these Verses;

— *Combustis igni,*
Hordeæ vel fruges, atq. ovi candida junget,
Adsit adeps porcæ (mira est nam forma medelæ)
Junge chelidonias, ac sic line vulnèra succis,
Quodq. recens ussit glacies, axungia simplex
Mulcet, & ex facili grata est medicamine cura.

Fresh greafe is very profitable for those members that are furboted or riven of their skin, and likewise to anoint them that are weary with long journeyes. The ashes of womens hair burned in a shell, and mingled with the fat of Swine, are said to ease the pain of St. *Antonies* fire, and to stanch blood, and to cure Ring-worms.

The gall of a Swine, or of a Boar, and the Lights with the fat, filleth up the Kibes; and the stalks of Cabiges with the roots burned, and mingled with Swines greafe being applyed to the sides, do cure the dayly pains thereof. And thus far of the use of this greafe for the bodies of men.

Now also it followeth in a word to touch the use thereof for the bodies of Beasts. When the horns of Oxen or Kine are broken, they take a little Lint, Salt, Vinegar, and Oyl, and lay them upon the broken horn, powring in the liquid, and binding the rest close on the outside, and this they renew three dayes together; the fourth day they take the like quantity of Swines greafe, and liquid Pitch, and with a smooth rind or bark of pine they bind it to close, and so it is fastened again. When the hoof or ankles of an Ox are hurt with the plough share, then take hard Pitch, Swines greafe and Sulphur, roul them up all together in unwashed wool, and with hot burning Iron melt them upon the wound or horn.

The ears of Dogs in the Summer time are exulcerated by flies, into the which sores it is good to insill liquid Pitch sod with Swines greafe, and this medicine also is good to deliver Beasts from the tickes, for they fall off as many as touch it. When Lambs or Kids are troubled with the Sheep pox, some use to anoint them with Swines greafe and the rust of Iron, that is two parts of Swines greafe, and one part of rust, and so warm them together. Also for the scabs upon Horses heels, that are called the scratches, which come for the most part in the Winter time, they cure them on this manner; They take the fat of Swine, and melt it on the fire, and pour it into cold water, which afterwards they take it out and beat it well together, at last they mingle it with Brimstone beaten small, and so anoint the place therewith three days together, and the third day they open the scabs, and so continue anointing till it be cured.

When a Horse cannot hold his Neck right, it is good to anoint him with Oyl, Wine, Hony, and Hogs-grease; the manner of some Leeches is, when they have made a suppuration by Oxen in burning, they first of all wash it with stale Urine, and afterwards mingle an equal quantity of Pitch and Hogs greafe together, wherewithal they anoint and cure the sore.

Sometime the blood of Oxen falleth down into their feet, wherein it congealeth and breaketh forth into scabs, then must the place first of all be scraped with a knife, and the scabs cut away, afterwards with cloaths wet in Vinegar, Salt, and Oyl, moistened and pressed hard, and last of all by an equall quantity of Hogs greafe, and Goats sewet sod both together, it will be cured by laying it unto it. And thus much for the remedies of Swines greafe towards Beasts. The huskes of Beans being beaten small to powder, and mixed with Swines greafe, is very profitable against the pain of the hips and the nerves.

Some Physitians take the greafe of Swine, the fat of Geese, the sewet of Bulls, and the *Oesypus* or sweat of Sheep, and anoint therewithal Gowty legs, but if the pain remove not, then do they add unto it Wax, Mirtle, Gum and Pitch, and some use it mixed with old Oyl, with the stone *Sacophagys*, Cinck-foyl beaten in Wine with Lime or ashes. This Swines greafe beaten in water with Cumin, is prescribed by *Simeon Lethi* against the Gowt. It remedieth the falling of the hair, and the pain in the heads of Women, mingled with one fourth part of gals, and the like virtue it hath with wilde Roses, *Lingulaca* and *Hippocampinus* with Nitre and Vinegar. When the corners of ones eyes are troubled with Worms, by anointing them with the fat of a Sow with Pig, beating them together both within and without, you shall draw all the Wormes out of his eyes.

When one hath pain in his ears whereby matter issueth forth, let him beat the oldest Lard he can in a Morter, and rake the juyce thereof in fine wool, then let him put that wool into his ear, making it to work through warm water, and then infuse a little more of the juyce of that Lard, and so shall he work a great cure in short time. And generally the fat of Geese, Hens, Swine, and Foxes, are prepared for all the pains in the ears.

If there arise any bunch in the neck or throat, see the Lard and Wine together, and so by gargaring that Liquor, it shall be dispersed, according to the Verses of *Serenus*;

— In rigore —

*Cervicis geminus mulcebitur unguine poples,
Hinc longam pariter nervos medicina sequetur.*

And it is no marvel that the vertue of this should go from the knees to the Nerves, seeing that *Pliny* affirmeth, that from the anointing of the knees the savour goeth into the stomach: there is so great affinity or operation of Rue upon the stones, that in antient time they were wont to cure burkness by anointing the Cods with wilde Rue and Swines greafe.

Also this Grease with rust of Iron, is good against all the imperfections in the seat. Butter, Goose greafe, and Hogs greafe, are indifferently used for this infirmity. Also this is used to keep Women from abortments that are subject thereunto, being applyed like an eye salve. In the diseases of the Matrix, especially Ulcers, they first of all dip Spunges or Wool in warm water, and so cleanse the places infected, and afterwards cure it with Rozen and Swines greafe mingled together, and often using it in the day and night by way of Oyntment; but if the exulceration be vehement, after the washing they put Hony unto the former confection, and some make a perfume with Goats Horn, Gals, Swines greafe, and Gum of Cedars. And *Fernerius* saith, that Lard cut small and beat in a Morter of stone like paste, in a Limbeck of Glasse, rendereth a white water, which maketh the hair yellow, and also the face comely. If a man be poysoned with Hemlock, he cannot avoid it better, then by drinking Salt, Wine, and fresh Greafe. A decoction hereof is good against the poyson of *Bouprestis*, and against Quicksilver. The sewet of a Sow fed with green Herbs, is profitable to them that are sick of a consumption of the Lungs, according to this Verse of *Serenus*;

Proderit & veteris sevi pila sumpta suilli.

This may also be given them in Wine, either raw or decocted, or else in pills to be swallowed down whole if it be not salted, and the fift day after they prescribe them to drink out of an Eggeshell Liquid Pitch, binding their sides, breast, and shoulder bones very hard. It is also used for an old Cough after it is decocted, the weight of a Groat being put into three cups of Wine with some Hony. It is given also to them that have the flux, especially old Lard, Hony, and Wine, being beaten together

together till they be all as thick as hony, whereof the quantity of a Hasil-nut, is to be drunk out of Water. Also morsels of Swines grease, Butter, and Hony, being put down into a Horse throat, cureth him of an old Cough; and finally a piece of this Grease being old, moistened in old Wine, is profitable to a Horse that hath been overheated in his journey. When Calves be troubled with belly Wormes, take one part of Swines grease, and mingle it with three parts of Hyfop, afterwards thrust it down into the throats of the Calves, and it shall expell the Wormes.

When the tongue and chaps wax black by a peculiar sickness of the mouth, which the Physicians call *Morbus Epidemicus*, it is most wholesome to rub the tongue with the inner side of the rines of Bacon, and so draw out an extreme heat: and it is said if a man be deeply infected, whose tongue is thus rubbed; the said Bacon rine being eaten by any Dog, will procure his death. The fat of Wolves and the marrow of Swine is good to anoint blear-eyes withal. By swallowing down the marrow of Swine, the appetite to carnal copulation is encreased.

The ashes or powder of Hogs bristles which are taken out of Plaisterers Pencils, wherewithal they rub wals, and mixed with Swines grease, doth ease the pain of burnings, and also stayeth the bleeding of wounds, and the falling down of the seat being first of all washed in Wine and dried Pitch mingled therewithal. The powder of the cheek-bones of Swine, is a most present remedy for broken bones, and also for ulcers in the legs and shins. The fat of a Boar is commended against Serpents, and so also is the liver of a Bore Pig when the Fibres are taken from it, if the weight of two pence be drunk in wine.

The brain of a Sow roasted at the fire, and laid to a Carbuncle, either disperfeth or emptieth it. Likewise the bloud and brains of a Boar or a Sow, or Boar Pig being mixed with Hony, doth cure the Carbuncles in the yard, and the brains alone, openeth the gums of children, to let out their teeth, as *Serenus* writeth;

Aut teneris cerebrum gingivis illine porci.

There are naturally in the head of a Hog two little bones that have holes in them, one in the right part, and another in the left. Now if it happen that a man finde these bones by chance, either one or both of them, let him lay them up safe, and whensoever he is troubled with the Head-ach, let him use them, hanging them about his neck by a silken threed, that is to say, if the head ach on the right side, let him hang the right bone; and if on the left, the left bone: These things I report upon the credit of *Marcellus*. *Galen* also writeth, that if the pole of the Swines ear be hanged about ones neck, it will preserve him from all Cough afterwards.

They were wont, as *Dioscorides* writeth, to see the a Gudgeon in a Swines belly, by the eating whereof, they stayed the falling down of the seat. If a man eat the lungs of a Boar, and a sow sodden and fasting, they will preserve him from drunkenness all that day; and likewise the said lungs doth keep the soles of the feet from inflammation which are caused by fraight shooes. It also healeth the piles, clifts, and breaking of the skin, and kibes of the feet, by laying to it a Boars gall, and a Swines lungs.

If a Man drink the Liver of a Sow in Wine, it saveth his life from the bitings of venomous beasts. Also the liver of a Boar burned with Juniper-wood, cureth all the faults in the secrets; and drunk in Wine without Salt after it is sod, stayeth the looseness of the belly. The gall of Swine is not very vehement, for as the whole body is waterish, so also is that; neither is there any beast herein comparable unto it, (except the wilde) and that is enemy to Ulcers, ripening the sore, scattering the evill humors, and resisting the bitings of venomous Beasts. Also the gall of Boars layed to bruised Articles, doth procure unto them wonderful ease. One shall take away an old scurfe very easily by the gall of a Sow, which farrow if it be mingled with the juyce of the hearb *Siclamine*, and therewithal to rub the head well in a Bath. To keep hair from growing upon the browes when it is once plucked off; Take the gall and fat of a Boar, and put them into a smooth thick earthen pot, and of the sharpest Vinegar and oyl of Almonds four ounces a piece, pour that into it, and then binde the mouth of the pot close with a thick linnen cloth, so letting them stand seven dayes together, afterwards open them again, and you shall finde upon the top a certain scum like gold, wherewithal anoint those places, which you would have remain bald, after that you have beaten it together in a morter: likewise the gall of a Barrow Hog or Boar Pig, doth scatter Apostumes and bunches in any part of the body. The gall of a Hog dryed in an Oven, and laid upon a Carbuncle, as much as will cover it, it cleaveth fast to the fore, and draweth out the root and core thereof.

It is likewise good against the Ulcers of the ears, except the Ulcer be of long continuance, and then it is good to use a sharper gall, such as is a Sheeps, an Oxes, a Bears or a Goats, they mingle herewithal sometimes oyl of Roses; but for old wounds in the ears, it is good to take one part of best Hony, and two parts of the sharpest Vinegar, and so let them boyl on the fire three walmes, afterwards set them far off from the fire, untill it leave seething or boyling, and then put Nitre unto it, so long till you know by the Vapor that the Nitre is settled, then see the it again upon a gentle fire, so as it boyleth not over, and lastly put into this the gall of a Boar, or of a Goat, and then see the it the third time, taking it from the fire, when it is luke-warm, infuse it into the ears, and this gal must not be the gall of a Sow, except of such as never bare Pig. Also this gall being dried doth

doth cure the Hemorrhoids and kibes. There are also certain sifters or clifts in the hoofs of Horses, which are cured in one nights space, by applying unto them the gall of a Barrow hog, mingled with the yolkes of Egges.

The blather of Swine will provoke urine, and of a Boar Pig sod, roasted or boyled, and so eaten and drunk, causeth a man to contain his urine, which never could before. When the head of a Man is exulcerated and runneth, take the bladder of a Barrow-hog, with the Urine, and cast the same into the fat cut small, afterwards mingle it so with Salt, that it may appear all white, then binde it up fast, and dig a hole in the Garden about a cubit deep, wherein bury and cover the said gall, and so let it rest forty or fifty days in the earth, till the matter therein contained be putrified, then take it out and melt it in a dish, and keep the ointment that ariseth of it. Then wash the head all over with lye, unto the intent that it may not be offended through the Acrimony thereof, mingle it with new wine or with water, and then when it is dry after such washing, anoint it with the said ointment, and so will the noxious and unclean hairs fall every one off, and new pure ones arise in their place, and you must be very carefull to keep the head from cold.

They were wont to give the stones of Swine against the Falling sickness, but when they were first dried, and afterwards beaten to powder, and given to the sick party in Swines milk, so he was commanded to abstain from wine many dayes before, and after he received it for many dayes together. In *Savoy* they take the stones out of a young Hog when they geld him, and scorch them at the fire so long, till they may be crushed to pieces, and this they prescribe to be drunk in Wine against the Colick.

Some give the powder of Boars stones to men and women, to increase copulation and conception. The Magicians or wisemen of the East prescribed to be drunk for the incontineny of urine, the powder of a Boar Pigs stones out of sweet wine, and then to make water in a Dogs kennel, which while he is doing, to speak to himself these words; *Ne ipse urinam faciam ut Canis in suo cubile*: but I will leave this superstition, as not worthy to be Englished. Some take the bladder of a Sow burned to powder, and drunk for this infirmity, and some a certain liquorish poyson, which droppeth from the Navel of a Boar Pig, immediately after it is farrowed.

Bacon beaten together, and made like meal, is good agais a continual Cough, or stayeth bleeding at the mouth. Bacon broath is also mingled with other medicines against the Gowt, and they make an emplaister of Bacon to scatter gravelly matter in the bladder. The bones of Bacon about the hips are kept to clense and rub teeth, and by burning of them, not only the loose teeth in men are fastned, but also the wormes in the teeth of beasts are killed. If a Horse be troubled with the Glanders, or any such liquid matter running out at his mouth and nose, then let the broath wherein Bacon and Swines feet hath been sod, be mixed with hony, and so strained afterward, let it be beaten well together with Egges, and so infused into the left Nostril of the Horse. *Gagnerius* prescribeth an Emplaister to be made of Cheese, and the feet of Swine against the shrinking up of the finews.

The ancle bone of a Sow being burned untill it be white, and bruised and taken in drink, doth cure the swellings of the neck, and pains of long continuance. The ancle bone of a Sow burned and bruised, and given to drink only in Water, is a remedy against the Colick and stone. The ankle bone of a Sow doth drive away those swellings which arise in the stomach, and doth ease the pains of the head.

The ashes of the ancle bone of a Sow or Boar, doth cure Corns, clefts, or other rifts in the skin, and the hardness of the skin that is in the bottom of the feet. It is also shewed, that if the bone shall be hung about the neck of those that are troubled with quartain agues, that then they shall be far better, but of what bone he speaketh, it is uncertain, but as he remembreth it is the next bone before the fat of the anckle bone.

The bones that are taken from the hoofs of Sows, burned and beaten to powder, are very good to rub and clense the teeth: Also the bones next to the ribs of Bacon, being burned, are very good to fasten the teeth. The bones that are taken from the hoofs of hogs, and burned to powder, are used to clense the teeth, and it is very good also to fasten the teeth. The ashes which are made of a Harts horne, or of the hoof of a Hog, are very good to clense or rub the teeth. The bones which are taken from the hoof of a hog burned and beaten to powder and sifted, and a little Spicknard added thereto, doth make the teeth very white, by often rubbing them therewith. The ashes of the hoofs of a Boar or Sow, put in drink, doth stay the incontineny of Urine, and also the Bloody flux. Take as much Mercurial sodden, as ones hand can hold, sod in two pintes of Water unto one pinte, and drink the same with Hony and Salt, and the powder of a Hogs hoof, and it shall loose the belly.

The milk of a Sow drunk with sweet Wine, helpeth women in travell; and the same being drunk alone restoreth milk in Womens breasts; it is also good against the Bloody flux and Tiffick. The stones of Swine beaten to powder, and drunk in Swines milk, are good against the Falling sickness. The wise men were wont to prescribe the left foot or leg of a Camelion to be bound unto the feet against the Gowt.

There are also many uses of the dung of Swine, and first of all it being mixed with Vinegar, is good against the bitings of venomous beasts, and *Aetius* maketh an Emplaister thereof, against the biting of a Crocodile. It is to be applied single against the stinging of Scorpions, and also the biting

biting of any other reptile creature. If a Serpent bite an Oxe or a Horse, or any other Four-footed Beast, take the stalk of *Nigella*, and beat it into a pinte of old wine, so as all the juyce may go out thereof, then infuse it into the Nostrils of the Beast, and lay Swines dung to the sore, so also it may be applyed unto men, whereunto some do add Hony Attick, and the Urine of a man, and so it is to be applyed warm, it being also warmed in a shell, and dryed to powder, mixed with Oyl, and layed to the body, easeth outward pains. It is likewise profitable against burnings, itch, scabs, and blisters, and trembling of the body, according to these Verses of *Serenus*;

Stercoris ex porco cinerem confundito lymphis :
Sic pavidum corpus, dextra pascente foveto.

This is also commended against hard bunches in the body, hardness of the skin, clifts and chinks in the flesh, freckles, lice, and nits, and also the breaking of the sinews;

Si cui forte lapis teneros violaverit artus,
Non pudeat luteæ stercus producere poræ.

It is also good to stay bleedings at the Nose, if it be layed to the Nostrils warm, and to stay the bleedings of Beasts, if it be given them in Wine; the same being mixed and covered with Hony, is anointed upon Horses for the Quinsie, or swellings of the throat. If the breasts of a Woman do swell after her delivery of childe, it is good to anoint them with water, and the dung of Hogs, also the powder thereof mixed with Oyl, is profitable for the secrets of men and women. If a man have received any hurt by bruises, so as his blood stayeth in his body, or suffer Convulsion of the Nerves through Cramps, those evils are cured by the dung of a Boar gathered in the Spring time, dried and sod in Vinegar, and some of the later Physitians prescribe it to be drunk in Water, and they say that *Nero* the Emperor was wont to use that medicine, when he would try the strength of his body, in a running Chariot: also the powder of the same being drunk in Vinegar, is profitable for the Rupture and inward bruises, and warmed in Wine against all manner of fluxes and Tificks. For the pains of the Loins and all other things which need mollifying, rub them first of all with Deers grease, and then sprinkle them with old Wine mixed with the powder of Swines dung.

The Urine of a Swine is also good against all bunches and Apostemations being layed to in wool. The urine of a Boar Pig dried in the smoak, and drunk with sweet Wine, the quantity of a Bean, is profitable against the Falling evill; against the whiteness of the eyes, and the stone in the reins and bladder. And thus much of the Swine in general.

Of the Wilde B O A R.

This Beast is termed, by no other name, then the common Swine among the Hebrews, namely, *Chasir*, as you may see in *Psal. 80.* where the Prophet speaketh of *Chasir de Silva*; that is, the Boar out of the wood. The Grecians call him *Capros* and *Syagros*, and *Clunis*, although some take *Clunis* for a Boar of an exceeding great stature. *Aristophane* saith, that there are some of this kinde which

which are called *Monii*, which word by St. Cyril upon the Prophet *Hosea* is interpreted a wilde Ass, but I rather incline to their opinion which say, that *Chlunis*, *Monios*, and *Chauliodon* are Poetical words for cruell Boars. *Aristotle* is of opinion, these Boars being gelt when they are young, grow greater and more fierce, whereunto *Homer* also yeeldeth as he is thus translated :

*Nutrit exetum sylvis horrentibus aprum
Instar non bruti, sed dorsi montis opaci.*

But this is to be understood of such Boars, as by accident geld themselves by rubbing upon any tree. The French call this Beast, *Sanglier* and *Porc Sanglier*; the Italiane, *Cinghiale* and *Cinghiare*, and *Porco*. The Spaniards, *Puerco Sylvestre*, and *Pueco montes*, and *Javali*; the Germans, *Wild Schwein*; the Illyrians *Weprz*; and the Latins, *Aper*; for *Porcus* signifieth the tame Swine, and *Aper* the wilde. The reason of this Latin name *Aper*, is derived from *Asper*, because he liveth among the sharp thorns and woods; but I rather think, that *Aper* is derived from *Capros* the Greek word, or else *Aper* a feritate, from fierceness and wildeness, by changing one letter into another.

The Epithets.

The Epithets of this Beast are many, both in Greek and Latin, such as these are; sharp, wilde, Arcadian, Atalantean, troubler, bloody, toothed, hard, Erymanthean, cruell, outrageous, fierce, strong, gnashing, lightning, yellow, raging, Acorn-gatherer, quick, rough, rough-haired, horrible, Menalian, Mysian, Meleagrian, threatening, woodwanderer, cruel, Sabelican, bristle-bearer, foaming, strict, filthy, Tegean, Tuscan, fearful, wry-faced, truculent, devourer, violent, Umbrian, wound-maker, impetuous, mountain-liver, armed on both sides, and such like.

But of these Epithets there are only three, Erymanthean, Calydonian, and Mysian, which do offer unto us peculiar stories, according as we finde them in the Poets, which we will prefix by way of moral discourse before we enter into the natural story of this beast. First of all, Erymanthus was a hill of Arcadia, wherein was a wilde Boar, that continually did descend down and depopulate their Corn-fields; Hercules coming that way, and hearing of that mischief, did kill the said Boar, and carryed him upon his back to Eurystheus, whereat Eurystheus was so much afraid, that he went and hid himself in a brazen vessell, whereof Virgil speaketh thus :

Placavit sylvam, & Lernam tremefecit arcu.

And of this Erymanthean Boar Martial speaketh ;

Quantus erat Calydon, aut Erymanthe iuvr.

Of the Calydonian Boar there is this story in Homer; When Oeneus the Prince of Aetolia sacrificed the first fruits of his Countrey to the Gods, he forgot Diana, wherewithal she was very angry, and sent among the people a savage Boar, which destroyed both the Countrey and Inhabitants : against whom the Calydonians and Pleuronians went forth in hunting, and first of all that wounded the wilde Beast was Meleager, the son of Oeneus; for reward whereof, he received his head and his skin, which he bestowed on Atalanta a Virgin of Arcadia, with whom he was in love, and which did accompany him in hunting: wherewithal the sons of Thestius, which were the Uncles of Meleager, were greatly offended (for they were the brothers to his mother Althea) those men lay in wait to destroy him, whereof when he was advertised, he killed some of them, and put the residue to flight. For which cause the Pleuronians made war against the Calydonians: in the beginning of which war Meleager fell out with his Mother, because she did not help her Countrey. At last when the City was almost taken, by the perswasion of his wife Cleopatra, he went out to fight with his enemies, where in valiant manner he slew many of them, others he put to flight, who in their chase running away, fell down upon steep rocks and perished. Then Althea the mother of Meleager, began to rage against her son, and flung into the fire the torch which the Fates had given unto her to lengthen his dayes; so when she saw her son was dead, she repented and slew her self, and afterwards was cast into the very self same burning fire with him. In the hunting of this Boar Ancaeus the companion of Jason to Colchis was slain. This Boar is also called a Meliagran and Atalantian Boar, of whom Martial writeth thus ;

*Qui Diomedem metuendus Setiger agris
Aetola cecidit cuspide, talis erat.*

And again in another place ;

*Lacte mero pastum pigrae mihi mortis alumnus
Ponat, & Aetolo de sue dives edat.*

It is said that this Boar had teeth of a cubit long, and the manner of his hunting was expressed in the pinnacle of the Temple of Tegea, for which cause he is called the Tegean Boar. Upon the one side of the Boar against his middle, were painted Atalanta, Meleager, Theseus, Telamon, Peleus, Pollux, and Iolans the companion of all Hercules travails. Prothus and Cometes, the sons of Thestius and brethren of

of *Althea*, on the other side of the Boar stood *Anceus* wounded, and *Epochus* sustaining his hunting spear; next unto him stood *Castor* and *Amphiaras*, the son of *Oicleus*. After them *Hippotus*, the son of *Cercion*, *Agamedes* the son of *Stymphelus*, and lastly *Pyrithous*. The teeth of this Boar were taken away by *Augustus* after the time that he had overcome *Anthony*, which he hung up in the Temple of *Bacchus*, standing in the Gardens of the Emperor. And thus much for the *Calidonian* Boar.

Now concerning the *Mysian* Boar, I finde this story recorded of him; When *Adrastus* the *Phrygian*, who was of the Kings bloud, had unawares killed his brother, he fled to *Sardis*, and after his expiation dwelt with *Cresus*. It happened at that time that there was a wilde Boar came out of *Olimpus*, and wasted a great part of the Countrey of *Mysia*: the people oppressed with many losses, and terrifyed with the presence of such a Beast, besought the King to send his own Son *Anys* with much company to hunt and kill the Boar. The King was affraid thereof, because in his dream he saw a vision, his Son perishing by an iron spear; yet at last he was perswaded, and committed the safeguard of his body to *Adrastus*. When they came to the wilde Beast, *Adrastus* bent his spear at the Boar, and while he cast it to kill him, the son of *Cresus* came betwixt them, and so was slain with the spear, according to the dream of his Father. *Adrastus* seeing this misfortune (that his hands which should have defended the young Prince, had taken away his life) fell into extreme passion and sorrow for the same, and although the King knowing his innocency, forgave him the fact, yet he slew himself at the Funeral of *Anys*, and so was burned with him in the same fire. And thus much for the *Mysian* Boar.

Now we will proceed to the particular story of the wilde Boar, and first of all of the Countries breeding Boars. The *Spaniards* say, that in the new found world, there are wilde Boares much lesse then ours, which have tails so short, that one would think they had been cut off, they differ also in their feet, for their hinder feet are not cloven, but stand upon one claw, and their forefeet are cloven like common Swines. Their flesh also is more sweet and wholesome then common Swines flesh, whereof *Peter Martyr* giveth reason in his *Ocean Decads*, because they feed under Palm trees, neer the Sea-shore, and in Marshes.

Olaus Magnus writeth, that in divers places of *Scandinavia*, they hunt wilde Boars which are twelve foot long. The wilde Boars of *India* according to *Pliny* have teeth, which in their compass contain a Cubit, and besides their teeth growing out of their chaps, they have two horns on their head like Calves horns. In the Islands *Madera*, there are abundance of wilde Boars, likewise in *Helvetia*, and especially in those parts that joyn upon the *Alpes*, where they would much more abound, but that the Magistrates give liberty to every man to kill and destroy them. There are no Boars in *Africa*, except in *Ethiopia*, where their Boars have all horns, and of those it was that *Lycotas* the Countryman saw in a publick spectacle at *Rome*;

Et niveos lepores, & non sine cornibus apros.

that is, Hares white like Swine, and Boars that have horns. It is a wonderful thing that there are no Boars in *Creet*, and no lesse admirable that the Boars of *Macedonia* are dum and have no voice: and thus much concerning the Countries of Boars.

Now concerning their Colour, it is observed, that wilde Boars for the most part are of a black and brown colour, especially at the top of their hair, and somewhat yellow underneath, and yet *Pausanias* writeth, that he hath seen Boars all white; howbeit that is not ordinary. Their bloud is sharp and black like black wine, and such as will never be thick, their eyes like to the eyes of wrathful beasts, as Wolves and Lyons. Their tuskes are most admirable, for with them while they are alive, they cut like sharp knives, but when they are dead, they have lost that cutting property, the reason of it is in the heat of the tooth, for it is certainly affirmed by Hunters of wilde Boars that when the Beast falleth first on the earth down before the Dogs and Hunters, if one pull off a bristle from his back, and lay it upon the tusk, the heat thereof will make it shrink up and turn together like a hot Iron, and if Dogs do chance to touch them, they burn their hairs from their back, whereby the ardent and fiery nature of this beast is manifest, as an everlasting monument of the work of God, and yet notwithstanding all their wrath they have no gall, (as *Pliny* writeth) their head and face are their strongest parts, and therefore upon them they receive the Hunters blowes as upon a bucket.

Their tears which they send forth of their eyes are very sweet, and of all other things they cannot abide their own urine, for it is thought to be so hot that it burneth them, and they can never run away in flight till they have emptyed their bellies thereof. The place of their abode is for the most part in the Marshes and Woods: for the *Scythians* did hunt Harts and wilde Boars in the Marshes, but *Roes* and wilde Asses in the plain fields. Sometimes they hide themselves among Fern, which they have gathered together in the fields, and they dig holes and ditches for themselves, wherein they rest: And this is observed, that they love not so much to wallow in the mire, as the tame and domesticall Swine, although they be of a hot and fiery nature. Their voice is like the voice of common Swine, but the females is somewhat more shrill. They live for the most part solitary and alone, and not in heards as the other do, and feed upon such meats as the vulgar Swine. *Tragus* saith, that there is a kinde of green Corn in *Germany*, which is armed with very sharp stalks and points at both ends like Barley, this the people do see the and eat like pease.

Now forasmuch as wilde Boars are destroyers of their Corn, they sow that grain neer the Woods

Of the wilde Boars parts and other accidents.

Oppianus. Gillius.

The places of their abode.

woods sides where the Boars abide, whereby they defend and safeguard their better Corn. Bores do also eat the worms of the earth, which they dig out with their noses; and in *Pamphilia* and the mountains of *Cilicia*, they do eat Salamanders without hurt or danger to themselves, and yet if men chance to eat of their flesh which have so devoured them, they die afterwards through the poyson: whereby it manifestly appeareth, that there is danger in eating wilde Hogs flesh. Hemlock and Henbane is also poyson to Swine, which they never eat but unawares, and having eaten it, presently they lose their strength in their hinder parts, whereby they are faine to draw them after them, and in that manner they crawl to the water sides, where they gather together Snails and Sea-crabs, by eating whereof they are restored to their former health. Ivy is also a medicine for the diseases of Boars, and old age maketh them altogether unfit to be preserved. Therefore in ancient time when they kept Boars in Parks, whereof *Fulvius Hirpinus* was the first beginner, *Lucius Lucillus* and *Quintus Hortensius* the immediate followers, I say they never kept Boars past four year old, because after that time they waxed lean and pined away.

The generati-
on of wilde
swine.

Now concerning their generation or copulation to engender, it is certain that they do not couple often in the year, as the tame Swine, but only once, and that in the beginning of Winter, or the middle, so that they may bring forth in the Spring time of the year; and they choose the most unused, narrow, hollow, and steep places to couple in. The male abideth with the female thirty dayes together, and the female beareth her young ones, both for the number and the time answerable to the vulgar Swine. When the Boar is in copulation before-hand, while he worketh the Sow, he carrieth a mouth as white as any Horse, which as in the Horse it riseth through vehement stirring, so in the Boar it riseth through vehement heat and fervor. In the time of their lust they are very sharp, eager, and cruell, fighting with all males that come in their presence, and therefore they arm their bodies by rowling in the durt, and also by rubbing them against trees, that so they may be hard to withstand one another. This fight of Boars is thus described of *Virgil*:

*Per silvas tum sevus Aper, tum pessima Tigris,
Ipse ruit dentesque sabellicus exacuit Sus,
Et pedibus subigit terram, fricat arbore costas,
Atq; hinc atq; illinc humeros ad vulnera durat.*

The fight of
Boars.

Being inflamed with venereal rage, he so setteth upright the bristles of his neck, that you would take them to be the sharp fins of Dolphins; then champeth he with his mouth, grateh and gnasheth his teeth one against another, and breathing forth his boyling spirit, not only at his eyes, but at his foaming white mouth, he desireth nothing but copulation, and if his female endure him quietly, then doth she satisfie his lust, and kill all his anger; but if she refuse, then doth he either constrain her against her will, or else layeth her dead upon the earth. Sometimes they force a tame Sow, and then the Pigs so begotten are called *Hibrida*, that is, by way of contumely, Bastards: And it is to be observed, that never any wilde beast being tamed, doth engender by copulation, except they be tamed very young, only wilde Boars do quickly mingle with vulgar Swine. The female of this kinde hath no teeth standing out of her mouth like the male, except very short ones, and therefore the residue are more like a saw then the teeth of a Boar, for it is a generall rule;

Nulli dentes exerti quibus ferrati.

Concerning the disposition of Boars in generall, it is brutish, stubborn, and yet couragious; wrathfull, and furious, because their blood is full of fibres, and ministreth unto them sudden matter of anger; neither are there any beasts so cloathed with hair as Lions and Boars; wherefore both of them are of like fierce and angry nature, yet we have shewed in the story of the Hart, how they were drawn from their meat and dens by the voice of Musick. It is said, that they are not capable of any discipline or instruction, and yet *Scaliger* affirmeth, that he saw a Bore that belonged to the Lord of *Salvimont*, of an exceeding great stature, tamed by his master, who at the founding of the horns, would come running like a Dog to hunting, and go abroad with his master among the Dogs, contending with the most swift in race to attain the prey.

They naturally desire to bury their own footsteps in wet miery places, that they may not be found out by the Hunters; and as the rage of the Boars is greatest in the time of their lust, so is it in the Sows after their farrowing; and therefore it was an excellent speech of *Cyaxares* unto *Cyrus*, that Swine when they see the Hunter, although they be many, yet run away with their Pigs; but if the Hunter follow one of the young ones, then doth the Dam turn again, and with all her force endeavour to destroy him that would deprive her of her young ones. Before the Boars do fight, they go and whet their teeth, but while they are in contention, if it happen that a Wolf cometh in sight, then they forsake their mutuall combats, and all of them joyn together to drive away the Wolf. The Beare dareth not to enter upon the wilde Boar, except behinde him, and unawares. *Hesiod* saith, that *Vulcan* pictured upon the shield of *Hercules*, the images and shapes of many wilde beasts fighting one with another, neither of both yeelding to other, till both of them fell down dead, which caused *Alciatus* to make this Emblem of a Vulture standing by to see their contention, and

and suffered them to kill one another without parting; whereby afterwards she enjoyed their dead carcases:

Dum sevis merent in mutua vulnera telis.

Vagus laeus ferox, dente timendus aper.

Accurrit vulnus spectatum, & prandia capat.

Gloria victoris, praeda futura sua est.

It is reported that Boars will swim single and alone like fishes, and some of them two together like Wolves, and many times in flocks and herds like Roes, for such is their ardent nature and desire of meat, that they fear not the highest Mountains, nor the deepest waters. Now concerning the flesh of wilde Boars, although we have spoken abundantly in the former discourse of Swine, yet must we adde something in this place; for although generally the flesh of tame Swine is viscous and cold, yet the flesh of the wilde is more temperate and nourishable, and therefore of lighter concoction and stronger nourishment. Therefore those which had a Timpany were prescribed to eat Boars flesh and wilde Sows, for it drieth, strengthneth, and moveth; and men that are vexed with Saint Antonies fire, are forbidden to eat all salt meats, and leavened bread, yet permitted to eat of Boars flesh. It is reported, that *Publius Servillus Rullus*, was the very first among all the Romans that did set at his Table a whole Boar, most delicately dressed and stuffed with variety of divers costly dishes; which Boar by *Varro* is called *Aper Millianus*, that is, *Mille librarum*, of a thousand pound worth; against which intolerable gluttony and cost, *Juvenal* made these Verses;

Quanta est gula, quae sibi totos

Ponit Apros, animal propter convivium natum.

Apitius in the beginning of his eight book, prescribeth the manner how to dresse the flesh of wilde Boars, wherewithall if any be delighted, let him read that book; for it is not my purpose in this Treatise, to blot any paper with any long instruction for Cooks and Belly-gods, neither were it any part of this naturall History, nor yet agreeable to my calling, or enterprise; and therefore I will only adde this observation of *Misaldus*, that Boars flesh salted in powdering tubs, doth change both colour and taste, at that time of the year wherein the living Boars do rage upon their females: And thus much shall suffice to have spoken of Boars flesh.

Now in the next place we will proceed to talk concerning the hunting of Boars, which is not only a pastime for Lords and Princes, but also a necessary labour for meaner men; for as the harm that cometh by Boars is exceeding great, and so much the greater by how much he is poorer that doth sustain it, so the utility to learn the means of destroying this beast is more commodious; because the common proverb is more true in this then in the vulgar Swine, that they never do good till they are dead.

It is reported of *Diocletian*, when he was Agent for the Romans in France, there came an old Woman called *Dryas* unto him, and reproved him for his covetousnesse, telling him that he was over-sparing, and parsimonious; to whom he answered in jest, When I am Emperour I will be more liberall: *Dryas* replied unto him, *Noli jocare Diocletiane, nam Imperator eris cum Aprum occideris.* That is, Jest not, O *Diocletian*: for thou shalt be Emperour when thou hast killed *Aper*; (that was a Boar as he thought) and therefore he gave himself to the hunting of Boars, never sparing any time that was offered unto him, alwayes expecting the event of that speech; whereof he was frustrated untill he killed *Arius Aper*, the Governour of the Judgement Hall, and then afterwards being Emperour, he knew that the woman did not mean a Boar, but a man. Now therefore the hunting of Boars, and the manner of their taking is many wayes, either by violence in chase, or by policy in ditches and traps, or else by impoysoned baits. The best time of their hunting is in the midst of Winter, as some say; but I think the Winter is the worst time, because then they are strongest, and seeing all Swine are impatient of heat, the Summer will quickly end their life, if then they be chased. It behooveth therefore the Hunter of Boars to be very wary, and therefore the Ancients ordained that such a one should wear a rough garment of a brown colour, and likewise that his Horse should be of a yellow and fiery colour, and that the Boar-spear should be strong and sharp, for this beast is armed with a very strong head and skin, and besides they cover themselves with dried durt, as it were with a Coat of male to blunt the weapon, and therefore he runneth willingly either without dread or fear upon the Hunters. In which encounter, if he receiveth not a deadly wound, he overthroweth his adversary, except he fall flat on the ground, for the Boars teeth cannot cut upward, but downward; therefore if the Hunter be a foot-man, he must seat himself neer some tree, and then also provide that if he misse the Boar, he may easily climb into the boughs, and so save himself; but if the Swine that is raised be a female, she will all to tear and bite the Hunter with her teeth if she get him within her clutches: wherefore, for the more speedy ending of the hunting, it is good to raise the beast early in the morning, before he hath made water, for the burning of his bladder doth quickly make him weary.

But if the Boar have either made water before, or got liberty and rest in the chase to ease himself, then will his taking be very difficult and tedious, such is the nature of this courageous beast that he never ceaseth running till he be weary, and being wearied dissembleth the same by

sitting upon his buttocks, and offereth combat to his Hunter, and yet he is not wont to strike a man, untill he be wounded first by him. When the Boar is first raised out of the Wood, he snuffeth in the winde, lifting up his nose to smell what is with him, and what is against him.

The hunting Spear must be very sharp and broad, branching forth into certain forks or horns, so as by no means the Boar shall break through them upon the Hunter, and when he bendeth the same before the beast, he must stand with one leg before another like a Wrestler, holding his left hand upon the middle of the Spear to direct the same, and the right hand behinde, to thrust it forward with violence, having his eye intent upon the beast, and if it be a Boar to wound him in the middle of his forehead betwixt his eye-lids, or else upon the shoulder, for in both those places the wound is deadly; but if he chance to hit him on the cheek, the greatest harm that he doth him, is that he maketh him unfit to use his tusks: of this he must be very carefull that if the Boar leap upon him, he likewise must give back and draw out his sword; and if he chance to be overturned, then to lye down in some hollow place where the Boar cannot come at him with his teeth.

Now concerning the instruction of Dogs, and the choice of such Hounds as are appointed for the hunting of Boars, you must note, that every Dog is not fit for the same, but great mastives, such as are used for the baiting of Bears. For the Boar first of all terrifieth the Dog with his voyce, and if he be not ready to fight but to run away, then are the Hunters in worse case then at the beginning. Therefore they must be sure to have them well instructed before they give the onset, and be likewise at hand to encourage them. When they come first of all to the place wherein they conjecture the Boar is lodged, if there be no appearance either by his footsteps, or by the wounds of his teeth upon the trees and boughs, then let them let loose one of the best Hounds, and casting about the Wood, follow with the residue whither the crie goeth.

The Dog presseth into the thickest bushes where commonly the Boar lodgeth, and when he hath found the beast he standeth still and bayeth, then must the Hunter come and take up that Dog, for the Boar will not stir very easily out of his lodging, and go and set up his nets and toyls in all the by-places, whereby it is likely the beast will passe, and these must he hang to some trees, for postes in the earth will not suffice, alwayes making the inside of them very light, that the beast may suspect no harm. The nets being thus set up, let him return again to his Dogs, loosing them all; and every Hunter arming himself with darts and a Boars Spear, so let the moit skilfull follow the Dogs close to exhort them and set them on, the residue follow one after another a good distance, scattering themselves into sundry angles, for their better safeguard and end of their sport: for if they should come all together, the Boar might light upon them, and wound some of them, for upon whomsoever he falleth in his rage he hurteth them: furthermore when the Dogs begin to come neer to his lodging, then must they be set on more eagerly, and so heartned that they be no wayes appalled at the raising of the Boar, for his mannr is to make force at the foremost Dog that is neerest to him, so must he be followed in chase even unto the nets, but if the nets stand upon a side-hill, or a steep rock, then when he is insnared he will get out with no difficulty; but if it stand upon plain ground, the toyls will hold him till the Hunters come, who must presently take care to wound him with darts and spears before they meddle with him, compassing him round about very warily, so that he nor they hurt any of the Dogs, and especially they must wound him in the face or shoulders, where the wounds are mortall, as I have said before: but if it happen that the beast getteth loose when he feeleth the blowes, the Hunters must not start away, but the strongest of them to meet him with his spear, setting his body as we have formerly expressed, having an especiall eye to the beasts head, which way soever he windeth and turneth the same, for such is the nature of the Boar, sometimes he snatcheth the spear out of the Hunters hands, or else recoyleth the force back again upon the smiter, for by both these means the Hunter is overcome and overthrown: Whensoever this hapneth, then is there but one means to save the Hunters life, which is this; another of his companions must come and charge the Boar, making as though he would wound him with his dart, but not casting it for fear of hurting the Hunter under his feet. When the Boar seeth this, he forsaketh the first man, and rusheth upon the second, who must look to defend himself with all dexterity, composing his body, and ordering his weapons, according to artificiall Boar-hunting, and in the mean season the vanquished Hunter must arise again, taking fresh hold on his spear, and with all courage setting upon the adversary beast, to wound him either in the shoulders or in the head, for it is no credit to escape with life, except he kill and overcome the Boar.

When he feeleth himself thus wounded that he cannot live, if it were not for the crosses and forks upon the Boar-spear, he would presse in upon the vanquisher to take revenge for his death: For so great is the servent wrath of this beast, that he spareth not to kill and wound, although he feel upon him the pangs of death: and what place soever he biteth either upon Dog or man, the heat of his teeth inflicteth a dangerous inflaming wound: and for this cause if he doth but touch the hair of Dogs, he burneth it off: but if it be a female that is raised, (for there is as great a rage in females as in males, though not so great power) then must the Hunter take heed he never fall to the ground, for as the male hurteth not but when a man standeth or lieth high, so the female hurteth not but when a man falleth or lyeth low: therefore if the Hunter chance to fall, he must raise himself with all speed, using no lesse dexterity and courage against the female, then he doth against the male.

There is also another manner of hunting wilde Swine, which is this. First of all they set up their nets in all passages, through which it is likely the beast will go, then do the men and Dogs with a gallant crie, filling the woods and fields, raise them out of their lodgings. In the mean season setting some valiant Hunters to keep the nets. When the beast perceiveth that he is sought after, up he starteth, looking about him like an evil spirit, where he may devour, but being terrified with the crie of men, and pursued by a multitude of greedy Dogs, forth he runneth in some of his usuall wayes, carefully looking behinde him, to avoid the train that followeth, untill he fall fast enclosed into the Hunters nets, then cometh the keeper of the nets, and woundeth him with his Boar-spear, as I said before: but if it fortune that he fall out of the nets, or never cometh to them, then must they prosecute him, both men and Dogs, untill they have wearied him, for such is the heat of his body, that he cannot long stand, and although he shall lodge himself in some Marish or Woods where the Hunters can have no use of their nets, yet must they not be afraid to approach unto him, and with such hunting instruments as they have, shew the magnitude and courage of their minde, by attaining their game by the strength of hand, when they are deprived from the help of Art: And to conclude, the same devises, diligence, labour, prosecution, and observations, are to be used in the hunting of the Boar, which are prescribed for the hunting of the Hart. It seldome falleth out that the Pigs of wilde Swine are taken, for they run and hide themselves among the leaves, and in the Woods, seldome parting from their parents untill their death, and as we have said already, the dams fight for their young ones most irefully. For it is not with these as with the vulgar Swine, that they beat away their young ones from following them, but because they conceive but seldome, they suffer their Pigs to accompany them a whole year: And thus much for the violent and forcible hunting of Boars. Now followeth the artificiall devises and policies which have been invented for the same purpose, whereby to take them without pursuit of Dogs: And first of all, the same engins which we have prescribed for taking of the Hart, are also in use for taking of the Boar, and *Petrus Crescentiensis* sheweth how a multitude of Boars may be taken together in one ditch; and first of all (he saith) neer to the place where Boars make their abode, they sow in some plain fields a kinde of fattening corn which Hogs love, and about that field they make a high and strong hedge, of the boughs of trees in the one part, whereof they leave a great gap, yet not altogether down to the ground. At the time of the year when the grain waxeth ripe, the Boars gather thereinto in great number: now right over against the said gap on the other side, there is another little low place of the hedge left, over which the Swine may easily leap. When the watch-man hunter seeth the field full, he cometh alone and unarmed to the first gap, and therein he standeth lewring and making a terrible noise to affright the Swine; now on the other side where the hedge is left low, there is also made a vast and deep ditch, the Hogs being terrified with the presence and noise of the Hunter, and seeing him stand in the place of their entrance; run to and fro to seek another escape, and finding none, but that low place of the hedge before the ditch, over they presse headlong as fast as they can, and so fall into the trench one upon another. Again, neer *Rome* there be divers that watch in the woods, and in the night time when the Moon shineth, set up certain Iron instruments through which there glistereth fire, unto which the Boars and wilde Swine will approach, or at the leastwise stand still and gaze upon them, and in the mean season the Hunters which stand in secret come and kill them with their darts: and to conclude, in *Armenia*, there are certain black venomous fishes, which the inhabitants take and mixe with meal and cast them abroad where Boars and wilde Swine did haunt, by eating whereof as also Hemlock and Henbane, they are quickly poisoned, and die: And thus much we have shewed out of *Xenophon* and other Authors, the severall wayes of hunting and taking of wilde Swine.

Politick means
to take Boars.

Now so far as much as the hunting thereof hath been often shewed to be dangerous both to men and Dogs, I will a little adde some histories concerning the death of them, which have been killed by Boars. For if that cometh not to passe which *Martiall* writeth;

Men that have
perished by
Boars in hunt-
ing.

*Thusce glandis Aper populator, & ilice multa,
Impiger Etrole fama secunda fere,
Quem meus intravit splendenti cuspide culter,
Præda jaces nostris invidiosa focis.*

Ifay, if the Boar be not killed by men, the Hunter is constrained many times to say with *Lydia* in the same Poet,

Fulmineo spumantis apri sum dente perempta.

Apuleius reporteth of one *Leopolemus*, that he loved the wife of *Thrasillus*; now to the intent that he might possesse her, he took her husband abroad with him to the hunting of a Boar, that under colour thereof he might kill him, and say the Boar slew him: Being abroad, the nets raised, and the Dogs loosed, there appeared unto them a Boar of a monstrous shape, wonderfull fat, with horrible hair, a skin set with standing bristles, rough upon the back, and his mouth continually foaming out abundance of froath, and the sound of his gnashing teeth ringing like the ratling of armor; having fire-burning eyes, a despiteful look, a violent force, and every way fervent: he slew the noblest Dogs which first set upon him, not staying till they came to him, but he sought out for them, breaking their cheeks

and legs asunder, even as a Dog will do some small bones; then he trod down the nets in disdain, passing by them that offered him the first encounter, and yet remembering his own vigor and strength, turning back again upon them, first overthrowing them, and grinding them betwixt his teeth like Apples, at length he meets with *Thrasillus*, and first teareth his cloth from his back, and then likewise tore his body in pieces, and this man I remember in the first place to be killed by this monster-Boar, whether he was a beast or a man. *Martiall* in his book of spectacles remembreth a story of *Diana*, who killing of a wilde Sow with Pig, the young ones leaped out of her belly, and this I thought good to remember here, although it be somewhat out of place;

*Inter Casarea discrimina seva Dianæ,
Fixisset gravidam cum levis hasta suam;
Exiliit partus misera de vulnere matris,
O Lucina ferox, hoc peperisse fuit?*

Anceus the father of *Agapenor* was killed by the *Calidonian* Boar, as we have said already. *Carmion* was slain by a Boar in the mountain *Tmolus*. There was one *Attas* a Syrian, and another an *Arcadian*, and both these were slain by Boars, as *Plutarch* writeth in the life of *Sertorius*. It is reported of one *Attes* a Phrygian, that as he kept his Sheep he did continually sing songs in commendation of the mother of the Gods, for which cause she loved him, honoured him, and often appeared unto him; whereupon *Jupiter* fell to be offended, and therefore sent a Boar to kill *Attes*. *Rea* after his death lamented him, and caused him to be buried honourably. The *Phrygians* in his remembrance did every year in the spring time lament and bewail him.

Adonis also, the Leman of *Venus*, is fained of the Poets to be killed by a Boar: and yet *Macrobius* saith, that it is an allegory of the Sun and the Winter, for *Adonis* signifieth the Sun, and the Boar the Winter: for as the Boar is a rough and sharp beast, living in moyst cold, and places covered with frost, and doth properly live upon winter fruits, as Acorns, so he is the fitter emblem for Winter, that is, a devourer of the Suns heat and warmth, both which fall away by death from all living creatures. When *Tenthra* a King of *Mysia* went to hunt in the mountain *Thrasillus*, he started a huge great Boar, which he and his guard followed and hunted unto the Temple of *Diana Orthosia*, whereinto the Boar entred for sanctuary.

The poor beast seeing the Hunters at hand, cryed out with the voice of a man: *Parce & rex pecudæ Deæ*, O King spare *Dianaes* Boar: But the king being nothing at all moved therewith, slew him in the Temple; which wickednesse the Goddess could not endure, and therefore first of all she restored the Boar to life, and afterwards afflicted the King with madnesse, who was therefore driven into the Mountains, and there lived like a beast.

When *Lysippe* his mother knew hereof, she went to him into the Woods, and carryed *Cyranine* the Prophet, who instructed him to pacifie the Gods by a sacrifice of Oxen, which when it was performed, the King recovered again his right minde; and so his mother in remembrance thereof, built there a Chappell to *Diana*, and set thereupon the picture of a Boar in Gold, with a mans mouth. There was also a custome in ancient time for champions and their fathers brethren and kindred to swear by a Boar cut in pieces. And thus much for the naturall and morall story of the Boar, which I will conclude with those verses of *Horace*, describing the prodigious habitation of Boars in the waters, and *Dolphins* in the Woods, as if one had changed with another;

*Delphinum silvis appingit, fluctibus aprum,
Qui variare cupit rem prodigialiter unam.*

The Medicines of the wilde Swine.

There are declared a M. things concerning the remedies of Goats, but a larger and more ample power shal be shewn of a wilde beast of the same kinde. Also the same regard shall be had concerning the remedies of a tame Sow and a wilde Boar, yea, of all other tame and wilde beasts, that is, that the same or things like to either of them may be ended, differing only according to more or lesse, because the same parts of wilde beasts living, are lesse moyst and cold then those that are tame. That which we repeat here concerning the common remedies of a Boar and Sow tamed, in some of the parts of them, to wit, the blood, the brain, the cheek-bone, the lungs or lights, the liver, the gall, the ankle bone, the hoof, the dung, and urine, is not in the Sow repeated before.

The brains of a Boar taken with blood, is very much commended against the bitings of Serpents. Again, the brains and blood of a Boar, doth help those that fear the coming of Carbuncles. The lard and fat of a Boar being sodden and bound fast together, doth with a wonderfull celerity make firm those bones that are broken. The fat of a Boar mingled with Hony and Rozin, is very much commended against the bitings of Serpents.

The fat of a wilde Boar mingled with the fat of the lungs or lights, doth very much profit those which have their feet broken or bruised by any mischance. The fat of a Boar being mixed with Oyl of Roses, is very good for those that are troubled with blisters or pusses, it being anointed thereupon. The brains of a Boar is very profitable for Carbuncles, and the pains of a mans yard. The brains of a Boar being bruised very small in Hony, and put thereto, doth wonder-

wonderfully make it sound. The brains of a Boar sodden and drunk in wine, doth ease all the pains and griefs. There are more things spoken concerning the remedies of the brain in the medicines of the Sow. The ashes of the cheek-bone of a Boar doth cure those ulcers which do encrease bigger by little and little.

Also the same thing doth make firm those bones that are broken. The lungs or lights of a Boar mixed with hony, and put upon the feet after the manner of a mollifying emplaister, they shall be freed from all exulcerations. *Dioscorides* also doth commend the lungs or lights of Sows, Lambs, and Bears. The liver of a Boar being new killed and scorched by a fire, and beaten to powder, and so being taken in wine, is an especiall remedy against the bitings of Serpents and Dogs. The liver of a Boar being old, and drunken in wine with Rue, is very much commended against the bitings of Serpents. The Fibres of the liver of a Boar, and those especially which are neere to the entrance of the gall and liver, being taken in Vinegar or rather wine, is much profitable against the bitings of Serpents.

The liver of a Boar is good to revive those whose spirits are drowfie. The liver of a Boar doth much profit, being stopped in the ears, for those that are troubled with Apostumes or any running sores therein. The liver of a Boar being new killed and drunken in wine is very effectually against the loosenesse of the belly. There are certain little stones in the liver of a Boar, as there is in a common or vulgar Sow, or at leastwise like unto little stones, and they are also white, which being sodden and taken in wine, are very effectually against the disease of the Stone. Thou shalt read many more things concerning the remedies of the liver of a Boar in the medicines of the Sow. The gall of a Boar is very much commended for Wennes or swellings in the neck.

The gall of a Boar being mingled with Rosin and Wax, doth cure those ulcers which do encrease bigger and bigger. The gall of a Boar, and Lambs milk, being mingled together, and dropped in the ears, is very profitable for all pains therein. The body of a man being anointed with the gall of a Boar, doth stirre him up to carnal copulation. The gall of a Boar being mingled with sewer and applyed upon every joynt of the body, doth immediately cure all pains of the Gowt. We have declared also many things in the medicines of the Sow, concerning the remedies of the gall of a Boar. The stones of a Boar being eaten is very good against the Falling sicknesse, or the stones of a Boar being taken in Mares milk or water, is also very effectual against the same disease. The hoofs of a Boar being burned to ashes, and sprinkled upon drink, and so taken, doth very much help those that cannot easily make water.

The hooves of a Boar being burned and beaten to powder, and given in drink, is very effectual against the stopping of urine. The hooves of a Boar or Sow being burned, and given to drink in wine, is very much commended for those that cannot hold their urine in their sleep. The dung of a Sow (which liveth in the Woods) being dried and drunk in water and wine, doth stay the voiding of blood, and doth ease also old pains of the sides: And again being taken in Vinegar, it doth stay all ruptures and convulsions, and also being mingled with the syrup of Roses, it doth remedy or help those places which are out of joynt.

The dung of a Boar being new made, and hot, is a speciall remedy against the flux of blood which issueth forth of the Nostrils. The dung of a Boar being mingled in wine, and applyed after the form of an emplaister, do presently draw away and make sound any thing which cleaveth to the body. It being also bruised and sodden with hony, and afterwards kneaded like Dough, and so applyed to the joynts, doth ease all pains that arise therein.

An emplaister made of the dung of a Boar, is very profitable against all venemous bitings, for it draweth forth the poyson. All other ulcers are filled up and cleansed with the dung of a Boar, except those which arise in the thighs. The dung of a Boar dried and beaten to powder, and sprinkled upon drink, doth cure all pains of the sides. Again, it being dried and beaten to powder, and administred in wine, doth not only cure the pain in the Spleen, but also the pain in the kidneys. The dung of a Boar being burned to the ashes, and given to drink in wine, doth ease all pains in the knees and legs. The dung of a Boar new made and anoynted upon those places that are out of joynt, is very profitable for them. The dung of a field-boar mixed with brimstone, and taken in wine, and strained Pitch, is very commendable for pains in the hips. The dung of a Boar being mingled with wine, and afterwards strained, and given to drink, about the measure of two little cupfuls at a time, doth speedily help those which are troubled with the Sciatica.

It also being sodden in Vinegar and Hony, doth mitigate all pains that rise in the feet or ankles. The dung of a Boar burned to ashes, and sprinkled upon wine luke-warm, and so given to drink, doth help all those that are troubled with the bloody-flux. The rest of the remedies which concern the dung of a Boar, thou shalt find in the medicines of the Sow. The urine of a Boar mingled with Hony and water, and so taken, is a speciall remedy for those that are troubled with the Falling sicknesse.

Again, the urine of a Boar being taken in sweet Vinegar, doth drive out those things which are dried in the bladder. The urine of a Boar being kept in a glasse, doth cure all diseases and pains in the ears, but it is especially profitable for those which cannot hear. The urine of a Boar being kept in a glasse, and made luke-warm, and dropped into the ears, is a speciall remedy for all Apostumes that are therein. The urine of a Boar which is kept long, is far more profitable, if so be that it be kept in a vessel of glasse. Again, the urine of a Boar, being dried in smok, and moistened with Hony, and so powred into the ears, doth cure the deafnesse of the ears.

The urine of a Boar, and Oyl of Cypresse, each of them being equally mingled, and made luke-warm, is also good for the same disease.

Sextus.

The urine of a wilde Boar also is of the same force and vertue. The bladder of a wilde Boar doth stay the incontineny of the urine, if it be eaten, roasted, or boyled. The bladder of a Goat being burned to powder, and given to drink in water and wine, is very good and profitable for those which cannot make water easily. The urine of a Boar being drunken, doth help those that are troubled with the stone in the bladder, but it is more effectuell if it be first of all mingled with the dung. The Bladder of a Boar moistened with the urine, and hung up untill the waterish humor cometh forth, and then boyled and given to those which are truculent with the Strangury, is very profitable and good for them.

The Bladder of a Boar being dried and given in drink, is very profitable for those which are troubled with pains in the bladder and wringings of the guts. The urine of a tame Boar hung up in the smoak in the bladder of a Sow, and mixed with drink, is very profitable for those that are troubled with the Strangury. The urine of a Boar, or at least wise the bladder being given in drink, hath cured those which have been troubled with the Hydropsy as some do say. The urine of a Boar being taken in drink, is very good for those that are troubled with the Stone.

Marcellus.

Now forasmuch also as Hunters are hurt by some, I thought it good to set down what remedies is fit for them. Therefore the wounds made of them are dangerous, because they are not only deep, but also large and great, and it is also impossible to bring them to a glutination with medicines, for the lips of the wounds which is made by contusion, are cut off and burned. They use a mutuall gnashing and striking of their teeth together, as it were against a whetstone, to take revenge upon those which pursue and follow them. Therefore they cause a certain scab to grow upon the lips of the wound, wherefore it is meet to use a suppurative and not a glutinative manner of cure in them. It is meet to use in running and moist ulcers, not hot things, but cold, both in Winter and Summer. For it is an easie matter for a Boar to hurt a Horse in the inside of his knee, in the time of his hunting, which doth breed to a waterish ulcer, and there doth also follow a swelling. To this cold things are to be applyed, and it is to be cured by anointing it with a medicine which is called *Diachalcantes*, or the head of a Dog, being burned about the tongue, and beaten into powder, and so to be applyed after the manner of a Cataplasme. And thus much concerning the medicines of the Boar.

Of the *TATU*s, or *Guinean* Beast.

THis is a four-footed strange Beast, which *Bellonius* saith, he found in *Turcbia*, among the Mountebanks and Apothecaries. It is brought for the most part out of the new-found world, and out of *Guinea*, and therefore may be safely conveyed into these parts, because it is naturally covered with a hard shell, divided and interlined like the fins of fishes, outwardly seeming buckled to the back like Coat-armor, within which the beast draweth up his body, as a Hedge-hog doth within his prickled skin; and therefore I take it to be a *Brasilian* Hedge-hog. It is not much greater then a little Pig, and by the snout, ears, legs, and feet thereof, it seemeth to be of that kind, saving that the snout is a little broader, and shorter then a Pigs, and the tail very long like a Lizards or Rats, and the same covered all over with a crust or shell. The gaping of the mouth is wider then a Swines; and one of these being brought into *France*, did live upon the eating of seeds, and fruits of the Gardens, but it appeareth by that picture, or rather the skin stuffed, which *Adrianus Marcellus* the Apothecary

the cary of *Ulmes*, sent unto *Gesner*, from whence this picture here expressed was taken, that the feet thereof are not cloven into two parts like Swine, but rather into many like Dogs, for upon the hinder feet there are five toes, and upon the fore feet four, whereof two are so small that they are scarce visible. The breadth of that same skin was about seven fingers, and the length of it two spans, the shell or crust upon the back of it did not reach down unto the rump or tail, but broke off as it were upon the hips, some four fingers from the tail. The Merchants as I have heard, and Citizens of London keep of these with their Garden worms.

Of the *AIOCHTOCHTH*.

There is another beast that may be compared to this, (whereof *Cardanus* writeth) and he calleth the name of it *Aiotochth*. It is a strange creature found in *Hispania Nova*, neer the River *Alvaradus*, being not greater then a Cat, having the bill or snout of a Mallard, the feet of a Hedge-hog, and a very long neck. It is covered all over with a shell like the trappings of a Horse divided as in a Lobster, and not continued as in an Oyster; and so covered herewith, that neither the neck nor head appear plainly, but only the ears; and the *Spaniards* for this cause call it *Armatto*, and *Contexto*: There be some do affirm that it hath a voice like a Swine, but the feet thereof are not indeed so cloven, that they remain unequal, but are like to a Horses, I mean the severall cloves. There are of these as I have heard to be seen in Gardens in London, which are kept to destroy the Garden worms.

Of the TIGER.

THE word *Tigris* is an *Armenian* word, which signifieth both a swift Arrow, and a great River, and it should seem that the name of the River *Tigris* was therefore so called, because of the swiftnesse thereof; and it seemeth to be derived from the *Hebrew* word *Gir* and *Griera*, which signifie a Dart. *Munster* also in his Dictionary of three languages, doth interpret *Tigros* for a Tiger. In the 4. of *Job* the word *Laisk* by the *Septuagints* is translated *Murmelion*, and by *S. Jerom*, *Tigris*. The *Jewes* call the same beast *Phoradei*, which the *Grecians* call *Tigris*; and all the people of *Europe*, to whom this beast is a stranger, call it after the *Greek* name, as the *Italians*, *Tigre* and *Tigra*, the *French* *Un Tigre*, and the *Germans* *Tigertier*.

Now concerning the name of the River *Tigris*, which because it joyneth in affinity with this beast, *Tigris*.

The names of
Tigers.

Of the River
beast, *Tigris*.

beast, it is necessary that I should say something in this place, because that we finde in holy Scripture that it is one of the four Rivers which runneth through Paradise; which according to *Josephus*, maketh many compasses and windings in the world, and at last faileth into the Red sea; and they further say, that there is no River of the world that runneth so swiftly as this: And therefore *Tigris* vocatur, id est *Sagitta*, quod *jaculum* vel *sagittam* velocitate aequet: That is, it is called a Tiger, a Dart, or Arrow, because it runneth as fast as an Arrow flyeth: and for this cause we finde in *The crimus*, that a River in *Sicilia* was called *Acis*, that is, *Spiculum*, a Dart.

Some of the Poets do derive the name of the River *Tigris* from this Tiger the wilde beast, whereupon these Histories are told. They say, that when *Bacchus* was distracted, and put out of his wits by *Juno*, as he wandered to and fro in the world, he came to the River *Sylax* (which was the first name of this water) and being there desirous to pass over, but found no means to accomplish it, *Jupiter* in commiseration of his estate did send unto him a Tiger, who did willingly take him upon his back, and carry him over; Afterward *Bacchus* called that swift River by the name of that swift beast, Tiger. Others do report the tale thus. When *Dionysius* fell in love with the Nymph *Alpheisibaea*, whom by no means either by promises, intreaties or rewards he could allure unto him, at last he turned himself into a Tiger, and so oppressing the Nymph through fear, did carry her over that River, and there begot upon her his son *Medus*, who when he came to age, remembering the fact of his father and mother, called the name of the River *Tigris*, because of his Fathers transformation. But to leave this matter as not worth the standing upon, whether the River was called after the name of the beast, or the beast after the name of the River, or rather both of them after the name of the dart or swift Arrow, we will proceed to the natural story of the Tiger, commending that to the Readers judgement which is essential to this story, containing in it necessary learning, and garnished with all probability.

Countries
breeding Ti-
gers.

First of all therefore, Tigers like Lyons are bred in the East, South, and hot Countries, because their generation desireth abundance of heat, such as are in *India*, and near the Red sea, and the people called *Asange*, or *Besingi*, which dwell beyond the River *Ganges*, are much troubled and annoyed with Tigers. Likewise the *Prasians*, the *Hyrceanians*, and the *Armenians*. *Apollonius* with his companions travelling betwixt *Hiphasis* and *Ganges*, saw many Tigers. In *Berigaza* and *Dachinabades*, which is beyond the *Mediterranean* Region of the East, there are abundance of Tigers, and all other wilde beasts, as *Arrianus* writeth. In *Hispaniola*, *Ciamba*, and *Guanassa*, *Peter Martyr* saith, by the relation of a *Spaniard* inhabiting there, that there are many Lyons and Tigers.

Quantity of
Tigers.

The *Indians* say, that a Tiger is bigger then the greatest Horse, and that for strength and swiftness they excel all other beasts. There be some which have taken them for Tigers, which are called *Thoes*, greater then Lyons, and lesser then the *Indian* Tigers, as it were twice so big as Lyons; but I rather agree to the relation of *Arrianus*, *Strabo*, *Megasthenes*, and *Mearcus*; for they say that a Tiger feareth not an Elephant, and that one of them hath been seen to fly upon the head of an Elephant, and devour it: and that among the *Prasians*, when four men led one of these Tigers tamed, by the way they met with a Mule, and that the Tiger took the Mule by the hinder leg, drawing him after him in his teeth, notwithstanding all the force of the Mule and his four leaders; which is unto me a sufficient argument not only of his strength, but of his stature also: and if any have been seen of lesser stature, they have been mistaken either for the *Linxes*, or for the *Thoes*.

The several
parts.

The similitude of the body of this beast is like to a *Lionesses*, for so is the face and the mouth; the lower part of the fore-head, and gnashing or grinning teeth, and all kinde of creatures which are ravening, are footed like a Cat, their neck short, and their skins full of spots, not round like a Panther, nor yet divers coloured, but altogether of one colour and square, and sometimes long, and therefore this beast and the Panther are of singular note among all the four-footed; yet *Solinus* and *Seneca* seem to be of opinion that their spots are sometimes of divers colours, both yellow and black, and those long like rods in these sayings:

Tibi dant varia pectora Tigres.

And again:

Uera virgata fere Caspie.

And *Silius* saith:

Corpore virgato Tigris.

Oppianus.

It were needless to speak of their crooked claws, their sharp teeth, and divided feet, their long tail, agility of body, and wildeness of nature which getteth all their food by hunting. It hath been falsely believed, that all Tigers be females, and that there are no males among them, and that they engender in copulation with the winde; whereupon *Camerarius* made this witty riddle in his Rhetorical exercises:

*A fluvio dicor, fluuius vel dicitur ex me,
Junctaq; sum vento, vento velocior ipso,
Et mihi dat ventus natos, nec quero maritos.*

The Epithets:

The Epithets of this beasts are these: *Armenian* Tigers, sharp, *Ganietican*, *Hyrceanian*, fierce, cruel,

cruel, and wicked, untamed, spotted, divers coloured, straked, bitter, ravenous, *African*, greedy, *Caspian*, *Carcesian*, *Caucasean*, *Indian*, *Parthian*, *Marsian*, straight-footed, mad, stiffe, fearful, strong, foaming, and violent, with many such others, as are easie to be found in every Author. The voice of this beast is called *Ranking*, according to this verse:

Tigrides indomita rancant, rugiantq; Leones.

Now because that they are strangers in *Europe*, as we have said already, never breeding in that part of the world, and as seldom seen, we must be constrained to make but a short story of it, because there are not many divers things concerning the nature of it, and in the Physick none at all. For the manner of their food, they prey upon all the greatest beasts, and seldom upon the smaller, as Oxen, Harts, and Sheep, but Hares and Conies they let alone. Their food.

It is reported by *Plutarch*, of a tame Tiger that was brought up with a Kid, the said Kid was killed and laid before him to eat, but he refused it two days together, and the third day oppressed with extremity of hunger, by her ranking and crying voice she made signes to her Keeper for other meat, who cast unto her a cat, which presently it pulled in pieces and devoured it. The like story unto this we have shewed already in the Panther. Generally the nature of this beast, is according to the Epithites of it, sharp, untamed, cruel, and ravenous, never so tamed, but sometimes they return to their former natures; yet the *Indians* do every year give unto their King tamed Tigers and Panthers, and so it cometh to pass, that sometimes the Tiger kisseth his Keeper as *Seneca* writeth. A history.

In the time of their lust they are very raging and furious, according to these Verses of *Virgil*:

*Per sylvas tum saevus aper, tum pessima Tigris,
Heu male cum Libya solis erratur in agris.*

They ingender as Lions do, and therefore I marvel how the fable first came up, that they were all females & had no males among them, and that the females conceived with young by the West wind. We have shewed already in the story of the Dogs, that the *Indian* Dog is engendered of a Tiger and a Dog, and so also the *Hircanian* Dogs: Whereby it is apparent, that they do not only conceive among themselves, but also in a mingled race. The male is seldom taken, because at the sight of a man he runneth away, and leaveth the female alone with her young ones, for he hath no care of the whelps, and for this occasion I think that the fables first came up that there were no males among the Tigers. The female bringeth forth many at once like a Bitch, which she nourisheth in her den very carefully, loving them, and defending them like a Lioness from the Hunters, whereby she is many times ensnared and taken. It is repoted by *Aelianus*, that when they hear the sound of Bells and Timbrels, they grow into such a rage and madness, that they tear their own flesh from their backs. Their copulation and generation.

For the taking of Tigers, the *Indians* near the River *Ganges* have a certain herb growing like *Bugloss*, which they take and press the juyce out of it, this they preserve beside them, and in still silent nights, they pour the same down at the mouth of the Tigers den, by vertue whereof it is said, the Tigers are continually enclosed, not daring to come out over it through some secret opposition; are not, but famish and dye, howling in their caves through intolerable hunger. So great is the swiftness of this beast, as we have shewed already, that some have dreamed it was conceived by the wind, as the swiftest Horses, and namely the Horses of *Dardanus*, are likewise fabled to be begotten of the Northern winde, so the Tigers by the West winde. The taking and killing of Tigers. Plutarch. Calisthenes.

There are they are never taken but in defence of their young ones, neither is there any beast that liveth upon preying so swift as they: *Solan Tigrim Indis insuperabilem esse dicunt, quoniam fugiendi celeritate, quae ventos aequare dicitur, e conspectu aufugit.* Only the Tiger, the *Indians* say can never be conquered, because when he is hunted he runneth away out of sight as fast as the winde. For this cause they diligently seek out the caves and dens of the Tigers where their young ones are lodged, and then upon some swift Horses they take and carry them away: when the female Tiger returneth and findeth her den empty, in rage she followeth after them by the foot, whom she quickly overtaketh, by reason of her celerity. Philostratus.

The Hunter seeing her at hand, casteth down one of her Whelps: the distressed angry beast knowing that she can carry but one at once, first taketh up that in her mouth, without setting upon the Hunter, contented with that one, returneth with it to her lodging; having laid it up safe, back again she returned like the wind, to pursue the Hunter for the residue, who must likewise set her down another, if he have not got into his ship, for except the hunter be near the water side, and have a ship ready, she will fetch them all from him, one by one, or else it will cost him his life: therefore that enterprise is undertaken in vain upon the swiftest Horses in the world, except the waters come betwixt the Hunter and the Tiger: And the manner of this beast is, when she seeth that her young ones are shipped away, and she for ever deprived of seeing or having them again, she maketh so great lamentation upon the Sea shore howling, braying and racking, that many times she dyeth in the same place, but if she recover all her young ones again from the Hunters, she departeth with unspeakable joy, without taking any revenge for their offered injury.

For this occasion, the Hunters do devise certain round spears of glass, wherein they picture their young ones very apparent to be seen by the dam, one of these they cast down before her at her approach, she looking upon it, is deluded, and thinketh that her young ones are inclosed therein, and the rather, because through the roundness thereof it is apt to rowl and stir at every touch, this she driveth along backwards to her den, and there breaketh it with her feet & nails, and so seeing she that is deceived, returneth back again after the Hunters for her true Whelps; whilest they in the mean season are safely harbored in some house, or else gone on some shipboard. It is reported by *Johannes Ledesma a Spaniard*, this excellent story of a male and female Tiger. In the Island *Dariene*, standing in the Occidental Ocean of the New-found World, some eight days sail from *Hispaniola*, it fell out (saith he) in the year of our Lord 1514. that the said Island was annoyed with two Tigers, a male and a female, for half a year together, so that there was no night free, but they lost some of their cattel, either a Horse, or an Ox, or a Cow, or a Mare, or a Hog, and Swine, and in the time that their young ones did suck, it was not safe for men to go abroad in the day time, much less in the night; but they devoured a man, if they did not first of all meet with another beast: At length the Countrey thus oppressed, necessity constrained them to devise a remedy, and to try some means to mitigate their calamities, wherefore they sought out all the ways and paths of the Tigers to and from their dens, that so they might take vengeance upon the raveners for the loss of so much blood: At the last they found a common beaten way, this they cut afunder and digged deep into a large dungeon: having made the dungeon, they strewed upon the top of it little sticks and leaves, so covering it to dissemble that which was underneath, then came the heedless Tiger that way, and fell down into the ditch upon such sharp Iron flakes, and pointed instruments as they had there set, with his roaring he filled all the places thereabout, and the Mountain sounded with the echo of his roaring voice.

The people came upon him, and casting great and huge stones upon his back killed him, but first of all, he broke into a thousand pieces, both the stones, Weapons, and Spears, that were cast against him; and so great was his fury, that when he was half dead, and the blood run out of his body, he terrified the standers by beholding and looking upon him. The male Tiger being thus killed, they followed the footsteps into the Mountains where the female was lodged, and there in her absence took away two of her young ones, yet afterward changing their mindes, carryed them back again, putting upon them two brazen collers and chains, and making them fast in the same den, that so when they had sucked till they were greater, they might be with pleasure and safety conveyed into Spain. At last when the time appointed was come that they should be taken forth to be sent away, the people went to the den, wherein they found neither young nor old, but their collers fastened in the same place that they had left them, whereby it was conceived that the envious mother had killed and torn her young ones in pieces, rather then they should fall into the hands of the hunters; so that this beastly love of hers, ended in horrible cruelty, and for this occasion is it that *Medea* thus speaketh in *Ovid*;

*Hoc ego si patiar, tum me de Tigride natam,
Tum ferrum & scopulos gestare in corde videbor.*

And for this cause it was faigned, not without singular wit by the Poets, that such persons, who are full of the fulness of their wrath in extremity of revenge, are transformed into Tigers. The Poet compareth the wrath of *Perseus* standing betwixt two advantages unto a Tiger betwixt herds of cattel, being in doubt whether of them to devour, in this manner;

*Tigris ut auditis diversa valle duorum,
Extimulata fame, mugitibus armentorum,
Nescit utro potius ruat, & ruere ardet utroq;
Sic dubius Perseus dextra levare feratur.*

In ancient times these Tigers were dedicated to *Bacchus*, as all spotted beasts were, and that the said Tigers did draw his Charriot whilest he did hold the reins; and therefore *Ovid* saith thus;

*Bacchus in curru quem summum texerat uvis,
Tigribus adjunctis aurea lora dabat.*

And *Horace* in this manner;

*Hac te merentem Bacche pater tuæ
Vexere Tigres indocili jugum collo trabentes.*

Tigers, notwithstanding their great mindes and untamable wildeness, have been taken, and brought in publike spectacle by men, and the first of all that ever brought them to Rome, was *Augustus*, when *Quintus Tubero*, and *Fabius Maximus* were Consuls, at the dedication of the Theater of *Marcellus*; the which Tigers were sent unto him out of *India*, for presents (as *Dion* writeth.) Afterwards *Claudius* presented four to the people; and lastly *Heliogabalus* caused his chariots to be drawn with Tigers, whereunto *Martial* alluded when he said;

*Piſto quod juga, delicata collo,
Pardus ſuſtinet, improbaq; Tigres;
Indulgent patientiam flagello.*

Ledeſma of whom we ſpoke before affirmeth, that he did eat of the Tigers fleſh that was taken in the ditch in the *Iſland Dariene*, and that the fleſh thereof was nothing inferior to the fleſh of an Ox, but the *Indians* are forbidden by the laws of their Countrey, to eat any part of the Tigers fleſh, except the hanches. And thus I will conclude this ſtory of the Tiger, with the Epigram that *Martial* made of a Tiger, devouring of a Lion.

Eating of Tigers.

*Lambere ſecuri dextram & conſueta magiſtri,
Tibris ab Hyrcano gloria rara iugo,
Sava ferum rabido laceravit dente Leonem:*

*Res nova, non ullis cognita temporibus.
Auſa eſt tale nihil ſylvæ dum vixit in altis:
Poſtquam inter nos eſt, pluſferitatis habet.*

Of the UNICORN.

WE are now come to the hiſtory of a Beaſt, whereof divers people in every age of the world have made great queſtion, becauſe of the rare vertues thereof; therefore it behoveth us to uſe ſome diligence in comparing together the ſeveral teſtimonies that are ſpoken of this beaſt, for the better ſatiſfaction of ſuch as are now alive, and clearing of the point for them that ſhall be born hereafter, whether there be a Unicorn; for that is the main queſtion to be reſolved.

Now the vertues of the horn, of which we will make a particular diſcourſe by it ſelf, have been the occaſion of this queſtion, and that which doth give the moſt evident teſtimony unto all men that have ever ſeen it or uſed it, hath bred all the contention; and if there had not been diſcloſed in it any extraordinary powers and vertues, we ſhould as eaſily believe that there was a Unicorn in the world, as we do believe there is an Elephant although not bred in *Europe*. To begin therefore with this diſcourſe, by the Unicorn we do underſtand a peculiar beaſt, which hath naturally but one horn, and that a very rich one, that groweth out of the middle of the forehead, for we have ſhewed in other parts of the hiſtory, that there are divers beaſts, that have but one horn, and namely ſome Oxen in *India* have but one horn, and ſome have three, and whole hoofs. Likewise the Bulls of *Aonia*, are ſaid to have whole hoofs and one horn, growing out of the middle of their fore-heads.

Many beaſts with horns, improperly called Unicorns.
Solinus.
Ælianus.
Oppianus.

Likewiſe in the City *Zeila* of *Æthiopia*, there are Kine of a purple colour, as *Ludovius Romanus* writeth, which have but one horn growing out of their heads, and that turneth up towards their backs. *Cæſar* was of opinion that the Elk had but one horn, but we have ſhewed the contrary. It is ſaid that *Pericles* had a Ram with one horn, but that was bred by way of prodigy, and not naturally. *Simeon Sethi* writeth, that the Musk-cat hath alſo one horn growing out of the fore-head, but we have ſhewed already that no man is of that opinion beſide himſelf. *Ælianus* writeth, that there be Birds in *Æthiopia* having one horn on their fore-heads, and therefore are called *Unicornes*: and *Albertus* ſaith, there is a fiſh called *Monoceros*, and hath alſo one horn. Now our diſcourſe of the Unicorn is of none of theſe beaſts, for there is not any vertue attributed to their horns, and

Whether there
be any Uni-
corns in the
World.

and therefore the vulgar sort of Infidel people which scarcely believe any herb but such as they see in their own Gardens, or any beast but such as is in their own flocks, or any knowledge but such as is bred in their own brains, or any birds which are not hatched in their own nests, have never made question of these, but of the true Unicorn, whereof there were more proofs in the world, because of the nobleness of his horn, they have ever been in doubt: by which distraction it appeareth unto me that there is some secret enemy in the inward degenerate nature of man, which continually blindeth the eyes of God his people, from beholding and believing the greatness of God his works.

But to the purpose, that there is such a beast, the Scripture it self witnesseth, for David thus speaketh in the 92. Psalm: *Et erigetur cornu meum tanquam Monocerotis.* That is, my horn shall be lifted up like the horn of a Unicorn; whereupon all Divines that ever wrote, have not only collected that there is a Unicorn, but also affirm the similitude to be betwixt the Kingdom of David and the horn of the Unicorn, that as the horn of the Unicorn is wholesome to all beasts and creatures, so should the Kingdom of David be in the generation of Christ; And do we think that David would compare the virtue of his Kingdom, and the powerful redemption of the world unto a thing that is not, or is uncertain or fantastical, God forbid that ever any man should so despight the holy Ghost. For this cause also we read in *Suidas*, that good men which worship God and follow his laws are compared to Unicorns, whose greater parts as their whole bodies are unprofitable and untamable, yet their horn maketh them excellent: so in good men, although their fleshy parts be good for nothing, and fall down to the earth, yet their grace and piety exalteth their souls to the heavens.

The Hebrew
names in Scri-
pture prove
Unicorns.

We have shewed already in the story of the Rhinocerot, that *Reem* in Hebrew signifieth a Unicorn, although *Munster* be of another opinion, yet the Septuagints in the translation of Deut. 33. do translate it a Unicorn, for the Rhinocerot hath not one horn, but two. *Rabbi Solomon, David Kimhi*, and *Saadius* do always take *Reem* and *Karas* for a Unicorn, and they derive *Reem* from *Rom*, which signifieth *Altitudinem*, height, because the horn of the Unicorn is lifted up on high. Hereunto the *Arabians* agree, which call it *Barkeron*; and the *Persians*, *Bark*; the *Chaldeans*, *Remana*. In the 39. of Job, the Lord speaketh in this manner to Job: *Numquid acquiescet Monoceros ut serviat tibi, aut ut moretur juxta praecepta tua? Numquid ligabis Monocerotem fune suo pro sulco faciendo, aut complanabit glebas vallium post te?* That is to say, will the Unicorn rest and serve thee, or tarry beside thy cratches? Canst thou binde the Unicorn with a halter to thy plough to make furrows, or will he make plain the clots of the Vallies? Likewise in the prophesie of *Esa.* the 34. chap. and in many other places of Scripture, whereby God himself must needs be traduced, if there be no Unicorn in the world.

The kinds of
Unicorns.

Besides the *Arabians*, as *And Bellun* writeth, call this beast *Alcherceden*, and say that it hath one horn in the fore-head which is good against poysons. The *Grecians* call it *Monokeros*, from whence *Pliny* and all the ancient *Grammarians* do call it *Monoceros*, yet the divines both elder and later do name it by a more learned proper Latine word *Unicornis*. The *Italians*, *Alicorno*, *Unicorno*, *Liocorno*, *Leocorno*; the *French*, *Licorne*; the *Spaniards*, *Unicorno*; the *Germans*, *Einhorne*; and the *Illyrians*, *Gednorozecz*: And thus much for the name. All our *European Authors* which write of beasts, do make of the Unicorn divers kinds, especially *Pliny*, *Ludovicus Romanus*, *Paulus Venetus*, *Nicholaus Venetus*, *Aeneas Sylvius*, *Albertus Magnus*, out of whose words we must gather the best description that we can of the Unicorn. The *Arcean Indians* (saith *Pliny*) do hunt a certain wilde beast which is very curst, untamable, having one horn, which in the head resembleth a Hart, in the feet an Elephant, in the tail a Boar, and in the residue of the body a Horse; the horn he saith, is about two cubits long, and the voice like the lowing of an Ox, somewhat more shrill, and they deny that this beast is ever taken alive. *Aelianus* writeth hereof in this manner, there are (saith he) certain Mountains in the midst of *India*, unto the which the passage is very difficult, where are abundance of wilde beasts, and among other Unicorns, which the *Indians* call *Cartazonens*, who in their ripe age are as big as a Horse, and their mane and hairs are yellow, excelling in the celerity of their feet and bodies, having feet cloven like an Elephants, the tail of a Boar, and one black horn growing out betwixt their eye-brows, not smooth, but rough all over with wrinkles, and the same groweth to a most sharp point, these things (saith *Aelianus*) by comparing of whose words with *Pliny*, it is apparent they describe in these words but one and the same beast, and so also doth *Phyles*; whereby I gather, that it is no other beast then the wilde Ass, or at the least the wilde Ass cometh nearest to the Unicorn of all others, for they agree in these things; first, in that both of them have one horn in the middle of the fore-head; secondly, in that both of them are bred in *India*; thirdly, in that they are both about the bigness of a Horse; fourthly, in their celerity and solitary life; fifthly and lastly, in their exceeding strength and untamable natures; but herein they differ both in their feet and colours, for the feet of the wilde Asses are whole and not cloven like the Unicorns, and their colour white in their body, and purple on their head; and *Aelianus* saith, that the horn also differeth in colour from the Unicorns, for the middle of it is only black, the root of it white, and the top of it purple, which *Bellonius* doth interpret, that the superficies or upper face of the horn is all purple, the inner part white, and the inward part or middle black; but of this *Indian* wilde Ass we have spoken already, and therefore I will adde nothing in this place but the words of *Philostrophus* in the life of *Apollo*, who writeth in this manner;

Countries of
Unicorns.

There

There are many wilde Asses which are taken in the Fens, near the River *Hipbafis*, in whose forehead there is one horn, wherewith they fight like Bulls, and the *Indians* of that horn make pots, affirming that whosoever drinketh in one of those pots, shall never take disease that day, and if they be wounded, shall feel no pain, or safely pass through the fire without burning, nor yet be poisoned in their drink, and therefore such cups are only in the possession of their Kings, neither is it lawful for any man except the King, to hunt that Beast, and therefore they say that *Apollonius* looked upon one of those Beasts, and considered his nature with singular admiration.

Now there was one *Damis* in his company, who asked him whether he did believe that the vulgar report of the Unicorns horns were true or no, *Apollonius* made this answer: *Adhibeo si huius regionis immortalem regem esse intellexero, qui enim mihi aut alteri cuiquam poculum ita salubre potest dare, nonne verisimile est ipsum quotidie illo uti, & ex eo cornu frequenter vel ad crapulam usque bibere, nemo enim ut puto illum calumniabitur qui in tali poculo etiam inebrietur.* That is to say, I would believe that report, if I found in this Countrey a King that were immortal and could never dye, for if a man would give me such a cup, or any other man, do not you think that I would believe he drunk in the same cup? and who would blame a man if he drunk in such a cup till he were drunk? for it were lawful to use that horn unto surfeiting: whereby we may gather the minde of that wise man concerning the Asses horn, and the Unicorns; namely, that they may give one some ease against accidental diseases, although they cannot prolong a mans life the space of one day: these things said he. There be Beasts (saith *Aristotle*) as the *Oryx* and *Indian As*, which are armed with one horn, and the cloven footed *Oryx* is no other then the whole footed *As*, for in the middle of their forehead they have one horn, by which both sides of their head are armed, *Cum medium pariter commune utriusque extremo sit.* Because the middle is equally distant from both the extremes; and the hoof of this Beast may well be said to be cloven and whole, because the horn is of the substance of the hoof, and the hoof of the substance of the horn, and therefore the horn is whole, and the hoof cloven; for the cleaving either of the horn or of the hoof cometh through the defect of nature, and therefore God hath given to Horses and Asses whole hoofs, because there is greatest use of their legs, but unto Unicorns a whole and entire horn, that as the ease of men is procured by the helps of Horses, so the health of them is procured by the horn of the Unicorn. These things (saith *Aristotle*.) And *Strabo* also writeth, that there are Horses in *India*, which have Harts heads, with one horn, of which horn their Princes make cups, out of which they drink their drink against poyson; and therefore by this which hath been said it appeareth unto me, that either the *Indian As* is a Unicorn, or differeth from it only in colour; and the objection of the hoofs is answered by *Aristotle*. Unto this discourse I will adde the travails of *Ludovicus Raman*, wherein he saw two Unicorns at *Mecha* in *Arabia*, where *Mahomets* Temple and Sepulcher is. There are preserved (saith he) within the walls and Cloysters of that Temple two Unicorns, which by way of miracle they bring forth to the people, and truly not without cause, for the sight is worthy admiration.

The use of a Unicorns horn.

Now their description is on this sort: One of them and the elder was about the stature of a Colt of two years and a half old, having a horn growing out of his forehead of two cubits length, and the other was much less, for it was but a year old, and like a Colt of that age, whose horn was some four spans long, or thereabouts. The colour of them was like a Weasleled coloured Horse, the head like the head of a Hart, the neck not long, and the mane growing all on one side. The legs slender and lean, like the legs of a Hinde, the hoofs of the fore-feet were cloven like a Goats feet, and the hinder-legs are all hairy and shaggy with the outside; the Beasts although they were wilde, yet by Art or superstition, they seemed to be tempered with no great wildeness; it was said that the King of *Ethiopia*, did send them to the Sultan of *Mecha*, with whom he is constrained to observe perpetual amity. Now these Unicorns are of another kinde, then the Unicorns of *Pliny* and *Ælianus*, because their Unicorn hath a whole hoof, and this cloven, but this objection was answered before; and although *Pliny* and *Aristotle* do acknowledge no other Unicorn then the *Oryx*, whose horn is black, as hard as Iron, and sharp at the point, yet it is clear that there is another Unicorn beside that.

Now *Paulus Venetus* saith, that in the Kingdom of *Basman*, which is subject to the great *Cham*, that there are Unicorns somewhat lesser then Elephants, having hair like Oxen, heads like Boars, feet like Elephants, one horn in the middle of their fore-heads, and a sharp thorny tongue, wherewith they destroy both man and beast: and besides he addeth, that they muddle in the dirt like Swine. Now if it were not for the horn in the middle of the fore-head, I would take this Beast for a Rhinocerot, but because the horn of the Rhinocerot groweth out of the nose, I deem this to be a second kinde of Unicorn; for there is no man that shall read this story, but will think that the learned Author had reason to discern betwixt the eyes and the fore-head, and therefore there can be no exception taken to my observation.

Nicolaus Venetus an Earl saith, that in *Masim* or *Serica*, that is, the Mountains betwixt *India* and *Cathay*, (as *Æneus Sylvius* writeth) there is a certain Beast having a Swines head, an Oxes tail, the body of an Elephant (whom it doth not only equal in stature, but also it liveth in continual variance with them) and one horn in the fore-head: now this if the Reader shall think it different from the former, I do make the third kinde of the Unicorn; and I trust that there is no wise man that will be offended at it: for as we have shewed already in many stories, that sundry Beasts have not only their divisions, but sub-divisions, into sub-alternal kindes, as many Dogs, many Deer,

many Horses, many Mice, many Panthers, and such like, why should there not also be many Unicorns? And if the Reader be not pleased with this, let him either shew me better reason, (which I know he shall never be able to do) or else be silent, lest the uttering of his dislike, bewray envy and ignorance.

Other dis-
courses of the
horn.

Philes.

Now although the parts of the Unicorn be in some measure described, and also their Countries, namely, *India* and *Æthiopia*, yet for as much as all is not said as may be said, I will add the residue in this place: And first of all there are two Kingdoms in *India*, one called *Niem*, and the other *Lamber* or *Lambri*; both these are stored with Unicorns: And *Aloisius Cadamustus* in his fifty Chapter of his Book of Navigation, writeth that there is a certain Region of the New-found World, wherein are found live Unicorns; and toward the East, and South, under the Equinoctial there is a living creature (with one horn which is crooked, and not great) having the head of a Dragon, and a beard upon his chin, his neck long, and stretched out like a Serpents, the residue of his body like to a Harts, saving that his feet, colour, and mouth are like a Lions: and this also (if not a fable or rather a Monster) may be a fourth kinde of Unicorn; and concerning the horns of Unicorns, now we must perform our promise, which is to relate the true history of them, as it is found in the best Writers. This therefore growing out of the fore-head betwixt the eye-lids is neither light nor hollow, nor yet smooth like other horns, but hard as Iron, rough as any file, revolved into many plights, sharper than any dart, straight and not crooked, and every where black except at the point.

There are two of these at *Venice* in the Treasury of *S. Marks Church*, as *Brasavolus* writeth, one at *Argentorat*, which is wreathed about with divers Spires. There are also two in the Treasury of the King of *Polonia*, all of them as long as a man in his stature. In the year 1520. there was found the horn of a Unicorn in the River *Arrula*, near *Bruga* in *Helvetia*, the upper face or outside whereof was a dark yellow, it was two cubits in length, but had upon it no plights or wreathings. It was very odoriferous (especially when any part of it was set on fire) so that it smelled like musk: as soon as it was found, it was carryed to a Nunnery called *Campus regius*, but afterwards by the Governor of *Helvetia* it was recovered back again, because it was found within his territory. Now the vertues of this horn are already recited before, and yet I will for the better justifying of that which I have said concerning the Unicorns horn, add the testimony of our learned men which did write thereof to *Gesner*, whose letters according as I finde them recorded in his work, so I have here inserted and translated word for word. And first of all the answer of *Nicholas Gerbellius* unto his Epistle, concerning the Unicorns horn at *Argentorat*, is this which followeth, for, saith he, The horn which those Noblemen have in the secrets of the great Temple, I have often seen and handled with my hands; It is of the length of a tall man, if so be that you shall thereunto add the point thereof: for there was a certain evil disposed person amongst them, who had learned (I know not of whom) that the point or top of the same horn would be a present remedy both against all poyson, and also against the Plague or Pestilence: Wherefore that sacrilegious thief plucked off the higher part or top from the residue, being in length three or four fingers.

For which wicked offence, both he himself was cast out of that company, and not any ever afterwards of that family might be received into this society by an Ordinance gravely and maturely ratified. This pulling off the top brought a notable deformity to that most splendiant gift. The whole horn from that which sticketh to the fore-head of this beast, even unto the top of the horn is altogether firm or solid, not gaping with chops, chinks or crevices, with a little greater thickness then a tile is usually amongst us. For I have oftentimes comprehended almost the whole horn in my right hand. From the root unto the point it is even as wax candles are rowled together most elegantly severed and raised up in little lines.

The weight of this horn is of so great a massiness, that a man would hardly believe it, and it hath been often wondred at, that a beast of so little a stature could bear so heavy and weighty a burden. I could never smell any sweetness at all therein. The colour thereof is like unto old Ivory, in the midst betwixt white and yellow. But you shall never have a better pattern of this, then where it is sold in little pieces or fragments by the Oylmen. For the colour of our horn is life unto them. But by whom this was given unto that same Temple I am altogether ignorant.

Gerbellius.
A second Hi-
story of a Uni-
corns horn.

Another certain friend of mine, being a man worthy to be believed, declared unto me, that he saw at *Paris* with the Chancellor, being Lord of *Pratus*, a piece of a Unicorns horn, to the quantity of a cubit, wreathed in tops or spires, about the thickness of an indifferent staffe (the compass thereof extending to the quantity of six fingers) being within and without of a muddy colour, with a solid substance, the fragments whereof would boil in the Wine, although they were never burned, having very little or no smell at all therein.

A third Hi-
story of a Uni-
corns horn.

When *Joannes Ferrerius* of *Piemont* had read these things, he wrote unto me, that in the Temple of *Dennis*, near unto *Paris*, there was a Unicorns horn six foot long, wherein all those things which are written by *Gerbellius* in our Chronicles were verified, both the weight and the colour: but that in bigness it exceeded the horn at the City of *Argentorat*, being also hollow almost a foot from that part which sticketh unto the fore-head of the Beast, this he saw himself in the Temple of *S. Dennis*, and handled the horn with his hands as long as he would. I hear that in the former year (which was from the year of our Lord 1553.) when *Vercella* was overthrown by the French, there was brought from that treasure unto the King of *France*, a very great Unicorns horn, the price

price whereof was valued at fourscore thousand Duckets. *Paulus Poëius* describeth an Unicorn in this manner; That he is a Beast, in shape much like a young Horse, of a dusky colour, with a maned neck, a hairy beard, and a fore-head armed with a horn of the quantity of two cubits, being separated with pale tops or spires, which is reported by the smoothness and Ivory whiteness thereof, to have the wonderful power of dissolving and speedy expelling of all venom or poyson whatsoever.

Another description of the Unicorn.

For his horn being put into the water, driveth away the poyson, that he may drink without harm, if any venomous Beast shall drink therein before him. This cannot be taken from the Beast being alive, forasmuch as he cannot possibly be taken by any deceit: yet it is usually seen that the horn is found in the Deserts, as it happeneth in Harts, who cast off their old horn through the inconveniences of old age, which they leave unto the Hunters, Nature renewing another unto them.

The horn of this Beast being put upon the Table of Kings, and set amongst their junkets and bankets, doth bewray the venom if there be any such therein, by a certain sweat which cometh over it. Concerning these horns, there were two seen, which were two cubits in length, of the thickness of a mans arm, the first at *Venice*, which the Senate afterwards sent for a gift unto *Solyman* the *Turkish* Emperour: the other being almost of the same quantity, and placed in a silver pillar, with a short or cutted point, which *Clement* the Pope or Bishop of *Rome*, being come unto *Marssels*, brought unto *Francis* the King for an excellent gift. Furthermore concerning the vertue of such a gift, I will not speak more of this Beast, then that which divulged fame doth perswade the believers.

Petrus Bellonius writeth, that he knew the tooth of some certain Beast in time past, sold for the horn of a Unicorn, (what Beast may be signified by this speech I know not, neither any of the *French* men which do live amongst us) and so a small piece of the same being adulterated, sold sometimes for 300. Duckets. But if the horn shall be true and not counterfeit, it doth notwithstanding seem to be of that creature which the Ancients called by the name of a Unicorn, especially *Ælianus*, who only ascribeth to the same this wonderful force against poyson and most grievous diseases, for he maketh not this horn white, as ours doth seem, but outwardly red, inwardly white, and in the midst or secretest part only black.

Of adulterated Unicorns horns.

But it cannot be denied, that this our Unicorns horn was taken from some living wilde Beast. For there are found in *Europe*, to the number of twenty of these horns pure, and so many broken; two of the which are shown in the treasury of *Saint Marks* Church at *Venice*, (I heard that the other was of late sent unto the Emperour of the *Turks* for a gift by the *Venetians*) both of them about the length of six cubits: the one part which is lowest being thicker, and the other thinner, that which is thicker, exceedeth not the thickness of three inches just, which is also attributed unto the horn of the *Indian* As, but the other notes of the same are wanting.

I do also know, that which the King of *England* possesseth to be wreathed in spires, even as that accounted in the Church of *S. Dennis*, then which they suppose none greater in the world, and I never saw any thing in any creatures more worthy praise then this horn. The substance is made by nature, not Art, wherein all the marks are found which the true horn requireth. And forsomuch as it is somewhat hollow (about the measure of a foot which goeth out of the head, and the bone growing from the same is comprehended) I conjecture that it never falleth, as neither the horns of a *Musk-cat*, a wilde *Goat*, and an *Ibex* do: but the horns of these beasts do yearly fall off, namely, the *Buck*, the *Hart*, *Field-goat*, and *Camelopardal*. It is of so great a length, that the tallest man can scarcely touch the top thereof, for it doth fully equal seven great feet. It weigheth thirteen pounds with their affize, being only weighed by the guess of the hand, it seemeth much heavier. The figure doth plainly signifie a wax candle, (being folded and wreathed within it self) being far more thicker from one part, and making it self by little and little less towards the point, the thickest part thereof cannot be shut within ones hand, it is the compass of five fingers, by the circumference, if it be measured with a thread, it is three fingers and a span.

That part which is next unto the head hath no sharpness, the other are of a polished smoothness. The splents of the spire are smooth and not deep, being for the most part like unto the wreathing turnings of *Snails*, or the revolutions or windings of *Wood-bine* about any *Wood*. But they proceed from the right hand toward the left, from the beginning of the horn, even unto the very end. The colour is not altogether white, being a long time somewhat obscured. But by the weight it is an easie thing to conjecture, that this Beast which can bear so great burden in his head, in the quantity of his body can be little less then a great *Ox*.

There are found oftentimes in *Polonia* certain horns which some men guess to be of the Unicorns, by a double argument. First, because they are found several, never by twains which as yet is heard, although sometimes they may be found with the skull and bones of the rest of the body: furthermore, because their strength or vertue is approved against great and most grievous diseases: concerning which thing *Antonius Schnerbergerus*, a Physitian of great learning amongst the *Sarmatians*, and an excellent observer of nature, writ unto me some five year past, to see some of these horns, having sent them by the labour of my very good friend *Joachimus Reticus*, a most excellent Physitian in *Sarmatia*, and incomparable in the *Mathematick Arts* in this age.

Of the Unicorns horns found in *Polonia*.

The first of these horns (saith he) I saw being of the length of my fadom, with a duskyish or darkish colour: the point thereof being exceeding sharp and smooth. The compass about

the root of the horn did exceed six spans. The outside was plain, with no turnings of spires: the substance easie to be crummed, the figure crooked, the colour exceeding white within, which if it be drunk in Wine, doth draw over it self a dark colour. Eight such divisions were joyned to the same, as you shall see in the greater part which I send, but that part is not of the horn, but either the entrance of the palat, or some other things as I conjecture.

This horn was found under the earth, (not deeper then a foot, in a solitary and high place, as between two hills, through which a River runneth) by Countrey-men that were digging to lay the foundation of a house. But the horn was smitten with an Ax, and severed into very small pieces: but that noble and excellent man *Joannes Frikas* (in whose field the horn was found, being distant from *Cracovia* two miles) by all diligence he could, lest that the small pieces should be cast abroad, took deliberate heed, that they should be taken out of the earth. From the root to the top it was all round and smooth, but touching it with ones tongue, it cleaveth fast unto it, the tooth was as big as a man could gripe in his hand, being in the upper or outward part bony or hollow within, white in the middle, and toward the end somewhat reddish.

But there was found all the Beast, as by the greatness of his bones might easily be perceived, being bigger in quantity then a Horse. It is most certain that it was a four-footed Beast, by the bones of the shoulders, thighs and ribs. But if this horn were the tooth of an Elephant, as some do suppose, you would marvel why two (which I have heard) were never found together. But the teeth or rather horns of Elephants are neither so crooked that they might come almost to half a circle as they did. The strength of this horn a penny weight thereof being put in Wine or water of Borage, healeth old Fevers, as also tertian or quartern Agues of three years continuance, and cureth many diseases in mens bodies, as asswaging the pain of the belly, and making of those to vomit, who can by no means ease their stomachs. Hitherto shall suffice to have spoken concerning one of those four horns which I saw. The other was like unto this, but less pure; for the colour was outwardly most black, inwardly most white, being found in the River. The third, and fourth most hard, so that a man would think it were by the touching thereof stone or iron, being solid even unto the point, for I have not seen them wholly, but the part of one, to the length of a cubit; of the other, to the length of half a cubit, with a dark colour, being almost of the same thickness as the two former: But forasmuch as the two former have no rifts or chinks in them, these have by their longitude, being like herbs bending or wreathing in their stalks.

There was another found in a certain field, so much appearing out of the earth, that the rude or Countrey sort did think it to be some pile or stake. Many also are cured and freed from shaking Feavers by the medicinal force of these, the cause whereof I suppose to be this, because the former are softer, for as much as one of them will ly in the water for so long a time, but the other under the earth being scarce well hid. I afterwards saw a fifth like unto the first, none of them being straight or direct up, but also crooked, some almost unto a half circle: Hitherto *Schnebergerus*, who also addeth this: That there are more of these to be found in *Polonia*, and therefore for the most part to be contemned.

There are moreover found in *Helvetia* some of these horns: one in the River *Arula* against the Town of *Bruga*, the other in the last year, in the River of *Birsa*, but it was broken, even as the third, with that famous Earl of the *Cymbrians*, *William Warner* in a Tower near unto the City *Rottavit*, who gave unto *Gesner* a good piece thereof, who found another piece as he was a fishing at *Birsa* in the River. And it is no great marvel that they are found there, where through length of time they are broken into small pieces, and carryed by the force of the waters into divers places.

But it is most diligently to be observed, whether they are found in the earth, as also to be known whether that great horn be of this beast, which hangs alone in the great Temple at *Argentaur*, by the pillar, for it hath hanged there many years before, as now it appeareth, for that doth plainly seem the same magnitude, thickness, and figure which *Schnebergerus* hath described in his own horn, that we have allowed before for wilde Oxen. The Ancients have attributed singular horns to the Unicorn, whom some have cald by other names as it is said: and furthermore to the *Oryx* (a wilde Beast unknown in our age except I be deceived) which *Aristotle* and *Pliny* call a Unicorn, *Ælianus* a *Quadrucorn*. *Oppianus* doth not expresse it, but he seemeth to make it a two horned Beast. *Simeon Sethi* doth also write, that the Musk-cat or Goat which bringeth forth Musk, hath one horn. Certain later writers (as *Scaliger* reporteth) say, that there is a certain Ox in *Ethiopia* which hath one horn coming out in the midst of his fore-head, greater then the length of a foot, bending upwards, the point being wreathed overthwart, and they have red hair, whereby we gather that the horn of all Unicorns is not pure. But the reason why these horns are more found in *Polonia*, then in any other place, I cannot well guess, whether from thence we shall suspect them to be of certain *Vries*, which at this day abide in the Woods of *Sarmatia*; in times past, there were many more, which have lived both in greater and larger Woods, neither were they killed with so often hunting: some whereof it is most like have come to great age, as appeareth by their great and stately horns, which things we leave to be considered of others. I suppose that the Apothecaries never have the true horn of a Unicorn, but that some do sell a kinde of false adulterated Horn, other the fragments of this great and unknown horn, of which we have spoken, and not only of the horn, but also of the bones of the head; some of which are so affected by longinquity of time, that you may take a three-fold substance in them, although it be broken by a certain distance, one being for the most part whitish and pale, the other whiter and softer, the third stony and most white.

I hear that in the new Islands there was a horn bought in the name of a Unicorns horn, being much praised for expelling of poyson: which what it is I have not as yet examined, but it is to be inquired, whether it be Rhinoceros or not, for both the ancient and late Writers do mingle this with the Unicorn. I do verily conjecture that the same strength is pertinent to both the Horns.

And thus much shall suffice concerning the true Unicorns horn, and the Vertues arising therefrom. In this place now we will proceed to the residue of the history, reserving other uses of this horn to the proper medicines.

These beasts are very swift, and their legs have no Articles. They keep for the most part in the Deserts, and live solitary in the tops of the Mountains. There was nothing more horrible then the voice or braying of it, for the voyce is strained above measure. It fighteth both with the mouth and with the heels, with the mouth biting like a Lion, and with the heels kicking like a Horse. It is beast of an untamable nature, and therefore the Lord himself in *Job* saith, that he cannot be tyed with any halter, nor yet accustomed to any cratch or stable. He feareth not Iron nor any Iron instrument, (as *Isidorus* writeth) and that which is most strange of all other, it fighteth with his own kinde, yea even with the females unto death, except when it burneth in lust for procreation; but unto stranger-beasts, with whom he hath no affinity in nature, he is more sociable and familiar, delighting in their company when they come willingly unto him, never rising against them, but proud of their dependance and retinue, keepeth with them all quarters of league and truce, but with his female, when once his flesh is tickled with lust, he groweth tame, gregal and loving, and so continueth till she is filled and great with young, and then returneth to his former hostility. He is an enemy to the Lions, wherefore as soon as ever a Lion seeth a Unicorn, he runneth to a tree for succour, that so when the Unicorn maketh force at him, he may not only avoid his horn, but also destroy him; for the Unicorn in the swiftness of his course runneth against the tree, wherein his sharp horn sticketh fast, then when the Lion seeth the Unicorn fastned by the horn, without all danger he falleth upon him and killeth him. These things are reported by the King of *Æthiopia*, in an *Hebrew* Epistle unto the Bishop of *Rome*.

It is said that Unicorns above all other creatures, do reverence Virgins and young Maids, and that many times at the sight of them they grow tame, and come and sleep beside them, for there is in their nature a certain savour, wherewithal the Unicorns are allured and delighted: for which occasion the *Indian* and *Æthiopian* Hunters use this stratagem to take the beast. They take a goodly strong and beautiful young man, whom they dress in the apparel of a woman, besetting him with divers odoriferous flowers and spices.

The man so adorned, they set in the Mountains or Woods where the Unicorn hunteth, so as the winde may carry the savour to the beast, and in the mean season the other Hunters hide themselves: the Unicorn deceived with the outward shape of a woman and sweet smells, cometh unto the young man without fear, and so suffereth his head to be covered and wrapped within his large sleeves, never stirring but lying still and asleep, as in his most acceptable repose. Then when the Hunters by the sign of the young man perceive him fast and secure, they come upon him, and by force cut off his horn, and send him away alive: but concerning this opinion we have no elder authority then *Tzetzes*, who did not live above five hundred years ago, and therefore I leave the Reader to the freedom of his own judgement, to believe or refuse this relation; neither was it fit that I should omit it, seeing that all Writers since the time of *Tzetzes*, do most constantly believe it.

It is said by *Ælianus* and *Albertus*, that except they be taken before they be two years old they will never be tamed; and that the *Thracians* do yearly take some of their Colts, and bring them to their King, which he keepeth for combat, and to fight with one another: for when they are old, they differ nothing at all from the most barbarous, bloody, and ravenous beasts. Their flesh is not good for meat, but is bitter and unnourishable: And thus much shall suffice for the natural story of the Unicorn; now followeth the medicinal.

The Medicines arising from the Unicorn.

Concerning the horns of the Unicorn, I have sufficiently already written, as the Antients have delivered in their remedies: but in this place I will handle the remedies which late Writers have attributed thereunto, as also our own observations of the same. I remember that in times past, I saw a piece of this horn of the weight of nine Inches, with a certain Merchant in the market, being black and plain, and not wreathed in circles or turnings, but at that time I did not so much observe it. Now amongst our Apothecaries I do not only finde small or little fragments out of which there issued (as they say) some certain marrow, which are rounder, whiter, and softer.

But both the same colour, as also the substance being put too much, and eaten, if it be easily crummed, and not stuf as other horns, doth signifie the same not to be good or perfect, but counterfeited and corrupted: as perhaps the horn of some other beast burnt in the fire, some certain sweet odors being thereunto added, and also imbrued in some delicious or aromatical perfume; peradventure also Bay by this means, first burned, and afterward quenched or put out with certain sweet smelling liquors. There is great care to be had, that it be taken new, and while it smelleth

sweet, not either abolished by age, nor the vertue thereof diminished by often or frequent cups. For rich men do usually cast little pieces of this horn in their drinking cups, either for the preventing or curing of some certain disease. There are also some which inclose it in gold or silver, and so cast it in their drink, as though the force thereof could remain many years, notwithstanding the continual soaking in Wine.

But that which is so used and drunk in Wine doth bring upon it a certain dark or obscure colour, the whiteness which before remained upon the same being quite lost, expelled and utterly abolished. Most men for the remedies arising from the same, command to use the horn simply by it self: Others prefer the marrow therein. It being cast in Wine doth boil, which some men either through ignorance or deceit, impute to be a sign of the true horn, when as contrarily any other horns being burnt, do in water or wine cause bubbles to arise. There are some wicked persons which do make a mingle mangle thereof, as I saw amongst the *Venetians*, (being as I hear say, compounded with lime and sope) or peradventure with earth or some stone: (which things are wont to make bubbles arise) and afterward sell it for the Unicorns horn.

Wherefore it shall be more safe to buy it out of the whole horn if it may be done, or of greater crums, and which may well describe the figure of a horn; then small fragments where you may receive less deceit. A certain Apothecary which was at *Noremberg*, in a stately mart Town amongst the *Germans*, declared the way unto me how to deface the colour of an adulterated Unicorns horn, being made by some with Ivory, either macerated or boiled with certain medicines (by Set-foil as I suppose, and other things) by which means having scraped it, I found within the true substance to be Ivory. *Antonius Brasavolus* writeth, that all men for the most part do sell a certain stone for Unicorns horn: which truly I deny not to be done, who have no certainty therein my self: notwithstanding also it may to come pass, that a very hard and solid horn, about the point of a sword especially (which part is preferred to inferior, as also in Harts horns) to which either stones or iron may yeild, such as Authors attribute to the Rhinocerot. And other Unicorns may bear the shape of a stone before it self. For if *Orpheus* concerning Harts horns rightly doubted, whether the same or stones were of greatest strength: I think it more to be doubted in the kinde of Unicorns, for the horns of Harts are not only solid (as *Aristotle* supposed) but also the horns of Unicorns, as here I have said.

The horn of an Unicorn is at this day used, although age or longinquity of time hath quite abolished it from the nature of a horn. There are some which mingle the Rhinoceros with the Unicorn, for that which is named the Rhinoceros horn, is at this day in Physical use, of which notwithstanding the Authors have declared no effectual force. Some say that the Unicorns horn doth sweat, having any poyson coming over it, which is false, it doth perhaps sometimes sweat, even as some solid, hard, and light substance, (as also stones and glass) some external vapour being about them, but this doth nothing appertain to poyson.

It is in like manner reported, that a kinde of stone called the Serpents tongue doth sweat having poyson come over it. I have heard and read in a certain book written with ones hands, that the true horn of a Unicorn is to be proved in this manner. To give to two Pigeons poyson (red Arsnick or Orpin) the one which drinketh a little of the true Unicorns horn will be healed, the other will die, I do leave this manner of trial unto rich men. For the price of that which is true, is reported at this day to be of no less value then gold. Some do sell the weight thereof for a floren, or eight pence: some for a crown, or twelve pence. But the marrow thereof is certainly of a greater price, then that which is of harder substance. Some likewise do sell a dram thereof, for two pence half penny, so great is the diversity thereof. For experience of the Unicorns horns to know whether it be right or not: put silk upon a burning coal, and upon the silk the aforesaid horn, and if so be that it be true the silk will not be a whit consumed.

The horns of Unicorns, especially that which is brought from new Islands, being beaten and drunk in water, doth wonderfully help against poyson: as of late experience doth manifest unto us, a man, who having taken poyson & beginning to swell was preserved by this remedy. I my self have heard of a man worthy to be believed, that having eaten a poysoned cherry, and perceiving his belly to swell, he cured himself by the marrow of this horn being drunk in Wine, in very short space.

The same is also praised at this day for the curing of the Falling sickness, and affirmed by *Aelianus*, who called this disease cursed. The ancient Writers did attribute the force of healing to cups made of this horn, Wine being drunk out of them: but because we cannot have cups, we drink the substance of the horn, either by it self or with other medicines. I happily sometime made this Sugar of the horn, as they call it, mingling with the same Amber, Ivory dust, leaves of gold, coral, & certain other things, the horn being included in silk, and beaten in the decoction of Raisins and Cinamon, I cast them in water, the rest of the reason of healing in the mean time not being neglected. It is moreover commended of Physicians of our time against the pestilent feaver, (as *Aloisius Mundellus* writeth) against the bitings of ravenous Dogs, and the strokes or poysonsome stings of other creatures: and privately in rich mens houses against the belly or maw worms, to conclude, it is given against all poyson whatsoever as also against many most grievous diseases. The King of the *Indians* drinking out of a cup made of an *Indian* Unicorns horn, and being asked wherefore he did it, whether it were for the love of drunkenness, made answer, that by that drink drunkenness was both expelled and resisted, and worser things cured, meaning that it clean abolished all poyson whatsoever. The horn of a Unicorn, doth heal that detestable disease in men called *S. Johns* evil, otherwise the

cursed

curled disease. The horn of an Unicorn being beaten and boiled in Wine, hath a wonderful effect in making the teeth white or clear, the mouth being well cleansed therewith. And thus much shall suffice for the medicines and vertues arising from the Unicorn.

Of the URE-OX.

This beast is called by the Latines, *Urus*; by the Germans, *Aurox*, and *Urox*, and *Grosse vesent*; by the Lithuanians, *Thur*; the Scythians, *Bubri*; and these beasts were not known to the Grecians, (as Pliny writeth) of whom Seneca writeth in this manner;

The several names.

*Tibi dant variae pectora Tigres,
Tibi villosi terga Bifontes,
Latifq; feri cornibus uri.*

And Virgil also maketh mention of them in his *Georgicks*, writing of the culture or tilling of Vines.

*Texenda sepes etiam & pecus omne tenendum;
Præcipue cum frons tenera, imprudensq; laborum,
Cui super indignas hyemes, solemq; potentem,*

*Silvestres uri assidue, capreaq; sequaces
Illudunt.*

These wilde beasts or Ure-oxes are wilde Oxen, differing from all other kinds, already rehearsed in the story of Oxen, Bugles, Bisons, or any other, although some have unskillfully taken them for Bisons, and Sir Thomas Eliot in his Dictionary, doth English *Urus* a Bugle but beside him no body, that I know, and for this cause he is reprehended by other. Now although there be nothing in this beast but ordinary, yet seeing it is a creature so well known, we have less reason to omit his shape and story, lest we should justly be condemned of negligence and carelessness.

In outward proportion of the body it differeth little from the Bull. It is very thick, and his back somewhat bunched up, and his length from the head to the tail is short, no ways answerable to the proportion of his stature and sides: the horns (as some say) are but short, yet black, broad, and thick, his eyes red, a broad mouth, and a great broad head, his temples hairy, a beard upon his chin, but short, and the colour thereof black, his other parts, as namely in the face, sides, legs, and tail, of a reddish colour.

These are in the wood *Hercynia*, in the *Pyrenay* Mountains, and in *Mazovia*, near *Lithuania*. They are call'd *Uri* of *Oron*, that is the Mountains, because their savage wildness is so great, that they seldom descend from those safeguards. They far excel Bulls, and other wilde Oxen, coming nearer to the quantity or stature of Elephants, then to the Bull. In resemblance a man would think them to be compounded of a Mule and a Hart, for their outward resemblance so seem. It is said they could never be taken by men, although they were taken when they were

The several parts.

Places of their abode.

young.

Coutreys of
their breed.

young, yet they love other heards of Cattel, and will not forsake them easily after they have once joyned themselves unto them, whereby many times they are deceived and killed, twenty, thirty, or forty at a time. *Caligula Caesar* brought of these alive to *Rome*, and did shew them in publick spectacle to the people, and at that time they were taken for wilde Bulls. Some affirm that there are of these in *Prussia*, and that they are so wilde, cruel, and untamable, as they fear or spare neither man nor beast; and when they are set upon and wounded by the Hunters in the Woods among the trees, feeling their hurts, and perceiving their blood issuing out of their body, they rage above measure; for having no means to take revenge upon the Hunter, by reason that he standeth behinde some great tree, for very wrath and fury they kill themselves with their own headlong force upon the same tree. It is said that their foreheads are so broad and large, that two men may easily fit betwixt their horns. They are able to take up an armed man and his Horse, and to toss him into the air like a Bull, and the heads of these or such like beasts are to be seen publickly fixed up in common places at *Mentz* and *Wormes*, which are worth the observation, because in all proportion they are twice so big as the vulgar Bull or Oxe.

Their stature.

Now although their large bodies and manes do also appertain to the Bisons, yet it is not unfit to attribute the same also to the Ure-oxe. For if it be in the pleasure of any man to make it also a kinde of Bison, I will not deny that this must be remembered, that both the body of this beast is much larger, and also the aspect not so grim or fierce as is the Bison.

There are many of these found also in *Angremannia*, and the Confines of *Lapponia*, and other Northern parts of the world, where they are called by the *Illyrian* term *Zubrones*, and these are so high as a tall man can hardly lay his hand upon the top of their backs, although he strain himself very much.

And some of them are fifteen cubits in length, of whom, beside their admirable strength, their velocity and nimbleness is also remarkable, for it is said of them, that when they empty their bellies, they can turn about to take their dung or excrement upon their horns before it fall to the ground, which they cast upon the Hunters or pursuers, Dogs or men, whereby they blinde and burn them. They which accustome or practise to kill and hunt these beasts, are greatly commended and rewarded when they have killed many of them, whereof they make proof, by bringing the horns of them that they have killed into the common Market-place.

In ancient time before the invention of Iron weapons, they did take them in those Countreys in ditches, and great caves of the earth, whereunto the strongest and most active young men did apply themselves, having both Dogs and all other needfull instruments to take away the life of this beast; and if it did not happen that he fastned his horns into some tree, then was all their labour lost, for they could never come neer to touch him, only when in his speedy swift fury among the woods, he ran his horns into the body of some Oaks or such like, whereby he was stayed, (for it is not so easie to pull them forth as to fixe them, because they are rugged, crooked, and stand upward) then he was overtaken and killed by some Hunter or other. And if at any time he met with a Hunter, it was fatall and deadly to the man, except he could avoid the beast by getting unto some tree.

Use of their
parts.

Sigismundus Baro, that honourable man writeth thus hereof, that in *Malonia* neer *Lituania*, it is bred, and called *Thur*, and they are a kinde of wilde Oxen, not differing from the vulgar, (except as aforesaid) but in their colour, and a spotted strake or line which goeth all along their backs. And those Ure-oxen are kept as it were in Parks and Chases, having a peculiar designment by the King, and the inhabitants of certain Villages to keep and watch them. Sometimes when they meet with a common or vulgar tame Cow, they leap upon her, and fill her; but such a Calf liveth not long, but dyeth as if it were not perfect, and if it do chance to live, it never resembleth the fire, nor yet is admitted into their society and herd, but are refused for bastards and ignoble breed. And when he was Ambassador to *Sigismundus* the Emperour he received for a gift one of these killed, and bowelled, having the skin of the forehead cut off and taken away, whereat he wondred much but durst not ask the question or reason thereof; yet afterward he understood that there were girdles made of that part of the hide, whereby the women in that Countrey were perswaded that they should be made apt to conceive and bring forth children: and *Bona* the mother of *Sigismundus* gave unto him two girdles for that purpose, whereof he said he bestowed one upon the Queen of *Romans*, who did take the same at his hand very graciously and thankfully. And it is certain, that out of the hides of these beasts are made girdles, which are two fingers thick, and strong, and yet the hair upon them is soft and gentle like any Wooll.

Histories of
other wilde
Oxen.

The flesh of these beasts is rank and heavy, and if it be eaten fresh it causeth loosenesse, but if it be salted a day or two it is nothing inferiour to Beef, for so the humidity is taken away. With the horns are made drinking Cups, and for that purpose the richer sort of people do edge or lip them over with silver and gold: they hold or contain as much as two ordinary Pitchers of water. Other take off the points and fasten them to spears, being very sharp, and not easily blunted or broken, and other make of them cut into slices or panes the best Lanthorns in the World. And thus much for the Ure-ox, unto whose History it is needfull for me to adde the story of divers other wilde Oxen not yet described.

Strabo saith, that there are Oxen called *Rhizes*, among the *Hesperian Ethiopians*, who in outward proportion are much like the vulgar Bulls, but in other parts, as quantity, strength, and vigour, comparable to the Elephants.

Theretus

Thevetus writeth, that betwixt *Florida* and *Palma*, in the new found World, there are very many strange shaped beasts, and among other a kinde of wilde Bull, whose horns are a foot long, but on his back he hath a tumour or bunch like a Camel, and is therefore called *Bos Camelita*, his hair all over his body is very long, but especially under his chin, and his colour like a yellow Mule, and this beast is a continual enemy to a Horse. Like unto these are the tame *Scythian* Oxen, and some other in *Asia*, who carry packs upon the bunches of their backs, and also bend their knees like Camels.

Of the *Lybian* O X E.

There is so great an innumerability of *Lybian* Oxen, of so great swiftnesse and celerity, that the Hunters are many times deceived in hunting them, and so do certainly chance or fall upon other wilde beasts for the same they raised, and he in the mean while doth hide himself in a place of brambles and briars, keeping himself there safe, while other wilde beasts doth appear like unto them, and so do deceive the eyes of the Hunters: therefore if any man do begin to follow after either of them, it will be but labour lost, for he is not able to comprehend or attain them with a Horse, except he may take them being wearied by longitude of time. But if any Hunters shall finde a young Calf, spare the life thereof, and shall not presently kill it, he shall reap a double profit by it: and first it doth bring profit to it self, and doth induce or lead his Dam into captivity. For after that the Hunter hath bound the Calf with a rope, she being inflamed by the love or affection which she beareth to her Calf, returneth back again unto it, coveting with an ardent desire to loosen and take away her Calf out of the bond or halter, therefore she thrusteth in her horn that she may loosen the cord, and pluck her young one away, whereby she is kept fast bound with her Calf, her horns being intangled in the rope. Then cometh the Hunter and killeth her, and *Ælianus*. taketh forth her liver, and also cutteth off her dugs or udder, and doth likewise pluck off her skin, and leaveth her flesh for the Birds and wilde Beasts to feed upon. There is another kinde of Ox in *Lybia*, whose horns do bend downward, and for that cause they are said to feed going backwards. Of the sayings of *Herodotus* and *Ælianus*, I have spoken before. *Philes* doth write, that they are called Oxen going backward, because the broadnesse of their horns doth cover their eye-sight, so that it standeth them in no use to go forward, but is very commodious to go backward. There is an Oxe which liveth in the Woods of *Africk*, which doth resemble a domesticall Oxe, yet lesse in stature, of a brown or russet colour, and also most swift of foot. This beast is found in the deserts, *Leo African.* or in the Marches or limits of the deserts. Their flesh is also of a perfect or absolute savour and taste, good for the nourishment of men.

Of the *Indian* wilde O X E N.

The horns of the Oxen of the *Garamantons* do grow downwards toward the earth, and therefore when they feed they bow the hinder part of the neck, (as *Solinus* writeth) and as we have *Pliny*. spoken before in the diversities of wilde Oxen. The Woods also in *India* are filled with wilde Oxen. In the Province of *India* where the *Gymnitis* inhabit, are great multitudes of Oxen which live in the Forrests or Woods. In the Kingdoms which are upon the borders or confines of *India*, (in the mid of the day) are many fair and great Oxen which live in the Woods. There are Mountains in the inmost Regions of *India*, which are very hard to come unto, where they say live those beasts wilde, which are among us domesticall and tame, as Sheep, Goats, Oxen, and so forth. The great King of *India* doth elect or choose a day every year for the runnings and combats of men, and also fightings of Beasts, who setting their horns one against another, do fight irefully with admirable rage, untill they overcome their adversaries. They do also labour, and strive with all their nerves and sinewes, even as if they were Champions, or fought for some great reward, or should get honour by their battell. *Strabo.* *Paul: Venet.*

Wilde Bulls, tame Rams, Asses with one horn, Hyenaes, and lastly Elephants, as if they were capable of reason, they wound them among themselves, and the one doth oftentimes overcome and kill the other, and sometimes fall down together being both wounded. I have also recited before in another place of the intreaty of Oxen, those *Indian* Oxen which are said to be most swift in their joynts in running to and fro, when they are at combate, because there we had not distinguished whether these were wilde Oxen or not: but it doth appear in this place, that they are wholly taken for wilde Oxen: and the thing it self doth manifest that domesticall Oxen are not so swift nor so strong. *Ælianus*.

The Oxen in *India* have altogether whole hoofs, and also but one horn. *Æthiopia* also doth *Pliny*. breed *Indian* Oxen, that is to say, Oxen that are like to those of *India*, for some have but one horn, and other some three. *Solinus* saith, that there are found in *India* some Oxen which have but one horn, and othersome which have three horns, with whole hoofs and not cloven. The *Indian* Oxen are said to be as high as a Camel, and their horn four foot broad. *Ptolemy* doth report, that he saw a horn of an *Indian* Oxe which did hold in the breadth of it thirty gallons.

Aristotle.

There are also Oxen which are bred in *India* which in greatnesse are no bigger then a Buck, or Goat, they do run yoked together very swift, nor do end their race with lesse speed then the Goat-land Horses, and I did not take them to be Oxen living in the Woods, for our Rangifer and Oxen which live in the Woods, are the swiftest of all beasts in this kinde, and most apt to combats and runnings, and they may partly be called Oxen having one horn, and partly Oxen having three horns: neither are they found in *Scandinavia*, but also in other Regions and Dominions of *Asia*, as we beleeve that *Indian* Oxen are of the same kinde. *Solinus* doth not rightly call those *Indian* Oxen, which *Ælianus* calleth *Æthiopicos*, as I have declared above in the story of the *Æthiopian* Oxen, for their horns are moveable. *Ctesias* doth write, that there are sprung up among the same beasts, that beast which is called *Manticora*: which is manifested by *Aristotle* in his History of Four-footed beasts. *Hermolaus* also and others have not considered this error. Among the *Aracbotans* there are Oxen which live in the Woods, which do differ from those that are bred in the City, as much as wilde Swine from tame. Their colour is black, bending a little downwards, and their horns broad and upright. There is a City in *India* called *Aracbotus*, taking the name from the River *Aracbotus*, which doth flow out of *Causacus*, what those beasts are which do bend their horns upward, I have declared in the story of the *Bison*; for as there may be spoken something concerning the difference of the Plants of the Woods, so also concerning the beasts that are bred in the City, and those that are bred in the Woods.

Of the WEASEL.

There are divers kinds of Weasels, but in this place we do intreat of the least kinde, whose form and shape we have also here set down. It is likewise properly named of the *Latines*, *Mustela*, a Weasel, for so we were wont plainly to name those which were common and domesticall, and to adde names to those which are more seldome seen, or live in the Woods for difference sake.

The word *Chuld* in *Levit. 11.* is translated a Weasel of all Interpreters. The *Rabbins* do call them *Chuldab*, and commonly *Mustela*, as *David Kimhi* writeth. The *Chaldeans* do translate it *Chulda*, the *Arabians* *Caldab*, the *Persians* *Gurba*, and *Hieron.* *Mustela*. *Oach* is an *Hebrew* word, whereupon it was once called *Ochim*, plurally in *Isai. 13.* *Babylon subvertetur, & implebunt domos eorum Ochim*, *Munsterus cercopithecus vertit.* That is to say, *Babylon shall be overthrowen, and their houses shall be filled with Ochim*, that is, *Weasels*, but *Munsterus* doth call them *Munkeys*. *David Kimhi*, and the Master of *Talmud*, do call it *Nemiab*, that is, like to a Cat, but commonly they call it a *Martin*, or *Firum*, and *Furon*. The Authors of the Concordances of the *Hebrewes*, do interpret *Koph*, *Circopithecum*, or *Cephum*, and *Culdab*, that is to say, *Mustela*, a Weasel, as the *Jewes* do think. The *Chalde* hath translated a *Martin* *Ochijn*. *Symmachus* also hath left or forsaken the *Hebrew* word. *Aquila* doth translate it *Typhones*, that is, a Whirle-winde, *Hieronimus* doth translate it *Draco*, that is, a Dragon.

Roab is truly interpreted to be a kinde of Lizard, or a *Chamelion*; in *Leviticus 11.* We also read in *Albertus*, *Hir*, and *Hyrz*, (two barbarous words) for a Weasel, which he himself doth not understand: but I have discerned or taken this signification out of the words of *Aristotle*: for *Albertus* doth most unlearnedly expound *Hircum* a Hare, being deceived, because both the living beasts do often times remove their young ones from one place to another in their mouths. *Fetis* also doth seem to be according to *Aristotle*, no other thing then *Gale*, that is to say, a Weasill. For *Feyton* (saith he) it hath wit like a Fox, that is to say, in setting upon Hens or Chickens, and the other shape and form of it is *Katiz*, that is to say, *Iñis*, a Ferret. *Namstza* also is even to this day called a Weasel among the *Grecians*. *Ibanauge* is also called a Weasel, *Ibinuers* is a little four-footed beast. *Bellula* also doth seem to signifie a Weasel, by a feigned word proceeding from the *French* or *Italians*, which do call also *Belemam*, *Balottam* pro *Mustela*, for a Weasel, but some of the later *Grecians* do abuse it, in terming it a Cat, as I have spoken before in the History of the Cat.

Silvaticus.

Theodorus Gaza in *Aristotle* doth interpret it sometimes a Weasel, and other sometimes a Cat; neither can I sufficiently gather wherefore he doth so change it, seeing that the *Grecians* call *Cattum* for a Cat *Aeluron*, and the *Latines* *Felem*. Some say, that *Mustela* for a Weasel hath been interpreted

or declared of late dayes, being only led (if I be not deceived) with the affinity of the German word, for the Germans do call *Mustela* a *Wifel*. The Grecians do usually take to this day *Mustela* for a Weasel, as I have read in the Oration of *Suidas*. A Weasel is called in Italy *Donnola*, or *Ballottula*. It is apparent by the words of *Avicen*, that *Donnula*, and otherwise *Dannula* is barbarously used pro *Mustela* for a Weasel: *Albertus* and *Niphus* do write *Damula* for a Weasel, by the which word, the later Writers do very obscurely understand *Dama* for a Weasel, which is of the kinde of Goats living in the Woods. *Damma* or *Dammula* is a small and weak beast, (as *Isidorus* writeth) speaking of those that are wilde, and will not come to hand. When it doth bring forth young, it doth presently devour the Seconds or those that come after birth, before they touch the earth, and yet it is a prey it self to other Four-footed beasts. You may also seem to take a little Dear, or a kinde of young Goat, or a Weasel, for that kinde of beast which doth devour her Seconds: But we read that neither of these do it.

The Lizard is said to devour her first litter which she littereth in her old age. We also call Domesticall Weasels, *Foinos*. A Weasel is called in France, *Belotte*, or *Belette*, and *Albalotte*. Some as I do hear, which do inhabit about the Towns of *Meta*, do call them *Baccal*. *Carolus Figuli* doth interpret a Weasel in French, *Fovinum*, or *Marturellum*, of which I have shewed before that there is two kinds, and also that there are Weasels living in the woods. In Spain also they are called *Comadreia*. The people of *Rhetia* which speak *Latine*, do keep the *Latine* name. The Germans do call them *Wifel* or *Wifele*. *Georgius Agricola* saith, that it is called a Weasel by reason of the noise that it maketh. Other some dwelling in *Helvetia*, do call it *Hermelin*, and some do call it by a corrupt word *Hamlin*, but those ought only to be named so which are altogether white, and are found in Winter time. But here in England it is called a *Weasell*, and some do write it *Wesyl*, or *Weasyl*: But the white Weasel is called *Minever*, by the transposition of the letters of the French word, it is called *Hermine*, and among the *Illyrians*, *Kolczanna*.

Some do think at this day, that the beast whose shape and form we have given for a Weasel, is the Shrew-mouse, but not rightly, for their only reason is, that the bitings of it doth poyson and harm almost in like manner. *Albertus* also doth write, that the Sea Weasel is called the field-Shrew, which is utterly false and untrue: For the Shrew is called among the Grecians, *Mygale*, male or female. They do now also commonly call *Ichneumon* the Indian Mouse, and other some the fallow Deer: But *Damula*, or *Donula*, is of the Italians and some later barbarous Writers, altogether called a common Weasel, and not *Ichneumon*, which is a peculiar beast to the Egyptians.

Now the reason of the *Latine* name *Mustela*, *Carolus Figulus* is of opinion, that it is derived of *Mys Niphus* and *Stelio*, two Greek words, because it devoureth Mice, and both the Germans and the English derive their word *Steal*, or *Stellen*, to rob or filch, from the Greek word *Stellein*: so that it is so called, because this Weasel is a still, and secret, stealing, and devouring beast. *Calepin* saith, that *Mustela* is quasi longior *Mus*. This beast is also called by *Aristotle*, *Habeninum*, and it is said, that it hunteth Moles or blinde Mice.

The Epithets hereof are, fearfull, in-creeper, and swift, and beside these I finde not any materiall, or worthy to be rehearsed. Now concerning their outward proportion, it is as we have here described, a long and thin body, but the colour thereof varieth; for some of them are brown, and branded, some black, and some clean white, which we have shewed already to be the *Ermyn*: for in some places of Germany, *Helvetia*, and the *Alpes*, the Weasels in the Winter become all white. But forasmuch as there are two kinds of Weasels, one vulgar and domesticall, living in houses and Cities, and the other wilde, living in the Woods and Mountains: we finde also that they differ in colour, neither of both being constant in the same; for the domesticall Weasel is upon the back, and side sandy, red, and sometime yellowish, and alwayes white on the throat, yea, sometimes as *Geor. Agricola* writeth, they are all white, whereat no man ought to wonder, seeing the Hares of *Helvetia* do in the Winter time turn white: And of these white Weasels or *Ermyns* there are abundance in the Northern parts of Europe, where their Summers are short, and their Winters long: And these white Weasels differ nothing from the common vulgar Weasels of other colours, except that their hair stick faster to their backs; and it is observed, that in *Russia* the Noblest women are apparelled with these skins: And there is a Wood in *Scandinavia* (called *Lanzerucca*) which is fourscore mile long, wherein are abundance of white Weasels: And the Kings tents among the *Tartarians* are said to be covered all over with the skins of Lyons without, and the walls to be hung with these *Armins* or white Weasels within; and although the price of these skins be very deer among them (for sometimes so many as are used in one Garment will cost two thousand Crowns) yet do the people earnestly seek after them, accounting it no small honour, to wear so much wealth upon their backs.

Now the reason why these beasts came to be called *Armini*, is from *Armilla* a chain, because they did wear them in fringes about their garments like chains; and although that some of the Alpine Mice be all white, and likewise the Pontique Mouse, yet there must be a difference observed betwixt these Weasels which are properly called *Armins*, and those Mice which are so called, only by way of resemblance, as we have shewed already in their stories. And of the Pontique Mouse, I may adde thus much more, that they live in the Winter time in hollow trees, wherein they become as white as snow all over, except their tails, and are in quantity like Squirrels, but in the end of May they turn somewhat red, because that then they give themselves to copulation and generation of young ones, when they lay aside their whitenesse, and live many dayes together in carnall copulation,

lation, among the green and fresh herbs, leaving behinde them such rank and unfavoury smells, as are very odious to a good sent: And it is said, that every three year their skins through abundance of food grow greater and greater, to the exceeding commodity of Merchants, and Skinners in Norway, and Helsingia.

Of the Lemmar.

There are certain little four-footed beasts called *Lemmar*, or *Lemmus*, which in tempestuous and rainy weather, do seem to fall down from the clouds, and it was never yet found, whether their beginning arose first from heaven or earth, but this is certain that as soon as ever they have fallen to the ground, some of them have been opened, and in their bowels have been found green herbs, and therefore I marvel why ever it should be beleaved that these beasts are bred of some feculent matter in the clouds; but if any man ask me from whence then have they their beginning, I answer from the earth, even as Locusts and Catterpillers, who are said in holy Scripture to be carryed to and fro with the windes, and so these beasts being destitute of naturall food in their places of generation, do advance themselves into the winde, and so are carried into other strange and unknown Countreys, where they fall like Locusts upon every green thing, living untill they have devoured all, but when once they taste of new grown herbs, they perish and die, by means whereof they encrease great pestilence and corruption, but the *Armins* or *Armins* do eat and devour them.

Now the Skins of these beasts are exceeding delicate having in them divers colours, and therefore the people flea them off from their bodies, and sell them by thirty or forty in bundles, for great price; but of these skins I have said enough, both here and elsewhere. The wilde Weasels differ not from the vulgar domesticall Weasel, their foreteeth are short and not long like a Mouses, the face broad, their genital part like a Foxes, their tail short, their legs and claws short, strong and sharp; and it is reported by *Strabo*, that the Weasels of *Mauritania* are as big as Cats, but their gaping and opening of their mouth much longer, and wider. There is an Island called *Dordocelena*, on the one side whereof (as *Pliny* writeth) there are Weasels, and through the middle there is a way over which they never passe, and on the other side there are not only not any bred, but also if they be brought into it, they die and perish, and so likewise it is reported of *Beotia*.

Places of their abode.

They make themselves caves and holes in the earth, rocks, and walls, wherein they lodge, into the which they frame two passages or doors, one into the South, the other into the North, (resembling herein the Squirrels) that so they may be free from the winde, on which side soever it bloweth, sometimes they get into stacks of Hay and straw, and there they lodge: those Weasels which live neer houses sleep not much, for they have been seen abroad all the Winter time, not only the vulgar but the *Armins*: neither are they unthankfull unto the Countrey men in whose houses they lodge, for they kill, eat, and devour all manner of Mice, Rats, and Moles; for because of their long, slender bodies, they are apt to creep into the holes of the earth, and narrow passages, fetching their prey from those places whither Cats cannot come; therefore in *Helvetia* the Countrey men nourish them more then Cats, because they destroy more vermin then Cats. The harm they do is to Hens, Chickens, and Eggs, and yet some say they eat the Eggs and let the Hens alone: they are likewise enemies to Geese, and devour their Eggs; and *Aelianus* writeth, that if they come unto dead men, they will pull out their eyes in such manner as they do Eggs, and therefore such Carkases are to be watched against them. *Amyntas* writeth, that the Shrew-mouse is conceived betwixt a Mouse and a Weasel, which opinion is not only ridiculous, but impossible, for how is it likely that a Mouse will ingender with that beast which lyeth in wait to destroy her? It is also said, that a Weasel fighteth with those Serpents that hunt after Mice, for no other cause, but to gain the prey from him.

Their copulation and conception.

There is nothing in this beast more strange, then their conception and generation, for they do not engender nor couple in their hinder parts, like other four-footed beasts, but at their ears, and bring forth their young ones at their mouth, and for this cause *Aristeas* writeth, the *Jewes* were forbidden to eat them, for this their action was an emblem of folly, and of foolish men, which can keep no secrets, but utter all that they hear (thus saith he) But we that are Christians knew other reasons why the *Jewes* were forbid to eat them. The *Egyptians* make of it another sign, for they say, that their copulation at the ear, and generation at the mouth, are emblems of speech which is first taught to the ear, and then uttered by the tongue: there be other again that hold this to be a fable: And Pope *Clement* writeth, that they conceive at the mouth, and bring forth at the ear. Many say, it is true of the Weasel of the Sea, but not of the Weasel of the earth, which is therefore called *Collipara*, and this they would confirm by another fable of *Medusa*, whose head after it was cut off, it is said to bring forth *Chrysaor* and *Pegasus*; some do alledge for this opinion, that the Crowes and the *Ibis* do conceive at their mouths: but this is certain, that they have places of conception underneath their tails like other four-footed beasts, and therefore how it should come to passe, that their young ones should come forth at their mouths, I cannot easily learn. It may be that the opinion thereof first arose from the sight of some old one carrying her young in her mouth, for the young ones are very small like Mice, and therefore it is likely that they remove them to and fro, as Cats do their young ones, for they are in continuall fear, lest they should be taken and destroyed by men, or by some other enemy beast.

The dung of Weasels doth smell many times like musk, the reason whereof we have shewed you in another place, all of them in generall have a most rank and filthy favour. It is a ravening and destroying beast; and although the body of it be very small, yet is the wit and understanding of it very

very great, for with singular art and subtilty it compasseth his prey, whereupon there lyeth this history of *Galanthis* the maid of *Alcmena*, as *Perottus* observeth out of *Ovid*. When *Alcmena* was in long travel and childe-birth, it is said that the maid perceiving she was hindered by *Lucina*, craftily obtained not only the knowledge of the cause by *Lucina*, but also the remedy; whereupon she eased her Lady, (like a true and faithfull servant) of many pains. *Lucina* seeing that she was beguiled by *Galanthis*, and that her crafty wit had over-reached a Goddesse, she turned her into a Weasel, for her punishment, that as she had sinned by revealing of the counsell of the Goddes, so she should be punished to bring forth all her young ones at her mouth, as Weasels do; and for this occasion, the Domesticall Weasel like a Maid doth continually live in houses, and her colour yellowish like the hair of *Galanthis*: thus say they of metamorphosing and transforming.

Other some say, that when *Alcmena* was in travail of *Hercules*, having indured long torments, she was delivered by the sight of a Weasel which came in her presence, and therefore the *Theban Grecians* do religiously worship a Weasel, for they say, that as it was nourisht by *Hecate* the Goddesse, so it did nourish *Hercules*; but herein they take *Gale* for *Galanthis* afore said, that is, a Weasel, for *Alcmena's* maid: And seeing we have begun to talk of transformations, I will adde another thing out of *Stobæus*, not impertinent to this common place, for he writeth in the dispraise of women, that the diversity of their dispositions perswadeth him that some of them are derived from one beast, and some from another: and namely those which come of Weasels, are a miserable, fullen, and sorrowfull kinde of women, to whom nothing is pleasing, delightfull, or acceptable, but having no minde to the pleasure of *Venus*, loathing her husband, hurteth her neighbours, robbeth her self, and devoureth consecrated and hallowed things, even after the manner of Weasels, which will take a booty from the Altar: Thus saith he, which I beleive to be true in the comparison, but not in the generation or transmutation of women from Weasels.

I do marvail how it came to passe, that a Weasel was called, an unhappy, unfortunate, and unlucky beast among Hunters, for they held opinion here in *England*, that if they meet with a Weasel in the morning, they shall not speed well that day; therefore the *Grecians* say *Galesteir*, and *Alciatus* hath an excellent Emblem, whereby he insinuateth that it is not good to have a Weasel run upon ones left hand, and therefore adviseth a man to give over his enterprize after such an Omen. Now although I would have no wise man to stand in fear of such a superstitious conceit, yet I will subscribe his verses, more for variety and elegancy, then for truth:

The significance of a Weasels occurrence.

*Auspiciis res capta malis bene cedere nescit:
Fœlici quæ sunt omine facta, juvant.
Quicquid ages, Mustela tibi si occurrer, omitte:
Signa male hæc sortis bestia prava gerit.*

It should seem that the beginning of this opinion did come from the punishment of a certain Generall of the *Corinthians* Navy, who being perjured in breaking his faith to that State, came running away from them; and they say, that afterwards he could never sleep, but that he dreamed Weasels came and tore his flesh from his body: At last through anguish and grief of minde, he slew himself. These things are reported by *Heraclides*, which whether they be true or false, are but a silly and slender foundation to build upon them a Propheticall opinion, or presage future evils; and so I will leave the morall part of the Weasel, and return again to the naturall. They have knowledge like Mice and Rats, to run out of houses before their downfall. They live in hatred with the Serpent that hunteth Mice, for by eating of Rue they drive them out of houses wherein they inhabit; and this is a wonderfull work of God, that this silly beast should have the knowledge of the vertue of that herb, and not only arm her self with it, because it is hatefull to Serpents, and they in no wise in nature able to abide it, but also by it to restore to life again her young ones after they are dead.

There is a poyson in Weasels which destroyeth the Cockatrice, for when the Weasel findeth the Cockatrices hole or den, she layeth her poyson in the mouth thereof, whereby two contrary natures meet and fight, and the lesser overcometh the greater; and this is affirmed both by *Pliny* and *Solinus*; wherefore all manner of Cattle do fear Weasels. They hunt all manner of birds, pulling out their throat as a Wolf doth a Sheeps. They will play with Hares till they have wearyed them, and then destroy them; they are in perpetuall enmity with Swine, Ravens, Crows, and Cats, for although Cats sometimes set upon them, yet they cannot overcome them. In many places of *Italy* they are nourished tame, for as Ferrets are used to fetch Conies out of the earth, so are Weasels by tying a string about their neck, to fetch young Pigeons out of Dove-cotes, and birds out of their nests. If the powder of a Weasel be given unto a Cock, Chickens, or Pigeons, it is said, they shall never be annoyed by Weasels.

Likewise if the brain of a Weasel be mingled with a rennet in Cheeses, it keepeth them from being touched with mice or corrupted with age. The flesh of a Weasel is not used for meat, but dried and preserved for medicines. The powder thereof mixed with water, driveth away Mice, by casting the gall of *Stellius* in a house where Weasels are gathered together, and then by Oyl of bitter Almonds, or salt Ammoniak they are killed, but if one of their tails be cut off, all the residue do forsake the house. And thus much shall suffice concerning the History of Weasels, now followeth the medicines arising out of their bodies.

The Medicines arising from the Weasel.

U. sinus.

A Weasel being applyed unto those which are troubled with Agues or Quartern Feavers, doth in short time cure them. It doth also being mingled with other things make a wonderfull pleasant mollifying medicine for those which are troubled with the gout, or any other infirmity in the joynts, and easeth those which have a continuall ache in the head, leaving a certain matter on the top thereof, and stroaking it from the forehead to the hinder part of the head.

Ætius.

For the curing also of the gout, this is an excellent remedy. To take a little young whelp alive, well fattened, and a living VVeasel in nine pints of Oyl, and unto the same two or three pounds of Butter, and to boyl them together, untill the beasts be made lank or lithier, and then to put your hands or feet a whole day in hot Oyl well strained. *Avicenna* attributeth certain things to VVeasels flesh only, which the classically Authors rather ascribe to the powder of VVeasels which are these: to be applyed to the gout, being drunk in wine against the Falling sicknesse, and the head-ache, but it is accounted an especiall remedy against the bitings of Scorpions.

Avicenna.

The flesh of a VVeasel being taken is a very good and effectually preservative against all poysons. The same being taken in meat, the head and feet only cast away, doth help those which are troubled with wens or bunches in the flesh, being first anoynted with the blood of the same beast. The blood of a VVeasel is very well applyed to broken or exulcerated sores in the flesh. The same vertue hath the whole body of a Weasel, boyled in wine, being in the manner of a plaister placed thereunto. For the expelling of the gout take a dead Weasel, and boyl him in Oyl, untill it be made liquid, then strain forth the Oyl, and mingle it with wax, fashioning the same in the form of a plaister, and this being in good order applyed, will in very short time expell it quite away.

Theophrastus.

A house Weasel is wont to be burned for divers remedies, and to be embowelled with salt, and dried in a shade. But there are some late writers which affirm, that a Weasel is better being dried or burned for the said disease, then used in the aforesaid manner, some also which are more foolish, think it best, being only salted, but it is more proper, being used in the first manner.

Dioscorides.

The bodies of creatures which are dry by nature being dried by the sprinkling of salt upon them, are unmeet for food, for a certain man going about to salt a Hare, made it like unto a dried VVeasel. Some have writen that the flesh of a Hedge-hog dried, doth very much profit those which are troubled with an outward or inward leprosie: which if it can effect, it will more strongly have a drying force or power: even as the flesh of a VVeasel being dried, and drunk in wine, expelleth poyson. A vulgar VVeasel being kept very old, and drunk in wine, to the quantity of two drams, is accounted a present remedy against the venom or stings of Serpents.

Galen.

A young VVeasel being prepared, as is before said, that is to say embowelled with salt, is of good force against all ill medicines. A VVeasel used in the same manner doth presently cure the bites of Serpents. A VVeasel being burnt and dried, especially the belly thereof, is accounted an excellent remedy against the bitings of any other wilde beast. Some small part of the belly of a young VVeasel, to the quantity of two drams being stuffed with Coriander, and drunk in wine, is given to those that are smitten by Serpents, and is curable for them. The flesh of a VVeasel being burnt, mingled with Rue and wine, and so drunk, is very medicinable for the curing of the bites of all creatures. The young whelps of VVeasels being imbowed with salt, is very profitable for the healing of the deadly stinging or biting of the Spider called *Phalangium*.

Pliny.

Albertus.

The whelp of a Weasel doth cure the venomous bitings of the Shrew. The flesh of a Weasel being dried, doth strongly drie and separate, by both which forces those are healed which are troubled with the Falling sicknesse having drunk it in wine. This vertue is also attributed unto the blood of Weasels. A Weasel being dried and drunk in wine, doth heal those that are troubled with the Palsie or shaking of the joynts. Concerning the powder of Weasels, there are many things read: But *Galen* writeth, that he never burned this creature, that he might try the excellency thereof. The blood and powder of a Weasel are very profitable, being anoynted on those whose bodies are vexed with the leprosie, according to the saying of *Serenus* in these verses;

Serenus.

Elephanti

*Morbo adversus erit cedri de cortice succus,
Mustelave cinis vel fusus sanguis ab illa.*

Myresus.

The powder of a Weasel being mingled with the blood of a young Swallow doth heal the Quinsie or Squinsie, the inflammation of the jawes, as also those which are grieved with the strangury, being either taken in bread or in drink. The same is also very effectually for the expelling of wens or bunches in the body, and healeth those which are troubled with the Falling sicknesse, being dayly taken in drink. The same diseases are both healed by this medicine, to burn a living Weasel altogether in an earthen pot, and to mingle with the powder thereof Hony, Turpentine, and Butter, of each a sufficient quantity, and in the manner of an Oyntment, to apply it unto the bodies of the grieved parties. The blood of a Swallow and a Weasel are commended by some to be very congruent and agreeable, but *Pliny*, *Avicenna*, and the rest of the antient writers commend the blood of a Weasel only to be very medicinable for these diseases following; namely, the Falling sickness, the Foul evil, and the head-ache.

The

The powder of a Weasel being mingled in water, and given to one that is mad or frenzy to drink, *Pliny.* is reported by some to be very good and profitable for him, if so be that they can compell the frantick person to perceive it. The powder of a Weasel is very effectually for the expelling or taking away of the pin and web in the eyes. There is a speedy remedy for the driving away of rheum in the head, and the Catarrh swelling by rheum in the jawes, which is this, To take a Weasel upon a Thursday in the old Moon, and put him alive in an unburned pot, that in the Boyling he may be torn, and dried into powder, which powder being gathered together and well tempered with Hony, to give it to the diseased person every day in a spoon fasting, to the quantity of three drams, and it will in short space wonderfully ease him.

A Weasel being burnt, and the powder thereof wrapped in some sear-cloth which is anoynted over with the Oyl of Flower-deluces, doth help and heal all sores or impostumes proceeding from the head to the ears, being applyed thereunto. A VVeasel being beaten to powder, mingled with *Galen.* wax, and in the manner of a sear-cloth applyed unto the shoulders, doth expell all pains, aches, or griefs therein whatsoever; it doth also purge or cleanse sores very effectually, according to these Verses of *Serenus* following;

*Obscenos si pone locos nova vulnera carpant,
Horrentum marisa curantur fronde ruborum.
Et si jam veteri succedit fistula morbo,
Mustela cinere immisso purgabitur ulcus,
Sanguine cum ricini, quem bos gestaverit ante.*

A VVeasel being burned in an earthen pot, is very medicinable for the curing of the gout. The powder thereof being mingled with Vinegar, and in that manner thereunto applyed. The *Dioscorides.* dust of a living VVeasel burnt, mingled with wax Rose-water, and anoynted with a Feather upon gouty legs, cureth the same disease. The brain of a VVeasel being kept very long, and thoroughly dried, afterwards mingled with Vinegar, and so drunk, doth very effectually cure the falling sickness.

The brains of a Camel mingled with the brains of a VVeasel, being both well dried, and drunk *Rasis.* in Vinegar, speedily helpeth those which are troubled with the disease called the Foul evil. If a horse shall fall into a suddain disease (being for the most part termed dangerous) which our Countrey-men call *Ræch*, concerning which I have spoken in the Horse, he is cured by some Horse-courfers by a small quantity of a VVeasels skin, being about the bignesse of a foresaid golden Crown) which is given to him inwardly, whether in a potion by some horn, or cut small and mingled with chaffe, I know not. Some do give to the Horses troubled with the aforesaid disease the tail of a white VVeasel being half black, and half white, cut exceeding small in their chaffe or provender. If a Serpent or any other venomous creature shall sting or bite an Oxe, let the wounded place be stroked or smoothed with the skin of a VVeasel, and it shall in short time be perfectly cured. The same they do in a manner command to be done to Horses which are so stung or bitten, rubbing the wound with a Weasels skin untill it wax hot, ministring in the mean time some certain Antidote within the Horses body. There are some also which are of opinion that the skin being in the said manner applyed, is of no efficacy, but that the whole beast being cut and applyed while it is hot, will rather profit, which both in a Shrew, as also in many other creatures is manifest.

The blood of a Weasel being anoynted upon any impostume arising behinde the ear, doth instantly cause the swelling to cease, or being broken, doth speedily heal the sore. The same also being anoynted upon any impostumes in the head either whole or broken, doth very effectually cure them. The blood of a Weasel being anoynted upon wens or bunches of flesh in any part of the body doth instantly expell them. The same doth also help those which are troubled with the Falling sickness: which disease is also cured by the whole body of a VVeasel either burnt or embowelled with salt. The head and feet of a VVeasel being cast away, and the body taken in any kinde of drink, doth perfectly heal those which are troubled with that pestiferous disease called *S. Johns* evil. The blood of the same same beast is an excellent remedy for the expelling of the foul evil. The blood of a Weasel being anoynted upon broken or exulcerated bunches in the flesh, doth not only mitigate the pain, but also heal the wounds. The blood of a Weasel being anoynted upon the jawes, doth heal all pains or sores therein whatsoever. The powder and blood of a Weasel being both mingled together, and anoynted upon the body of any leprous man, doth in short time drive away all scabs or scurfs thereon. The blood of a VVeasel being anoynted with a Plantain upon the legs or feet of any one that is troubled with the gout, doth very speedily mitigate or assuage the pain thereof. The same being anoynted upon the nervs or sinewes which are shrunk together, doth easily mollifie them again, and loosen the grievous pain either in the joynts or articles. The liver of a VVeasel mingled with his own brains, being both well dried, and taken in any kinde of drink, doth very much profit those which are troubled with the disease called *S. Johns* evil. The liver of a VVeasel, being throughly dried, and afterwards taken in water to drink, doth heal the disease called the Foul evil, taking hold of sense and minde together: but there must great care be had that this medicine be ministring unto the sick party, even when the disease is coming on him. The gall of a Hare being mingled with the liver of a VVeasel to the quantity of three drams, one dram of Oyl of Beavers stones, four drams of Myrrhe, with one dram of Vinegar, and

Sextus.

Pliny.

Kiranides.

Æginetta.

Avicenna.

Ælianus.

and drunk in hony, or bastard wine, doth heal those which are troubled with a dizzinesse or certain swimming in the head. The liver of a Weasel is reported to be very good and medicinable for the curing of the Lethargy, or Dropsie evil. The liver of a Weasel being bound to the left foot of a woman, doth altogether hinder her from conception. The gall of a Weasel is a very excellent and effectuell remedy against the venom or poyson of Asps, being taken in any kinde of drink. The yard of a Weasel, Hart, or Doe, being dried, and beaten to powder, and taken in wine, or any other drink, is an excellent medicine for the curing of the bites or stings of Serpents. The yard of a Weasel or Ferret, is commended for a very excellent remedy against the strangury, or disease called the Colick and stone. The stones of a male Weasel, or the secret parts of a female Weasel, is reported by some to be very medicinable for the curing of the Falling sicknesse. The stones of a Weasel being bound unto any part of a woman while she is in travail of childe birth, doth altogether hinder her from her delivery. By the left stone of a Weasel being bound in a piece of a Mules hide, there is a certain medicine made, which being drunk by any woman not being with childe, causeth barrennesse, as also by women being with childe, hard and grievous pain in delivery. The efficacy or force in them, have the stones of a Weasel being cut off in the change of the Moon, and he suffered to go away alive, being tied upon any part of a woman in the hide of a Mule. The heel of a living Weasel being taken away and bound unto a woman, doth make her that she shall not conceive so long as she shall so bear it. The powder of a Dogs head dried, being put into any broken or exulcerated sores, doth eat away all the corruption or dead flesh encreasing therein. The same vertue hath the powder of Weasels dung, being used in the said manner.

The dung of Mice or of a Weasel, being anoynted upon the head, is an excellent remedy for the falling off of the hair on the head, or any other part of mans body, and doth also cure the disease called by some the Foxes evil. The biting of a Weasel is reported by some to be very venomous, and in his ravening or madnesse not to be lesse hurtfull then the bitings of mad Dogs. For Weasels and Foxes are very often mad. But *Arnoldus* is of a contrary opinion, and affirmeth that the Weasel doth more hurt by his biting, then by any venom he can put forth. Others also do affirm, that there is venom in Weasels for this cause, that in all kinde of Weasels when they are angry, the force of their smell is so rank and strong. The best way to drive away Mice, is by scattering the powder of Weasels or Cats dung up and down, the savour whereof Mice cannot abide, but the same being made into some certain kinde of bread will smell more strongly. That the bites of a Weasel are venomous and deadly, there is an example written by *Aristides*, of a certain man, who being bitten by a Weasel, and ready to die, gave a great sigh, and said, that if he had died by a Lyon or Panther, it would never have grieved him, but to die by the biting of such an ignoble beast, it grieved him worse then his death. The biting of a Weasel doth bring very quick and grievous pain, which is only known by the colour, being dusky or blewish: and it is cured by Onions and Garlick, either applyed outward, or taken in drink, so that the party drink sweet wine thereon. Unripe Figs also mingled with the flour of the grain called *Orobos*, doth much profit the same. Treacle in like manner being applyed in the manner of a plaister, speedily cureth them. Garlick being mingled with Fig-tree leaves and Cinamon, and so beaten together, are very well applyed to the said bites. It cometh also to passe, that sometimes the Weasel biteth some Cattell, which presently killeth them, except there be some instant remedy. The remedy for it is this, to rub the wounded place with a piece of a Weasels skin well dryed untill it waxe hot, and in the mean time give the best Treacle to drink in the manner of an antidote. The Weasel usually biteth Cowes dugs, which when they are swollen if they be rubbed with a Weasels skin they are instantly healed.

Of the WOLF.

The severall
names.
Æsculapius.

A Wolf is called in Hebrew *Zeeb*, as it is said in *Gen. 49.* and among the *Chaldeans*, *Deeba* and *Deba*, among the *Arabians* *Dib*. The female is called *Zebab* a she-Wolf, and the masculine *Zee-bim*, but in *Ezek. 22.* it is called *Zebeth*, that is to say, a Wolf. *Allebba* (saith *And. Bellun.*) is a common name for all Four-footed beasts which do set on men, killing and tearing them in pieces, devouring

devouring them with their teeth and claws, as a Lyon, a Wolf, a Tiger, and such like, whereon they are said to have the behaviour of *Alsebbas*, that is, wilde beasts which are fierce and cruel. From hence happily cometh it, that not only *Albertus*, but also some ignorant Writers do attribute unto a Wolf many things which *Aristotle* hath uttered concerning a Lyon.

Oppianus among the other kinde of Wolves hath demonstrated one which is bred in *Cilicia*. And also he doth write, that it is called in the mountains of *Taurus* and *Amannus*, *Chryseon*, that is to say, *Aureum*, but I conjecture that in those places it was called after the language of the *Hebrewes* or *Syrians* which do call *Sabab*, or *Schab aurum*, and *Seeb Lupum* for a Wolf, or *Dahab*, or *Debab* for *Aurum*: They also do call *Deb* or *Deeba* for a Wolf: *Dib* (othertherwise *Dijb*) is an *Arabian* or *Sageneian* word: Also the translation of this word in the book of medicines is divers, as *Adib*, *Adep*, *Adhip*, and *Aldip*: but I have preferred the last translation, which also *Bellunensis* doth use. *Aldip Alambat* doth signifie a mad or furious Wolf. The Wolf which *Oppianus* doth call *Aureum*, as I have said even now, doth seem to agree to this kinde, both by signification of the name *Aurum*, and also by the nature, because it doth go under a Dog close to the earth, to eschew the heat of the Summer, which *Oppianus* doth write, doth seek his food out of hollow places, as a Hyena or *Dabb* doth out of graves where the dead men are buried. The golden coloured Wolf is also more rough and hairy then the residue, even as the Hyena is said to be rough and maned. And also these Wolves necks in *India* are maned, but it differeth according to the nation and colour where there are any Wolves at all.

Lycos a Wolf among the *Grecians*, and *Lugos*, and *Lucania*, and *Lycos*, among some of the *Arabian* Writers, is borrowed from them, as *Munster* hath noted in his *Lexicon* of three languages. In *Italy* it is called *Lupo*. In *French* *Loup*, in *Spain* *Lobo*, in *Germany* *Vulff*, in *England* *Wolf*. In *Illyria* *Vulk*, as it were by a transposition of the letters of the *Greek* word. Now because both men, women, Cities, places, Mountains, Villages, and many artificiall instruments have their names from the *Latine* and *Greek* words of this beast, it is not vaine or idle to touch both them and the derivation of them, before we proceed to the naturall story of this beast. *Lupus* as some say in *Latine* is *Quasi* *Leopos*, Lyon-footed; because that it resembleth a Lyon in his feet, and therefore *Isidorus* writeth, that nothing liveth that it presseth or treadeth upon in wrath. Other derive it from *Lukes*, the light, because in the twilight of the evening or morning it devoureth his prey, avoiding both extreme light, as the noon day, and also extreme darknesse as the night. The *Grecians* do also call them *Nycterinoi canes*, dogs of the night. *Lupa* and *lupula* were the names of noble devouring Harlots, and from thenceforth cometh *Lupanar* for the stews. It is doubtfull whether the nurse of *Romulus* and *Remus* were a Harlot, or she-wolf, I rather think it was a Harlot then a Wolf that nursed those children. For we read of the wife of *Fostulus*, which was called *Laurentia*, after she had played the whore with certain Shepherds was called *Lupa*. In all Nations there are some mens names derived from Wolves, therefore we read of *Lupus* a *Roman* Poet, *Lupus Servatus* a Priest or Elder, of *Lupus de Oliveto* a *Spanish* Monk, of *Fulvus Lupinus* a *Roman*, and the *Germans* have *Vulf*, *Vulfe*, *Hart*, *Vulfegang*.

The *Grecians* have *Lycambes*, of whom it is reported he had a daughter called *Neobole*, which he promised in marriage to *Archilochus* the Poet, yet afterwards he repented and would not perform his promise, for which cause the Poet wrote against him many bitter Verses, and therefore *Lycambes* when he came to knowledge of them, dyed for grief. *Lycæon* was a common name among the *Grecians* for many men, as *Lycæon Gnotius* an excellent maker of edged tools. *Lycæon* the brother of *Nestor* another, the son of *Priamus* slain by *Achilles*: But the famous and notorious among all, was *Lycæon*, the King of *Arcadia*, the son of *Titan* and the earth, whose Daughter *Calisto* was deflowred by *Jupiter*, and by *Juno* turned into a Bear, whom afterwards *Juno* pitying, placed for a sign in heaven, and of whom *Virgil* made this Verse;

Pleiadas, Hyadas, claramque Lycæonis Arcton.

There was another *Lycæon* the son of *Pelæsus*, which built the City *Lycosui*, in the Mountain *Lyceus*, this man called *Jupiter Lyceus*, upon a time sacrificed an Infant upon his Altar, after which sacrifice he was presently turned into a Wolf. There was another *Lycæon* after him, who did likewise sacrifice another childe, and it was said, that he remained ten years a Wolf, and afterwards became a man again: whereof the reason was given, that during the time he remained a beast, he never tasted of mans flesh, but if he had tasted thereof he should have remained a beast for ever. I might adde hereunto *Lycophron*, *Lycastus*, *Lycimnius*, *Lycinus*, *Lycomedes*, *Lycurgus*, *Lycus*, and of womens names, *Lycæa*, *Lyce*, *Lycaste*, *Lycoris*, *Lycias*, and many such others, besides the names of people, as *Ipinia*, of Mountains and places, as *Lycabetus*, *Lyceus*, *Lycæna*, *Lycæonia*, *Lycæspus*, *Lycæum* *Aristotles* School. Of founts and Rivers, as *Lycus*, *Lycormis*. Of Plants, as *Wolfbane*, *Lupum salicarium*, *Lupinus*, *Lycanthemum*, *Lycophrix*, *Lycophone*, *Lycopsis*, *Lycocitation*, and many such others, whereof I have only desired to give the Reader a taste, following the same method that we have observed in other beasts: And thus much shall suffice to have spoken of the names of this beast.

The Countreys breeding Wolves, are for the most part these that follow. The inhabitants of *Crete* were wont to say, that there was neither Wolves, Bears, nor Vipers could be bred in their Island, because *Jupiter* was born there; yet there is in a City called *Lycastus*, (so named for the multitude of Wolves that were abiding therein.) It is likewise affirmed of *Sardinia*, and *Olympus*.

a Mountain of *Macedonia*, that there come no Wolves in them. The Wolves of *Egypt* are lesse then the Wolves of *Greece*, for they exceed not the quantity of Foxes. *Africa* likewise breedeth small Wolves, they abound in *Arabia*, *Suevia*, *Rhetia*, *Atbesis*, and the Earldome of *Tyrol* in *Muscovia*, especially that part that bordereth upon *Lituania*. The Wolves of *Scanzia*, by reason of extremity of cold in those parts, are blinde and lose their eyes: There are no Wolves bred in *Lombardy* beyond the *Alpes*, and if any chance to come into that Countrey, presently they ring their Bells, and arm themselves against them, never giving over till they have killed him, or drove him out of the Countrey. In *Norway* there are three kinde of Wolves, and in *Scandinavia* the Wolves fight with Elks. It is reported that there are Wolves in *Italy*, who when they look upon a man, cause him to be silent that he cannot speak. The *French* men call those Wolves which have eaten of the flesh of men *Encharnes*. Among the *Crotoniate* in *Meotis*, and divers other parts of the world, Wolves do abound: there are some few in *France*, but none at all in *England*, except such as are kept in the Tower of *London*, to be seen by the Prince and people, brought out of other Countreys, where there fell out a rare accident, namely, a Mastive Dog was limed to a she-Wolf, and she thereby conceived, and brought forth six or seven young Whelps, which was in the year of our Lord 1605. or thereabouts.

The severall
kinds of
Wolves.

There are divers kinds of Wolves in the world, whereof *Oppianus* in his admonition to Shepherds, maketh mention of five, the first is a swift Wolf, and runneth fast, called therefore *Toxenter*, that is, *Sagittarius*, a shooter. The second kinde are called *Harpages*, and these are the greatest raveners, to whom our Saviour Christ in the Gospel compareth false Prophets, when he saith, *Take heed of false Prophets which come unto you in Sheeps clothing, but are inwardly Lycos Harpages, ravening Wolves*; and these excell in this kinde. The third kinde is called *Lupus aureus* a golden Wolf, by reason of his colour; then they make mention of two other kinds, (called *Acmonæ*) and one of them peculiarly *læmus*.

Oppianus.

The first, which is swift, hath a greater head then other Wolves, and likewise greater legs fitted to run, white spots on the belly, round members, his colour betwixt red and yellow, he is very bold, howleth fearfully, having fiery-flaming eyes, and continually wagging his head. The second kinde hath a greater and larger body then this, being swifter then all other; betimes in the morning he being very hungry, goeth abroad to hunt his prey; the sides and tail are of a silver colour, he inhabiteth in the Mountains, except in the Winter time, wherein he descendeth to the gates of Cities or Towns, and boldly without fear killeth both Goats and Sheep, yet by stealth and secretly.

The third kinde inhabiteth the white Rocks of *Taurus* and *Silicia*, or the tops of the hill *Amannus*, and such other sharp and inaccessible places, being worthily for beauty preferred before the others, because of his golden resplendent hairs: and therefore my Author saith, *Non Lupus sed Lupoprestantior fera*. That he is not a Wolf, but some wilde beast excelling a Wolf. He is exceeding strong, especially being able with his mouth and teeth to bite asunder not only stones, but Brasse and Iron: He feareth the Dog star, and heat of Summer, rejoycing more in cold then in warm weather, therefore in the Dog dayes he hideth himself in some pit or gaping of the earth, untill that Sunny heat be abated. The fourth and fifth kinds are called by one common name *Acmonæ*, now *Acmon* signifieth an Eagle, or else an Instrument with a short neck, and it may be that these are so called in resemblance of the ravening Eagle, or else because their bodies are like to that instrument, for they have short necks, broad shoulders, rough legs and feet, and small snowts, and little eyes: herein they differ one kinde from the other, because that one of them hath a back of a silver colour, and a white belly, and the lower part of the feet black, and this is *læmus canus*, a gray Kite-wolf; the other is black, having a lesser body, his hair standing continually upright, and liveth by hunting of Hares. Now generally all Authors do make some two, some three, some four, and some five kinds of Wolves, all which is needlesse for me to prosecute, and therefore I will content my self with the only naming of such differences as are observed in them, and already expressed, except the *Thoes* and the sea-Wolf, of whom there shall be something said particularly in the end of this History. *Olaus Magnus* writeth, in his History of the Northern Regions, that in the Mountains called *Doffrini*, which do divide the Kingdomes of *Swetia* and *Norway*, there are great flocks or herds of Wolves of white colour, whereof some wander in the Mountains, and some in the vallies. They feed upon little, small, and weak creatures, but there are also wilde common Wolves, who lie in wait to destroy their herds of Cattell, and flocks of Sheep, against whom the people of the Countrey do ordain generall huntings, taking more care to destroy the young ones then the old, that so the breeders and hope of continuance may be taken away. And some also do keep of the Whelps alive, shutting of them up close and taming them, especially females, who afterwards engender with Dogs, whose Whelps are the most excellent keepers of flocks, and the most enemies to Wolves of all other.

Wolves are
not wilde
Dogs.

There be some have thought that Dogs and Wolves are one kinde; namely, that vulgar Dogs are tame Wolves, and ravening Wolves are wilde Dogs. But *Sealiger* hath learnedly confuted this opinion, shewing that they are two distinct kinds, not joyned together in nature, nor in any natural action, except by constraint; for he saith, that there are divers wild Dogs that are not Wolves, and so have continued for many years in a hill called *Mountfalcon*, altogether refusing the society and service of men, yea, sometimes killing and eating them; and they have neither the face, nor the voyce, nor the stature, nor the conditions of Wolves, for in their greatest extremity of hunger, they never set upon flocks of Sheep: so that it is unreasonable to affirm, that Wolves are wilde Dogs, although it must needs be confessed, that in outward proportion they are very like unto them.

Some

Some have thought that Wolves cannot bark, but that is false (as *Albertus* writeth) upon his own knowledge, the voyce of Wolves is called *Ululatus*, howling, according to these verses;

The voices of Wolves.

Ast Lupus ipse ululat, frendet agrestis aper;

And again:

Per noctem resonare Lupis ululantibus urbes.

It should seem that the word *Ululatus*, which the Germans translate *Heulen*, the French, *Hurler*; and we in English, howling, is derived either from imitation of the beasts voice; or from a night whooping Bird called *Uula*; I will not contend, but leave the Reader to either of both; for it may be that it cometh from the Greek word *Oluluzein*, which signifieth to mourn and howl after a lamentable manner, and so indeed Wolves do never howl, but when they are oppressed with famine: And thus, I leave the discourse of their voyce with the annotation of *Servius*: *Ululare Canum est & Furiarum*. To howl is the voyce of Dogs and Furies. Although there be great difference of colours in Wolves, as already I have shewed, yet most commonly they are gray and hoary, that is, white mixed with other colours, and therefore the Grecians in imitation thereof, do call their twy-light which is betwixt day and night, as it were participating of black and white *Lycophos*, Wolf-light, because the upper side of the Wolves hair is brown, and the neather part white. It is said, that the shaggy hair of a Wolf is full of vermin and worms, and it may well be, for it hath been proved, that the skin of a Sheep which was killed by a Wolf breedeth worms.

The brains of a Wolf do decrease and increase with the Moon, and their eyes are yellow, black, and very bright, sending forth beams like fire, and carrying in them apparent tokens of wrath and malice; and for this cause it is said, they see better in the night then in the day, being herein unlike unto men, that see better in the day then in the night, for reason giveth light to their eyes, and appetite to beasts, and therefore of ancient time the Wolf was dedicated to the Sun, for the quickness of his seeing sense, and because he seeth far. And such as is the quickness of his sense in seeing, such also it is in smelling, for it is reported, that in time of hunger by the benefit of the winde, he smelleth his prey a mile and a half or two mile off: for their teeth they are called *Charcharodontes*, that is sawed, yet they are smooth, sharp, and unequal, and therefore bite deep, as we have shewed already, for this cause the sharpest bits of Horses are called *Lupata*.

The several parts.

Calius.
Stumpfius.

All beasts that are devourers of flesh do open their mouths wide, that they may bite more strongly, and especially the Wolf. The neck of a Wolf standeth on a straight bone that cannot well bend, therefore like the Hyæna, when he would look backwards he must turn round about, the same neck is short, which argueth a treacherous nature. It is said that if the heart of a Wolf be kept dry, it rendreth a most fragrant or sweet smelling savour. The liver of a Wolf is like to a Horses hoof, and in the bladder there is called a certain stone call'd *Syrites*, being in colour like Saffron or Hony, yet inwardly contains certain weak shining stars: this is not the stone called *Syriacus* or *Indicus*, which is desired for the vertue of it against the stone in the bladder. The fore-feet have five distinct toes, and the hinder-feet but four, because the fore-feet serve in stead of hands, in Lions, Dogs, Wolves, and Panthers. We have spoken already of their celerity in running, and therefore they are not compared to Lions which go foot by foot, but unto the swiftest Dogs. It is said they will swim, and go into the water two by two, every one hanging upon anothers tail, which they take in their mouths, and therefore they are compared to the days of the year, which do successively follow one another, being therefore called *Lucabus*. For by this successive swimming they are better strengthened against impression of the floods, and not lost in the waters by any over-flowing waves or billows. Great is the voracity of this beast, for they are so insatiable that they devour hair and bones with the flesh which they eat, for which cause they render it whole again in their excrements, and therefore they never grow fat. It was well said of a learned man: *Lupus vorat potius quam comedit carnes, & pauco utitur potu*. That is, A Wolf is said rather to raven than to eat his meat.

The meat and voracity of Wolves.

When they are hungry they rage much, and although they be nourished tame, yet can they not abide any man to look upon them while they eat; when they are once satisfied, they endure hunger a great time, for their bellies standeth out, their tongue swelleth, their mouth is stopped, for when they have drove away their hunger with abundance of meat, they are unto men and beasts as meek as Lambs, till they be hungry again, neither are they moved to rapine, though they go through a flock of sheep: but in short time after, their bellies and tongue are calling for more meat, and then saith mine Author: *In antiquam figuram redit, iterumque Lupus existit*. That is, They return to their former conditions, and become as ravening as before. Neither ought this to seem strange unto any man, for the like things are formerly reported of the Lion; and it is said that Wolves are most dangerous to be met with all towards the evening, because of their fasting all the day before, and for this is alleadged the saying of holy Scripture where the Prophet makes mention of *Lupi Vespertini*, but we have shewed already in the story of the Hyæna, what those signifie.

Ælianus.
Philes.

It is said that Wolves do also eat a kinde of earth called *Argilla*, which they do not for hunger, but to make their bellies waigh heavy, to the intent, that when they set upon an Horse, an Ox, a Hart, an Elk, or some such strong beast, they may weigh the heavier, and hang fast at their throats till they have pilled them down; for by vertue of that tenacious earth, their teeth are sharpened, and the weight of their bodies encreased; but when they have killed the beast that they

Albertus.

they set upon, before they touch any part of his flesh, by a kinde of natural vomit, they disgorge themselves, and empty their bellies of the earth, as unprofitable food.

The remainder of their meat they always cover in the earth; and if there be many of them in hunting together, they equally divide the prey among them all, and sometimes it is said, that they howl and call their fellows to that feast which are absent, if their prey be plentiful. Now this they have common with Lions, in their greatest extremity of hunger, that when they have election of a man and a beast, they forsake the man and take the beast. Some are of opinion, that when they are old, they grow weary of their lives, and that therefore they come unto Cities and Villages, offering themselves to be killed by men, but this thing by the relation of *Niphus* is a very fable; for he professeth that he saw an old Wolf come into a Village, and set upon a Virgin to destroy and eat her, yet he was so old that he had scarce any teeth in his head, but by good hap company being at hand, the Maid was saved, and the Wolf was killed.

Now those Wolves that are most sluggish and least given to hunting, are most ready to venture upon men, because they love not to take much pains in getting their living. This Wolf is called *Vinipeta*, but the industrious hunting Wolf *Kunegiseia*. It is reported that a Wolf will never venture upon a living man, except he have formerly tasted of the flesh of a dead man, but of these things I have no certainty, but rather do believe the contrary; that like as Tyrants in an evill grieved estate, do pick quarrels against every man that is rich for the spoil of their goods, accounting them their enemies, how well soever they have deserved at their hands: In like manner, Wolves in the time of their hunger fall upon all creatures that come in the way, whether they be men or beasts, without partiality, to fill their bellies, and that especially in the winter time, wherein they are not afraid to come to Houses and Cities.

They devour Dogs when they get them alone, and Elks in the Kingdom of Norway, but for Dogs it hath been seen, that they have lived in a kinde of society and fellowship with Wolves, but it was to steal and devour in the night time, like as Thieves do cover their malice and secret grudges one to other, when they are going about to rob true men. Wolves are enemies to Asses, Bulls, and Foxes, for they feed upon their flesh, and there is no beast that they take more easily then an Ass, killing him without all danger, as we have shewed already in the story of an Ass.

They also devour Goats and Swine of all sorts, except Boars, who do not easily yeeld unto Wolves. It is said that a Sow hath resisted a Wolf, and that when he fighteth with her, he is forced to use his greatest craft and subtlety, leaping to and from her with his best activity, lest she should lay her teeth upon him, and so at one time deceive him of his prey, and deprive him of his life. It is reported of one that saw a Wolf in a Wood, take in his mouth a piece of Timber of some thirty or forty pound weight, and with that he did practise to leap over the trunk of a tree that lay upon the earth; at length when he perceived his own ability and dexterity in leaping with that weight in his mouth, he did there make his cave and lodged behinde that tree; at last it fortuned there came a wilde Sow to seek for meat along by that tree, with divers of her Pigs following her, of different age, some a year old, some half a year, and some less. When he saw them near him, he suddenly set upon one of them, which he conjectured was about the weight of wood which he carryed in his mouth, and when he had taken him, whilst the old Sow came to deliver her Pig at his first crying, he suddenly leaped over the tree with the Pig in his mouth, and so was the poor Sow beguiled of her young one, for she could not leap after him, and yet might stand and see the Wolf to eat the Pig which he had taken from her. It is also said, that when they will deceive Goats, they come unto them with the green leaves and small boughs of *Ofiers* in their mouths, wherewithal they know Goats are delighted, that so they may draw them therewith, as to a bait to devour them.

Their manner is when they fall upon a Goat or a Hog, or some such other Beast of small stature, not to kill them, but to lead them by the ear with all the speed they can drive them to their fellow Wolves, and if the beast be stubborn and will not run with him, then he beateth his hinder-parts with his tail, in the mean time holding his ear fast in his mouth, whereby he causeth the poor Beast to run as fast or faster then himself unto the place of his own execution, where he findeth a crew of ravening Wolves to entertain him, who at his first appearance seize upon him, and like Devils tear him in pieces in a moment, leaving nothing uneaten but only his bowels.

But if it be a Swine that is so gotten, then it is said, that they lead him to the waters, and there kill him, for if they eat him not out of cold water, their teeth doth burn with an intolerable heat. The Harts when they have lost their horns do lie in secret, feeding by night for fear of the Wolves, untill their horns do grow again, which are their chiefest defence. The least kinde of Wolves we have shewed already, do live upon the hunting of Hares, and generally all of them are enemies to sheep, for the foolish sheep in the day time is easily beguiled by the Wolf, who at the sight of the Sheep maketh an extraordinary noise with his foot, whereby he calleth the foolish Sheep unto him, for standing amazed at the noise he falleth into his mouth and is devoured: but when the Wolf in the night time cometh unto a fold of Sheep, he first of all compasseth it round about, watching both the Shepherd and the Dog, whether they be asleep or awake, for if they be present and like to resist, then he departeth without doing any harm, but if they be absent or asleep, then loseth he no opportunity, but entereth into the fold, and falleth a killing, never giving over till he have destroyed all, except he be hindered by the approach of one or other; for his manner is not to eat any till he have killed all, not because he feareth the over-livers will tell tales, but for that his

Tutor.
Albertus.

his insatiable minde thinketh he can never be satisfied, and then when all are slain he falleth to eat one of them.

Now although there be great difference betwixt him and a Bull both in strength and stature, yet is he not afraid to adventure combat, trusting in his policy more then his vigor, for when he setteth upon a Bull, he cometh not upon the front for fear of his horns, nor yet behinde him for fear of his heels, but first of all standeth aloof from him, with his glaring eyes, daring and provoking the Bull, making often proffers, to come near unto him, yet is wise enough to keep aloof till he spy his advantage, and then he leapeth suddenly upon the back of the Bull at the one side, and being so ascended, taketh such hold that he killeth the Beast before he loosen his teeth. It is also worth the observation, how he draweth unto him a Calf that wandereth from the dam, for by singular treachery he taketh him by the nose, first drawing him forward, and then the poor Beast striverth and draweth backward, and thus they struggle together, one pulling one way, and the other another, till at last the Wolf perceiving advantage, and feeling when the Calf pulleth heavyest, suddenly he letteth go his hold, whereby the poor Beast falleth back upon his buttocks, and so down right upon his back; then flyeth the Wolf to his belly which is then his upper part, and easily teareth out his bowels, so satisfying his hunger-greedy appetite: But if they chance to see a Beast in the water, or in the marsh, encombred with mire, they come round about him, stopping up all the passages where he should come out, baying at him, and threatening him, so as the poor distressed Ox plungeth himself many times over head and ears, or at the least wise they so vex him in the mire, that they never suffer him to come out alive. At last when they perceive him to be dead and clean without life by suffocation; it is notable to observe their singular subtilty to draw him out of the mire, whereby they may eat him; for one of them goeth in, and taketh the Beast by the tail, who draweth him with all the power he can, for wit without strength may better kill a live Beast, then remove a dead one out of the mire: therefore he looketh behinde him and calleth for more help, then presently another of the Wolfs taketh that first Wolfs tail in his mouth, and a third Wolf the seconds, a fourth the thirds, a fifth the fourths, and so forward, encreasing their strength, until they have pulled the Beast out into the dry land: whereby you may see, how they torment and stretch their own bodies, biting their tails mutually, pinching and straining every joynt until they have compassed their desire, and that no man should think it strange for a Wolf to kill an Ox; it is reported that *Danaus* did build a Temple to *Apollo* at *Argos*, in the very same place where he saw a Wolf destroy an Ox, because he received instruction thereby, that he should be King of *Greece*. Wolfs are also enemies to the Buffes, and this is no marvail, seeing that it is confidently reported by *Ælianus*, that in time of great famine when they get no meat, they destroy one another; for when they meet together, each one bemoaning himself to other, as it were by consent they run round in a circle, and that Wolf which is first giddy, being not able to stand, falleth down to the ground, and is devoured by the residue, for they tear him in pieces, before they can arise again.

Pliny affirmeth that there be Wolfs in *Italy*, whose sight is hurtful to men, for when a man seeth one of them, though he have never so much desire to cry out, yet he hath no power: but the meaning of this is, as we find in other Writers, that if a Wolf first see a man, the man is silent, and cannot speak, but if the man see the Wolf, the Wolf is silent and cannot cry, otherwise the tale is fabulous and superstitious, and thereupon came the proverb *Lupus in fabula est*, to signifie silence. Now although these things are reported by *Plato*, *Ruellius*, *Vincentius*, and *Ambrose*, yet I rather believe them to be fabulous then true, howbeit *Albertus* writeth, that when a man is in such extremity, if he have power to loose his cloak or garment from his back, he shall recover his voyce again. And *Sextus* saith, that in case one of these Wolfs do see a man first, if he have about him the tip of a Wolfs tail he shall not need to fear any harm. There be a number of such like tales concerning Wolfs and other creatures, (as that of *Pythagoras*) A Beast making water upon the urine of a Wolf, shall never conceive with young. All domestical four-footed Beasts, which see the eye of a Wolf in the hand of a man, will presently fear and run away.

If the tail of a Wolf be hung in the cratch of Oxen, they can never eat their meat. If a Horse tread upon the foot-steps of a Wolf which is under a Horse-man or Rider, he breaketh in pieces, or else standeth amazed. If a Wolf treadeth in the foot-steps of a Horse which draweth a Waggon, he cleaveth fast in the rode, as if he were frozen.

If a Mare with Foal tread upon the foot-steps of a Wolf, she casteth her Foal, and therefore the *Egyptians* when they signifie abortment, do picture a Mare treading upon a Wolfs foot. These and such other things are reported, (but I cannot tell how true) as supernatural accidents in Wolfs. The Wolf also laboureth to overcome the Leopard, and followeth him from place to place, but forasmuch as they dare not adventure upon him single, or hand to hand, they gather multitudes, and so devour them. When Wolfs set upon wilde Boars, although they be at variance among themselves, yet they give over their mutual combats, and joyn together against the Wolf their common adversary. For these occasions a Wolf hath evermore been accounted a most fierce and wilde Beast, as may further appear by this History following. When *Euristines* and *Procles* intended to marry the Daughter of some *Grecian*, that so they might joyn themselves in perpetual league and amity by afinity, they went to *Delphos* to ask counsel of *Apollo* in what place they should meet with their wives. *Apollo* gave them answer, that when they should meet with an extreme wilde Beast, as they went into *Lacedemonia*, and yet the same Beast appear meek and gentle unto them, there they should

Men destroyed
by Wolves.

Celius.
Tzetzes.

The taking of
Wolves, and the
reward of the
hunters.

should take their wives. When they came into the land of the *Cleonians*, they met with a Wolf carrying a Lamb in his mouth, whereupon they conceived that the meaning of *Apollo* was, that when they met with a Wolf in that Countrey, they might very happily and successively take them wives, and so they did, for they married with the daughters of *Thefander Cleonymus*, a very honest man of that Countrey. It is reported of *Milo Crotoniata*, that valiant strong man, how upon a season rending a tree in sunder in the woods, one of his arms was taken in the closing of the tree, and he had not strength enough to loose it again, but remained there inclosed in most horrible torments, until a Wolf came and devoured him.

The like story unto this, is that which *Ælianus* reporteth of *Gelon* the *Syracusan*, a Scholar, unto whom there came a Wolf as he sat in the School writing on his Tables, and took the writing tables out of his hand. The Schoolmaster being enraged herewith, and knowing himself to be a valiant man, took hold of the same tables in the Wolfs mouth, and the Wolf drew the Master and Scholars in hope of recovery of the tables out of the School into a plain field, where suddenly he destroyed the Schoolmaster and a hundred Scholars, sparing none but *Gelon*, whose tables were a bait for that prey, for he was not only not slain, but preserved by the Wolf, to the singular admiration of all the world; whereby it was collected, that that accident did not happen naturally, but by the overruling hand of God: Now for these occasions, as also because that the wooll and skin of beasts killed by Wolves are good for nothing, (although the flesh of Sheep is more sweeter) are unprofitable and good for nothing.

Men have been forced to invent and finde out many devises for the destroying of Wolves, for necessity hath taught men much learning, and it had been a shameful misery to indure the tyranny of such spoiling beasts, without labouring for resistance and revenge: for this cause they propounded also a reward to such as killed VVolves, for by the law of *Draco*, he that killed a young VVolf received a talent, and that killed an old VVolf received two talents.

Solon prescribed that he that brought a VVolf alive, should receive five pieces of money, and he that brought one dead, should receive two. *Apollo* himself was called *Lycogonos*, a VVolf-killer, because he taught the people how to put away VVolves. *Horner* calleth *Apollo* *Lycegenes*, for that it is said immediately after he was born of his mother *Latona*, he was changed into the shape of a VVolf, and so nourished; and for this cause there was the Image of a VVolf set up at *Delphos* before him.

Others say, that the reason of that Image was, because that when the Temple of *Delphos* was robbed, and the treasure thereof hid in the ground, while diligent inquisition was made after the thieves, there came a VVolf and brought them to the place where the golden vessels were covered in the earth, which she pulled out with her feet. And some say that a VVolf did kill the sacrileger, as he lay asleep on the Mountain *Parnassus*, having all the treasure about him, and that every day she came down to the gates of *Delphos* howling, until some of the Citizens followed her into the Mountain, where she shewed them the thief and the treasure both together: But I list not to follow or stand upon these fables. The true cause why *Apollo* was called a VVolf-killer was, for that he was feigned to be a Shepherd or Herdsman, and therefore in love of his Cattle to whom VVolves were enemies, he did not only kill them while he was alive, but also they were offered unto him in sacrifice, for VVolves were sacred to *Apollo*, *Jupiter*, and *Mars*: and therefore we read of *Apollo Lycius*, or *Lyceus*, to whom there were many Temples builded, and of *Jupiter Lyceus*, the sacrifices instituted unto him called *Lycea*, and games by the same name. There were other holy-days call'd *Lupercalia*, wherein barren women did chastise themselves naked, because they bare no children, hoping thereby to gain the fruitfulness of the womb, whereof *Ovid* speaketh thus:

*Excipe secunda patienter verbera dextra:
Jam socer optatum nomen habebit avi.!*

Propertius and some other writers seem to be of the minde that those were first instituted by *Fabius Lupercus*, as appeareth by these verses:

*Verbera pellitus seto samovebat arator,
Unde licens Fabius sacra Lupercus habet.*
And *Junenal* thus:
Nec prodest agili palmas præbere Luperco.

Divers policies
and inventions
to take
Wolves.

Now concerning the manner of taking of VVolves the Ancients have invented many devises and gins, and first of all an Iron toil which they still fasten in the earth with Iron pins, upon which pins they feave a ring, being in compass about the bigness of a VVolf's head, in the midst whereof they lay a piece of flesh, and cover the Toil, so that nothing is seen but the flesh, when the Wolf cometh and taketh hold of the flesh, feeling it stick, pulling hard, he pulleth up the ring, which bringeth the whole Toil on his neck, and sharp pins. This is the first manner that *Crescentienfis* repeateth of taking VVolves, and he saith there are other devises to ensnare their feet, which the Reader cannot understand, except he saw them with his eyes.

The *Italians* call the nets wherein VVolves are taken, *Tagliola*, *Harpago*, *Lo Rampino*, and *Lycino*, the *French*, *Hauspied*; and *Blondus* affirmeth, that the shepherds of *Italy* make a certain gin with a net, wherein

wherein that part of the VVolf is taken which is first put into it. Now the manner of taking VVolfs in ditches and pits is divers, first of all they dig a deep ditch, so as the VVolf being taken, may not get out of it, upon this pit they lay a hurdle, and within upon the pillar they set a live Goose or Lamb, when the VVolf windeth his prey or booty, he cometh upon the trench, and seeing it at a little hole which is left open on purpose to cast the VVolf into the deep ditch; and some use to lay upon it a weak hurdle, such as will not bear up either a man or a beast, that so when the VVolf cometh upon it, it may break, and he fall down; but the best devise in my opinion that ever was invented in this kinde, is that the perch and hurdle may be so made, and the bait so set, that when one VVolf is fallen down it may rise again of it owne accord, and stand as it did before to entrap another; and great care must be had, that these kinde of ditches may be made in solid and strong earth, or if the place afford not that opportunity, then must the inside be lined with boards, to the intent that the beast by scraping and digging with his feet make no evasion.

The *Rhetians* use to raise up to a Tree a certain engine like a Mouse-trap, but much greater, through which there is a cord where they hang a bait of flesh or pullen, or some such thing which the VVolf loveth; when he cometh unto it, he suddenly snatcheth at it, and so pulleth the trap upon his own pate. The *Tencrians*, *Mysians*, and *Thraceans*, Inhabitants of *Asia*, were wont to carry short weapons to kill VVolfs, and they used also the strongest Dogs, who by the encouragement of the Hunters would tear the VVolfs in pieces, for there is hardly any Dog so couragious, as to adventure upon a VVolf at single hand.

The Dogs have therefore certain collers made unto them of leather stufte full of sharp Iron nails, to the intent that their necks may be safe guarded from the VVolfs biting. Now *Blonius* saith, that all hunting of VVolfs with Dogs is in vain, except there be also set up certain great nets made of strong cords, stretched out and standing as stiffe as may be immoveably fastned to the bodies of trees, or strong pillars in the earth, and in divers places of these nets they must set boughs to cover them, to the end the VVolf descry them not; and at either end of the net must be made a little shed with boughs to cover a man, wherein the hunter must lodge with his Spear, ready to pierce through the VVolf when he perceiveth him in the net, for if the VVolf be not instantly wounded, he will deliver himself and escape, and then also he must be followed with the cry of Men and Dogs, that he may not return back again into his den, and the Hunters observe this order in hunting of a VVolf, and driving him to their nets.

VVhen they are far from their nets, they hunt them but gently, and let them go at leisure, but when they are clofer and nearer unto them, they follow them with all speed and violence, for by that means many are intrapped and suddenly killed; and these are those hunting observations which I finde to be recorded in Authors for the taking of VVolfs. And this is the nature of this beast, that he feareth no kinde of weapon except a stone, for if a stone be cast at him, he presently falleth down to avoid the stroke, for it is said that in that place of his body where he is wounded by a stone, there are bred certain worms which do kill and destroy him; and therefore the *Egyptians* when they do decipher a man that feareth an eminent danger, they picture a VVolf and a stone; as *Orus* writeth.

VVolfs do likewise fear fire even as Lions do, and therefore they which travel in woods and secret places by night, wherein there is any suspicion of meeting of VVolfs, they carry with them a couple of flints, wherewithal they strike fire, in the approach of the ravening beast, which so dazleth his eyes, and danteth his courage, that he runneth away fearfully. It is said that VVolfs are afraid of the noise of swords or iron struck together, and it may well be, for there is a true story of a man travelling near *Basil*, with a bell in his hand, who when he saw that the throwing stones at the VVolf which followed him would nothing avail, and by chance fell down, in the mean time a bell which he carryed about him did give a sound, at which sound the VVolf being affrighted ran away, which when he perceived, he sounded the bell aloud, and so drove away the wilde ravening beast. As the Lion is afraid of a white Cock and a Mouse, so is the VVolf of a Sea-crab or shrimp. It is said that the pipe of *Pithecaris* did repress the violence of VVolfs when they set upon him, for he sounded the same unperfectly, and indistinctly, at the noise whereof the raging VVolf ran away; and it hath been believed, that the voyce of a singing man or woman worketh the same effect. *Horace* testifieth so much of himself, that by singing he drove away a VVolf, as in these verses;

*Namq; me sylva Lupus in Sabina,
Dum meam canto Lalagen, & ultra
Terminum curis vagor expeditus,
Fugit inermem.*

*Quale portentum neq; militaris
Daunia in latis alit esuletis,
Nec Juba te'lus generat Leonum
Arida nutrit,*

If at any time a VVolf follow a man afar off, as it were treacherously to set upon him suddenly and destroy him, let him but set up a stick or staffe, or some such other knowledgable mark, in the middle space betwixt him and the VVolf, and it will scare him away; for the suspicious beast feareth such a man, and thinketh that he carryeth about him some engin or trap to take away his life: and therefore also it is said, that if a traveller do draw after him a long rod or pole, or a bundle of sticks and clouts, a VVolf will never set upon him, worthily mistrusting some deserved policy to overthrow and catch him. *Æsculapius* writeth, that if a man do anoint himself with the fat or

sewet

fewer taken out of the reins of a Lion, it will drive away from him all kinde of Wolves. There be some that take VVolves by poysoning, for they poyson certain pieces of meat, and cast them abroad, whereof when the Wolves do eat, they die immediately. There were certain Countrey men which brought the skins of Wolves into the City of Rome, and carryed them up and down the streets publicly to be seen, affirming that they had killed those Wolves with the powder of a certain herb call'd *Cardus Marianus*, and that therewithall also they would kill Rats and Mice. *Pausanias* saith; that there was a Temple of *Apollo Lyceus*, at *Sicyon*, and that on a time the Inhabitants were so annoyed with Wolves, that they could receive no commodity by their flocks, whereupon *Apollo* taking pity of them, told them that there was in their Temple a certain piece of dry wood, commanding them to pull off the rinde or bark of that wood, and beating it to powder, to mingle it with convenient meat for VVolves, and so cast it abroad in the fields.

The people did as they were commanded by the Oracle, and thereby destroyed all the VVolves; but what kinde of wood this was, neither *Pausanias* nor any of the Priests of *Sicyon* could declare. In one part of the world the Ewe-tree, and certain fragments of Juniper. The Spindle tree, and *Rododaphne* do yeeld poyson unto VVolves mixed in their drink, and besides them we know no trees that are venomous, and yet plants innumerable, especially VVolf-bane. And the occasion why there are more poysonful herbs then trees, is in the juyce or liquor whereby they are nourished, for where the juyce is wholesome and well tempered, there it increaseth into a great tree, but where it is imperfect and venomous, there it never groweth tall, nor bringeth forth any great stock.

There are certain little Fishes called by the *Grecians*, *Lycoi*, and by the *Latinists*, *Blenni*, which we may English VVolf-fishes, and these the Hunters use to take Wolves in this manner: when they have taken a great many of them alive, they put them into some tub or great mortar, and there kill them by bruising them to pieces, afterwards they make a fire of coals in the Mountains where the VVolves haunt, putting into the same some of these fishes mixed with bloud and pieces of Mutton, and so leaving it, to have the savour thereof carryed every way with the winde, they go and hide themselves: whilst that in the mean time the VVolves enraged with the savour of this fire, seek to and fro to finde it, because of the smell, the fire before they come is quenched or goeth out naturally, and the VVolves by the smoak thereof, especially by tasting of the flesh, bloud and fish which there they finde, do fall into a drowsie dead sleep, which when the Hunters do perceive, they come upon them and cut their throats. The *Armenians* do poyson them with black fishes, and some do take a cat, pulling off her skin, taking out the bowels, they put into her belly the powder of Frogs, this Cat is boyled a little upon coals, and by a man drawn up and down in the Mountains where VVolves do haunt; now if the VVolves do chance to meet with the train of this Cat, they instantly follow after him, enraged without all fear of man to attain it, therefore he which draweth the Cat, is accompanied with another Hunter armed with a Gun, Pistol, or Cross-bow, that at the appearance of the VVolf, and before his approach to the train, he may destroy and kill him.

Poysoning of
Wolves.

I will not discourse of VVolf bane, commonly called *Aconitum* in *Latine*, wherewithall both men and beasts are intoxicated, and especially VVolves, but referring the Reader to the long discourse of *Conradus Gesner*, in his History of the VVolf, I will only remember in this place an Epigram of *Ausonius* wherein he pleasantly relateth a story of an adulterated woman, desiring to make away her jealous husband, and that with speed and vehemency, gave him a drink of VVolf-bane and Quick-silver mingled together, either of both single are poyson, but compounded are a purgation, the Epigram is this that followeth:

*Toxica ze'otypo dedit uxor mæcha marito,
Nec satis ad mortem credidit esse datum,
Miscuit argenti letalia pondera vivi,
Cogeret ut celerem via geminata nocem.
Dividat hæc si quis, faciunt discreta venenum;*

*Antidotum sumet, qui sociata bibet.
Ergo inter sese dum noxia pocula certant,
Cessit letalis noxa salutare,
Protinus & vacuos alvi petiere recessus,
Lubrica dejectis qua vita nota cibis.*

The enemies
of Wolves.

Concerning the enemies of Wolves, there is no doubt, but that such a ravening beast hath few friends, for except in the time of copulation wherein they mingle sometime with Dogs, and sometime with Leopards, and sometime with other beasts, all beasts both great and small do avoid their society and fellowship, for it cannot be safe for strangers to live with them in any league or amity, seeing in their extremity they devour one another: for this cause, in some of the inferiour beasts their hatred lasteth after death, as many Authors have observed; for if a Sheep skin be hanged up with a Wolves skin, the wool falleth off from it; and if an instrument be stringed with strings made of both these beasts, the one will give no sound in the presence of the other; but of this matter we have spoken in the story of the sheep, shewing the opinion of the best learned, concerning the truth hereof. The Ravens are in perpetual enmity with Wolves, and the antipathy of their natures is so violent, that it is reported by *Philes* and *Ælianus*, that if a Raven eat of the carcase of a beast which the Wolf hath killed, or formerly tasted of, she presently dyeth.

There are certain wilde Onions called *Scille*, and some say the Sea-Onion, because the root hath the similitude of an Onion, of all other things this is hateful to a Wolf, and therefore the *Arabians* say, that by treading on it his leg falleth into a cramp, whereby his whole body many times endureth

endureth insufferable torments, for the Cramp increaseth into Convulsions; for which cause it is worthy to be observed how unspeakable the Lord is in all his works, for whereas the VVolf is an enemy to the Fox and the Turtle, he hath given secret instinct and knowledge both to this Beast and Fowl, of the vertuous operation of this herb against the ravening VVolf; for in their absence from their nests, they leave this Onion in the mouth thereof, as a sure gard to keep their young ones from the VVolf.

There are certain Eagles in *Tartaria* which are tamed, who do of their own accord being set on by men adventure upon VVolves, and so vex them with their talons; that a man with no labour or difficulty may kill the beast, and for this cause the VVolves greatly fear them and avoid them; and thereupon came the common proverb, *Lupus fugit aquilam*: And thus much shall suffice to have spoken in general concerning their taking.

Now we will proceed to the other parts of their History, and first of all of their carnal copulation. They engender in the same manner as Dogs and Sea-calves do, and therefore in the middle of their copulation they cleave together against their will. It is observed that they begin to engender immediately after *Christmas*, and this rage of their lust lasteth but twelve days, whereupon there was wont to go a fabulous tale or reason, that the cause why all of them conceived in the twelve days after *Christmas* was, for that *Latona* so many days together wandered in the shape of a she VVolf in the Mountains *Hyperborei*, for fear of *Juno*, in which likeness she was brought to *Delus*; but this fable is confuted by *Plutarch*, rehearsing the words of *Antipater* in his Book of Beasts, for he saith when the Oaks that bear Acorns do begin to cast their flowers or blossomes, then the VVolves by eating thereof do open their wombs, for where there is no plenty of Acorns, there the young ones dye in the dams belly, and therefore such Countries where there is no store of Oaks, are freed from VVolves; and this he saith is the true cause why they conceive but once a year, and that only in the twelve days of *Christmas*, for those Oaks flower but once a year, namely, in the Spring time, at which season the VVolves bring forth their young ones. For the time that they go with young, and the number of whelps, they agree with Dogs, that is, they bear their young nine weeks, and bring forth many blinde whelps at a time, according to the manner of those that have many claws on their feet. Their legs are without Articles, and therefore they are not able to go at the time of their littering, and there is a vulgar opinion, that a she VVolf doth never in all her life bring forth above nine at a time, whereof the last which she bringeth forth in her old age is a Dog, through weakness and infirmity: but the *Rhetians* among whom VVolves do abound, do affirm constantly, that in the beginning of *May*, they bring their young out of their dens, and lead them to the water, sometimes seven, and sometimes nine, every year encreasing their number; so that the first year she littereth one whelp, the second year two, the third year three, and so observeth the same proportion unto nine, after which time she groweth barren and never beareth more: and it is said when she bringeth her young ones to the water, she observeth their drinking very diligently, for if any of them lap water like a Dog, him she rejecteth as unworthy of her parentage, but those which suck their water like a Swine, or bite at it like a Bear, them she taketh to her, and nourisheth very carefully.

VVe have said already that VVolves do engender not only among themselves, but among other beasts, and such are to be understood of them which bear their young an equal proportion of time, as of Dogs and VVolves cometh the *Lupus Canarius*, or Panther, and the *Crocuta*. Of the Hyæna and the Wolf come the Thoes, of whom we shall speak in their due place in the end of this story, and the Hyæna it self seemeth to be compounded of a Wolf and a Fox.

Concerning the natural disposition of this Beast we have already spoken in part, and now we will adde that which doth remain; and first of all their Epithets which are attributed unto them among severall Authors are most clear demonstrations of their disposition; as sowe, wilde, *Apulian*, sharp, fierce, bold, greedy, whoar, flesh-eater, wary, swift, bloody, blood-lovers, degenerate, hard, glutton, hungry, Cattle-eater, famishing, furious, yellow, falling, ungentle, dishonest, untameful, harmful, Cattle-hurter, teeth-gnasher, insatiable, treacherer, martial, sorrowful, mountain, nightly, robber, strate, ravener, mad, snatcher, cruel, pack-bearer, blood-sucker, foamer, proud, searing, fullen, terrible, vehement, howling, and such other like belonging to the male Wolf. Now unto the female there are some peculiar ones also, as inhumane, ungentle, martial, obscure, rank, ravener, fanded, *Romulian*, greasie, terrible, and *Volsan*: and the ravening desire of this Wolf doth not only appear in the Proverbs of holy Scripture already repated, as where Christ compareth the Hereticks to Wolves, but also from hand instruments and sicknesses, for a little hand-saw is called of the *Latines* and *Germans* *Lupus*, a Wolf; because of the inequality of the teeth, wherewithal a man sheareth asunder violently any piece of wood, bones, or such like thing.

There is a disease called a Wolf, because it consumeth and eateth up the flesh in the body next the sore, and must every day be fed with fresh meat, as Lambs, Pigeons, and such other things wherein is blood, or else it consumeth all the flesh of the body, leaving not so much as the skin to cover the bones. Also the galls on a mans seat which cometh by Horse-riding, are by the Ancients called *Lupi*, and by *Martial*, *Ficus*, whereof he made this distichon;

*Stragula succincli venator sume veredi,
Nam solet à nudo surgere ficus equo.*

There be also instruments called *Lupi*, and *Harpages*, or *Harpagones*, wherewithall Ankers are loosed in the Sea, or any thing taken out of the deep. There is a certain territory in *Ireland*, (whereof Mr. *Camden* writeth) that the Inhabitants which live till they be past fifty year old, are foolishly reported to be turned into Wolves: the true cause whereof he conjectureth to be because for the most part they are vexed with the disease called *Lycanthropia*, which is a kinde of melancholy causing the persons so affected, about the moneth of *February* to forsake their own dwelling or houses, and to run out into the Woods, or near the graves and sepulchres of men, howling and barking like Dogs and Wolves. The true signes of this disease are thus described by *Marcellus*: those saith he which are thus affected, have their faces pale, their eyes dry and hollow, looking drounfully, and cannot weep. Their tongue as if it were all scabd, being very rough, neither can they spit, and they are very thirsty, having many ulcers breaking out of their bodies, especially on their legs; this disease some call *Lycæon*, and men oppressed therewith *Lycæones*, because that there was one *Lycæon* as it is faigned by the Poets, who for his wickedness or sacrificing of a childe, was by *Jupiter* turned into a Wolf, being utterly distracted of humane understanding, and that which Poets speak of him, may very well agree with melancholy, for thus writeth *Ovid*:

*Territus ipse fugit, noctusq; silentia ruris
Exululat, frustra; loqui conatur.*

And this is most strange, that men thus diseased should desire the graves of the dead. Like unto this is another disease, called by *Bellunensis*, *Dæmonium Leoninum*, which is saith he, *Confusio rationis cum factis malis, noxiis & iracundiis*; à *Leone dictum videtur malum, quod eo detemi alios homines ledant, & Leonum instar in eos sevant*; that is, the Lion-devil disease is a confusion of reason, joyned with wrathful, and impious facts; and it seemeth to be named of Lions, because that such as are oppressed therewith, do rage against men, and wound them like Lions.

The apology
of Wolves and
Lambs.

There is a pretty Apology of a league that was made betwixt the Wolves and the Sheep, whereupon came the word *Lycophilos*, my Author rehearseth it thus: *Lupis & agnis fœdus aliquando fuit, datis utrinq; obsidibus, Lupi suos catulos, oves Canum cohortem dedere. Quietis ovibus ac pascen- tibus Lupuli matrum desiderio ululatus edunt, tum Lupi irruentes fidem fœdusq; solutum clamitant, ovesq; Canum præsidio destitutas laniant*, that is to say, There was a peace made betwixt the Wolves and the Sheep, either side giving hostages to other, the Wolves gave their young whelps, and the Sheep gave the Shepherds Dogs to the VVolves. Now when the young VVolves were among the flock of Sheep, they howled for their dams, which when the old VVolves heard, they came rushing in upon the Sheep, crying out that they had broken the league, and therefore they destroyed the Sheep in the absence of the Dogs that should keep them: whereby is notably signified the simplicity of innocent men, and the impiety of the wicked, for whatsoever bonds of truce and peace are made with them, they ever respect their own advantage, taking any small occasion, like VVolves at the crying of their young ones, without all offence of the innocent and harmless, to break through the brazen walls of truce, peace, and amity, for the execution of their bloody and ungodly mindes.

The particu-
lar disposition
of Wolves.

VVolves are truly said to be fierce and treacherous, and not generous and bold, and noble like Lions. They especially rage in the time of their hunger, and then they kill not so much as will suffice, but all the flock before them; but being satisfied, as we have said already, they seem rather Lambs then VVolves. The male is always as careful of the young ones as the female, for while she suckleth her young ones, he bringeth meat unto her in the den, and when that they are greatly constrained both to fly away, they carry their young ones along with them. Great is their malice toward them that hurt them, as *Nepos* saith, he tryed one day when he was a hunting near *Rome*, for his Dog was fighting with a VVolf, and he coming in with the multitude of Hunters, alighted from his Horse, and drew his sword, and gave the VVolf a wound, the VVolf feeling the stroke of the sword forsook the Dog and turned upon the man, making all force at him he could to bite him, but he professed he escaped with singular danger, more by the help of his fellow hunters, then by his own valour; wherefore he concludeth, that as VVolves are enemies to all, so they take special revenge of them that harm them, as we have said before of Lions. Some say that when many of them have obtained a spoil, they do equally divide it among them all, I am sure the like is reported betwixt the old Lion and the young, but whether it be true in VVolves I cannot tell, but rather think the contrary, because they are insatiable and never think they have enough. And *Albertus* saith, they do not communicate their prey like Lions, but when they have fed sufficiently, they hide the residue in the ground till they hunger again.

VVhen they set upon horned beasts, they invade them behinde, and on their backs; when they set upon Sheep, they choose a dark cloudy day or time, that so they may escape more freely; and to the intent that their treadings should not be heard, they lick the bottom or soles of their feet, for by that means they make no noise among the dry leaves; and if going along they chance to break a stick, and so against their minde make a noise, then presently they bite their foot, as if it were guilty of that offence: For the most part they set upon such Cattle as have no Keepers, and raven in secret. If they come unto a flock of Sheep where there are Dogs, they first of all consider whether they be able to make their party good, for if they see they cannot match the Dogs, they depart away although they have begun the spoil, but if they perceive their forces to be

be equal or superior, then they divide themselves into three ranks, one company of them killeth Sheep, a second company fighteth with the Dogs, and the third setteth upon the men. When they are in danger to be taken by the hunters, they bite off the tip of their tails, and therefore the Egyptians, when they would describe a man delivered out of extremity and danger, do picture a Wolf lacking that part of his tail. To conclude, when they are in peril they are extremely fearful, astonished, and afraid, especially when they are unavoidably included they seem harmless, and this argueth the baseness of their minde which is subtil, cowardly, and treacherous, daring do nothing but for the belly, and not then neither, but upon a singular advantage, and for the manifesting hereof, I will expresse these two stories following, as they were related to *Gesner* by *Michael Herus*, and *Iustinus Goblerus*. It happened (saith the first), that a certain Wolf constrained by famine, came unto a village near *Milan* in *Italy*, and there entred into a certain house, wherein sat the good wife and her children, the poor woman being terrified herewith, and not knowing what she did, ran out of the house, pulling the dore to after her, and so shutting the Wolf in among her children; at last her husband returned home, unto whom she related the accident, and how she had shut up the Wolf; the man being more afraid then was cause, lest the Wolf had devoured some of his children, entered hastily in a dores, longing to save and deliver his poor Infants, whom the fearful mother had left with the Wolf, when he came in he found all well, for the Wolf was in worse case, astonished, amazed, daunted, and standing like a stock without sense, not able to run away, but as it were offering himself to be destroyed: And this is the first history.

The second is like unto this, but more admirable, for the great Uncle of *Goblerus*, being marvelously addicted to the hunting of wilde beasts, had in his land divers ditches and trenches cast up with other pits and caves wrought very artificially for the safe keeping of such beasts as should fall into them. Now it hapned that upon one Sabbath day at night there fell into one of those pits three creatures of divers disposition, and adverse inclination, none of them being able to get out thereof: the first was a neighbors wife of his a poor woman, which going to the field to gather Beets and Rapes for her meat the day following, it fortuneth that she fell down by a mischance into the said pit, wherein she was faine to lodge all night (you must think with great anguish, sorrow, and perillous danger to her self) beside that which her husband and family conceived at home, but she had not tarried long in the said pit ere a Fox was likewise taken and fell down upon her, now began her grief to be encreased, fearing lest the wilde best should bite and wound her, having no means to escape from him, nor no man to help and rescue her, although she cryed as loud as ever she could; wherewithal being wearyed, necessity made her to be patient, being a little comforted to see the Fox as much afraid of her, as she was of him, and yet she thought the night full long, wishing for the break of the day, when men stir abroad to their labours, hoping that some or other would hear her moan, and deliver her from the society of such a Chamber-fellow: while thus she thought, striving betwixt hope, fear, and grief, lo what befel her more wofully then before, for suddenly a Wolf was taken and fell down upon her, then she lost her hope, and in lamentable manner thinking of husband and children, how little they conceived of her extremity, resolved to forsake the world, and commended her soul to God, making no other reckoning but that her distressed lean limbs should now be a supper and breakfast to the Wolf, wishing that she might but see her husband, and kiss her children before she lost her life by that savage execution; but all her wishes could not prevail, nor clear her heart from fear and expectation of an unavoidable death: while thus she mused, she saw the Wolf lie down, she sitting in the one corner, and the Fox resting in another, and the Wolf appaled as much as either of both, so the woman had no harm but an ill nights lodging, with the fear whereof she was almost out of her wits. Early in the morning came his great Uncle the Hunter to look upon his trenches and pits what was taken, and coming unto that pit, he found a treble prey; a Woman, a Wolf, and a Fox; whereat he was greatly amazed, and stepped a little backward, at the first sight the woman seeing him cryed out, calling him by his name, and praying his aid: he knowing her by her voyce, presently leaped down into the pit, (for he was a valiant man) and with his weapon first slew the Wolf, and then the Fox, and so delivered the woman from the fear of them, yet there was forced to leave her till he went and fetched a ladder, for she was not able to come forth as he was; then having brought the ladder, he went down again into the pit, and brought her forth upon his shoulders, in that manner delivering her safe to her husband and family. Now these two stories do plainly set forth, that a Wolf dareth do nothing when he is in fear himself.

It hath been a question whether Wolves can be tamed or no, some say that they are always wilde and can never be tamed. *Albertus* writeth, that being taken whelps, they are tamed and will play like Dogs, yet he saith, they never forget their hatred against the Hunter and the desire of Lambs or other beasts which are devoured by Wolves, whensoever he goeth abroad. And *Stumpsius* writeth, that even when they are tamed, they are angry with their Masters that look upon them while they eat their meat.

Of tamed Wolves.

Strabo writeth a fable of two Woods among the ancient *Veneti*, one of them dedicated to *Juno*, and the other to *Diana*, and he would make the world believe, that therein the Wolves lived peaceably and gently with the Harts, and did come to the hands of men like familiar and tame Dogs, suffering themselves to be stroked with their hands. *Aelianus* and *Stephanus* do say, that near the plain of *Meotis*, there are Wolves which live like tame Dogs with men, being continually conversant among the Fishermen, and these Wolves do part stakes and divide their prey with the

the inhabitants dwelling upon the Sea-shores, and there is such a mutuall charity and commons observed betwixt them and the men, for sometimes the Wolves take fishes when the men take none, and then they part with the Wolf, sometimes the men take fishes when the Wolves have none; and thus they live together in quiet manner like confederates, each one relieving and helping other; but if the men at any time break with the Wolves, and do not give them a share, they recompense their ingratitude and falshood with tearing in pieces their nets: which thing if it be true, is a singular example of that rare concord and agreement which was primitively ordained by God to be betwixt man and beast: Some say, these kinde of Wolves be Otters, but I rather beleieve that they be Sea-wolves, of whom we shall talk presently.

Albertus.

The Wolf
hath no friend
but the Parrot.

There be many magicall inventions about the parts of Wolves, namely, their heads, teeth, ears, tails, and privy parts, which I will not stand to recite in this place, because I cannot tell what benefit shall come to the knowledge of them by the *English* Reader. Wolves are subject to the same diseases that Dogs are, especially the swellings of the throat, madnesse, and the gout: when they are sick, they eat of an herb which makes them cast, some say, it is ground Ivy, some say it is grasse, and some otherwise, of this they eat when they have a pain in their bellies, and not otherwise. The reason why Dogs and Wolves are more subject to madnesse than any other beast, is because their bodies are cholerick, and their brains increase and decrease with the Moon. If a man be bitten by a mad Wolf, he is to be cured by the same medicines that are applyed to the bitings of a mad Dog. They live very long, even untill they lose their teeth, therefore in their old age oppressed with famine they flie unto Cities and houses to seek meat. They have no friends but the Parrots. A Wolf was once the part of the Arms of *Rome*; and the Judgement-seat at *Athens* had in it the Picture of a Wolf. There were ancient Coins of money stamped with the image of a Wolf, both among the *Grecians* and among the *Romans*, which were therefore devised, because *Romulus* and *Remus* were said to be nursed by a Wolf: with the skins of Wolves after they were dressed by Curriers, we do read that there were garments made, wherewithall great Princes and Noble men were cloathed, the bare being inward next to their bodies, and the rough being outward, these were used in journeys and huntings, and they were the proper garment of the guards of Tyrants. And this shall suffice of the vulgar Wolf.

Of the SEA-WOLF.

Although nothing hath hitherto been brought to light concerning the Sea-wolf of the ancient writers, that I know, yet his form is notable to be observed; and you may chuse whether you will call him a Thief or a Sea-monster, much differing from the Wolf-fish, as that he seemeth to challenge a particular description or treatise. It is also a Four-footed beast that liveth both on sea and land, satisfying his hunger on the most part upon fishes: It hath been seen upon the *Britain* Ocean shoar, and it doth resemble the Wolf that liveth on the land, that it is not undeservedly called among the common people a Wolf.

Bellonius.

It doth live also a long time being tamed, it hath a dangerous head, and very many hairs growing on both sides of his eyes to shadow them, his nostrils and teeth are like unto a Dogs, and strong hairs growing about his mouth: also small bristles growing upright upon his back: and adorned and marked on every side with black distinct spots, a long tail, thick and hairy, all the other parts being like to a Wolves, as you may easily see by this expressed Picture: and unto this belongeth the story of the Wolves last before expressed, which live upon fishes, and divide them familiarly with men.

Of the THOES.

There are two kinds of Thoes, as there are of Panthers, differing only in magnitude or greatness. But the lesser Thoes is like unto the lesser Panther, a Lycopanther, and the *Lupus canarius* engendered betwixt a VVolf and a Dog, are all one four-footed beast. The Thoes also are a kinde of VVolf. And again there is a kinde of VVolf which *Aristotle* doth call *Chabex*, but *Avicen* doth write, that it ought to be called *Beruet*, in the *Persian* tongue. And again in another place, where he doth write, that the Lion and the Thoes are utter enemies, and *Albertus* doth translate it, that a VVolf doth fight with the four-footed beast *Toboz*, which is a corrupted word, *Toboz* for *Thoes*, as *Cabez* for *Thoboz*, and this some men think to be the Lynx. Thoes is called in *Hebrew*, *Tabas*; *Alshali* is a four-footed beast like to a Wolf. *Adeditach* is also a kinde of Wolf, but I do not know whether these names belong only to the Thoes, or to any other kinde of Wolf. *Solinus* doth call *Thoes* *Æthiopian* Wolves, and a little before he said that *Lycan* was an *Æthiopian* Wolf, maimed on the neck, and so divers coloured that a man would think there were no colors wanting in them. *And. Bellu.*

The people of *Scythia* likewise say, that the Buff doth change his colors, neither is there any other beast covered with hair, except the *Lycan* among the *Indians*, (as *Pliny* also writeth) and besides this there is no mention made of the *Lycan* among all the ancient writers. *Lycans* are called Dogs, in the story of the diversities of Dogs. The lesser kinde of Thoes are the best, for some make two kinde of Thoes, and some three, and these like birds, and other four-footed beasts, change their color, both in Winter and Summer, so that sometime they appear bare, and again at other times rough all over, that is bare in the Summer, and rough in the Winter, but it doth plainly seem that there is no more kinde of Thoes but one, which the things that come after doth prove and make manifest. *Nearchus* saith, that those Tigers are not true Tigers, which are commonly called Tigers, but changeable Thoes (as if that every Thoes were not changeable) and greater then the other Thoes.

They have no reason which take the *Lupus cervarius* for a Thoes, which we have already shewed to be a Lynx, for the *Rhatians* which speak *Italian*, & the *Savoyans* do to this day call him *Cervario*, and for the *Armenian* Wolf the *Cicatus*, and the *Lupus Canarius* we have already shewed, that it is a Panther, and therefore it is needless to stand any longer upon those names in this place. We will therefore take it for confessed, that the Thoes is a beast engendered betwixt a Wolf and a Fox, whereof some are greater and some are smaller, and these are found about the Mountain *Pangens*, *Cittus*, *Olympus*, *Mysius*, *Pindus*, and *Nisa*, beyond *Syria*, resembling for the most part a Hyæna, having a longer body, and a straighter tail then a Wolf, and although it be not so high of stature, yet it is as nimble and as strong as is the Wolf, and it seemeth that the very name Thoes is taken from the celerity and swiftness in running and leaping, for it getteth his living by the quickness of his feet. In the outward face it much resembleth a Wolf his Father, but in spots and length of his body it resembleth a Panther his Mother; they couple in generation like Dogs, bringing forth two or four at a time, like Wolves, which are blinde, and their feet cloven into many toes. *Arrian.*

They are enemies to Lions, and therefore they do not live in the same place where Lions are, not only because they live upon the same victuals and food, but also because they are a more pitiful creature then they, especially to man, for if they see the face of a man at any time, they run unto him and do him all such reverence as their brutish nature can demonstrate.

And further *Philes* and *Selinus* write, that if they see a man oppressed by any other beast, they run and fight for him, although it be with the Lion, not sparing to offer their own lives, and to spend their dearest blood in the defence of him, who by secret instinct of nature they understand to be ordained of God, the King and chiefest of all worldly creatures: therefore *Gravius* called this kinde, *femiferam*, *Thoen de sanguine prolem*, and of their taming and fighting with Lions, he speaketh:

Thoes commissos Leones
Et subiere astu, & parvis domuere lacertis.

They live for the most part upon Harts, whom they take in the swiftness of their course, these they bite and suck their blood, then suffering them to run away to some Mountains, thither they follow them and take them the second time, not destroying them all at once, but by distance of time, whereby the Harts blood groweth sweeter unto them, and they have the better appetite thereunto to destroy them. The Lycopanthers, and also the beast Pathyon, whereof *Albertus* speaketh, I do take to be two several distinct beasts from the Thoes, although the quantity and stature agree, and I see no cause if there be any such beast in the world, but that we may truly say they are a lesser kinde of Panthers: And this shall suffice to have said of these beasts, which are deemed to be of the kinde of Wolves, wherein we have endeavored to say so much of the general and special as we could collect out of any good Authors; and thus we will shut up the story of the Wolf with a short remembrance of his medicinal virtues.

The Medicines of a Wolf.

A Wolf being foddren alive until the bones do only remain, is very much commended for the pains of the Gout, or a live Wolf steeped in Oyl and covered with Wax, is also good for the same disease.

The skin of a Wolf being tasted of those which are bit of a mad or ravenous Dog, doth preserve them from the fear or hazard of falling into water. The skin of a Wolf is very profitable for those which are troubled with the winde colick, if it be bound fast about the belly: and also if the person so affected doth sit upon the said skin, it will much avail him. If any labouring or travelling man doth wear the skin of a Wolf about his feet, his shooes shall never pain or trouble him. The skin of a Wolf being new plucked off from him, and especially when it hath the natural heat in it, and rowled about the member where the cramp is, is very effectual against it.

The blood of a Wolf being mixed with Oyl, is very profitable against the deafness of the ears. The dung and blood of a Wolf is much commended, for those that are troubled with the Colick and Stone.

The blood of a Buck, Fox, or Wolf being warm, and so taken in drink, is of much force against the disease of the stone. He which doth eat the skin of a Wolf well tempered and sodden, will keep him from all evill dreams, and cause him to take his rest quietly. The flesh of a Wolf being sodden, and taken in meat, doth help those that are Lunatick. The flesh of a Wolf being eaten, is good for procreation of children. You may read more things in the chapter going before, concerning remedies of the flesh of a Wolf taken in meat. The fat of a Wolf is no less efficabile, then the flesh.

The fat of a Wolf doth very much profit, being anointed upon those whose joynts are broken. Some of the later writers were wont to mingle the fat of the Wolf, with other Ointments for the disease of the Gout. Some also do mingle it with other Ointments, for the Palsie. It doth soften also the Uvula, being anointed thereon. The same also being rubbed upon the eyes, is very profitable for the bleardness or blood-shot of the eyes. The head also of a Wolf is very good for those that are weak to sleep upon, being laid under their pillow. The head of a Wolf being burned into ashes, is a special remedy for the loosness of teeth. The right eye of a Wolf being salted, and bound to the body, doth drive away all Agues and Feavers. The eye of a Wolf being rubbed upon the eye, doth diminish all diseases that rise in the sight of the eye, and it doth also take away all marks or prints being made with hot Irons. The right eye of a Wolf also is profitable for those that are troubled with itches on the right side of the belly; and the left eye of a Wolf for pains on the left side. The right eye of a Wolf is very good against the bitings of Dogs. Also the eye of a Wolf is much commended for those that are Lunatick by the bitings of Dogs.

The teeth of a Wolf being rubbed upon the gums of young Infants, doth open them, whereby the teeth may the easier come forth. Again, the gums of children are loosened with the tooth of a Dog, being gently rubbed thereon, but they are sooner brought forth with the teeth of a Wolf. Some men do commend the tongue of a Wolf to be eaten of those that are troubled with the Falling-sickness. The artery which springeth in the throat of a Wolf being taken in drink, is a most certain cure against the Squinsie. The throat of a Wolf taken in drink, is very much commended for those that are troubled with the Falling-sickness. The lungs or lights of a Wolf being sodden and dried, and mingled with Pepper, and so taken in milk is very profitable for those that are puffed up or swoln in the belly.

The heart of a Wolf being burned and beaten to powder, and so taken in drink, doth help those that are sick of the Falling-sickness. Take one ounce of the gum of an Oak, and half an ounce of the gum of a Pear-tree, and two drams of the powder made of the top of a Hart-horn, and one dram of the heart of a Wolf, all which being mingled together, and made into medicine, is always used for the cure of all ulcers: but it will be more effectual if thou dost add thereto the hinder-part of the skull of a man beaten to powder. The Liver of a Wolf is of no less vertue then the Lungs or Lights, which I have manifested in the medicines of the Fox. The Liver of a Wolf helpeth or profiteth those that are sick of the Falling-sickness. The Liver of a Wolf being washed in the best white wine, and so taken, is very good for those diseases that arise in the Liver. The Liver of a Wolf mixed in the medicine made of Liver-wort, is very much commended for the diseases in the Liver. Galen also doth say, that he hath holpen those which have been diseased in the Liver, only using the medicine made of Liverwort, and he saith, if he did apply any other medicine thereto, it did little or nothing at all profit him.

The Liver of a Wolf is very profitable for those that are troubled with the scurfe in the mouth. The Liver or laps of a Wolf is much used for those that are troubled with diseases in the Liver; but you must dry it and afterwards beat it to powder, and so give the party so affected one dram of it in sweet wine. The Liver laps of a Wolf saith *Marcellus*, being dried and beaten to powder, and a little part of it mingled in like portions with the powder made of Fenegreek, of Lupines, Wormwood, and of the herb called *Herba Maria*, and so mingled that it may be about the quantity of a cup full, and so given him that day which he is not troubled with the Fever, but if he shall be troubled with it, let him take it in water for the space of three days, and after he hath drunk it, let him lie for the space of half an hour with his arms spread abroad: and afterwards let him walk very often, but eat very seldom, and let him be sure he keep himself for the space of those three days well ordered, and from drinking any cold drink, or eating any salt or sweet thing, and within a little space after he shall be freed from that disease. The Liver laps of a Wolf being wrapped in bay-leaves, and so set to dry at the Sun or at the fire, and being dried, beat it to powder in a Mortar, first taking away the leaves very warily, which being powdered, you must keep it in a clean vessel, and when you give it him to drink, you must adde thereto two leaves of Spoonwort, with ten grains of Pepper beaten very small, and as much clarified Honey as is needful, and also made hot with a hot burning Iron, and mingled very diligently in a Mortar, which being so warmed, you must give him to drink sitting

right

Pliny.
Sextus.

Blondus.

right up in his bed, that after he hath taken the potion, he may lye down on his right side for the space of an hour, drawing his knees together, and after that he hath done so, let him walk up and down for the space of an hour, and this will likewise cure him of the same disease. *Avicen.*

Avicen doth set down a medicine concerning the cure of the hardness of the Liver, which is, Take Opium, Henbane, Oyl made of Beavers stones, Myrrhe, Saffron, Spicknard, Agrimony, the Liver of a Wolf, and the right horn of a Goat burned, of each equal parts, and make thereof a medicine. The Liver of a Wolf being made in the form of a dry Electuary and given as a Lozeng, doth also very much profit against the diseases of the Liver. *Dioscorides.*

Gugir a Philosopher doth affirm, that the Liver of a living beaſt doth very much profit against all pains of the Liver. The Liver of a Wolf being thoroughly dried and drunk in sweet Wine, doth mitigate all griefs or pains of the Liver. The Liver of the same beaſt to the quantity of a penny, taken in a pinte of sweet Wine, is very medicinable for the curing of all pains in the Liver whatsoever. The Liver of a Wolf being taken in hot wine, doth perfectly cure the cough. If an intolerable cough doth vex any man, let him take of the Liver of a Wolf, either dried or burnt, as much as he shall think convenient, and therewith let him mingle wine, honey, and warm water, and afterward drink the same fasting every day, to the quantity of four spoonfuls, and he shall in short space be cured of the same. *Galen. Pliny.*

The laps or fillets of a Wolves Liver, being applyed unto the side, doth perfectly heal any stitch or pricking ach therein. The Liver of a Wolf being taken in sweet wine, doth heal those which are troubled with a Tifick. The Liver of a Wolf being first boyled in water, afterwards dried, beaten and mingled with some certain potion, doth instantly heal the grief and inflammation of the stomach. The powder of a Wolves Liver mingled with white wine, and drunk in the morning for some certain days together, doth cure the Dropſie. The Liver of a Wolf taken either in meat or drink, doth assuage the pains of the secret parts. Two spoonfuls of the powder of a Wolves Liver being given in drink, doth cure all pains or sores of the mouth. The gall of a Wolf being bound unto the navel of any man, doth loosen the belly.

The gall of a Wolf taken in wine, doth heal all pains in the fundament. The entrails of a Wolf being washed in the best white wine, blown upon, dried in an Oven, pounded into dust, afterwards rowled in Wormwood, is a good and effectual remedy against the Colick and Stone. If some part of the yard of a Wolf being baked in an oven, be eaten by any, either man or woman, it instantly stirreth them up to lust. Concerning the genital of a Wolf I have spoken before in the medicines of the Fox: but antiquity, as *Pliny* saith, doth teach that the genital of beaſts which are bony, as Wolves, Foxes, Ferrets, and Weasels, are brought to an especial remedy for many diseases. If any man take the right stone of a Wolf, being bloody, steep it in Oyl, and give it unto any woman to apply it unto their secret parts, being wrapped in wooll it instantly causeth her to forsake all carnal copulation, yea although she be a common strumpet. The same being taken in some certain perfume, doth help those which are troubled with the foul evil. *Sylvius. Albertus. Rasis.*

The eyes being anointed with the excrements of a VVolf, are instantly freed from all covers or spreading skin therein. The powder of the same VVolf being mingled with the sweetest Hony as can possible be had, and in like manner rubbed or spread upon the eyes, doth expel all dazeling from them. The fime of a VVolf long rubbed, until it be very light, being mingled with Honey, by the union thereof, causeth the filth or scurfie growing about the eyes to avoid away, and restoreth them to an exceeding clearness. The powder of a VVolves head being rubbed upon the teeth, doth make fast and confirm the looseness thereof, & it is most certain that in the excrements of the same beaſt, there are certain bones found, which being bound unto the teeth, have the same force and efficacy. *Galen.*

The dung of a VVolf or Dog being beaten into small powder, mingled with Honey and anointed upon the throat, doth cure the Quinsie or Squinansie, as also all other sores in the throat whatsoever. The fime of a VVolf being given to those which are troubled with the Colick to drink, doth easily cure them, but this dung is more effectual if it have never touched ground, which is very hard to come by, but it is found by this means. The nature of the VVolf both in making his water, as also in voiding his excrements is like unto a Dogs, for while he voideth his water he holdeth up his hinder-leg, and voideth his excrements in some high or steepy place far from the earth, by which means it falleth down upon bushes, thorns, fruits, elder-trees, or some other herbs growing in those places, by which means it is found never touching the earth. There is furthermore found in the fime of VVolves certain bones of beaſts which they have devoured, which for as much as they could not be grinded or chewed, so also can they not be concocted, which being beaten and bruised small, are by some commended to be excellent given in drink for the ease of the Colick, but if the grieved party shall be some fine or delicate person which cannot endure so gross a medicine, then mingle it with Salt, Pepper, or some such like thing, but it is most often given in sweet wine, so there be but a small quantity thereof drunk at one time.

But this dung which the *Græcians* call *Lagonas*, and is to be applyed to the groin of the diseased person, ought to be hanged in a band made of wooll, but not of any wooll: But it would be more effectual if it were made of the wooll of that Sheep which was slain by a VVolf. But if the same cannot be got, then is it fit that there be two bands, one which may be bound about the groin, and another which may be bound upon the dung to keep it from falling.

There are also some which cast a small quantity of the same dung to the bigness of a Bean in a little pot, fastening the same to any one which is troubled with the said disease, and it healeth them (which in

in a manner seemeth incredible) in very short time. The dung of a Wolf boyled in small white wine, and afterwards taken in drink, is very profitable for those which are troubled with the colick: and it is also reported that if the same dung be covered with the skin of the same beast, and hung upon the thigh of any one which hath the colick being bound with a thread made of the wooll of a Sheep slain by a Wolf, it will instantly cure the said disease.

The fime of a Wolf, so that it be not found upon the earth, but upon some trees, Brambles, or Bulrushes, being kept, and when there shall be need bound unto the arm of him that shall be troubled with the Colick, or to his neck being included in a bone, or in Copper, and hung with the thread wherewith silk-women weave, doth wonderfully and most speedily cure him, so there be great care had, that in the mean time there be a little of the same dung given to the grieved party to drink, not knowing what it is. The dung of a Wolf being taken, and the bones therein beaten into powder, mingle therewith cold water, giving it to any one to drink which is troubled with the Stone, and it will instantly cure him.

The dung of a Wolf beaten into the smallest powder then strained and given unto any in his fit which is troubled therewith to the quantity of half a spoonfull in hot water, is a very effectually and approved cure for the Stone. The bones which are found in Wolves, being bound unto the arm of any one which is troubled with the Colick, having never touched the ground, do with great speed and celerity cure him. The pastern bone of a Hare found in the dung of a Wolf, being bound unto any part of the body of him which is troubled with the colick, doth very effectually cure him. The dung of a Wolf with the hairs of a white Ass, taken by any woman in a certain perfume, maketh her apt for conception.

The teeth of a Wolf are unequall, wherefore their bitings are very dangerous. A ravening Wolf by his biting bringeth the same danger, as a ravenous Dog, they also are cured by the same medicines, as we have declared at large in the story of the Dog. The wounds which come by the teeth or nails of a Wolf are very dangerous, for the filth which pierceth through all clouts or sponges which are laid upon them: But they are cured by no other means then the bitings of Dogs: *Aristotle* writeth these things concerning the biting of a Lion, and not of a Wolf.

Johannes Vitus the *Hungarian* declared that there were certain men in *Hungary* bitten by a mad Wolf, and that they were as it seemed presently cured: But before forty dayes expired they all died by a most bitter or painfull disease; small pieces of flesh encreasing through their urine in the form of Dogs, with an exceeding pain or torment. It is also reported of a certain Countreyman, who when he had stricken a Wolf with his Club, and the Wolf had so torn his face with his nails, that he pulled off the skin, he was in short time healed that there appeared no sign of any harm, but in short time after he began to be sick, and to howl like unto a Dog, and so perished; by which it was conjectured that that Wolf was mad. An Oxe being bitten by a mad Wolf or Dog is cured by Garlicke, being beaten and rubbed upon the wound: the Wolf himself is also healed of any wound by old salt flesh applied unto the same. Two drams of Gentian being drunk in wine, is an excellent cure for the bites of a mad Dog and ravening Wolves, as also of all beasts tearing with their teeth or nails. The bites of Wolves being marked in the bodies of any Cattell, are burned or seared with a hot Iron, lest that the biting be assuredly hurtfull, may draw unto it self corruption. And thus much shall suffice concerning the medicines of the Wolf.

Avicenna.

Of the ZEBEL, commonly called a SABEL.

AMong all the kindes of Weasels, Squirrels, Wood-mice, wilde Mice, or other little beasts of the world, there is none comparable to this Zebel, commonly called in *Latine* *Zebellus*, and *Zobela*, from whence the *Germans* call it *Zobel*, the *Illyrians* and *Polonians*, *Sobol* and *Soboel*, the *Italians*, *Sesli*, and *Sablins*: The skins hereof are called *Zebelline*, and *Zobelline*, and sometimes *Zibelline*. It is bred in *Muscovia*, and the Northern parts of the World, among the *Lapones*, but no where more plentifull then in *Tartaria*, *Scythia*, and *Sarmatia*, and it is therefore called by some *Mus Scythicus*, the *Scythian* Mouse. The *French* men because of the similitude it hath with a Martin, do call it by a compounded name, *Marteis Soublineis*. It liveth for the most part in the Woods, being lesser then a Martin every way, and hath also shorter legs: They run up and down upon trees like Squirrels, easily fastning their claws in the boughes; when they leap, their tail serveth them instead of a cross Beam to direct them. They bite most irefully, for their teeth are as sharp as Razors, and there is no beast in the World of their quantity so angry and terrible as they: their flesh is unprofitable and good for nothing. The only price and estimation of this beast is for the skin, which farre excelleth all the skins of the World, either Ermins, Martins, or Foines, differing herein from the Martins, because their hair is thinner, and if you stroke them from the head to the tail, or on the contrary from the tail to the head, they do lie every way smooth, whereas the Martins do only fall smooth from the head to the tail.

These are more subject to Worms then other skins, except they be continually worn, or laid up with bunches of Wormwood; but above all other things the laying of them open one day together in the Sun or air, doth him more harm then a whole years wearing, for the beast it self liveth evermore in shadowy places, forbearing the sun except she be hunted, and catcheth small birds in secret. In the furthest part of *Lituania* they have little or no money, and therefore the Merchants which traffique thither do exchange their wares for Zebel or Sabel skins; those are the best which have

have most white and yellow hairs mingled in them, and the Garments of Princes are only fringed and lined with these *Sabel* skins, and honourable Matrons, ancient Noble men and their Wives do likewise use two or three of these to wear about their necks; for it is certain that a garment of these skins is much dearer then cloth of Gold, and I have heard and also read, that there have been two thousand Duckets payed for so many as were put in one Cloak.

It is a very libidinous and lustfull beast, and at that time stinketh very rankfully, wherefore it mingleth it self with Martins of all sorts that it meeteth. And thus much shall suffice to have discoursed of this little beast. Now there are divers other which seem to be of this kinde, of which, though I have not much to say, yet rather then they should be omitted, I will expresse their bare names, that so I may give occasion to all our Countrey-men that shall travail into other Nations, to make enquiry after them, that so at their return, if they have any conscience of publique good, they may get themselves eternall fame and names, by communicating publicly their own knowledge, experience, and learning, which they have gained in these, or other Four-footed beasts.

Of the NOERTS.

THis beast is of the quantity of a Weasel, and by the *Germans* called *Noerts*, and *Nerts*, from which word the *Latines* have their *Noerza*, for this beast. It liveth (as *Georgius Agricola* writeth) in the Woods, betwixt *Suevia* and *Vistula*, the colour of the hairs which is short and smooth, is for the most part like an Otters. Their skins are sold at *Franckford* by forty in a heap or bundle, they are long, and more red then the Ferrets, every bundle most commonly is sold for six and twenty Nobles. Some think that this is the *Latax*, spoken of before, because it getteth his living in the waters.

Of the VARMEL.

THis beast is called by the *Latines* *Vormela*, by the *Germans* *Wormiein*, it is lesse then a Ferret, the belly whereof is black, all the residue of the skin full of white, pale, red, and yellow spots, which adorneth it in admirable manner, very comely and excellent to be looked upon, the tail not past half a hand breadth long, the tip whereof is black, but the hairs of the residue mixed with white and ash colour together.

There is another beast which for the variety of the colours, which are apparent in his skin, he is called a *Salamander*, not that which liveth in the fire, but one like unto it, having a gentle hair, distinguished all over into black and yellow spots, and these because of our ignorance we reckon among our outlandish Weasels.

In *India* there is a little beast called *Ghiurca*, having a very precious skin, and this (as *Cardan* writeth) hath a bag under the belly, wherein it suffereth his young ones to go in and out, as before we have said of the *Simivulpa*, or Foxe-Ape.

There is another little beast in *Hungaria*, called *Uncken*, which dwelleth in holes of the earth as Conies do, the outward proportion whereof is like a Weasel, but it is much thinner and longer, the colour of the back is red, and all the residue of the body Mouse colour. Now although I do not read any speciall use of the skin of this beast, yet I thought it good to name it in this place, because it is reported that the breathing thereof upon the face of man is venemous and poysonfull, for when Souldiers sleep in their tents upon the earth, they come many times and look in their faces and poyson them: And thus much for the *Zebel*, and the severall kindes of this little beast.

Of the ZIBETH, or SIVET-CAT.

THe best description that is of this beast in all the World, that I could ever finde, was taken by Doctor *Cay*, and thus sent as it is here figured to Doctor *Gesner* with these words following. There came to my sight (saith Doctor *Cay*) a *Zibeth* or *Sivet* very lately, which was brought out of *Africa*, the picture and shape whereof in every point I caused to be taken, which is this prefixed, so that one Egge is not more like another, then this is to the said *Sivet* or *Zibet*. It is greater then any

any Cat, and lesser then a *Taxus*, having a sharp face like a Martin, a short, round, blunt ear, which was black without, but pale within, and on the brims a blew sky-coloured eye, a foot and leg black, and more broad or open then a Cats: Likewise a black claw, neither so crooked, nor so hid in the foot as it is in a Cat, but their teeth are more fearfull and horrible. It is all spotted over the body, but the nose thereof is black, the nether part of the upper chap pale, and the middle part black, and from thence to the top of the head it is of the colour of a Badger. The lower chap was all black, and the bristles of the upper chap were white, growing forth of a pale skin, and a little above the eye there were two other white ones growing forth of a black skin.

The throat thereof was black, and a little above the eye there arise three black lines or strakes, whereof the first or uppermost descendeth down right to the throat, the second descendeth compass in and out to the middle of the neck, and the third down to the shoulder, and then a little beneath that place on the contrary, arise two other black lines like circles ascending in the compass of the shoulder to the back bone: and all the residue of the body is distinguished and parted into many colours, having divers and sundry black spots scattered abruptly throughout the whole circuit, whereof some are continued and joyned together. For that which is upon the back is continued from the shoulder, and the second and third arising in that part, are broken and divided, the fourth and all the residue are in like sort discontinued and separated one from the other, so that their position runneth all in length.

The first part of his tail to the middle is spotted, and all the residue black. The hair both on the face, legs, and feet, is soft, and very gentle to be handled, falling down, but in all other parts of the body, it is harsh, deep, and standing upright: the spots doth both ascend and descend, the tongue hereof was smooth and not rugged, and under the tail was the passage for the excrements after the fashion in other beasts, and a little beneath the same was the receptacle or bag containing the Sivet, and a little space after that the privy part of the male which was hid or sheathed in the body. The beast being moved to anger, uttereth a voyce like to the voyce of an angry Cat, withall doubling the letter R R. but being not angry the voyce is like a young Cats although lower.

This *Zibeth* was in length from the head to the tail, one foot, three palms, and one Roman fingers breadth, but the breadth thereof under the belly, was one foot, two palms, and three Roman fingers. It was a gentle and tractable Creature, and was sold for eight pounds of English money, which was in French twenty four Crowns, or in Florens forty and eight. These things are said by Doctor Cay. Now unto this *Gesner* addeth, that he received such another Picture from one *Johannes Kentmannus*, which he took by another of these Cats in the possession of the Duke of Saxony, and he said that it was bought by him for seventy Taters (every Tater being worth in our English money eight pence half penny) in the year of the Lord, 1545. This beast is a very clean beast, I mean, a hater of filthinesse: and therefore the place wherein it lyeth must be swept every day, and the Vessels clean washed. The Sivet or liquor distilled out of the Cod, must be taken away every second or third day, or else the beast doth rub it forth of his own accord upon some poste in his kennel, if he be tamed or inclosed. This Sivet is an Excrement not growing in the secret part only, but in a peculiar receptacle by it self, increasing every day the weight of a groat; the colour whereof at the beginning is like Butter, but afterwards it groweth more sad and brown: one ounce of it if it be pure and not sophisticated, is sold for eight Crowns at the least. There be Impostors, which do adulterate it with an Oxes gall, Styra, and Hony. This is of a strange savour, and preferred before Musk by many degrees, yet it smelleth worse if it be held hard to the nose: It is said that the liquor running out, doth go back again if any Vessel be put to receive it, except it be a Silver Spoon or Porringer.

Leo Afer saith, these Beasts are wilde; untamable, and live upon flesh, but the European Merchants buy of the young ones and nourish them tame, with Bran, Milk, hard Egges, and other things, and that so they convey them into Europe out of *Africk*, emptying their Codstwicke or thrice a day in the hot Countreys; and that this Sivet is nothing else but the sweat of the beast under the ribs, fore-legs, neck, and tail. There were divers of these *Zibeths* tamed among other. It is reported of a Consul of the Florentine Merchants at *Alexandria*, that had one of these so tame, that it would play with a man, and bite his nose, ears, cheeks, or lips so gently that it should not be felt, the reason whereof was given, because it was at the first nourished with the milk of a Woman. Cardinall *Galeottus* had three of these at Rome, which he kept for their Sivet: And *Otho* Duke of *Bavaria*, had also one which he nourished with Sugar. They are bred in *Ethiopia* and *India*, about the City *Pegu* and *Tarnasari*. Their Sivet is not savoury till it be washed and cleansed. It is said to be very excellent against the strangulations of the wombe; and it is good against the Colick: It hath also vertue to purge the wombes of women, to purge the brain, and is applyed to many other diseases and infirmities.

The end of the History of Four-footed Beasts.

THE
HISTORY
OF
SERPENTS.

OR,
The second Book of living Creatures:

WHEREIN IS CONTAINED

Their Divine, Natural, and Moral descriptions, with their
lively Figures, Names, Conditions, Kindes, and Natures of all venomous
BEASTS: with their several Poysons and Antidotes; their deep harred to
Mankinde, and the wonderful work of God in their Creation, and Destruction.

Necessary and profitable to all sorts of Men: Collected out of divine Scriptures,
Fathers, Philotophers, Physitians, and Poets: amplified with sundry accidental
Histories, Hieroglyphicks, Epigrams, Emblems, and Ænigmatical Observations.

By EDVVARD TOPSELL.

Creatures: as also their several Properties and Antidotes: their deep buried
Manners, and the wonderful work of God in their Creation, and Destruction.
Necessary and profitable to all sorts of Men: Collected out of divine Scriptures,
Fables, Philosophers, Physicians, and Poets: amplified with sundry accidental
Observations, Histories, Experiments, and Anatomical Observations.

By EDWARD TORSSELL.

To the Reader.

Entle and pious Reader, although it be needlesse for me to write any more of the publishing of this Treatise of Venemous Beasts, yet for your better satisfaction and direction, briefly take this which followeth.

After the publishing of the former book of *Four-foot-ed Beasts*, I understood of two things much misliked therein, wherein I also my self received a just offence.

First, the manifold escapes in the Presse, which turned and sometimes over-turned the sense in many places, (especially in the *Latine*) which fault as it may in part concern me, so yet it toucheth another more deeply, yet are both of us excusable: He in wanting the true knowledge of the *Latine* Tongue; and I, because of my employment in my Pastorall charge, and both of us together, because we were not so thoroughly estated, as to maintain a sufficient Scholar to attend only upon the Presse. Wherefore, in this second Book, we have removed away that blot, and used a more accurate diligence, and I trust there is no escape committed perverting the sense, and not very many altering the letters.

The first fault
is in this Edition
amended.

The second exception taken against the former Treatise, was the not Englishting or translating of the *Latine* Verses, which thing I purposed to have done, if I had not been overhastened in the businesse; for it had been to the work an Ornament, and to the History a more ample declaration: This fault I have now amended in the setting forth of this second Book of *Living Creatures*. All therefore that can be said for your direction, I could wish the History more compleat for the manifestation of the most blessed *Trinities* glory, whose works are here declared; and for the better revelation of the severall natures of every Serpent. I may fail in the expressing of some particular, yet I suppose that I have omitted no one thing in their narration, which might be warranted by good authority or experience. And therefore, although I cannot say that I have said all that can be written of these living Creatures, yet I dare say I have wrote more then ever was before me written in any Language.

To the Reader.

Now therefore ask the Creatures (after God) and they will tell you: For, saith S. Austin, *Interrogatio creaturarum profunda est consideratio ipsarum: responsio earum, attestatio ipsarum de Deo, quoniam omnia clamant, Deus nos fecit.* The asking of the Creatures is a deep and profound consideration of their severall natures: their answer is, their attestation or testimony of God, because all of them cry out, *The Lord hath made us.* Wherefore, seeing it is most true, *incognita non desiderantur*, things unknown are not desired, to the intent that all true English Christians may hereafter more affectionately long after and desire, both the mysticall vision of God in this World, and also his perfect sight in the World to come, I have (for my part) out of that weak ability wherewith I am endued, made known unto them in their own mother Tongue, the wonderfull works of God; for the admiring of Gods praise in the Creatures, standeth not in a confused ignorance, not knowing the beginnings and reason of every thing, but rather in a curious and artificiall investigation of their greatest secrets.

Therefore, let all living men consider every part of divine wisdom in all his works; for if it be high, he thereby terrifieth the proud; by the truth he feedeth the great ones; by his affability he nourisheth the little ones. And so I will conclude my Preface with the words of the three Children: *O all ye works of the Lord, praise him and magnifie him for ever.*

Edward Topsell.

A GENERAL TREATISE
OF
SERPENTS,
DIVINE, MORAL, and NATURAL.

Of the Creation and first Beginning of SERPENTS.

Here is no Man that can justly take exception that this History of Serpents beginneth at their Creation: for seeing our purpose is, to set forth the works of GOD, by which as by a clear glass, he endeavoureth to disperse and distribute the knowledge of his Majesty, Omnipotency, Wisdom and Goodness, to the whole race of Mankind, it seemeth most proper that the first stone of this building, laid in the foundation be fetched from the Creation: and the rather, because some Naturalists (especially amongst the ancient Heathen) have taken the Original of these venomous Beasts, to be of the earth, without all respect of Divine and Primary Creation. And hereunto some Hereticks, as

the *Manichees*, and *Marcianites*, have also subscribed, though not directly; for they account the Creation of these venomous and all hurtful Beasts an unworthy work for the good GOD, because they could never see any good use of such creatures in the World.

*Augustine.
Epiphanius.*

Yet we know the blessed Trinity created the whole frame of this visible World by it self, and for good, reasonable, and necessary causes, framed both the beneficial and hurtful Creatures, either for a Physical or Metaphysical end. Therefore it is most certain, that if we consider the outward parts of these Creatures endued with life, no man nor nature could begin and make them, but the first Essence or Fountain of life: and if we can be brought to acknowledge a difference betwixt our shallow capacity, and the deep wisdom of God, it may necessarily follow by an unavoidable sequel, that their uses and ends were good, although in the barrenness of our understanding, we cannot conceive or learn them. But I purpose not to follow these things Philosophically by arguments, but rather Divinely by evident demonstration of the things themselves. And first of all, it appeareth, Gen. 1.24. that God brought out of the earth *all creeping things after their kinde*: And lest that any man should doubt, that under the general name of creeping things, Serpents, and other venomous Beasts, were not intelligibly enough expressed, it is added Chap. 3. 1. *That the Serpent was more subtle then all the Beasts of the field which God had made*. The Prophet David also, Psal. 148. 7. among other things which are exhorted by the Prophet to praise their Creator, there are named Dragons, which are the greatest kinde of Serpents. Unto this also alluded S. James, ch. 3. 7. saying: *That the whole nature of Beasts, and of Birds, of creeping things and things in the Sea is tamed by the nature of Man*: for Man, which is next unto God, hath authority and power, to rule over all his works, and therefore over Serpents.

Zanchinus.

And herein it is fit to shew, what wonders men have wrought upon Serpents, taming and destroying them rather like Worms and Beasts, no ways enemies to mankind, but friendly, and endued with sociable respect, or else as weaklings commanded by a superior power. Such an one was *Atyr* a notable Inchanter, who by touching any Serpent brought it into a deadly sleep: according to these verses;

*Nec non Serpentes diro exarmare veneno,
Doctus Atyr: tactuque graves sepire chelydras.*

In English thus;

*The cunning Atyr, Serpents fierce, of poyson did disarm,
And Water-snakes to deadly sleep, by touching he did charm.*

E e e 2

Alvius

Alvisus Cadamustus, in his description of the new World, telleth an excellent history of a *Ligurian* young man, being among the *Negroes* travelling in *Africk*, whereby he endeavourerh to prove, how ordinary and familiar it is to them, to take and charm Serpents, according to the verse of the Poet :

Frigidus in pratis cantando rumpitur anguis.

That is,

The cold-earth-snake in Meadows green,

By singing, broke in pieces may be seen.

The young man being in *Africk* among the *Negroes*, and lodged in the house of a Nephew to the Prince of *Budoniel*, when he was taking himself to his rest, suddenly awaked by the hearing the unwonted noise of the hissing of innumerable sorts of Serpents; whereat while he wondred, and being in some terror, he heard his Host (the Princes Nephew) to make himself ready to go out of the doores, (for he had called up his servants to saddle his Camels:) the young man demanded of him the cause, why he would go out of doores now so late in the dark night? to whom he answered, I am to go a little way, but I will return again very speedily: and so he went, and with a charm quieted the Serpents, and drove them all away, returning again with greater speed then the *Ligurian* young man his guests expected. And when he had returned, he asked his guests if he did not hear the immoderate hissing of the Serpents? and he answered, that he had heard them to his great terrour: Then the Princes Nephew (who was called *Bisboror*) replied, saying; they were Serpents which had beset the house, and would have destroyed all their Cattel and Herds, except he had gone forth to drive them away by a charm, which was very common and ordinary in those parts, wherein were abundance of very hurtful Serpents.

The *Ligurian* young man hearing him say so, marvelled above measure, and said, that this thing was so rare and miraculous, that scarcely Christians would believe it. The *Negro* thought it as strange that the young man should be ignorant hereof, and therefore told him, that their Prince could work more strange things by a charm which he had, and that this and such like were small, vulgar, and not to be accounted miraculous. For when he is to use any strong poyson upon present necessity, to put any man to death, he putteth some venom upon a sword, or other piece of Armor, and then making a large round circle, by his charm compelleth many Serpents to come within that circle, he himself standing amongst them, and observing the most venomous of them all so assembled, which he thinketh to contain the strongest poyson, killeth him, and causeth the residue to depart away presently; then out the dead Serpent he taketh away the poyson, and mixeth it with the seed of a certain vulgar tree, and therewithal anointeth his dart, arrow, or sword's point, whereby is caused present death, if it give the body of a man but a very small wound, even to the breaking of the skin, or drawing of the blood. And the said *Negro* did earnestly perswade the young man to see an experiment hereof, promising to shew all as he had related, but the *Ligurian* being more willing to hear such things told, then bold to attempt the trial, told him, that he was not willing to see any such experiment. And by this it appeareth, that all the *Negroes* are addicted to Incantations, which never have any approbation from GOD, except against Serpents, which I cannot very easily be brought to believe.

And seeing I have entered into this passage of Charming, being (no doubt) an invention of Man, and therefore argueth his power to tame these venomous Beasts, according to the former saying of Saint *James*, although I condemn such courses utterly, yet it is lawful to prosecute the same, seeing the holy Ghost, Psalm 58. vers. 4, 5. affirmeth a practise against Serpents, a dexterity and ripeness in that practise, and yet an impossibility to affect any good, except the voyce of the Charmer come to the ear of the Adder: For thus he writeth; *Their poyson is like the poyson of a Serpent, like a deaf Adder that stoppeth his ear.* 5. *Which heareth not with the voyce of the Inchanter, though he be most expert in cunning.* Upon which words Saint *Augustine*, Saint *Jerom*, and *Cassiodorus* writing, say; that when the Charmer cometh to Inchant or Charm, then they lay one of their ears to the earth so close, as it may not receive the sound, and their other ear they stop with their tail. I will therefore yet add somewhat more of this taming of Serpent.

I have heard a Gentleman of singular learning, and once my worshipful good friend, and dayly encourager unto all good labours, report divers times very credibly, upon his own knowledge and eye-sight, that being at *Padua* in *Italy*, he saw a certain Quack-salver, or Mountebanck upon a stage, pull a Viper out of a box, and suffered the said Viper to bite his flesh, to the great admiration of all the beholders, receiving thereby no danger at all. Afterward he put off his doublet and shirt, and shewed upon his right arm a very great unwonted blew vein, standing beyond the common course of nature; and he said, that he was of the lineage of Saint *Paul*, and so were all other that had such veins, and that therefore (by special vertue to that Family given from above) no Viper nor Serpent could ever annoy or poyson them: but withall, the fellow drank a certain compound water, or antidote, for fear of the worst, and so at one time vented both his superstitious hypocrisie, and also much of his Antidote to his great advantage.

But I have since that time also read, in *Matthiolus* his Commentaries upon the sixth Book of *Dioscorides*, that there were wont to be many such Juglers in *Italy*, carrying in their bosomes living Serpents, of whose fraudulent Impostures he speaketh in this sort. They take Serpents in the

Winter

Mr. Will.
Morley of
Glynde in
Suffex.

Winter time, when they grow dead and stiffe through cold, & yet for their better defence against their venomous biting, they defend themselves by a certain experimental unguent, known to be practised in this sport, made of the Oyl pressed out of wilde Radish, the roots of Dragonwort, the juyce of Daffodil, the brain of a Hare, the leaves of Sabine, sprigs of Bay, and some other few things thereunto added. As soon as they have taken them, they instantly all to spet upon their heads, for by reason of a secret antipathy in Nature, they grow very dull thereby, and lay aside the force and rage of venom; for the spetle of a Man, is of a clean contrary operation to their poyson. And when after ward they make ostentation hereof in the Market, or publique Stage, they suffer them to bite their own flesh: but first of all, they offer them a piece of hard flesh, whereupon they bite to cleanse their teeth from all spawn and spume of venom, or else sometime pull forth the little bags of poyson, which inhere in their chaps, and under their tongues, so as they are never more repleat or filled again: And by this deceit they deceive the world where ever they come, giving forth that they are of the lineage of Saint Paul, who cast a Viper off from his hands, as we read in the holy Scripture.

It was an invention of ancient time among the wise Magitians, to make a pipe of the skins of Cats legs, and therewithall to drive away Serpents; by which it appeareth, that the soveraignty of Man over Serpents, was given by GOD at the beginning, and was not lost, but continued after the fall of man, (although the hand that should rule be much weaker) and practised by the most barbarous of the world, necessity of the defence forcing a violence and hatred, betwixt the Serpent and the Womans seed. For this cause we read of the seaven daughters of *Atlas*, whereof one was called *Hym*, whose daily exercise was hunting of venomous Beasts, and from her the *Hyades* had her denomination. And for a conclusion of this Argument, I will adde this one story more out of *Ælianus*. When *Thonis* the King of Egypt had received of *Menelaus*, *Helen* to be safely kept, whiles he travelled through *Æthiopia*, it hapned that the King fell in love with her beauty, & oftentimes endeavoured by violence to ravish her; then, it is also said, that *Helen*, to turn away the Kings unlawful lust, opened all the matter to *Polydamna* the wife of *Thonis*, who instantly fearing her own estate, lest that in time to come, fair *Helen* should deprive her of her husbands love, banished her into the Island of *Pharus*, which was full of all manner of Serpents, and yet taking pity on her for her simplicity, gave her a certain herb, whereby she drove away all Serpents. For (it is said) when the Serpents and venomous Beasts do but smell the same herb, they instantly hide their heads in the earth. *Helen* coming into that Island planted the same there, and was therefore called by the Inhabitants after her own name *Helenium*, which the skilful Herborists at this day affirm to grow in *Pharus*.

Unto this discourse of the taming of Serpents, I may add yet more strange things, if any thing be strange in the nature of this world. And those are some Histories of the familiarity of Men, Women and Serpents. *Alexander* was thought to be begotten of a Serpent, for it is said, that on a time there was found a great Serpent upon his Mother *Olympia* as she was sleeping; and some say (for the honour both of the Mother and the Son) that this Serpent was *Jupiter*, turned into the likeness of a Serpent, as we read he changed himself into many other shapes. And the like story unto this, is alledged of *Scipio Africanus* his mother, who long time remained barren without the fruit of the womb, insomuch as *P. Scipio* her husband utterly despaired of posterity. It hapned one day, as she was in her bed, her husband being absent, there came a great Snake and lay beside her, even in the presense of the servants and family, who being mightily astonished thereat, cryed out with loud voyces for fear, whereat the woman awaked, and the Snake slid away invisibly. *P. Scipio* hearing this report at his return home, went to the Wizards to understand the secret or signification of this prodigie: who making a sacrifice, gave answer that it betokened prolification, or birth of children, and thereupon followed the birth of *Scipio Africanus*.

We read also in *Plutarch* of certain Serpents, lovers of young Virgins, who after they were taken and insnared, shewed all manner of lustful, vitious, and amorous gestures of uncleanness and carnality; and by name, there was one that was in love with one *Ætolia* a Virgin, who did accustom to come unto her in the night time, sliding gently all over her body never harming her, but as one glad of such acquaintance, tarried with her in that dalliance till the morning, and then would depart away of his own accord: the which thing being made manifest unto the Guardians and Tutors of the Virgin, they removed her unto another Town. The Serpent missing his love, sought her up and down three or four days, and at last met her by chance, and then he saluted her not as he was wont, with fawning, and gentle sliding, but fierce assaulted her with grim and austere countenance, flying to her hands, and binding them with the spire of his body fast to her sides, did softly with his tail beat upon her backer parts. Whereby was collected, some token of his chastisement unto her, who had wronged such a Lover with her wilful absence and disappointment.

It is also reported by *Ælianus*, that *Egemon* in his verses, writeth of one *Aleva* a *Thessalian*, who feeding his Oxen in *Thessaly*, near the Fountain *Hamonius*, there fell in love with him a Serpent of exceeding bigness and quantity, and the same would come unto him, and softly lick his face and golden hair, without doing him any manner of hurt at all.

These, and such like things do evidently prove, that Serpents are not only involuntarily tamed by Men, but also willingly keep quarter with them, yeelding to the first Ordinance of the Creator, that made them subjects and vassals to men. And thus much shall suffice to have spoken in this place, concerning the first cteation of Serpents.

Plutarch.

Ca. Oppian.
Jul. Higinius.
Gellius.

Pierius.

Pierius.

Of the natural Generation of SERPENTS, and their several Originals.

IT being thus cleared, that Serpents were at the beginning created by GOD, and are ruled by men, it now followeth, that we should in the next place talk of the matter of their beginning, and the means of their continuance ever since their Creation.

First therefore it is most plain in Genesis, that the Earth (by the vertue of the Word of GOD) did produce all Creeping things, and among them Serpents: but since that time, they have engendered both naturally, and also prodigiously.

As concerning their constitution, it is held to be most cold, above all other living Creatures; *Pliny*. and therefore *Pliny* writeth, that they have neither heat, nor blood, nor sweat. Hereunto subscribeth *Galen* and *Rasis*; yet *Avicen* seemeth to affirm the contrary. *Mercurius* decideth this controversie, and proveth that Serpents are extreemly cold, and their bodies outwardly moist. First, because those which are stung and poysoned by Serpents, are oppressed with an unnatural cold, which overcome natural heat, and distendeth all their parts, vexing them intolerably. Secondly, there can be assigned no other reason why these Creatures hide themselves four moneths in the year, but only their natural cold, making them so tender, as they are altogether unfit to endure any external frigidty. Thirdly, if a man take a Snake or a Serpent into his handling in the midst of Summer, and warmest part of the year, yet shall he perceive that they are cold in a palpable manner being alive, which is not a quality competent to any other creature. Fourthly, seeing that blood is the proper and native seat of all heat in natural living bodies, Serpents having a very small quantity of blood, must also have a smaller proportion of heat: and therefore it followeth unavoidably, that the eminency of their temperament is cold in the highest degree, above all other living Creatures. And that their bodies be outwardly moist, it appeareth (saith *Isidorus*) by this, that when they slide along upon the Earth, (which way soever they go) they leave behinde them in their train or path a slimy humour.

By this therefore it is confirmed, that they are of the Earth and of the Water, as afterward we shall shew in the description of their kinds. But yet there are prodigious beginnings of Serpents, whereof some seem to be true, and other to be fabulous. The first sort are those which *Pliny* affirmeth to be engendred of the marrow in the back-bone of a man, and that indifferently, out of the dead bodies of good and evill men. Yet some more modest, thinking it unreasonable, that the remnants of a good meek man, should beget or be turned into so barbarous, venomous, and cruel a nature; rather taking it for granted, that peace and quietness is the reward of such persons, attribute these beginnings or alterations to the bodies of wicked men, as a just deserved punishment of their former evils, that the reversions of their bodies should after death turn into Serpents, whom they resembled being alive in the venomous fraud of their spirits. Of this *Ovid* speaketh.

*Sunt quæ cum clauso putrefacta est Spina sepulchro,
Mutari credunt humanas angue medullas.*

Which may be thus Englished,

*Some think the putrid back-bone in the grave rack'd,
Or marrow chang'd, the shape of Snakes to take.*

In Egypt, as Frogs and Mice are engendered by showres of rain, so also are Serpents: And *Avicen* *Macrobius*, saith, that the longest hairs of women are easily turned into Serpents. *Nicander* dreameth, that all venomous Beasts are engendered of the blood of the Titans or Giants. *Acusilaus*, of the blood of *Typhon*. *Apollonius Rhodius*, of the drops of blood which do distil from *Gorgons*. *Virgilius* saith, that dung being laid in a hollow place, subject to receive moisture, engendereth Serpents. Of the *Gorgons* drops, *Ovid* writeth thus;

*Cumque super Lybicas victor penderet arenas,
Gorgonei capitis gutta cecidere cruenta,
Quas humus exceptas, varios animavit in angues,
Unde frequens illa est infestaque terra colubris.*

Which may thus be Englished:

*And as he over-flew
The Lybick sands, the drops of blood that from the head did fell
Of Gorgon being new cut off, upon the ground did fall,
Which taking them, and as it were conceiving them withall,
Engendred sundry Snakes and Worms: by means whereof that Clime
Died swarm with Serpents ever since, to this same present time.*

But most strange of all other, are the succeeding Narrations. For it is reported that when *L. Scipio*, and *C. Norbanus* were Consuls, that the Mother of *Clustus* in *Hetruria*, brought forth a living Serpent in stead of a childe, and the said Serpent by the command of the Wizards was cast into a River, nevertheless it would not drown, but swimm'd against the stream. And *Pliny* saith, that at the beginning of the *Morsyck* war, there was a maid-servant that brought forth another Serpent. And

Faustina

Obsequens.

Faustina the Empress dreamed that she brought forth Serpents, when she was with childe of *Commodus* and *Antoninus*, and one of these Serpents seemed more fierce then the other, which proved allegorically true: for afterward *Commodus* was so voluptuous and tyrannous, that he seemed like a Serpent to be born for nothing, but for the destruction of mankind.

In the year of our Lord 1551. there was a little *Latine* Book printed at *Vienna*, wherein was contained this History following. In this Summer (saith the Book) about *S. Margarets* day, there happened most rare and admirable accidents: for near a Village called *Zichsa*, by the River *Ibeose* in *Hungaria*, there were many Serpents and Lizards bred in the bodies of men, very like to such as are bred in the earth, whereupon they fell into exquisite torments: and there dyed of that calamity, about three thousand, and some of the bodies being laid against the Sun gaping, the Serpents came forth of their mouths, and suddenly entred into their bellies again. Amongst other, there was a certain Nobleman's daughter which dyed of that malady, and when she was dissected or ripped, there were found in her body two great Serpents. These things seem to be miraculous, and above the order of Nature: yet credible, because in our experience in *England*, there have been Worms like Serpents found in the bodies of men, whereof some have been ejected the parties being alive, and other when as the parties were dead. But that these beginnings of Serpents being unnatural, are Divine and sent from God as scourges, it may appear by another notable History, recorded in the aforementioned Book, both in the same year, and in the same Countrey.

There was (saith mine Author) found in a mow or ryck of Corn, almost as many Snakes, Adders, and other Serpents, as there were sheafs, so as no one sheaf could be removed, but there presently appeared a heap of ugly and fierce Serpents. The Countrey-men determined to set fire upon the Barn, and so attempted to do, but in vain, for the straw would take no fire, although they labored with all their wit and policy to burn them up. At last, there appeared unto them at the top of the heap a huge great Serpent, which lifting up his head spake with mans voice to the Countrey-men, saying: Cease to prosecute your devise, for you shall not be able to accomplish our burning, for we were not bred by Nature, neither came we hither of our own accord, but were sent by God to take vengeance on the sins of men. And thus much for the true and natural beginnings of Serpents.

Now we read in read in holy Scripture, that the rod of *Moses* was turned into a Serpent by divine miracle, whereby he was assured of the power that God would give him to deliver his people *Israel* out of *Egypt*, which land abounding with Serpents, both natural bred in the earth, and moral, such are crafty and politick Princes and people: yet *Moses* should take them as he did his Serpent by the tail, and cause them to bend unto him like as it were a wand, or else some other little walking staffe: and also that his power should be unresistible, because his Serpent devoured others. The Magicians or Sorcerers, (as *Jannes* and *Jambres*) resisted him, and also turned their rods into Serpents. But *Moses* did it by true piety, they by diabolical delusions, as false Christians many times work miracles by outward signes of true piety, and therefore *Moses* rod overcame the Sorcerers Serpents, because the end of fraud and falsehood is, to be overcome by truth and piety.

From this changing of rods into Serpents, came the several metamorphosing of sundry other things into Serpents also, as that tale of *Orpheus* head, after he was torn in pieces by the *Thracian* women; and the same thrown into a River, was taken up in *Lemnos*. The Poet describeth it thus;

*Hic ferus exposito peregrinis anguis arenis
Os petit, & sparsos stillanti rore capillos
Lambit, & hymniferos inbiat divellere vultus:*

*Tandem Phœbus adest: morsusque inferre parantem
Arcet, & in Lapidem rictus Serpentis apertos
Congelat, & patulos ut erant indurat hiatus.*

In English thus;

No sooner on the forain coast now cast a land they were,
But that cruel natur'd Snake did straight upon them fly,
And licking on his ruffled hair, the which was dropping dry,
Did gape to tyre upon those lips that had been wont to sing
The heavenly hymnes. But Phœbus straight preventing that same thing,
Dispoins the Serpent of his bait, and turns him into stone,
With gaping chaps, &c. —

So *Isacius Tzetzes* writeth, that when *Tiresia* found Serpents in carnal copulation in *Cithæron*, he slew a female, who presently after death was turned into a Woman, then also he slew a male, who likewise being dead, was in the same place and manner turned into a Man. When *Cadmus* was sent by his Father, to seek out his sister *Europa* that was ravished by *Jupiter*, with straight charge not to return back again except he could finde her, having spent much time in seeking her to no purpose, because he could not finde her, and not daring to go back again to his father; he was warned by the Oracle that he should go into *Bœotia* to build a City. Coming thither, he sent his companions to the fountain of *Mars* that was in the Countrey to fetch water, where a great Serpent came and killed them; at last, *Cadmus* not finding their return, went likewise to the same Fountain, where he found all his men slain, and the Serpent approaching to assail him, but he quickly killed it. Afterward he was admonished by *Pallas*, to strew the teeth of the same Serpent upon the ground, which he performed, and then out of those teeth (saith *Ovid*) arose a multitude of Armed men, who instantly fell to fight one with the other, in such cruel and bloody manner, that at the last there were but five of them all left alive, which five (by the will of *Pallas*) were preserved to be the Fathers of

of the people of *Thebes*. And so *Apollonius* saigneth, that with the help of men bred of Serpent, teeth, came *Jason* to obtain the Golden Fleece.

They saign also, that *Achelus* when he strove with *Hercules* about *Deianira*, turned himself into divers shapes, and last of all into a Serpent, or as some say, into a River. So likewise *Cadmus* afore-said, being overcome with the sight and sense of his own miseries, and the great calamities that befell to his Daughters and Nephews, forsook *Thebes*, and came into *Illyrium*, where it is said, that he earnestly desired of the Gods to be turned into a Serpent, because a Serpent was the first original of all his extremities. *Antipater* saigneth *Jupiter* to be turned into a Serpent; and *Medusa* refusing the love of *Neptune*, is also saigned by *Ovid* to be turned into a Serpent, when he writeth;

*Hanc pelagi rector templo vitasse Minervæ
Dicitur, aversa est & castos Ægide vultus
Nota Jovis textit: neve hoc impune fuisset,*

*Gorgoneum crinem turpes mutavit in Hydros.
Nunc quoque ut attonitos formidine terreat hostes,
Pectore in adverso, quos fecit sustinet angues.*

In English thus;

*It is reported how she should abus'd by Neptune be,
In Pallas Charch, from which foul fact Joves daughter turn'd her eye:
And lest it should unpunisht be, she turn'd her seemly hair
To loathsome Snakes, the which the more to put her foes in fear,
Before her breast continually she in her hand doth bear.*

Pierius writeth, that the myrtle rod was not lawful to be brought into the Temple of *Hecate*, and that a Vine branch was extended over the head of her sign: and whereas it was not lawful to name Wine, they brought it into her Temple under the name of milk, and that therein continually lived harmleis Serpents. The reason of all this was, because that her own Father *Faunus* fell in love with her, whom she resisted with all modesty, although she were beaten with a Myrtle rod, and made to drink Wine; but at last the beastly father was transformed into a Serpent, and then he oppressing her with the spires of his winding body, ravished her against her minde. These and such like stories and Fables are extant about the beginnings of Serpents; all which, the Reader may consider, to stir up his minde to the earnest and ardent meditation of that power that of stones can make men, of Rocks, water; of water, Wine; and of small Rods great Serpents.

Then thus having exprest the Original of Serpents in their Creation, it followeth now to add the residue of this Chapter about their generation. It is a general rule that all Beasts wanting feet and have long bodies, perform their work of carnal copulation by a mutual embracing one of the other, as Lampreys and Serpents: And it is certain, that two Serpents in this action seem to be one body and two heads, for they are so indivisibly united and conjoynd together, and the frame of their body is altogether unapt for any other manner of copulation. When they are in this action they send forth a rank savour offensive to the sense of them that do perceive it: And although like unto many fishes, they want stones, yet have they two open passages wherein lyeth their generative seed, and which being filled, provoketh them to their venereal lust, the seed it self being like a milky humor; and when the female is under the male, she hath also her passages to receive the seed, as it were into the cells of her womb, and there it is framed into an Egge, which she hideth in the earth an hundred in a cluster, about the quantity of a Birds egg, or a great bead, such as are used sometime by women.

And this is general for all Serpents, except Vipers, who lay no Egges, but hatch in their wombs their young ones, as we shall shew at large in their particular history. The Serpent having laid her Egge sitteth upon them to hatch them at several times, and in a year they are perfected into young ones. But concerning the supposed copulation of Serpents and Lampreys, I will not meddle in this place, reserving that discourse to the History of Fishes, and now only it sufficeth in this place to name it, as a feigned invention; although Saint *Ambrose* and other ancient Writers have believed the same, yet *Athenæus*, and of late days *P. Jovius*, have learnedly and sufficiently declared by unanswerable arguments the clean contrary. The Serpents love their Egges most tenderly, and do every one of them know their own, even among the confused heaps of the multitude, and no less is their love to their young ones, whom for their safeguard, sometime they receive into their mouths, and suffer them to run into their bellies: And thus much for the generation of Serpents.

Of the Names of Serpents, and their several parts of Anatomy.

BY Serpents we understand in this discourse all venomous Beasts, whether creeping without legs, as Adders and Snakes, or with legs, as Crocodiles and Lizards, or more neerly compacted bodies, as Toads, Spiders, and Bees, following herein the warrant of the best ancient Latinists, as namely *Cornelius Celsus*, *Pliny* and *Apuleius* do call Lice Serpents, in that their relation of the death of *Pherecydes* the Syrian, who was the Præceptor of *Pythagoras*, of whom it is said *Serpemibus periisse*, to have perished by Serpents, when on the contrary it is manifested he was killed by Lice. *Aristotle* and *Galen* define a Serpent to be animal sanguineum pedibus orbatum & oviparum, that is, a bloody Beast without feet, yet laying egges; and so properly is a Serpent to be under stood.

The

The Hebrews call a Serpent *Nachasch*. *Darcon* and *Cheveia* by the Chaldees : so also *Thaninim* and *Schephiphen*, by the Hebrews ; as Rabbi Solomon, Munster and Pagnine write. The Grecians, *Ophidi* and *Opbis*, although this word do also signifie a Viper in particular, even as the Latine, *Serpens*, or *Serpula* do, sometime a Snake, and sometime an Adder. The Arabians, *Haie*, and *Hadaie*, for all manner of Serpents. And *Testub*, or *Tensu*, or *Agestim* for Serpents of the Wood, likewise *Apantias* and *Atussi*. The Germans, *Eiu schlang* ; which word seemeth to be derived from *Anguis*, by an usual figure, and after the German fashion, preposing *Sch*. The French call it *Un serpent* ; the Italians, *Serpe* & *Serpente* : and *Massarius* saith, that *Scorzo* and *Scorzona*, are general words for all manner of Serpents in Italy, which strike with their teeth. The Spaniards call them *Sierpe* ; the Grecians call the young ones in the Dams belly, *Embrua* ; and the Latines, *Catuli*. And thus much for the names in general, which in holy Scripture is Englished a Creeping thing.

Now it followeth, that I should set down a particular description of all the outward parts of Serpents ; and first of all, their colour is for the most part like the place of their habitation, or abode, I mean like the Earth, wherein they live ; and therefore I have seen some black, living in dung ; some yellow, living in sandy rocks ; and some of other colour, as green, living in trees and fields ; but generally they have spots on their sides and belly, like the scales of fish, which are both white, black, green, yellow, brown, and of other colours also, of which *Ovid* writeth :

——— *Longo caput extulit antro*
Ceruleus Serpens, borrendaque sibila misit.
That is,

The greenish Serpent extold her head from den so steep,
And fearful hissing did send forth from throat so deep.

The frame of their bodies do not much vary in any, except in the feet and length, so that with a reservation of them, we may express their universal Anatomy in one view ; for almost all of them are of the same proportion that is seen in Lizards, if the feet be excepted, and they made to have longer bodies. For they are inclosed in a kinde of shell or crusty skin, having their upper parts on their back, and their neather parts on the belly like a Lizard, but they want stones, and have such manner of places for copulation as fishes have, their place of conception being long and cloven. All their bowels, by reason of the length and narrowness of their bodies, are also long and narrow, and hard to be discerned, because of the dissimilitude of their figures and shapes. Their artery is long, and their throat longer then that : the ground or root of the artery is near the mouth, so as a man would judge it to be under the tongue, so as it seemeth to hang out above the tongue, especially when the tongue is contracted and drawn backward. The head long like a Fishes, and flat ; never much bigger then the body, except in monstrous and great shaped Serpents, as the Boas. Yea, *Aristotle* maketh mention of a Serpent that had two heads ; and *Arnoldus*, of a Serpent in the *Pireney* Mountains, slain by a souldier, that had three heads, in whose belly were found two sons of the said souldier devoured by him, and the back-bone thereof was as great as a mans skull, or a Rams head. And such an one we read in our English story was found in England, in the year 1349. And the 23 year of *Edward* the third, there was a Serpent found in *Oxfordshire*, near *Chippingnorton*, that had two heads and faces like women, one being shaped after the new attire of that time, and another after the manner of the old attire, and it had great wings, after the manner of a Bat.

Holinshead.

The tongue of a Serpent is peculiar, for besides the length and narrowness thereof, it is also cloven at the tip, being divided as it were with very little or small nails points. It is also thin, long, and black of colour, voluble ; neither is there any beast that moveth the tongue so speedily : wherefore some have thought, that a Serpent hath three tongues, but in vain, as *Isidorus* sheweth, for they deceive by the nimbleness thereof. Their ventricle is large, like their maw, and like unto a Dogs, also thin, and uniform at the end. The heart is very small, and cleaveth to the end of their artery, but yet it is long, and sheweth like the reins of a Man : wherefore sometimes it may be seen to bend the tip or lap thereof to the breast-ward. After this followeth the lights, but far separate from it, being simple, full of fibres, and open holes like pipes, and very long : The liver long and simple ; the milt small and round as in Lizards. The gall is for the most part as in fishes, but in Water-snakes it is joyned to the Liver : in other Serpents to the stomach or maw. All their teeth stand out of their mouth, and they have thirty ribs, even as there were among the Hebrews and Egyptians thirty days to every moneth.

Aristotle saith, that as their eyes be small, so also they have the same good hap that befalleth young Swallows, for if by chance they scratch or rend out their eyes, then it is said they have other grow up naturally in their places ; In like manner their tails being cut off, grow again. And generally Serpents have their heart in the throat, the gall in the belly or stomach, and their stones near their tail : Their egges are long and soft, and in their teeth they cary poyson of defence and annoyance, for which cause they desire above all other things to save their heads. Their sight is but dull and dim, and they can hardly look at one side, or backward, because their eyes are placed in their temples, and not in their fore-head, and therefore they hear better then they see. They have eye-lids, for generally no creatures have eye-lids, except those which have hair in the other parts of their bodies ; four-footed beasts in the upper cheek, fowls in the neather, or Lizards which have

Ælianus.
Isidorus.

have eggs, or Serpents which have soft backs. They have also certain passages of breathing in their nostrils, but yet they are not so plain that they can be termed nostrils, but breathing places. Their ears are like to finny Fishes, namely small passages, or hollow places in the backer parts of their head, by which they hear.

Their teeth are like Sawes, or the teeth of Combes joynd one within the other, that so they might not be worn out by grinding or grating together; and yet they bend inward, to the end that they may the better hold their meat in their mouths, being without all other externall help for that purpose; for even those Serpents which have feet, yet can they not apply them to their chaps. In the upper chap they have two longer then all the residue, on either side one, bored thorough with a little hole like the sting of a Scorpion, by which they utter their poyson. Yet there be some good Authors that affirm, that this poyson is nothing else but their gall, which is forced to the mouth by certain veins under the ridge or back-bone. Some again say, that they have but one long tooth, and that a crooked one, which turneth upward by often biting, which sometime falleth off, and then groweth again, of which kinde those are, which men carry up and down tame in their bosoms.

Although they be great raveners, yet is their throat but long and narrow, for help whereof, when they have gotten a booty, they erect themselves upon their tails, and swallow down their meat the more easily. They cannot be said properly to have any neck, yet something they have, which in proportion answereth that part. They have tails like all other creatures, except Men and Apes, and some say that their poyson is contained in their tails, and is from thence conveyed into little bladders in their mouths, therefore the Mountebanks or Juglers, break that bladder, that they may keep them without poyson, but within the space of twenty four hours they are recollected, and grow anew again.

Their bodies are covered over with a certain skin like a thin bark, and upon Serpents it supplyeth the place that scales and hair do upon Beasts and fishes; for indeed, it is a pure skin, and in most things they are like to Fishes, except that they have lights, and Fishes have none: the reason is, they live on the earth, and the Fishes in the sea, and therefore have fins and gills instead thereof. The little Serpents have all their bones like thorns, but the greater, which stand in need of greater strength, have solid bones for their firmitude and better constitution. It is questionable whether they have any milt or no, and some say they have at the time of their laying of egges, and not otherwise. Their place of conception or secret, is large, and standeth far out, beginning beneath, and so arising up to the back-bone double; that is, having one skin or enclosure on either side, with a double passage, wherein the eggs are engendered, which are not laid one by one, but by heaps or clusters together. They have no bladder to contain urine, like to all other Creatures which have feathers, scales or rinde-speckled skins, except the Tortoises: the reason is, because of the exiguity and smallnesse of the assumed humour, and also all the humour acquired, is consumed into a loose and evaporate flesh. And to conclude this Anatomy, I will adde a short description which *Gregorius Macer* a Physitian wrote to *Gesner*, 1558. by his own dissection as followeth, saying.

As I lay at rest in a green field, there came unto me a great Serpent hissing, and holding up her neck, which I suddainly with a piece of wood amazed at a stroak, and so slew without peril to my self. Afterward, sticking her fast to a pale, I drew off her skin, which was very fast and sharp, and I found betwixt the skin and the flesh, a certain little thin skin, descending all upon the body with the outward skin, and this was somewhat fat. And when I came unto the place of excrements I found it like a Fishes, but there issued forth certain filth, farre exceeding in stinking savour the excrements of a man. After I had thus pulled off the skin, it was easie for me to look into the inward parts, which I found to answer the inward Anatomy of fishes and Fowls in some parts, and in other things, there appeared a proper disposition to the Serpent it self. For the Artery *Trachea* was about three or four fingers long, turned about with little round circles, and so descended to the lights, unto which the heart and the bladder containing the gall, did adhere or cleave fast. Then the liver was long, like the Fish *Lucius*, and so a white caul or fatnesse covered both the liver and stomach, which was half a span long: The guts began at the chaps, and so descended down to the place of excrements, as we see they do in Fishes.

Beneath the liver were the guts, upon either side descended a certain nervy or hard vein, unto which the eggs did cleave: which were covered with such little skins as Hens eggs are before they be layd, but yet they were distinguished in seat or place, because of their multitude; for upon either side I found two and thirty eggs. The tongue of the Serpent was cloven, and very sharp, but there appeared not any poyson therein. And so it is evident, that in the vein *Trachea*, heart and lights, it agreeth with Birds; in the liver, guts and caul, it resembleth a Fish, but in the place of the gall, and disposition of the eggs, it differeth from both. And thus farre *Macer*, with whose words I will conclude this Chapter of Serpents Anatomy.

Of the quantity of Serpents, and their abode, food, and other accidents.

SO great is the quantity of Serpents, and their long during age increaseth them to so great a stature, that I am almost afraid to relate the same, lest some suspicious and envious minded persons, should utterly condemn it for fabulous; but yet when I consider not only the plentiful testimonies of worthy and undoubted Antiquaries, and also the evidence of all ages, (not excepting this wherein we live) wherein are and have been shewed publickly many Serpents, and Serpents skins, I receive warrant sufficient to express what they have observed, and assured answer for all future Objections, of ignorant, incredulous, and unexperienced Asses. Wherefore as the life of Serpents is long, so is the time of their growth; and as their kindes be many, (as we shall manifest in the succeeding discourse) so in their multitude, some grow much greater and bigger then other.

Gellius writeth, that when the Romans were in the Carthaginian war, and *Attilius Regulus* the Consul had pitched his Tents near unto the River *Bragrada*, there was a Serpent of monstrous quantity, which had been lodged within the compass of the Tents, and therefore did cause to the whole Army exceeding great calamity, untill by casting of stones with slings, and many other devises, they oppressed and slew that Serpent, and afterward fleyed off the skin and sent it to Rome, which was in length one hundred and twenty feet. And although this seem to a beast of unmatched stature, yet *Possidonius* a Christian Writer, relateth a story of another which was much greater, for he writeth, that he saw a Serpent dead, of the length of an acre of Land, and all the residue both of head and body, were answerable in proportion, for the bulk of his body was so great, and lay so high, that two Horsemen could not see one the other being at his two sides, and the wideness of his mouth was so great, that he could receive at one time within the compass thereof, a Horse and a man on his back both together: The scales of his coat or skin, being every one like a large buckler or target. So that now there is no such cause to wonder at the Serpent which is said to be killed by *S. George*, which was as is reported so great, that eight Oxen were but strength enough to draw him out of the City *Silena*.

Mela.

There is a River called *Rhyndacus* near the Coasts of *Bythinia*, wherein are Snakes of exceeding monstrous quantity, for when through heat they are forced to take the water, for their safeguard against the Sun, and birds come flying over the pool, suddenly they raise their heads and upper parts out thereof, and swallow them up. The Serpents of *Megalana*, are said by *Pausanias* to be thirty cubits long, and all their other parts answerable. But the greatest in the world are found in *India*, for there they grow to such a quantity, that they swallow up whole Bulls and great Stags. Wherefore I do not marvel that *Porus* the King of *India*, sent to *Augustus Caesar* very huge Vipers, a Serpent of ten cubits long, a Tortoise of three cubits, and a Partridge greater then a Vulture. For *Alexander* in his Navigation upon the Red-sea, saith; that he saw Serpents forty cubits long, and all their other parts and members of the same quantity.

Pliny.

Megasth.

Solinus.

Textor.

Strabo.

Ælianus.

Among the *Seyrine*, the Serpents come by great swarms upon their flocks of Sheep and cattel, and some they eat up all, others they kill and suck out the blood, and some part they carry away. But if ever there were any thing beyond credit, it is the relation of *Volateran*, in his twelfth Book of the *New-found Lands*, wherein he writeth, that there are Serpents of a mile long, which at one certain time of the year come abroad out of their holes and dens of habitation, and destroy both the Herds and Heard-men if they find them. Much more favourable are the Serpents of a *Spanish Island*, who do no harm to any living thing, although they have huge bodies, and great strength to accomplish their desires.

Alefius.

Gellius.

Scaliger.

Cardan.

In the Kingdom of *Senega*, their Serpents are so great that they devour whole Beasts, as Goats, and such like, without breaking any one of their bones. In *Calechute*, they are as great as their greatest Swine, and not much unlike them, except in their head, which doth far exceed a Swines. And because the King of that Countrey hath made a Law, that no man kill a Serpent under pain of death, they are as great in number as they are in quantity: for so great is his error, that he deemeth it as lawful to kill a Man as a Serpent.

P. Fagius.

All kindes of Serpents are referred to their place of habitation, which is either the earth, or the waters of the earth; and the Serpents of the earth are more in number then the Serpents of the water, except the Serpents of the Sea: And yet it is thought by the most learned *Rabbins*, that the Serpents of the Sea, are fishes in the likeness of Dragons. Now the places of Serpents abode being thus generally capitulated, we must enter into a farther narration of their habitations, and regions of their native breeding. In the first place, *India* nourisheth many and divers sorts of Serpents, especially in the Kingdom of *Morfilium*, and *Alexander* the Emperor, found among other Beasts, sundry kindes of Serpents in a long Desert, which is on the North-side of *India*. But all the Nations of the World may give place to *Æthiopia* for multitude and variety, for there they gather together on heaps, and lie in compass like round hills, visibly apparent to the eyes of them that behold them a far off. The like is said of all *Africa*, for in *Numidia*, every year there are many men, women and children destroyed by Serpents. The Island *Pharus*, is also (by the testimony of the *Egyptians*) filled with Serpents: The Coasts of *Elyma* are annoyed by Serpents; and the *Caspians* are so annoyed by Serpents which come swimming in the floods, that men cannot sail that ways but in the

Pierius.

Winter

Winter time. For from the beginning of the Spring, or æquinoctial, they seem (for their number) to approach ravening, like Troops and Armies. There are certain Islands called *Ophiussa insule*, named after *Ophis* a Serpent, for the multitude bred therein: And there are Serpents in *Candy*, *Ephesus*, and all hot Countries, for this priviledge hath GOD in nature given to the colder Countreys, that they are less annoyed with Serpents, and their Serpents also less nocent and hurtful: and therefore the Serpents of *Europe* are fewer in number, lesser in quantity, and more resistable for their weakness and strength.

Solinus.

Ælianus.

Cor. Gellus.

Pierius.

There were a people in *Campania* called *Ofci*, because of the multitude of Serpents bred among them: Likewise there are great store in *Lombardy* and *Ferrara*. And whereas we have said, that the most nocent and harmful Serpents are bred in the hottest Regions, where they engender more speedily, and also grow into greater proportions, yet is it not to be understood of any special property appertaining to them alone, for I read in *Olaus Magnus* his description of the Northern Regions, of Serpents of as great quantity as in any other place of the world; but yet their poyson is not half so venomous and hurtful, as in the hotter Regions, especially the *African* Serpents. In *Botina* near *Livonia*, there are great store of great Serpents also, so that the Heard-men are at continual war and contention with them for defence of their flock: Likewise in the Mountains of *Helvetia* and *Auvergne*, whereof there are many wonders reported in the World, which I will not stand upon to relate in this place. We read also, that some places have been disinhabited, and dispeopled by Serpents, such were the people of *Scythia*, called *Neuri*, who before the war of *Darius*, were constrained to forsake their soil, because they were annoyed, not only with home-bred Serpents, but also with many other which came from other parts: and so the Countrey remaineth desolate to this present day, the ancient Inhabitants being all removed to dwell among the *Budiani*. The City *Amycle* in *Italy*, (as *M. Varro* writeth) was destroyed also by Serpents. And there be certain places of the world, which have received their denomination from Serpents, besides the *Ophiuse* near *Crete*.

Scaliger.

Olaus Mag.

The Island *Tenos*, was called *Hydrussa* and *Ophiussa*, so were *Crete*, *Ægium*, and the Mountains *Macrocremni*, *Rhodus*, and the long Islands *Ophiades* in the *Arabian* coast, which after it had remained along time desert, was purged and cleared from Serpents by the Kings of *Egypt*. *Nicæus* also calleth *Cyprus*, *Ophiodia*. And in *Pausanias*, we read of a place named *Ophios Kephalè*, the Serpents head. The like might be said of Rivers, as of *Orontes*, called also *Ophis*, and *Ophis* in *Pontus*, which divideth asunder *Colchis*, and the Countrey *Thiamica*. *Ebusus* nourisheth no Serpents, and the Earth thereof hath in it a secret vertue to drive away Serpents, wherefore it is much desired of all men to carry about them, for that it hath been often proved, that never any venomous beast durst adventure upon any man possessed thereof. The like is said of *Ireland*, as our own Chronicles do plentifully declare, and therefore I will spare to enter into any narration thereof.

Eupalides.

Diod. Sicul.

Arrianus.

Suetonius.

Pliny.

To come therefore to the more particular abode of Serpents, especially of such as are known to us, we must leave off the talk and nomination of Kingdoms, and descend to dens, holes, caves, dunghills, Sheep-coats, valleys, rocks, hollow-walls and trees, woods, green pastures, hedges, and such like places, wherein they make their most abode: And now and then in these Northern parts of the world (and yet seldom) they dive down into the bottom or roots of trees, especially such as are green all the Winter time: For they finde in them a greater heat or warmth, then in other, whose leaves fall off and decay in the cold weather, except in the roots of Birch. And by reason of their multitude gathered together at the root of this tree, it falleth out that their breath heateth the same, and so preserveth the leaves from falling off: Wherefore in ancient time, the ignorant multitude, seeing a Birch tree with green leaves in the Winter, did call it our *Ladies Tree*, or a holy tree, attributing that greenness to miracle, not knowing the former reason, or secret in Nature. *Solinus* reporteth of such a like Wood in a part of *Africa*, where in all the Winter time, the leaves of all the trees abide green, the cause is as before recited, for that the Serpents living at the roots of the trees in the earth, do heat them with their breath. Neither ought any man to wonder that they should so friendly live together, especially in the Winter and cold time, seeing that by experience in *England*, we know that for warmth they will creep into bed-straw, and about the legs of men in their sleep; as may appear by this succeeding discourse, of a true history done in *England*, in the house of a worshipful Gentleman, upon a servant of his, whom I could name if it were needful. He had a servant that grew very lame and feeble in his legs, and thinking that he could never be warm in his bed, did multiply his clothes, and covered himself more and more, but all in vain, till at length he was not able to go about, neither could any skill of Physitian or Chirurgion finde out the cause.

It hapned on a day as his Master leaned at his Parlour window, he saw a great Snake to slide along the house side, and to creep into the chamber of this lame man, then lying in his bed (as I remember,) for he lay in a low chamber, directly against the Parlour window aforesaid. The Gentleman desirous to see the issue, and what the Snake would do in the chamber, followed, and looked into the chamber by the window; where he espyed the Snake to slide up into the bed-straw, by some way open in the bottom of the bed, which was of old boards. Straightway his heart rising thereat, he called two or three of his servants, and told them what he had seen, bidding them go take their Rapiers and kill the said Snake. The serving men came first and removed the lame man (as I remember) and then the one of them turned up the bed, and the other two the straw, their

master standing without at the hole, whereinto the said Snake had entered into the chamber. The bed was no sooner turned up, and the Rapier thrust into the straw, but there issued forth five or six great Snakes that were lodged therein: Then the serving-men bestirring themselves, soon dispatched them, and cast them out of doors dead. Afterward, the lame Mans legs recovered, and became as strong as ever they were: whereby did evidently appear, the coldness of these Snakes or Serpents, which came close to his legs every night, did so benum them as he could not go. And thus for heat they pierce into the holes of chimneys, yea into the tops of hills and houses, much more into the bottoms and roots of trees.

Epist. 5.

When they perceive that Winter approacheth, they finde out their resting places, wherein they lie half dead four months together, until the Spring sun again communicating her heat to all Creatures reviveth, and (as it were) raiseth them up from death to life. During which time of cold Winter, as Seneca writeth, *Tuto tractari pestifera Serpens potest, non desunt tunc illi venena, sed torpent*: They may be safely handled, without fear of harm, not because they want poyson at that time, but because they are drouzy, and deadly astonished. But there is a question, whether when they be in this secrecie or drouziness, they awake not to eat, or else their sleep be unto them in stead of food. Olaus Magnus affirmeth of the Northern Serpents, that they eat not at all, but are nourished with sleep. Cardan saith, that they take some little food, as appeareth by those which are carryed up and down in boxes to be seen, and are fed with bran or cheafil. But this may be answered, that Serpents in boxes, are not so cold as those in Woods and Deserts: and therefore seeing cold keepeth them from eating, the external heat of the box-house, or humane body which beareth them about, may be a cause, that inclosed Serpents feed in Winter as well as in Summer, and yet the Serpents which run wilde in the fields eat nothing at all, during the time of their Chias or Ebriaw, that is, their lying hid.

Grevinus that learned man proponeth this question, *Si Serpentes calidi sunt, qui fit ut integros tres aut quatuor menses, id est toto illo tempore quo delitescunt, absque cibo vivunt?* If (saith he) Serpents be hot, how cometh it to pass that they can live three or four moneths without all food, that is, all the time of their lying secret? He maketh (in my opinion) a sufficient answer to this question, which for me shall conclude the cause, saying; Doth it not fall out with Serpents as it doth with some women, who being full of humor, and thick phlegmatick matter, have but a little and weak natural heat, (yet proportionable to the said humor) do live a great time by reason thereof without food or nourishment? And for this cause, all the hoasts of Philosophers do define, that Serpents do also abstain from eating a long season. For Nature hath clothed them with a more solid skin, and lined them with a more thick and substantial flesh, to the intent that their natural heat should not easily vanish away and decay in their bodies, but remain therein permanent, for the feeding and preserving of life. When they sleep, they seem to sleep with open eyes, which is elegantly described by Philes in these Greek verses:

Opōs kat' éude kaí dōkēz palin blepein
Opōis te kai ptox kai thumou pleres león
Epipetatai gar he chlām̄ys ton ommaton

Alou tinos Chitonos hapaloterou.
Phorourontos autois os dioptras, task-óras.

Which may be Englished thus;

How can the Hare, the Serpent, and the Lion bold,
Both sleep, and see together at one time?
Within their eye-lids, a soft skin their sight doth fold,
Shielding their apples, as glass doth weakened eyne.

The food of Serpents that is permitted them by God, is the dust of the earth, as may appear by that first and just sentence, which GOD himself gave upon them, for seducing our first Parents, Adam and Eve, Gen. 3. 14. *Because thou hast done this thing, thou art accursed above all the Beasts of the field, for thou shalt go upon thy belly, and eat dust all the days of thy life.* And again, Esay 65. 25. *Dust shall be meat to the Serpent.* And lest that we should think that this curse hath not taken hold upon the Serpent, we may finde the expresse practise hereof, Mich. 7. 17. where it is said of Gods enemies, that, *They shall lick the dust like the Serpent.* Yet Aristotle affirmeth truly, that Serpents are *Omnivori*, that is, devourers of flesh, fish, herbs, or any other things; howbeit, herein they pass their kinde, or else the curse of God reacheth not to any other kindes then to that alone which deceived our first Parents.

We have shewed already, how they eat and devour men, women and children, Oxen, Sheep, and Goats, but whatsoever they eat, they retain nothing but the moisture of it, and the residue they eject whole and undigested. Whatsoever is offered them, that they take, either a bird, or a small chicken, or an egge, having it, they take hold but of one end, as of the head of a chick, or small end of an egge, and so set it directly before them; then do they gather themselves together in as short a compass as may be, that so their bodies which seem long and small, being extended, may appear great and wide, reduced into a short and compacted frame. And surely hereby they open and make wider their passage and swallow, for then they suddenly goble in the beast or meat before them, without any great ado; and having kept it in their body till it be dryed from all moisture, they cast it out again as they swallowed it up, at another ordinary place. But for birds and chickens, they strive with them till they have gotten off their feathers, or else, if they swallow them whole, they eject the feathers as they do egge-shells.

The

The Serpents of the North do in the Summer time eat the flesh of birds, and herbs, and after the eating of them, they taste of a little water, or milk if they can attain it, or else Wine. For this cause they will suck the udders of Kine, or Goats, or Sheep, as hath been seen in England. Yet is their appetite to drink but small, as is in all other creatures, whose livers are fungous, and soft like sponges; and so are all beasts and creatures which lay egges. Above all kindes of drink they love Wine, and thereof they be drunk, wherefore in Italy they set pottles of Wine to entrap Vipers: for if once they smell the Wine, they enter the vessel gladly and speedily, and the Wine or Milk whereof they drink, is poysoned by them. But in those places of Africa where it never raineth, they eat a kinde of black moist worm, which hath many legs, as is said by Theophrastus. And to conclude, their meat and drink is so small, that it is received for truth, *Natum venenatum perit fame vel siti*, that no venomous beast perisheth by hunger or thirst.

The voyce of Serpents is called *Sibilus*, a hissing, and their voyce differeth from all other Beasts hissing, in the length thereof: for the hissing of a Tortoise is shorter and more abrupt. Of this hissing voyce speaketh Lucan, saying;

Quod strident ululantque ferae, quod sibilat anguis.
In English thus;
Gnashing and howling is the voyce of wilde Beasts,
Long hissing in Snakes and Serpents doth rest.

Among other things notable in a Serpent, this is one, because it casteth off his old age every year, whereof the Grecians tell this fabulous reason. Once Man-kinde strove earnestly with the Gods by supplication for a perpetual youth, that they might never wax old: and obtaining their desire, they laid the same to be carryed upon an As. The silly Beast waxing fore athirst in his travail, at last came unto a water, and thereof endeavoured earnestly to drink; but the keeper of the same water being a Serpent, denyed leave to the As to drink thereof, except he would grant him his carriage, which was Perpetual youth: The poor As ready to perish for thirst, easily condescended thereunto. Whereupon the Serpent changeth her age for youth, and Men their youth for old age; and the As for his punishment, is more tormented with thirst then any other Beast.

But to leave fables, and to come more neer the mark, the Latines call the casting off their skin, *Anguina senectus*, *spolium Serpentis*, & *vernatio*; the Grecians, *Ophios derma*, *Suphar*, *Leberis* & *Geras*; the Arabians, *Geluc* & *Genlut*, & *Falcalbaileb*; the Italians, *Spoglia delle Serpi*: and the Spaniards, *Pelle de la culebra*. About this Snakes skin there is great difference among Authors, some affirming it to be the very skin. Other, that it is nothing but a kinde of hard Leprosie, grown upon them during the Winter time while they lie hid. Some again say, that they cast it twice a year, first in the Spring, and then secondly in the Autumn. But by conference of all together it appeareth, that while the Serpents lie hid, by reason of their drought now in the beginning of the Spring when they come first abroad, they rub off this skin by sliding betwixt two stones, or underneath some root of a tree, or else betwixt some boughs or small trees, beginning at the head, and so continuing to the tail. And within four and twenty hours, that which was raw and bald, beginneth to have another skin upon it; and so as a young childe or beast cometh out of the Secondine doth a Serpent come out of the skin.

As concerning their eye-sight, they naturally do take the juyce of Fennel, which they eat, and by that recover their seeing again: and if it happen that they cannot finde sufficient, they rub their dim eyes thereupon. And if it happen that any of his scales be bruised, or fall senseless, then do they rub themselves upon the thorns of Juniper. And whereas it is thought that they cast their skins again in Autumn, that is to be attributed either to Vipers alone, which cast their skins twice a year, or else to those which are long before they cast, and so it falleth off in Harvest or Autumn the first time, which by reason of the unseasonableness, is thought to be a second coat. And this have I my self often found here in England in the Summer time. The casting off this skin is thus elegantly described by Tibullus:

*Crudeles Divi! Serpens novus exuit annos,
Formae non ullam fata dedere moram.
Anguibus exuitur tenui cum pelle vetustas:
Cur nos angusta conditione sumus?*

Which may thus be Englished;

*O cruel Gods, sub Serpents change their yearly age,
And Fates delay not to refine their form,
Sub Snakes with tender skin excus'd their years enlarge,
Why unto worser hap is Mankind born?*

*Of the inward disposition of Serpents, and of their concord
and discord with other Creatures.*

IT is ever to our woe to be remembred, that which the Lord himself hath left recorded in Genesis, that, *The Serpent was more subtle then all the beasts which God had made.* By which is expressed the natural disposition of this beast above other to subtilty and policy; For I cannot approve the saying of them, who think that the Devil at the beginning might as well have used the tongue of an As or a Dog to have deceived Man, as well as a Serpents; but surely that old Serpent knew very well, (better then all they which speak the contrary) that he could not have so fit a subject in all the World, as the shape, wit, and cunning of a Serpent. And that this came not into the Serpent at that time when the Devil framed his tongue to speak, may appear by the precept of our Saviour Christ, where he saith; *Be wise as Serpents, be innocent as Doves.* For if there had not been naturally, some extraordinary faculty of understanding in this beast, as there is of meekness in a Dove, his wisdom would never have sent us to a Serpent posselt with a Devil, but rather to some other ingenious Beast, whereof there were great store in the World. And therefore I conclude, that subtilty and prudence came not to the Serpent as speaking into *Balaams As*, but rather by nature or creation.

And yet concerning this last sentence of our most blessed Saviour, I cannot but expresse the words of *Tzetzes*, who writeth thus upon it, *Servate capita vestra, quemadmodum Serpens qui insidiis petitis vapulansque ad mortem, omnimodo caput suum abscondit, sic vos à tyrannis & impiis cruciati, caput servate mihi, fidem vestram, & ne Deum negetis usque ad ipsam mortem.* That is, it is as much as if our Saviour Christ should say; Even as when a Serpent is set upon and stroken, by all the means she can she hideth her head, and exposeth all her other parts to blows, reserving that sound; so you, when you are persecuted by Tyrants, preserve your head, that is, your faith, and deny not your God to death. And this thing is affirmed by all Writers, both divine and humane, which have ever touched this point, that above all the parts of the body the Serpent preserveth his. For *Pliny* saith, that if his body be cut off but two fingers length from his head, he will go away as if he had no harm at all, and live longer.

Paulus Fagius writing upon Genesis, saith; It is the opinion of some *Hebrews*, that the Serpent at the beginning did go upright, and was indued with all the affections of men: but this Jewish fable is not worthy to be confuted, because humane affection cannot proceed but from a reasonable soul, which to ascribe to the Serpent, were blasphemous and absurd. Besides, that then the soul might die, and that God had created such a soul, otherwise then by breathing into the body the breath of life.

Serpents have many Epithets given unto them, as illiberal, perfidious, treacherous, venomous, poysonful, stinging, implacable, furious, savage, merciless, devourer, and such like: And indeed the holy Writers, by a Serpent do understand implacable fury: For they are *immitissimum animalium genus*, a most ungentle and barbarous kinde of all creatures, as may appear by the rage of a little Snake, one of the least of Serpents kinde: for when he perceiveth that he is hurt or wounded, he never ceaseth casting out his poyson, until he have done harm, or die for madness.

Two things I finde to be notable in Serpents, the first is proper to their kinde, the second is common to them with Swine, Rats, and Mice. First, they are above measure kinde, not only to their young ones, but also to their Egges. For *Funckius* confidently sweareth, that at *Lestorfium* he saw a Serpents Egge taken and cast into a hot furnace, and when it began to fry in the same, whether by natural instinct, or by smell thereof, the old Serpent came, and would have run into the fire to fetch it out, but that he and other strangers hindered her by killing her. And so likewise, if in a Wood one of them be set on fire, all the Serpents that are within the savour thereof, or within the hearing of the hissing, will instantly gather unto it, even as beasts when they hear one another roar. And so great is their love one toward another, (as *Pliny* and *Textor* write) that it was a vulgar saying, *Serpentium morsus non petit Serpentes*, one Serpent will not bite another. And *Juvenal* writeth;

*Sed jam Serpentum major concordia——
Scilicet, quam hominum inter se.*

That is to say;

*Better do Serpents with Serpents accord,
Then Man with Man, who should be their Lord.*

I cannot conceal a most memorable History as ever was any in the World; of a fight betwixt the Serpents of the Land and the Water. This History is taken out of a Book of *Schiltbergerus*, a *Bavarian*, who knew the same (as he writeth) while he was a captive in *Turky*, his words are these. In the Kingdom called *Gemycke* there is a City called *Sampson*, about which while I was prisoner with *Baiazeta* King of *Turkes*, there pitched or arrived an innumerable company of Land and Water Serpents, compassing the said City a mile about. The Land-serpents came out of the woods of *Trienick*, which are great and many, and the water Serpents came out of the bordering Sea.

These

These were nine days together assembling in that place, and for fear of them there was not any that durst go out of the City, although it was not observed that they hurt any man, or living creature thereabouts. Wherefore the Prince also commanded, that no man should trouble them, or do them any harm, wisely judging, that such an accident came not but by Divine miracle, and that also to signifie some notable event. Upon the tenth day these two valiant Troops joyned battel early in the morning before the Sun-rising, so continuing in fight until the Sun-set, at which time the Prince with some Horse-men, went out of the City to see the battel, and it appeared to him and his associates, that the Water Serpents gave place to the Land Serpents. So the Prince and his company returned into the City again, and the next day went forth again, but found not a Serpent alive, for there were slain above eight thousand: all which he caused presently to be covered with earth in ditches, and afterward declared the whole matter to *Baiazeta* by Letters after he had gotten that City, whereat the great *Turk* rejoiced, for he thereby interpreted happiness to himself.

But I have been too long in this first and proper affection of Serpents, namely, their mutual concord; and this example of the Land and Water Serpents, doth not break the common promised rule, because it is to be understood of Serpents that live in the same element. The second property is to presage Pestilence, rottenness of air, famine, floods, and ruine of those places wherein they are commorant, and have their abiding: so do they know to chuse a good air, and fore-know fertility of fruits, earth-quakes and great tempests. When *Helice* was destroyed, five days before, the Serpents, Snakes, Rats, Mice, and Weasels, departed all out thereof, being wiser then Men, that misdeeming no harm, although they saw and wondered at these removals, yet stood it out to their own utter ruine, overthrow and destruction.

Helianus.

Of the friendship and enmity which Serpents keep with other Creatures.

Ever since the Devil entered into the Serpent, it became hateful to all, or the most part of the beasts of the field, so that it may as truly be verified of the Serpent as it was of *Esau*, that the hands of all Men and Beasts are against them, (except very few) for they are strangers to all, and finde very few or no friends. Yet it is reported, that the Serpent and the Fox will live peaceably together in one cave or lodging. There is a story, not unpleasant, of a Man that found a Serpent enclosed betwixt two stones, and at the intreaty of the Serpent, he loosed him out of danger, and did him no harm. The Serpent being released and free from death, in stead of other recompence for so good a turn, told the Man that he had been therein a long time inclosed, and was very hungry, and therefore was forced (against his will) to make the best of his fortune, and therefore must needs eat the Man, and bad him prepare himself for death. The Man astonished at this motion, replied to the Serpent, that he hoped he would not deal so with him, having delivered him from death, now to put his deliverer to death: and said moreover, that he would not be the Judge of his own case, but refer the same to the next they found: and the Serpent also yeilded to that judgement, being assured that no creature would quit the Man, lest he should cast his own life into peril. Forth then they went and met with an Ass, to whom the Man told the difference betwixt him and the Serpent, how kindly he saved the Serpents life, and how unkindly he again would take away his life. And then the Serpent bade the Ass consider what judgement he gave, and for whom he spake. The Ass adjudged it lawful for the Serpent to kill the Man. Lo now, said the Serpent, make you ready, for the matter is judged against you, and withall, began to make force at him with mouth and sting. But the Man said, that he would not take this Asses decree for reasonable, and therefore prayed the Serpent to tarry yet a little longer, and try once more the next Beast they met withall; and the Serpent thinking himself sure of the booty, yeilded thereunto. Then forth they passed again, and shortly after met with a Fox, to whom the Man related his case, and the benefit he had done to the Serpent: The Serpent again confessed he released him, but withall, denied his case to be as the Man had said, so desperate, but only he entrapped himself the better to compass a booty. The Fox having heard them both, (desirous to end the matter for the Mans benefit) would needs go with them both to the place where the Serpent was inclosed, and so all parties consented. And when the Fox came thither, he bade the Serpent go into the same place again, that so he might the better judge of the whole matter. The Serpent went in again betwixt the stones, and was so inclosed, as he was before, for he could not stir neither backward nor forward. Then the Fox asked the Man if this were the Serpents case, from which he had delivered him? The Man answered yea, in all points. Then he bade the Serpent come out again, as he said he could, without the help of the Man. But the Serpent called the Man to help him again. Nay, said the Fox, I found you two at variance, because of your discharge from this place, and seeing now you are as you were before, and the Man as he was before your enlargement, my sentence is, that when you come forth of that place you are in, then shall you eat the Man: and if he will let you forth again, I will never pity him. By this fable is shewed, that Foxes love not Serpents so well as they love Men, and yet they never love Men, but they are afraid, suspicious, and willing to forsake their familiarity.

Ponzettus.

Some say there is a kinde of love betwixt Serpents and Cats, whereof I finde this story in *Ponzettus*. There were certain Monks, who all of them fell sick upon a sudden, and the Physitians could not tell how or whence this sickness came, except from some secret poyson. At last, one of the servants of the Abbey, saw the Cat which was daily fed at the Monks table, to play with a Serpent; and thereby it was conjectured, that the Serpent having in his sport lost or left some poyson upon the Cats skin, the Monks by stroking of the Cat were infected therewith. And the cause why the Cat was not harmed thereby, was for that she received the poyson from the sport, and not from the anger of the Serpent.

And this thing surely is not so marvellous, seeing that little Mice and Rats do also play with Serpents, and herein Politicians play the Serpents, who hold correspondence and peace both with the Cat and the Mouse: that is, with two sworn and natural enemies together. The like peace and league they are also said to keep with Eeles, as may more plainly appear by this following History, of a certain Monk called *Radolphus a Will Monachus Capellensis*.

There was (as this Monk affirmeth) one of his fellow Monks, which did often tell him, that being a little boy, and using to sport himself by the water side, he hapned to catch an Eele, which he attempted (for his own pleasure) to carry to another water, and by the way as he went, he passed through a Wood, at which time when he was within the Wood, the Eele began to hiss and cry mainly, at the hearing whereof, there gathered together very many Serpents round about him, insomuch that he was afraid, and set down his basket fast pinned and ran away; afterward he came again and sought for his basket, but he found not the Eele therein, wherefore it was supposed, that the Serpents delivered the same Eele out of the basket, by some sleight of nature: the only doubt is, whether Eeles do hiss or not, seeing they are fishes, and *Omnes pisces muti*, all fishes are mute or dumb. But for answer to this objection, it is most certain that Eeles have a voyce, as all they know which use fishing in the night; for I my self, have not only heard such a voyce in the night time in Rivers, and other waters where Eeles abounded, but have had it confirmed by divers other, of greater practise and experience in fishing. The reason whereof, may be their manner of generation; for they engender not by spawn as other fishes, but of the slime of the earth or water, and differ not from Serpents in their external form, except in their colour, and therefore may be said to partake with Fishes and Serpents in both their natures: that is, having a voyce like a Serpent, and a substance like a Fish. Such is their confederacy with living Creatures, and with no more that I ever read or heard of.

But moreover, it is said that they love some Plants or Herbs above measure, as the Fennel and Ivy; and for this later, both *Pliny* and *Textor* do not without great cause wonder, that ever there was any honour ascribed or given to the Ivy, seeing that Serpents (the most unreconcilable enemies of man-kinde) delight so much therein. But herein the Devil blinded their reason, as he did the modest women, that worshipped *Priapus*; or the *Tartars*, which at this day worship the Devil, to the end that he should do them no harm. Thus much I can only say of the friends and lovers of Serpents, by the multitude whereof we may conjecture, how among other parts of the curse of God upon them, they are held accursed both by man and Beast.

Now then it followeth, that we enter into a more particular description, or rather a relation of that hatred which is between them and other creatures, and first I will begin with their arch enemy, I mean Man-kinde. For when GOD at the beginning did pronounce his sentence against the Serpent, for deceiving our first Parents, among other things he said, *I will put enmity betwixt thee and the Woman, betwixt thy seed and the Womans seed*. Whereby he did signifie that perpetual war, and unappeasable discord, which should be for ever (by his own appointment) betwixt them. And the truth hereof is to be seen at this day, for by a kinde of secret instinct, and natural motion, a man abhorreth the sight of a Serpent, and a Serpent the sight of a man. And as by the tongue of the Serpent, was wrought mans confusion, so by the spittle of a mans tongue, is wrought a Serpents astonishment. For indeed such is the Ordinance of God, that Men and Serpents should ever annoy and vex each other. And this *Erasmus* saith shall continue, as long as *meminerimus illius inauspicati pomi*, we shall remember that unfortunate Apple.

Isidorus saith, that Serpents are afraid of a man naked, but will leap upon, and devour a man clothed. Which thing is also affirmed by *Olavus Magnus*, for he saith, that when he was a boy he often tried it, that when he was naked, he found little or no resistance in Serpents, and did safely without all danger combat with them hand to hand. I my self also in my younger time, when I was about ten or twelve years old, used many times in the Spring and Summer time, to wash my self with other my Colleagues, in certain fish-ponds, wherein I have seen and met with divers Water-snakes without all harm; and I did never in my life, hear of any harm they did to any of my fellows being naked, neither did I ever see any of them run away so fast on the land, as they did fly from us in the water; and yet are not the Water-snakes less hurtful then the Land-adders. And this was well known to many.

At Seaven-oak

to Sir Ralph
Bosserville,
Knight, &c.

Ælianus.
Pliny.

About the beginning or Fountain Springs of *Euphrates*, it is said, that there are certain Serpents which know strangers from the people of the Countrey, wherefore they do no harm to the natural born Country-men, but with strangers, and men of other Countreys they fight with might and main. And along the banks of *Euphrates* in *Syria*, they also do the like; saving that if they chance to be trode upon by any of the people of those parts, they bite (like as a Dog doth) without any great harm; but if any other, forainer or stranger annoy them, they also repay him with malice, for

for they bite him, and intolerably vex him; wherefore the Countrey-men nourish them, and do them no harm. Such as these are also found in *Tirinthus*, but they are very little ones, and are thought to be engendered of the earth.

The first manifestation in nature, of Mans discord with Serpents, is their venom; for as in a Serpent there is a venom which poysoneth a Man: so in a Man, there is the venom of his spittle which poysoneth a Serpent. For if the fasting spittle of a Man fall into the jaws of a Serpent, he certainly dyeth thereof. And of this, thus writeth the Poet *Lucretius*;

*Est utique ut Serpens, hominis quæ tacta salivæ
Disperit, ac sese mandendo conficit ipsa.*

In English thus;

*As Serpent dyeth when spittle of Man he tasteth,
Gnashing his teeth to eat himself he wasteth.*

The cause of this, the Philosophers (which knew nothing of *Adams* fall, or the forbidden Apple) *Pierius*, do assign to be in the contrariety betwixt the living souls or spirits of these Creatures: for the Serpents life is cold and dry, and the Humane life hot and moist, wherefore either of both abhorreth one the other; and the Serpent leapeth as far from a Mans spittle, as it would do out of a vessel of scalding water.

Agatharides writeth, that there was a King in *Africk* called *Phyllus*, whose Sepulchre was preserved in the greater *Syries*. From this King there were certain people named *Phyllians*, in whose bodies there was a certain inbred and natural power to kill, or at the least to astonish Serpents, Spiders, Toads, and such like, and lay them for dead, even by the favour or smell of them. And the manner of these men, to try the chastity of their Wives, was to take their children newly born, and to cast them unto dreadful Serpents: for if they were of the right line, and lawfully begotten, then did the Serpents die before them, but if they were adulterous, and the children of strangers, the Serpents would eat and devour them. *Pliny* affirmeth, that even in his days there were some of those people alive among the *Nasamons*, who destroyed many of them, and did possess their places; yet some running from death, escaped. Generally, such people were called *Marsi* and *Psilli*, for the *Marsi* were a people of *Italy*, descended of *Circes* (as is said) in whom there was a vertue to cure all the stinging of Serpents, by touching the wounded places. Such saith *Crates Pergamenus*, are in *Hellepont*, about the River *Parus*. And some are of opinion, that at the beginning they were *Ophiogenes*, born or bred of Serpents; or that some great Nobleman, father of that Countrey, was of a Serpent made a man. And *Varro* saith, that in his time there were some few men alive, in whose spittle was found that vertue, to resist and cure the poyson of venomous Beasts.

But having named *Ophiogenes*, or *Anguigena*, that is, Men bred of Serpents or Snakes, I see no cause why it should be judged, that those which cure Serpents poyson, should be so misjudged; for to cure poyson, is not the work of poyson, but of an Antidote, or contrary power to poyson: and therefore curers and resisters of poyson, are without all learning called *Ophiogenes*, that is, Serpents brood: but rather, that term belongeth more justly to those people, whose nature is sociable with Serpents, and Serpents agree with them, as they would do with their own kinde. Such an one was *Exagon* the Embassadour of *Rome*, who at the commandement of the Consuls, (for their experience) was cast naked into a vessel or tun of Snakes, who did him no harm, but licked him with their tongues, and so with great miracle, he was let forth again untouched; and yet there is no more reason to say, that this man was born of the lineage of Serpents, because those Men-enemies did not hurt him, then it was to say, that *Daniel* was born of Lions, because that the Lions did not harm him. Or that *Romulus* and *Remus* were born of the kindred of Wolves, because a she Wolf did nourish them. We do read of many people in the World, which were surnamed of Serpents, all which may as well be deemed to be descended of such creatures, because of their name, as well as the other, who were by GOD for their innocency preserved from death.

Ebusus was called *Colubraxia*, and the people thereof *Ophiussæ*, and in *Arabia* we read of the *Ophiades*, both which are derived from Serpents, called in Greek, *Ophēis*. *Eustathius* also relateth a story of a man called *Ophis*. I omit to speak of the *Ophite* and others; yet thus much I must needs say, that commonly such names have been given to Serpents, for some cause or accident, either faignedly or truly derived from Serpents. So we read of *Ophion*, a companion of *Cadmus*, and a builder of *Thebes*, who was said to be made by *Pallas* of a Dragons tooth. Likewise the *Spartanes* were called *Ophiodeiros* *Cælius Rhod.* by *Pythius*, because in a famine they were constrained to eat Serpents.

S. Augustine maketh mention of certain blasphemous Heretiques, who were called *Ophite*, because they worshipped a Serpent, and said that the Serpent which deceived our first Parents *Adam* and *Eve*, was Christ. Wherefore they kept a Serpent in a Cave, whom they did nourish and worship, which at the charm of the Priest would come out of his Cave, and lick the Oblations which they set upon his Den; rowling and folding himself round about them, and then would go in again: then did these abominable Hereticks break these oblations into the Eucharist, and receive them as sanctified by the Serpent. And such also is the story of *Cælius Rhod.* where he tearmeth the great Devil *Ophiomachus*, whom both holy Scripture, and ancient Heathen say, that he fell out of Heaven. But all these things are but by the way, upon occasion of that unnatural conceit of those men called *Ophiogenes*: that is, descended or begotten by Serpents. Therefore I will return where I left,

left, namely, to the hatred of Men to Serpents, and of Serpents to Men again: In testimony whereof, there have been mutual slaughters, namely Men which have killed monstrous Serpents, and Serpents which have killed men again.

Diod. Sicul.

Hercules being but an Infant, (as Poets feign) killed those two Serpents which *Juno* sent to his cradle to destroy him; for *Juno* is said to be much offended at his birth, because he was begotten by *Jupiter* upon *Alcmena*; and therefore there was reserved the Image of *Hercules* at *Athens*, strangling a Serpent. But *Pierius* maketh of this fiction a good moral or Hieroglyphick, when he saith, that by *Hercules* strangling of the Serpents in his cradle, is understood, how those men which are born for any great enterprises, should kill their pleasures while they be young. I need not to stand long upon this point, for it is evident, that to this day there are many *Hyades*, both men and women, which are not afraid to kill the Serpents brood. But such as have perished by Serpents; I mean men of any note, are also expressed, whereof *Ovid* writeth of *Ælacos*, the son *Priamus* and *Alixothoes*, who following the Nymph *Hesperia*, (with whom he was in love) was suddenly killed by a Snake biting his foot. So were *Apesantus*, *Munitus*, *Eurydice*, *Laocoon*, *Opheltis* the son of *Lycurgus* King of *Nemea*, *Orestes*, *Idmon* and *Mopsus*, slain by Serpents: whereof *Opheltis*, by the negligence of his Nurse *Hyppisphile*, leaving him ungarded in his cradle.

It is recorded by *Ælianus* and *Pliny*, that when a Serpent hath killed a Man, he can never more cover himself in the earth, but in punishment of so vile an offence, wandereth to and fro, subject to infinite miseries and calamities, being not acknowledged by his female if he be a male, nor yet by the male if it be a female, and is forsaken of all his crew or society. The earth it self not daigning to entertain a man-murderer into her bowels, but constraining him to live Winter and Summer abroad upon the open earth. And thus hath the Divine Providence dispensed his justice, that he suffereth not murder of men to be unpunished among the greatest haters and enemies of men.

Ælianus.

Herodotus.

Æneas Syl.

What monsters therefore are they which have Serpents in their delights, and admire that in them which should be hated of all men. And how base were those minded *Grecians*, which worshipped the Serpent for a God? Or the *Athenians*, which kept a Serpent in their Temple, for an opinion that the same did conserve their Tower or Castle from all enmity. *Jupiter* was also worshipped in many places in the shape of a Serpent. And the ancient *Borussians* worshipped a natural Serpent of the earth. It is strange to consider the error of the King of *Calebut*, who doth as severely punish the slaughter of a Serpent, as he doth the slaughter of a Man; and not only restraineth his subjects from harming them, but also buildeth for them little coats, wherein they safely lodge in the Winter time. And the cause of this error, is their conceit, that they think Serpents are Divine powers dropped out of Heaven, which they prove, because when they sting fiercely, they quickly kill, and dispatch their enemy suddenly. Wherefore they think that no creature can kill so speedily, except an Angel of God. Some of the Heathen had their *Ophiocephale* Beasts with Serpents heads, which they did worship for a God. And the Poet *Virgil* hath an excellent description of *Æneas* his sacrificing to the ghost of his Father *Anchises*.

Gellius.

Adytis tum lubricus anguis ab imis

Septem ingens gyros septena volumina traxit

Amplexus placide tumulum, lapsusque per aras

Cerulea cui terga note, maculosus & auro

Squammam incendebat fulgor: ceu nubibus arcus

Mille trahit varios adverso sole colores,

Obstupuit visu Æneas, ille agmine longo

Tandem inter pateras, & levia pocula Serpens

Libavitque dapas, rursusque innoxius imo

Succesit tumulo, & depasta altaria liquit.

Which may be thus Englished;

Then from the hollow boles, a sliding Snake appeared,

Which seven ways did winde and turn, and dead-mans tomb embrace,

Gliding along the Altar from, and back, with colour cleered,

By Sun-shine-light, like spots of gold each varied to the face

A thousand hiew; whereat Æneas marvelled: but yet at last,

This Snake the holy dishes, and smoothest cups of choice

Did hast to touch, like as it would the sacreds tast,

And so sunk down from Altar clean, without both harm or noise.

Lampridius.

And to make an end of this Section, of the Antipathy betwixt Men and Serpents, that whosoever is of the Womans seed, may profess himself an enemy to the Serpent, let him but consider how that hateful monster *Heliogabalus*, having by the help of the *Marsick* Priests gathered together many Serpents, one day in the morning, when the people were gathered together to see some rare and unheard of spectacle, suddenly he let loose the Serpents, and hurt many of the people. *Tzetzes* telleth another story, of a devise or warlike stratagem, how Serpents by slings or trunks, were sent abroad among the Camps of their enemies. So doth *Galen*, of Serpents included in an earthen pot, and cast like darts among the Tents of the *Romans*. And so did *Hannibal* shew to *Antiochus*, how in a battel by Sea, he might shoot Serpents among the Mariners to his Enemies, and hinder their rowing: for when he did follow the same devise at *Prusie*, he went away Victor and Conqueror. And thus I will conclude this part, with the Emblem of *Alciatus*, which he wrote unto the Duke of *Millian* upon his Arms, being an Infant proceeding out of a Snakes jaws.

Pierius.

Exiliens

*Exiliens Infans sinuosi è faucibus anguis,
Est Gentilitiis nobile stemma tuum.
Talia Pelleum gessisse numismata regem
Vidimus, hisque juum concelebrasse genus,*

In English thus;

Out of the mouth of winding Snake,
Great Duke, this is thy Crest,
A leaping Infant making scape
From jaws, a wofull rest:
The like Coat did Pelleus King
Upon his silver presse,
As we have seen, the same to sing
Of Kindreds worthinesse.

*Dum se Ammone satum, matrem anguis imagine lusa,
Divini & sobolem numinis esse docet.
Ore exit, tradunt sic quosdam enituer angues,
An quia sic Pallas de capite orta Jovis?*

For whiles of Jove he glorieth,
Descended of his race,
He feigns his mother like a Snake,
Born of Divinest grace.
But why proceeding from the mouth?
Some Serpents so are bred,
Or else that Pallas issueth
Out of great Jove his head.

And the like by the same Author is expressed upon this Theam, *That the wisdom of man is foolishnesse with GOD*; therefore upon the unnaturall conjunction of two mortall enemies, framed into one body, he thus writeth elegantly;

*Quid dicam, quodnam hoc compellem nomine Monstrum?
Biforme quod non est homo, nec est draco.
Sed sine vir pedibus, summis sine partibus anguis,
Vir angui-pes dici, & homiceps anguis potest:
Anguem pedit homo, hominem rucavit & anguis,*

That is to say;

What shall I call? or how this Monster rightly name?
Biformed, which nor man nor Dragon, in all the same.
But man unlegged, and Snake unheaded: doubtfull parts,
Man-snake, Snake-man, exceeding humane arts.
Mans tail breeds Snake, and Snake a man up-casterth,
One end is not of man, nor other of wilde beast tasteth.
Such one was Cecrops, learned Athens King,
And Giants su. b did earthly mother bring.
Mishapen then, an earthly minde expressest,
Devoid of grace for worlds good only wishest.

*Nec finis hominis est initium, nec est fera.
Sic olim Cecrops doctis regnavit Athenis,
Sic & Gigantes terra mater protulit.
Hæc vaftrum species, sed & religione carentem
Terrena tantum quique curet induat.*

Thus then I will leave to talk of our most just (and by GOD ordained) hostility, betwixt men and Serpents, and descend to a particular discovery, how Serpents and other beasts are for mans sake at the like enmity. And first of all I will begin with the Fowls, and so descend to Four-footed beasts, and Insects, or imperfect creatures.

Eagles are alway in warre with Serpents, from an high they espy them, and suddainly flie down upon them, with a great noyse or cry, tearing out their bowels, and casting aside their venom or poyson. And some (as *Albertus*) say, that they will in particular deal with Vipers, Tigers, and Dragons, when she seeth them hunting those small beasts or birds which are her prey. This fight is thus described by *Virgil*, how the Eagle griping the Serpent in her talons, flyeth into the air.

*Utique volans alte raptum cum fulva draconem
Fert Aquila, implicuitque pedes, atque unguibus hæsit.
Saucius & Serpens, sinuosa volumina versat,*

In English thus;

As Eagle flyeth on high, and in her clawes a Dragon beareth,
Folded within her feet, wounded, dying to her talons cleaveth.
The Serpent fierce now windeth round, and with her head erected,
Hissing out threath, rough scales upstteth that were dejected,
To fright her so: but all in vain, for she with beak doth strive,
And beat the air with wings of force, till Dragon cease to live.

*Arrectis horret squammis, & sibilat ore,
Ardus insurgens: illa hand minus urget adunco
Lucantem rostro, simul æthera verberat alis.*

There is in the seventh book of *Ælianus* History of living Cretures, a notable and elegant story of an Eagle which was almost overcome by a Serpent, and yet preserved and made Conquerour by a man. There was (saith he) sixteen men which were threshing of corn in the heat of the Sun, by reason whereof they became very thirsty, then they agreed to send one of their company to a Fountain not far off, to fetch some water for them all to drink; and so the Messenger coming to the Fountain, found an Eagle almost killed by a Serpent: for whiles from an high she beheld the Serpent, being more greedy of the prey for to feed her young, then wary to avoid danger, fell down upon her booty, which was too strong for her; for the Serpent received her adversary with fell force, power, and preparation to stifle her, and so indeed she had accomplished, had not by chance this thresher come unto them: for the Serpent had so ensnared and wrapped up the Eagle

Eagle with her long body, that she was nearer *ad pereundum quam ad perdendum*, that is, to be killed, then to kill, or get a prey. The Man beholding the fight, with his sickle cut asunder the Serpent, and so delivered the Eagle: but how the Eagle requited the Man, shall be shewed in the history of the Eagle.

In the Mountains of *Morsilium*, there are great store of great Serpents, which are very dangerous, but there are also great white Eagles, which do eat and destroy them. Some say that the Vulture doth destroy Serpents, but herein I cannot be satisfied, for all Eagles do not hunt after this game, but only the lesser sort of them. Eagles when they build their nest to breed in, they seek out a certain stone called *Aetites*, the vertue whereof keepeth Serpents from their young, and also make their eggs fruitful, so as it is a very rare thing for Eagles to have a rotten egge.

P. Venetus.
Aristotle.
Philostratus.

Solinus.

All kindes of great Hawks, Bussards and Kites, are also enemies to Serpents, Snakes, and Adders, and the Kites will eat them, if they finde them alive or dead, as I my self have often seen by experience. The Storks also do hunt after Serpents, wherefore in *Theffaly*, it is as unlawful to kill a Stork as to kill a Man; for they have many devises to catch Serpents, and all venomous Beasts, and thereof to eat without harming themselves: and not only eat themselves, but give thereof to their young ones, as *Juvenal* witnesseth:

—Serpente ciconia pullos

Nutrit, & inventaper devia rura lacerta.

In English thus;

The Stork her young ones, according to kinde,
In Serpents and Lizzards, do their meat finde.

Sometimetime they fight together irefully, and the Serpent stranglenth the Stork by twynning about her neck; again, the Stork killeth the Serpent by pecking upon her head, and so sometimes they are both found dead together. As the Eagle hath the stone *Aetites*, so hath the Stork *Lych-nites*, to defend herself and her young ones from the rage of Serpents. There is (as *Oppianus* writeth in his *Ixeuticus*) this vulgar story in *Italy*. There was a certain Serpent, which came two years together to the nests of divers Storks, and destroyed their young ones, neither could all the Storks make sufficient force against her with all their might to save their brood. The third year the Serpent came again to attempt the like slaughter; but there among the Storks she found a certain strange Bird never seen before, being shorter then the Storks, and yet had a great long sharp bill, as sharp as the point of any sword. This Bird (as it seemeth) was brought thither by the Storks to guard their young ones, when the Parents were gone abroad to forrage for them. Then, as soon as the young ones were hatcht, out cometh the Serpent from his hole, and beginneth to assail the nests of the Storks, but the guardian Bird, (according to the trust committed to her) resisted the Serpent, and pecked at her mortally with her sharp beak. The Serpent to end his adversary, nimble advanced himself upright, and endeavoured to reach the Bird, but the wary Bird soared so high above his reach, that the langrel Serpent could not catch him, and so they continued in fight, till at last the Bird killed the Serpent, after that the Serpent had once only fastened his venomous teeth upon the Bird, which afterward so wrought upon this Bird, that all her feathers did flie off from her back.

Philes.
Marcedi.
Simocratus.
Diodorus.
Zoroaster.

But of all other Fowls enemies to Serpents, there is none greater or more deadly, then the Bird called *Ibis*, which the *Egyptians* do wonderfully honour; for when swarms of Serpents come into *Egypt*, out of the *Arabian* gulfs and fens, these Birds meet and destroy them: and there is such an admirable fear in Serpents of these Birds, that they do not only tremble, and fall senseless at their sight, but also at the sight of their feathers: they do harm to no other living thing, except Locusts and Caterpillers, wherefore they are worthily nourished, and called *Inimice & populates Serpentum*, enemies and destroyers of Serpents.

All kinde of Pullen, as Cocks and Hens, are likewise enemies to the brood of Serpents. And a good couragious Cock, (as *Columella* saith) is able to kill and resist a Serpent. For, (as *Rondolitus* saith) he hath found in the crop or craw of Pullen, young Serpents devoured by them. But from whence *Albertus* had his relation, that a Hen cannot be hurt that day by a Serpent wherein she layeth an Egge, I cannot tell, and therefore leave it to the Reader to believe or refuse.

Crescentius.

And it is also said, that the flesh of Hens applyed to the bitings of Serpents, doth cure them, or else cause a Hen to sit upon the wounded place; but if the Beast which is wounded, be a Cow with Calf, or any such other femal with young, howsoever it fareth with the old one, surely the young ones shall perish.

Textor.

There is also another Bird, which for his combating with Serpents, is termed *Ophiomachus*, a fighter with Serpents. Although *Gesner* be of opinion, that *Ophiomachus* never signifieth a Bird. Of this Bird the *Septuaginta* make mention, *Levit. 11.* but many of the better learned, do interpret it for a Lizard, or a Locust, or an *Ichneumon*. The Peacock also is a terrour to Serpents, so as they will not abide within the hearing of his voyce, for it is perpetual with all venomous beasts. And the Vulture, as we said before, is a terrour unto them, insomuch as one of their feathers burned will by the favour of the smoak drive away the Serpent. And to conclude, the Swallows also are at variance with the Serpents brood, for the Snake will creep up to the Swallows nest, and therein suddenly surprize the young, for the old ones will fly away chattering, and chirping in mournful sort, not being

being able to hinder or resist their chick-devouring foes. But at the last, when they see all their young ones dispatched, as if they could not endure to live for sorrow, or else thinking it possible to fly into the snakes belly to fetch out again their devoured young ones, they fall down upon their enemies jaws, doing what they can to make them devour and swallow them up also. And thus much for the hatred betwixt fowls and Serpents: Wherein, although they kill the Serpent, either in their own defence, or else for raven and prey, yet may we admire the prudence of the most mighty Creator, who hath so disposed of his power, that he causeth the Fowls of Heaven to revenge Mans quarrel upon the Serpents of the earth, by whose subtilty Man was plucked from Heaven, and they made subject to corruption.

Oppianus.

In the next place, God hath also framed an opposition betwixt Serpents, and the Beasts of the earth and water, which live with Serpents in the same Element, that so they might be both annoyed at home and abroad. I will therefore begin with the Dog, who is a notable enemy to the Serpents, as I my self have seen many in *England*, for he will earnestly seek them out with nose and foot, both in waters, dunghils, and hedges, and when he hath found any one, he will suddenly snatch him into his mouth, biting him about the middle, and so holding it in equal poysse, will sling and shake it about his ears very fast and violently, till he perceive it can stir no more, and then suddenly again letteth it fall out of his mouth to the earth; but if it begin to stir, he snatcheth it up again, and shaketh it about his ears as before, and so never giveth over till it appear dead: but they seldom kill them, only they astonish them, and so may a young childe knock out their brains. Howbeit, when they fight in defence of their Masters, then they kill them, by biting them in pieces. And yet is it more safe for them, to astonish them, and leave them for dead, by shaking them about their ears, then by biting them in pieces, for that commonly then, while they share them asunder, they are stung or bitten by the Serpent. And this I have seen often in mine own experience. But one of the greatest enemies of Serpents are Harts, a timorous beast of all other, and yet greedy to combat with the Serpent, wherefore I will briefly describe this their war and hatred, out of *Solinus*, *Ælianus*, *Plutarch*, and *Oppianus*.

The Hart will greedily follow out the path of the Serpent, and finding it lodged in his den or hole, by the vertue of his nose draweth it out of the Earth, and thereof some have derived *Elaphos*, a Hart, of *Elainein tous opheis*, that is, driving away of Serpents. And herein I think it not reason to follow the opinion of *Ælianus*, who intreating of Harts drawing Serpents out of the earth, saith, that the Serpent is inticed and allured out of her hole, by the breath of the Hart, as by a Philtre or Cup of love; for seeing that there is so great an hostility, and antipathy in nature, betwixt their whole disposition, how can it come from any secret sympathy, that the Serpent (which is the subtillest of all beasts) should be bewitched with the love of his enemies breath? But if it be said that Serpents, which are by nature very cold, can easily be drawn forth by a warmer breath, as it were by the sweet beams of the hot Sun; how then falleth it not out, that when any other Beast breatheth upon their lodging, and into their dens, they are not removed? But let it be granted, that the warmth of the Harts breath maketh him forsake his den, yet it cannot be ascribed to any secret in nature, as if there were a fire of love in the Harts throat or bones, but only from the natural concomitant quality of heat, with expiration, respiration, and inspiration: and therefore I cannot but conclude, that there is not any possibility or probability in nature, that where the spirits, which take and make the breath, are at such variance, there the breath proceeding from the one adversary, should so enchant and beguile the other.

But the true cause of this extraction of Serpents out of their lodgings, is, as I conjecture, not her warm breath that allureth, nor yet scorcheth and burneth her adversary; but that when the Hart hath found the den of the Serpent, by her violent attraction of the air out from the Serpent, she enforceth it for the safeguard of life to follow it out of the den. As when a vessel is broched, or vented, the Wine followeth the flying air; or as a Cupping-glass draweth blood out of a scarified place of the body: and so is a Serpent against her will, drawn to follow the breath of her destroyer. *Oribasius* and *Gunterius* do subscribe unto this opinion, and take it for most consonant to reason and truth, and therefore I will not follow it any further: for by the self same manner do the Sea-Rams draw the Sea-calves out of their lodgings among the Rocks under the earth, for when they have found the Calf, they keep it from air, and prevent their refrigeration.

When the Serpent seeth himself so drawn forth by his adversary, he being above measure incensed to rage, flyeth away, and maketh his poyson more noisome, violent and powerful, for which cause, there was wont to be a Proverbial caveat or warning: *Cave ne incideris in Serpentem, quum extracta à latebris anhelitu cervi effugerit, tum enim propter iracundiam vehementius ei venenum est.* Take heed lest you meet with a Serpent flying away from the Hart, after she is drawn out of her den by her breath, for then, by reason of her rage, her poyson is more forcible. But I will proceed to the more strange and wonderful combats betwixt Serpents and Harts. For when the Serpent perceiveth the unavoidable danger, and that she must needs fight for her life, she hisseth strongly, lifting up her head from the earth, even to the throat of the Hart, and thereat catcheth and gnaseth with her teeth; but on the other side, the valiant Hart, (if such a word may be given to a fearful Beast) as it were deriding his adversaries weak endeavours to harm, suffereth the Serpent to winde about his breast and belly, and to embrace both neck and legs with his long and weak body, that so he may have the more power upon it, for he teareth it into an hundred pieces.

But

But the most strange combats are betwixt the Harts and Serpents of *Lybia*, where hatred hath his deepest footing, for there the Serpents watch the Hart when he lyeth down to sleep upon the ground, and being a multitude of them set upon him all together, fastning their poysonfull teeth in every part of his skin, some on his neck and breasts, some on his sides and back, some on his legs, and some hanging upon his privy parts, biting him with mortall rage, to end and overthrow him. The poor Hart being thus oppressed with multitude, and assailed without any warning to the battle, in vain attempteth to run away, for their cold earthy bodies, winding tayls, and pinching teeth, hinder his wonted pace, and overcharge his strength: whereat being forced to quit himself in the best manner he can, enraged, with teeth, feet, and horns assaileth his enemies, whose spears and arrowes of teeth and stings, stick so fast in his body; tearing them in pieces which he can touch with his teeth, beating others asunder where he can reach them with his horns, and trampling under his feet those which cleave to his lower parts: and yet such is the rage and dauntlesse courage, or rather hatred of these enemies, not willing to die alone, (but like Champions to end their lives upon and with their adversary) do still hold fast, and even when their bodies are beaten in pieces, their heads stick close, and hang sharp upon the Harts skin, as though they would grow with him, and never fall off till he should also fall down dead. But the Hart feeling some ease, and having by the slaughter of their bodies delivered his feet from thralldome, by a divine naturall instinct, flyeth and runneth fast to some adjoyning fountain, where he seeketh for Sea-crabs, whereof he maketh a medicine, that shaketh off their heads which cleave so fast unto him, and also cureth all their wounds and poyson. This valiant courage is in Harts against Serpents, never yeelding, tiring, or giving over, and yet otherwise, are afraid of Hares and Conies by nature.

But what is the cause of this hostility betwixt Harts and Serpents? Is it for meat, or for medicine and cure? Surely they would abhorre to eat them, if it were not for health and naturall medicine, for sometimes the pores of their body are dulled and shut up, sometimes the worms of their belly do ascend up into the roof of their mouths while they chew the cud, and there cleave fast; for remedy whereof, the Hart thus afflicted, runneth about to seek for Serpents, for the eating of a Serpent cureth this malady. *Pliny* saith, that when the Hart waxeth old, and perceiveth that his strength decayeth, hair changeth, and his body begins to be feeble, then for the renewing of his strength, he first devoureth a Serpent, and afterward runneth to some fountain of water, whereof when he hath drunk, he findeth a sensible alteration, both in horn, hair, and whole body. And this thing is also delivered by the Writer of the *Glosse* upon the 42. Psalm, which beginneth, *Like as the Hart desireth the water springs, so longeth my soul after my GOD.* But for the ending of this question, we must consider and remember, that there are two kindes of Harts, one eateth Serpents, and feeling the poyson to work, straight-way by drinking casteth up the poyson again, or else cureth himself by covering all his body over in water. The other kinde only by nature killeth a Serpent, but after victory forbeareth to eat it, and returneth again to feed in the Mountains. And thus much for the discord betwixt Harts and Serpents.

In the next place, great is the variance betwixt Serpents, Dragons, and Elephants, whereof *Pliny* and *Solinus* write as followeth. When the Elephants called Serpent-killers, meet with the Dragons, they easily tread them in pieces, and overcome them, wherefore the Dragons and greater Serpents use subtilty in stead of might; for when they have found the path, and common way of an Elephant, they make such devises therein to intrap him, as a man would think they had the devise of men to help them, for with their tails they so ensnare the way, that when the beast cometh, they intangle his legs as it were in knots of ropes; now when the beast stoopeth down with his trunk to loose and untie them, one of them suddenly thrusteth his poysoned head into his trunk, whereby he is strangled. The other also (for there are ever many which lie in ambush) set upon his face, biting out his eyes, and some at his tender belly; some winding themselves about his throat, and all of them together, sting, bite, tear, vex, and hang upon him, untill the poor beast, emptied of his blood, and swollen with poyson in every part, fall down dead upon his adversaries, and so by his death kill them at his fall and overthrow, whom he could not overcome being alive. And whereas Elephants (for the most part) go together in flocks and troops, the subtille Serpents do let passe the foremost of every rank, and set only upon the hindmost, that so one of the Elephants may not help another; and these Serpents are said to be thirty yards long.

Ælianus.

Likewise, forasmuch as these Dragons know, that the Elephants come and feed upon the leaves of trees, their manner is to convey themselves into the trees, and lie hid among the boughs, covering their foreparts with leaves, and letting their hinder parts hang down, like dead parts and members; and when the Elephant cometh to brouze upon the tree-tops, then suddenly they leap into his face, and pull out his eyes, and because that revenge doth not satisfie her, thirsting only after death, she twineth her gable-long body about his neck, and so stranglenth him.

It is reported that the blood of Elephants is the coldest blood in the world, and that the Dragons in the scorching heat of Summer, cannot get any thing to cool them except this blood: for which cause they hide themselves in Rivers and Brooks, whither the Elephants come to drink, and when he putteth down his trunk they take hold thereof, and instantly in great numbers leap up into his ears, which only of all his upper parts are most naked and unarmed, out of which they suck his blood, never giving over their hold till he fall down dead, and so in the fall kill them which were the procurers of his death. So that his and their blood is mingled both together, whereof

whereof the Ancients made their Cinnabaris, which was the best thing in the World to represent bloud in painting: Neither can any devise or art of man ever come neer it; and beside, it hath in it a rare vertue against poyson. And thus much for the enmity betwixt Serpents and Elephants.

The Cat also by *Albertus* is said to be an enemy to Serpents, for he saith she will kill them, but not eat thereof; howbeit, in her killing of them, except she drink incontinently, she dyeth by poyson. This relation of *Albertus* cannot agree with the Monks of *Mesuen* their relation about their Abby-cat. But it may be that *Albertus* speaketh of wilde-cats in the Woods and Mountains, who may in ravin for their prey kill a Serpent, which followeth with them the same common game.

The Roes or Roe-bucks do also kill Serpents, and the Hedge-hog is enemy unto them, for sometimes they meet both together in one hole, and then at the sight of the Serpent, the Hedge-hog foldeth himself up round, so as nothing appeareth outwardly, save only his prickles and sharp bristles: the angry Serpent setteth upon him, and biteh him with all her force; the other again, straineth herself above measure, to annoy the Serpents teeth, face, eyes, and whole body: and thus when they meet, they lie together afflicting one another, till one or both of them fall down dead in the place. For sometime the Serpent killeth the Hedgehog, and sometime the Hedge-hog killeth the Serpent, so that many times she carrieth away the Serpents flesh and skin upon her back.

The Weasels also fight with Serpents with the like successe; the cause is, for that one and other of them live upon juyce, and so for their prey or booty, they fall together in mortall warre. Herein the Weasel is too cunning for the Serpent, because, before she fighteth, she seeketh Rue, and by eating thereof quickly discomfeth her adversary. But some say, that she eateth Rue afterward, to the intent to avoyd all the poyson she contracted in the combat.

Aristotle.

Perottus.

Isidorus.

Aelianus.

The Lyon also and the Serpent are at variance, for his rusling mane is discouraged by the extolled head of the Serpent to his breast. And therefore as *S. Ambrose* saith, this is an admirable thing, that the Snake should run away from the Hart, the most fearfull of all other beasts, and yet overcome the Lyon, King of all the relidue.

The *Ichneumon* or *Pharos* Mouse is an enemy to Serpents and eateth them, and because he is too feeble to deal with a Snake alone, therefore when he hath found one, he goeth and calleth as many of his fellowes as he can finde, and so when they find themselves strong enough in company, they set upon their prey, and eat it together; for which cause when the *Egyptians* will signifie weaknesse, they paint an *Ichneumon*. The Peacock is also a professed terror and scourge to Snakes and Adders, and they will not endure neer those places where they hear their voice. The *Sorex* and Swine, do also hate and abhor Serpents, and the little *Sorex* hath most advantage against them in the Winter-time, when they are at the weakest. To conclude, the Horse is wonderfully afraid of all kindes of Serpents if he see them, and will not go over, but rather leap over a dead Snake. And thus I will end the warre betwixt Serpents and Four-footed beasts and Fowls.

Bellerophon.

Crut.

Now left their curse should not be hard enough unto them, God hath also ordained one of them to destroy another, and therefore now it followeth to shew in a word the mutuall discord betwixt themselves. The Spider, (although a venemous creature) yet is it an enemy to the Serpent; for when she seeth a Serpent lie under her tree in the shadow, she weaveth or twisteth a thred down from her web upon the head of the Serpent, and suddenly biteh into his head a mortal wound, so that he can do nothing but only roul to and fro, being stricken with a Megrim, whereby he hath not so much power as to break the Spiders thred hanging over his head, untill he be dead and overthrown. The Cockatrice is such an enemy to some kinde of Serpents, that he killeth them with his breath or hissing.

Pliny.

Erasmus.

The Lizard a kinde of Serpent is most friendly to man, and very irefull against Serpents, to the uttermost of his power, whereof *Erasmus* (in his book of Friendship) telleth this story: I saw (saith he) on a day, a very great Lizard fighting with a Serpent in the very mouth of a Cave, at the first sight whereof I marvelled at the matter, for the Serpent was not visible out of the earth: there was with me an *Italian*, who said, that surely the Lizard had some enemy within the Cave. After a little while the Lizard came unto us, and shewed us his side all wounded, as it were craving help, for the Serpent had bitten him sore, for of green he made him appear red, and this Lizard did suffer himself to be touched of us. Thus saith *Erasmus*.

Again, in the same place he saith, that when a Lizard saw a Serpent lye in wait to set upon a man being asleep, the Lizard ran to the man, and never ceased running upon the mans face, scratching his neck and face gently with his clawes, untill he had awaked the man, and so discovered to him his great danger. The Locust also fighteth with a Serpent, and killeth him when he lusteth, for he getteth hold with his teeth upon his lower chap, and so destroyeth him; but this is not to be understood of every kinde of Locust, but only of one kinde, which for this cause is called *Ophiomachum genus*.

The Serpent is also an enemy to the Chamæleon, for in the extremity of famine, she setteth upon them, and except the Chamæleon can cover herself from his rage, he hath no defence but death. *Albertus* calleth a certain Worm, *Spoliator colubri*, because (as he saith) it will take fast hold upon a Serpents neck underneath his jawes, and never give over till he hath wearied and destroyed his adversary. The Tortoises are enemies to Serpents, and will fight with them, but before they enter combat, they arm themselves with wilde Marjoram or Penniroyall.

Aelianus.

Thrasillus.

Pliny.

Ælianus.

But there is not any thing in the world that fighteth more earnestly against Serpents then Sea-crabs and Crevises, for when the Sun is in *Cancer*, Serpents are naturally tormented with pains and feavers, and therefore if Swine be stung or bitten with Serpents, they cure themselves by eating of Sea-crabs. There is a great water near *Ephesus*, at the one side whereof there is a Cave full of many noysome and hresfull Serpents, whose bitings by often probation, have been very deadly both to men and beasts. These Serpents do often times endeavour to crawl over the pool; now on the other side, there are great store of Crabs, who when they see the Serpents come crawling or swimming, they instantly put out their crooked legs, and as it were with tongs or pinfers, reach at the sliding Serpent, wherewithall the Serpents are so deterred, that through their sight, and often remembrance of their unhappy successe with them, they turn back again, and never dare any more adventure to the other side. Where we may see the most wise providence of the Creator, who hath set Sea-crabs the enemies of Serpents, to guard both men and Cattell, which are on the opposite side: for otherwise, the inhabitants would all perish, or else be drove away from their dwellings. To conclude, not only living Creatures, but also some kinde of earth, and Plants are enemies to Serpents: And therefore most famous are *Ebus* and *Creet*, as some say, although *Bellonius* say, that there are *Scolopendries* Vipers, and Slow-worms in *Creet*, yet he saith they are without venom: and there are very few in *England* and *Scotland*, but none at all in *Ireland*, neither will they live if they be brought in thither from any other Countrey. This antipathy with Serpents, proceedeth from living to dead and vegetable things, as trees, herbs, and plants, as may be seen by this discourse following.

There is such vertue in the Ash-tree, that no Serpent will endure to come neer either the morning or evening shadow of it, yea though very far distant from them, they do so deadly hate it. We set down nothing but that we have found true by experience: If a great fire be made, and the same fire encircled round with Ashen boughs, and a Serpent put betwixt the fire and the Ashen boughs, the Serpent will sooner run into the fire, then come neer the Ashen boughs: Thus saith *Pliny*; *Olaus Magnus* saith, that those Northern Countreys which have great store of Ash-trees, do want venomous beasts, of which opinion is also *Pliny*. *Callimachus* saith, there is a Tree growing in the land of *Tachinia*, called *Smilo*, to which if any Serpents do either come neer or touch, they forthwith die. *Democritus* is of opinion, that any Serpent will die if you cast Oken-leaves upon him. *Pliny* is of opinion, that *Alciadum*, which is a kinde of wilde Buglosse, is of the same use and quality; and further, being chewed, if it be spit upon any Serpent, that it cannot possibly live. In time of those solemn Feasts which the *Athenians* dedicated to the Goddesse *Ceres*, their women did use to lay and strew their beds, with the leaves of the Plant called *Agnos*, because Serpents could not endure it, and because they imagined it kept them chaste, whereupon they thought the name was given it. The herb called *Rosemary*, is terrible to Serpents.

Ælianus.

Constantinus.

Ælianus.

The Egyptians do give it out, that *Polydama*, the wife of *Thorris* their King, taking pity upon *Helen*, caused her to be set on shore in the Island of *Pharus*, and bestowed upon her an hearb (whereof there was plenty) that was a great enemy to Serpents; whereof the Serpents having a feeling sense (as they say) and so readily known of them, they straightwayes got them to their lurking holes in the earth: and *Helen* planted this herb, who coming to the knowledge thereof, she perceived that in his due time it bore a seed that was a great enemy to Serpents, and thereupon was called *Helenium*, as they that are skilfull in Plants affirm; and it groweth plentifully in *Pharus*, which is a little Isle against the mouth of *Nilus*, joyned to *Alexandria* with a Bridge. Rue, (called of some Herb of grace) especially that which groweth in *Lybia*, is but a back friend to Serpents, for it is most dry, and therefore causing Serpents soon to faint and lose their courage, because (as *Simocatus* affirmeth) it induceth a kinde of heaviness or drunkenness in their head, with a vertiginy or giddiness, through the excess of his driness, or immoderate ficcity. Serpents cannot endure the favour of Rue, and therefore a Weasel when she is to fight with any Serpent, eateth Rue, as a defensive against her enemy, as *Aristotle*, and *Pliny* his Interpreter are of opinion.

Elecampane in English.

The Countrey-people leaving their Vessels of Milk abroad in the open fields, do besmear them round about with Garlick, for fear lest some venomous Serpents should creep into them, but the smell of Garlick, as *Erasmus* saith, driveth them away. No Serpents were ever yet seen to touch the herb *Trifolie*, or Three-leaved grasse, as *Aedonius* would make us believe. And *Cardan* the Physitian hath observed as much, that neither Serpents nor any thing that is venomous, will lodge, dwell, nor lurk privily neer unto *Trifolie*, because that it is their bane, as they are to other living Creatures: and therefore it is sown to very good purpose, and planted in very hot Countreys, where there is most store of such venomous Creatures. *Arnoldus Villanovanus* saith, that the herb called *Dracontea* killeth Serpents. And *Florentinus* affirmeth, that if you plant Wormwood, Mugwort, and Sothernwood about your dwelling, that no venomous Serpents will ever come neer, or dare enterprise to invade the same. No Serpent is found in Vines when they flourish, bearing flowers or blossoms, for they abhor the smell, as *Aristotle* saith. *Avicen* an Arabian Physitian, saith, that Capers doe kill Worms in the guts, and likewise Serpents. If you make a round circle with the herb *Betony*, and therein include any Serpents, they will kill themselves in the place rather than strive to get away. *Galbanum* killeth Serpents only by touching, if Oyl and the herb called *Fennel-giant* be mixt withall. There is a shrub called *Therionarca*, having a flower like a Rose, which maketh Serpents heavy, dull, and drowsie, and so killeth them, as *Pliny* affirmeth.

Albertus and *Kyranides* affirm, that there is a certain Tree in *Asia*, called *Hyperdiocis*, which soundeth as much as *Against the right hand*, with whose sweet fruit Doves are delighted; but there are Serpents which are sore enemies to the Doves: so lying in wait for them, and not being able to abide the smell & shadow of the tree, the Doves notwithstanding very safely do there in the tree seek their refuge, and finde food wherewith to sustain themselves. *Rasis* (who practised Physick one hundred years) affirmeth, that if any man do melt *Sal Almoniack* in his mouth, and then spit it into a Serpents mouth, that he will die of it.

Of the Medicines made and taken out of SERPENTS.

IT is manifest, that if any man be wounded of a Serpent, though the wound seem incurable, that the bowels or inward parts of the same Serpent, being applyed to the wound, will cure the same; and those that have eaten the liver of a boyled Viper at any time, shall never after be wounded of any Serpent. Neither is a Snake venomous, unlesse at some times of the Moon, when she is thoroughly moved or angered. And a live Snake or Serpent being caught, if the bitten place be bathed, loked, or washed with the Snake being bruised in any water, it is of notable effect. Besides, they are thought to be very soveraign against many infirmities, and therefore (as *Pliny* saith) they are dedicated to *Æsculapius*.

Remedies to be
had and taken
from Serpents.

Avicen saith, that if any be troubled with the Leprosie, he is to be cured by taking a black Serpent, and being excoriated, he must be buried so long till there breed Worms of him, and then he is to be taken forth of the earth and dried, and so to be given to the leprous person for three dayes together, the quantity of one dram at every time, with syrup of Hony. *Pliny*, and with him agreeth *Cornelius Celsus*, affirmeth, that if any one do eat the middle part of Snakes or Serpents, casting away the heads and tayls, they cure *Strumes*, which we in English call the Kings-evil. There is a disease called *Elephantia*, or *Elephantiasis*, which is a kinde of Lepry proceeding of melancholy, choler, and flegme, exceedingly adust, and maketh the skin rough, of colour like an Elephant, with black wannish spots, and dry parched scales and scurf: This disease (I say) so grievous, and *Strumes*; are exceedingly holpen by eating often of Vipers and Serpents, as *John Taganet* in his first Book *Institut. Chirurg.* hath assured us.

Pliny saith, that if you take out the right eye of a Serpent, and so binde it about any part of you, that it is of great force against the watering or dropping of the eyes, by means of a rheum issuing out thereat, if the Serpent be again let go alive. And so he saith, that a Serpents or Snakes heart, if either it be bitten or tyed to any part of you, that it is a present remedy for the tooth-ache: and he addeth further, that if any man do taste of the Snakes heart, that he shall never after be hurt of any Serpent.

Paulus Venetus in his second Book, Chap. 40. writeth, how that in the Province of *Caraiam*, there be Serpents of exceeding greatnesse, which being killed, the inhabitants of the Countrey do pull out their gall, which they use to prize at a very high rate when they sell any of it, for it is very medicinal; so that they which are bit of a mad Dog, if they take inwardly in any drink but the quantity of a penny weight of this gall, they are presently cured. And if a woman be in her travail of childe-birth, if she taste never so little of this gall, the birth will be the more speedy. So if any be troubled either with the Pyles, or Hemorrhoids in the fundament, if that the place be anoynted with this gall, after a few dayes he is set free from his disease. *Hippocrates* giveth the seed of Serpents as a remedy against the suffocation of the belly.

Nicholaus Myrepsus prescribeth this medicine against strains and hardnesse. Take a dead Serpent and put him into a new pot, luting it very well with *Gypsum*, then set it in a furnace that it may be burnt, after that, commixe the ashes of a Serpent with an equall portion of the seeds of Fenugreek, so being wrought up with Attick Hony, and thoroughly digested, anoynt the place affected. And with him agreeth *Pliny*, who expressly affirmeth, that the ashes of Snakes and Serpents, being anoynted upon *Strumes*, either with Oyl or Waxe, is a singular medicine. And likewise to drink the ashes of a Serpent that is burnt to powder in a new earthen pot, is very good: but it will be the more effectually, if the Serpents be killed between two tracks or furrowes that are made with Cart-wheels. The ashes of a Serpent burnt with salt in a pot, being put with Oyl of Roses into the contrary ear, helpeth the tooth-ache.

An unguent against the Morpheue, prescribed by *Olaus Magnus*. Take of the ashes of a Serpent burnt in a new pot, and well covered, two ounces, *Lytbarg*, *Galbanum*, *Ammoniacum*, and *Opoponax*, dissolved in Vinegar, three ounces, boyl them untill the Vinegar be consumed, then strain them, putting to them of Turpentine three ounces, Frankincense, Mastick, and Sarcocolla three ounces, Saffron two ounces, working them with a Spathuler till they be cold. The powder of a burnt Serpent, is likewise good against Fistulaes. The fat of a Snake or Serpent mixt with Oyl, is good against *Strumes*, as *Pliny* saith. The fat of Snakes mixt with Verdegrease, healeth the parts about the eyes that have any rupture. To which agreeth the Poet, when he saith:

*Anguibus ereptos adipos ærugine misce,
Hi poterant ruptas oculorum jungere partes.*

Which may be thus Englished;

*The fat of Snakes mingled with Iron rust,
The parts of eyes doth mend, which erst were burst.*

G g g 2

It

It is certain that barrenness cometh by means of that grievous torment and pain in childe-birth; and yet *Olympias* of *Thebes* is of opinion, that this is remedied with a Bulls gall, the fat of Serpents, and Verdigrease, with some Hony added to them, the place being therewith anointed before the coming together of both parts. When a Woman is not able to conceive by means of weakness in the retentive vertue, then there is no doubt, but there must needs grow some membrane in the bellies entrance, for which it is not amiss to make a Pessary of the fat of a Serpent, Verdigrease, and the fat of a Bull mixt together, &c. and to be applyed, *Hippocrates in lib. de Sterilibus*.

Gesner had a friend who signified to him by his Letters, that the fat of a Serpent was sent to him from those sulphureous bathes which were neer unto *Cameriacum*, and was sold at a very dear rate, namely, twelve pounds for every ounce, and sometimes dearer. They use to mix it with the emplaister of *John de Vigo*, (that famous Chirurgion) for all hardneses, and other privy and unseen (though not unfelt) torments proceeding of the *Spanish* pox. They use it yet further, against leproous swellings and pimples, and to smooth and thin the skin. *Matthiolus* saith, that the fat of a black Serpent, is mixt to good purpose with those Ointments that are prepared against the *French* or *Spanish* pox. And *Pliny* mixeth their fat with other convenient medicines, to cause hair to grow again. The suffumigation of an old Serpent, helpeth the monthly course. *Michael Aloisius* saith, that Oyl of Serpents decocted with the flowers of Cowslips, (ever remembring to gather and take that which swimmeth at the top) is singular to anoint podagrical persons therewith.

Now followeth the preparing of Serpents: Take a Mountain Serpent, that hath a black back, and a white belly, and cut off his tail, even hard to the place where he sendeth forth his excrements, and take away his head with the breadth of four fingers; then take the residue and squeeze out the blood into some vessel, keeping it in a glass carefully, then fley him as you do an Eele, beginning from the upper and grosser part, and hang the skin upon a stick and dry it, then divide it in the middle, and reserve all diligently. You must wash the flesh and put it in a pot, boyling it in two parts of Wine, and being well and thoroughly boyled, you must season the broth with good Spices, and Aromatical and Cordial powders, and so eat it. But if you have a minde to roast it, it must be so roasted, as it may not be burnt, and yet that it may be brought into powder, and the powder thereof must be eaten together with other meat, because of the loathing, and dreadful name, and conceit of a Serpent: for being thus burned, it preserveth a Man from all fear of any future Leprosy, and expelleth that which is present. It keepeth youth, causing a good colour above all other Medicines in the world; it cleareth the eye-sight, gardeth surely from gray hairs, and keepeth from the Falling-sickness. It purgeth the head from all infirmity, and being eaten (as before is said) it expelleth scabbiness, and the like infirmities with a great number of other diseases. But yet such a kinde of Serpent as before we have described, and not any other, being also eaten, freeth one from deafness.

You may also finely mince the heads and tails of Serpents, and feed therewith Chickens or Geese, being mingled with crums of Bread or Oates, and these Geese or Chickens being eaten, they help all to take away the Leprosie, and other foulness in Mans body. If you take the dried skin, and lay it upon the tooth on the inner side, it will mitigate the pain thereof, specially if it proceed from any hot cause. In like sort, the same skin washed with spittle, and with a little piece of the tail laid upon any Impostume, or *Noli me tangere*, it will tame and master the pain, causing it to putrefie more easily and gently, and scarcely leaving behind any cicatrice or skar. And if a Woman being in extremity of pain in Childe-birth, do but tie or binde a piece of it on her belly, it will cause the birth immediately to come away. So the skin being boyled and eaten, performeth the same effects that the Serpent doth.

The blood of a Serpent is more precious then *Balsamum*, and if you anoint your lips with a little of it, they will look passing red: and if the face be anointed therewith, it will receive no spot or fleck, but causeth to have an orient or beautifull hew. It represseth all scabbiness of the body, stinking in the teeth and gums, if they be therewith anointed. The fat of a Serpent, speedily helpeth all redness, spots, and other infirmities of the eyes, and being anointed upon the eye-lids, it cleareth the eyes exceedingly. *Item*, put them into a glassed Pot, and fill the same with Butter in the Moneth of May, then lute it with well with Paste, (that is, Meal well kneaded) so that nothing may evaporate, then set the Pot on the fire, and let it boil welnigh half a day; after this is done, strain the butter through a cloth, and the remainder beat in a mortar, and strain it again, and mix them together; then put them into water to cool, and so reserve it in silver or golden boxes, that which is not evaporated, for the older, the better it is, and so much the better it will be, if you can keep it forty years. Let the sick Patient, who is troubled either with the Gout, or the Palsie, but anoint himself often against the fire with this unguent, and without doubt he shall be freed, especially if it be the Gout. All these prescriptions, were taken from the writings of a certain nameless Author.

Hippocrates saith, that a Hart or Stag having eaten any Serpents, the worms in their guts are thereby expelled. And *Absyrus* hath the same words, that Harts by eating of a Serpent, do kill and expell worms from their guts. *Hierocles*, to a certain medicine which he prepared for the Strangulion in a Horse, mingled the dung of a Lizard, and *Stear herpetuou*, (that is, as I interpret it) the fat of a Serpent, the blood of a Dove, &c. *Laurence Rustus* saith, that it is good to give the flesh and decoction of Serpents to madde, biting, and striking Horses. And that the fat of a Serpent, &c. doth

doth cure the puffing or swellings that arise in Horses backs, which come by means of any compression, or close sitting and thrusting down.

Item, The unguent that droppeth from a Serpent, whilest he is roasted on a spit, is highly commended for Fistulaes that are in Horses hoofs. *Galen* and *Rafius* do counsell us to cut in pieces a Snake or Serpent, and to lay the fat thereof upon a stick, and to anoynt the outward parts of the hoof of any Horse. Horfeleaches, live Mice, the green Lizard being burned, if they be given to a Hawk in her meat, they do cause a speedy mutation of her feathers or wings; and the same effect have little River-fishes, finely beaten or stamped, if they be cast upon any meat.

Item, the Serpent that is speckled, and of divers and sundry colours, of all others, hath the least poyson; and in the *German* tongue it is called *Huf*, (peradventure it is that which we call a Snake) if (I say) you take this Serpent, and boyl it with Wheat, and give the same Wheat to a Hen to feed upon, being mingled amongst her meat and drink with the venom of a Serpent; a Hawk being fed with the flesh of such a Hen, forthwith casteth her sick feathers, and is freed from any other disease, if she have any at all, as *Albertus* saith.

The old skin of an Adder or Snake, that he casts off in the Spring time, if it be rubbed upon the eyes, cleareth the sight, as *Pliny* saith. And *Galen* biddeth us, if any be troubled with bloud-shotten eyes, to take the old cast skin of Serpents, & being beaten with Sea water, to anoint them therewithal. And *Cardan* saith, that the cast skin of a Snake, if the eyes be rubbed therewith every morning, that they will never be very dim of sight, nor yet ever have any pin or web in them. Amongst compositions that are made for the eyes, they use to mix the cast skin of Snakes, as *Dioscles* affirmeth; adding further, that the old age, or cast skin of a Snake being boiled in Wine, is an excellent help for pain in the ears, if a little thereof be dropped into them. Boyl the cast skin of a Snake with tops of Poppy, and drop a little thereof into the ears, if any be troubled with pain thereof, and this is an excellent remedy, as *Galen* in his third Book, *De Composit. medicam. sc. loca*, hath taught us, having himself learned the same from *Archigenes*. The cast skin of Serpents being burned in a pot, or on a hot burning tyle-shard, if it be mingled with Oyl of Roses, and so dropt into the ears, is proved to be very effectual against all sores, and sicknesses of the ears; but especially against the stinking savour of them; or if they be purulent or full of matter, then to be mixt with Vinegar. Some use to mingle Bulls gall therewith, and the juyce of the flesh of Tortoises being boyled.

Marcellus saith, that if you take the gall of a Calf, with a like quantity of Vinegar, and mix them with the cast skin of a Serpent, if then you dip a little Wooll into this medicine, and put it into the ear, that it helpeth very much, especially if with a sponge being soaked in warm-water, you first foment the ear. *Dioscorides* and *Galen* do affirm, that the cast skin of a Serpent, if it be boiled in Wine, doth cure the tooth-ach, if the pained place be washed therewith. But yet, in intolerable pains of the teeth, this is proved more singular. Take the cast skin of a Serpent and burn it, then temper it with Oyl till it come to the thickness or consistence of hard Honey, and cover the tooth (being first scoured and cleansed therewith, anointing all the neer places to the same, and put some of it into the hollownes of the tooth. And as *Archigenes* saith, if you lay the cast skin of a Snake unto the teeth, not being burnt, they will all fall out. It cureth likewise the low sicke evill called *Phthiriasis*. And *Galen* prescribeth this cast skin of Snakes or Serpents, for a remedy against the Colick, if it be put into a brasse pot with some Oyl, and so burnt to powder, if then it be dissolved in Oyl, and the place therewith anointed, it is of great vertue. And if it be boiled in a Tin vessel with some Oyl of Roses, it remedyeth the Bloudy-flux, and such as be troubled with *Tenesmus*, which is, a great desire in going to stool, and yet can do nothing.

Arnoldus de Villa nova, in his Breviary saith, that if you take the cast skin of a Serpent, *Opopanax*, Myrrhe, *Galbanum*, *Castoreum*, yellow Sulphur, Madder, Pigeons or Hawkes dung, and incorporate them with the gall of a Cow, they being first pulverised, and the same thereof received through a tunnel at the lower parts, it bringeth forth either the dead or living birth. *Cardan lib. de Subtil.* saith, that the cast skin of a Serpent burned in the full of the Moon; and entring into the first degree of *Aries*; if the ashes thereof be sprinkled on the head, that thereby terrible and fearful dreams will follow. And if the face be anointed or washed therewith, being first laid in water, that it will cause one to look very fearfully and horribly: and if it be held under the tongue, it will make one very wise and eloquent: and if it be kept under the soles of the feet, it maketh one very gracious among Princes, Magistrates and Great men. And another saith, that this cast off skin being pulverised when the Moon is in her increase, and in the first degree of *Aries*, if the powder thereof be set on the table, in a wooden or metalline dish; if any poyson be therein, it will be dispersed and do no hurt, and yet the powder will remain safe and whole: and if given to a Leprous person, his disease will spread no further. And if you put a little of this powder into any wound, it will cure it within three days. I have seen (saith *Galen*) Goats that have eaten of the boughs and leaves of *Tamarisk*, and I have found them without a Spleen: also I have seen other Goats that have licked up Serpents after they had cast their skin; and I have proved, that after that, they have grown very white, and to have kept their young years a great while; so that it was long before they waxed old.

Of the way to drive away Serpents. Of their poyson and bitings.

A certain and sure way to cure those who either have been poysoned, in-venomed, or bitten by them.

Suffumigations
to expell Ser-
pents.

TO expell and drive farre away any venomous Creatures, we use to make fumigations of the root of Lillies, Harts-horn, and the horns and hoofs of such beasts as be cloven footed: likewise of Bay-leaves and berries, Calamint, Water-creffes, and the ashes of the Pine-tree. The leaves of *Vitex*, *Bitumen*, *Castoreum*, *Melanthium*, Goats-horns, *Cardamomum*, *Galbanum*, *Propolis*, which may be called Bee-glew, the herb called *Horsfrange*, *Panax*, *Opopanax*, *Fleabane*, the shavings or scrapings of the Cypresse or Cedar-tree being steeped in Oyl, the Jet-stone, *Sagapinum*, the herb called *Poley*, Fern, and all other things that have a strong or vehement ill savour, being cast on the coals for a fumigation, do with their vapour chase away venomous beasts. For whereas all venomous Creatures have the passages or pores of their bodies very straight and narrow, they are very easily filled and stuffed, and are quickly stopped and suffocated by such like fents and smells.

Actius in his thirteenth Book setteth down an excellent fume after this manner. Take of *Galbanum*, of *Sandracha*, Butter, and of Goats-fat, of every one alike much, make them into Pills, and use them for a fumigation. *Nicander* in *Theriakis* setteth down some for the same intentions, in these Verses.

*Cervinique gravi cornu nidore fugabis :
Et sic cum accendens Gagata quandoque lapillum,
Quem consumentis non exedit impetus ignis :
Multifidam filicem crepitantibus injice flammis,
Aut imas viridis libanotidos accipe fibras,
Tantumdemque acris nasturci : his junge duobus
Æquali caprea jam jactum pondere cornu,*

In English thus;

*By Hart-born fume do Serpents slide away
When stone Gagates burning's put thereto :
Which heat of fire doth not clean destroy :
Then int' those flames cast many-leaved Fern also.
Of green hogs-fennel, take the lowest branches,
Of Nosewort sharp, so much : then to them joyn
A like proportion of Roes horn in weight and kanches,*

*Aut exiccantem nares cerebrumque nigellam,
Interdum Sulphur, sædum quandoque Bitumen,
Ut sumpta equali pendantur singula parte.
Præterea graveolens candentibus indita prunis
Galbana, & ignitum faciens urtica dolorem,
Dentatisque cedrum maxillis scdile lignum,
Omnibus invisum Serpentibus est odorem.*

*Or else Nigella, drying nose and brain,
Or Brimstone, called filthy Sulphure,
So all be equall in weight and parts to cure.
Besides Galbanum rank, laid on burning coals,
Or nettles, which do cause a fiery pain,
And Cedar cut, all burn'd bout Serpents holes,
Them overcome, and make them flie amain.*

The breath or vapour that issueth from Serpents is so pestilent, that it killeth all young chickens, as *Columella* saith; and for preventing of this mischief, it is good to burn Harts-horn, Womens hair, or *Galbanum*.

*Vis & mirificos cautus perdiscere odores,
Accensis quibus arcetur teterrima Serpens,
Aut Styracem uras, aut atri vulturis alam,
Vel Nepetam aut frondem rigide stirpemque myrica.*

In English thus;

*If thou wouldst learn what odours for thy skill
Were best to scare the Serpent fierce away,
Burn Styrax, or black Vultures winged quill,
Or Neppe, green leaves, or stock of Tamarisk assay.*

And *Pliny* and *Sextus* agreeing with him, do say; that if you burn the feathers of a Vultur, all Serpents will quickly avoid the strong sent thereof. There is a certain River in the Countreys of *Media* and *Pæonia*, (as *Aristotle* testifieth) wherein there is a stone found, with whose fume Serpents are chased away: whose property is such, that if any man cast water on it, it will burn, and burning, if with any Fan you go about to make it to flame, it is straightway quenched; and thus being extinguished, it sendeth forth a savour stronger then any Brimstone. And to this subscribeth *Nicander* in these words.

*Vel tu Threicium flamma succende lapillum,
Quilicet irriguis mersus tamen ardet in undis,
Expressaque statim restinguitur unctus oliva,*

*Hanc quem fluctisoni mittant de littore Ponti,
Qui, rude vulgus, ibi vefcentes carne magistri
Pascendi pecoris sua post armenta sequuntur.*

In English thus;

*Or take the Thracian stone, which set on fire
Will burn in water, yet quenched is with Oyl.
This cast from Pontus shore, Heard-men desire,
The better to feed their flocks, and Serpents foyle.*

The powder of a Cedar tree, putteth to flight venomous Serpents, as *Virgil* in the third of his *Georgicks* witnesseth.

*Disce & odoratum stabulis accendere Cedrum,
Galbanoque agitare graves nidore chelydros.*

Which may be Englished thus;

*Learn how of Cedar, fire in thy folds to make,
And with Galbanums savour, put to flight the Snake.*

Things that are strewed or laid under us, both in our houses and in high-ways or beds, will likewise defend and keep us from venomous creatures: as for example; Southernwood, Dittander, Fleabane, Calamint, Gentian, *Hastula regia*, Sage, Nightshade, S. Johns wort, called of some *Fuga demonum*; Marjoram, Origan, wilde Rue, wilde Thyme, Bay-leaves, the shavings or tops of the Cypress or Cedar-tree, *Cardamomum*, Penroyal, Wormwood, Mugwort, *Lysimachia*, called in English Loose-strife, and Rosemary. And if we cannot lie upon such a bed;

Of such things as are laid under us, that will expel Serpents.

*Tunc juxta virides sinuosi vorticis alveos,
Amnicolam nepetam per obesas collige ripas.
Aut tibi casta salix, pulchro qua flore renidet,
Præbeat, instrata securum fronde grabatum.
Sic quoque montanum polium, cujus grave spirant
Horret odor, nomenque suum qua debet eebidne
Herba, & ab Euxina qua fertur origanus urbe,
Quæcunque illarum decerpitur obvia, prædest.
Quin etiam multo per aprica cacumina flore*

*Ridens abrotonum, pecorique ingrata petitum
Pabula serpyllum, molli quod pascitur horto.
Præstat item exiguum circumlustrare conyzam;
Urticeasque comas, & spinosas anagyros;
Sic & punicea scissis ex arbore ramis,
Regalisque amplis licet hasta frondibus uti.
Accipe item innocuo medicantem frigore strumum,
Atque invisâ pigris Scyra prima æstate bubulcis.*

Nicander.

In English thus;

*Then by the winding banks of crooked streams
The Water-nep take up, which under-foot is tread,
Or the chaste Osier, whose fair flower bath beams
And leaves, secure from Serpents make thy bed.
The Mountain Poley, whose strong smelling breath
The snakes abhor, & that which doth the hydra name,
The Origan which cometh from Euxinus earth,
Do profit all gainst Serpent, if you bear the same.*

*The smiling Southernwood, which groweth on tops of
Wilde Marjoram, to beasts abhorred food, (hills,
Conyza strewed, the haunt of Serpents spills,
The Nettle-crops, thorny Anagres stay their mood,
So do Pomegranate branches cut from tree;
And the broad leaves of Kingly Hasta use,
Strume, healing strumes in harmless cold I see,
And Scyra, which in Summer Neatbeards do refuse.*

In like sort, to sprinkle the place with water, where in *Sal Ammoniacum* is dissolved, driveth away Serpents, as *Avicen* affirmeth.

If any one anoint himself either with Dears-sewet, the fat of Elephants or Lions, Serpents will shun that person; and there be some, (as *Pliny* saith) that for fear of Serpents, do anoint their bodies with the seeds of Juniper. The juyce of the black Vine extracted from the root, and anointed on the body, performeth the like. For preservation from Serpents, *Nicander* compoundeth this ointment. Take two Vipers about the end of Spring time, Deer-sewet thirty drams, *Ungenti rosati* thirty six drams, crude Oyl of Olives as much, commix them with nine ounces of Wax, boil the Serpents till the flesh fall from the bones, which you must cast away because they are venomous.

Of Unguents and things born about us, from which Serpents will run away.

They that will yet be more assured, let them anoint their bodies with a thin cerate, made of Wax, Oyl of Roses, a little *Galbanum*, some powder of Harts-horn, or else Cummin-seed of *Æthiopia*, &c. *Aetius*. If a man carry about him the tooth of a Stag, or those small bones which are found in his heart, he shall be secured from Serpents. If any one do bear about him wilde Bugloss, or the root of the wilde Carot, he cannot be wounded of any Serpents. *Grevinus* is of the minde, that the Jet-stone, beside other manifest qualities, hath yet this as peculiar to it self, that he which carryeth it about with him, need neither to fear Serpents, nor any other poysons.

Now for venomous beasts, which are found in any houses, the best way is to pour scalding water into their dens and lurking holes. And if any man (constrained by necessity) can finde no other place to sleep, but such a one as where Salamanders, the Spiders called *Phalangia*, or the like Serpents do abound, it is good to stop the holes and corners with Garlick beaten with water, or some of those herbs which before we have spoken of. But yet men now adays hold it the safest course, to pour unquenched Lime sprinkled with water into their dens and secret corners.

As they that are bitten by a mad Dog, so all such persons be wounded by venomous creatures, are in exceeding great danger, unless at the first they receive speedy help and succour: The safest way therefore to cure the poyson, is by attractives, which draw from the more inward parts to the surface, and not to make too much post-hast in closing up the wound. But if any one hath swallowed down, and taken inwardly any poyson, the best way is (as *Dioscorides* writeth) to vomit often; but if any be wounded by biting, then it is best to use scarification, and to fasten Cupping-glasses upon the place affected, to draw out the poyson. Some use to suck the venom out, and others to cut off and dismember the part. And this is to be observed, that if any one will undertake to suck out the venom, the party that attempteth it must not be fasting; and besides, he must wash his mouth with

some

some Wine, and after that, holding a little Oyl in his mouth, to suck the part, and to spit it presently forth. And before Cupping-glasses be applyed, the part must first be fomented with a Sponge, then scarified deeply, that the venomous matter may the more speedily be drawn out from the more inward parts; and yet cutting off the flesh round in a compass, doth more good then any scarification.

But if the place will admit no section or incision, then cupping-glasses, with deep scarification, with much flame, must needs be used: for by attraction of the bloud, and other humors with windiness, the poyson it self must of necessity follow. And *Aetius* in his 13. Book and tenth Chapter, counselleth that the sick person be kept from sleep, and so sit still, until he finde some ceasing or releasing from his pain. Besides, the member which is envenomed, ought to be bound round about, that the poyson may not too easily convey it self, and penetrate into the more noble and principal parts, as the heart, liver, or brain. And in this manner having applyed your Ligature, you must by the advice of *Fumanellus*, set on your Cupping-glasses, and they being removed, apply the herb Calamint upon the place, and to give the patient some of the root of Mugwort in powder, or the best Treacle, and such Cordials as do corroborate the heart; and for this intent, Bugloss, Borage, Balm, and any of their flowers are much commended.

A Dove or Pigeon being divided in the midst, and applyed hot to the place affected, attracteth poyson to it self, and healeth. And the same effect and vertue have other living creatures, as namely, Hens and Chickens, young Kids, Lambs and Pigs, if they be set to in the beginning, immediately after the Cupping-glasses be removed, for being as yet hot and warm, they draw out the poyson, and mitigate pain. But if neither any one for love or money can be found, that will or dare suck out the venom, and that no Cupping-glass can be provided, then it is best that the patient do sup of Mutton, Veal, or Goose broth, and to provoke vomiting. Yet they that will more effectually and speedily give help, use to kill a Goat, and taking out the entrails, with the warm dung therein found, forthwith binde unto the place.

The learned Physitian *Matthiolus*, in his Comment upon *Dioscorides*, saith; that to avoid the danger that cometh by sucking out the venom, men now adays use to apply the fundament of some Cock or Hen, or other Birds after the feathers are puld off, to the wounded place, and the first dying, to apply another in the same order, and so another and another, until the whole venomous matter be clean driven away: whereof one may be certainly assured, if the last Hen or Bird so applyed, do not die. *Avicen* the Arabian saith, that the Physitians of Egypt, (in which Countreyy there be infinite store of venomous Beasts) do hasten to burn the part with fire, as the safest and surest remedy, when any one is this way endangered: For fire not only expelleth poysons, but many other grievances. But the way how they used to burn with fire, was divers in these cases: For sometimes they used to sear the place with a hot Iron, and other whiles with a cord or match being fired, and sometimes scalding Oyl, and many other devises they had with burning medicaments, to finish this cure, as saith *Hieron. Mercurialis* in his first book *De Morb. Venenatis* writeth, and *John Tagault*, *Instit. Chirurg. lib. 2.* saith, that the wound must first be seared with a hot Iron (if the place can endure it) or else some caustick and vehement corroding medicine must be used: for all such wounds are for the most part deadly, and do bring present death, if speedy remedy be not given: and therefore, according to *Hippocrates* counsel, to extream griefs, extream remedies must be applyed; so that sometimes the safest way is to take or cut off that member, which hath either been bitten or wounded.

Neither am I ignorant (saith *Dioscorides*) what the Egyptians do in these cases: For when they reap their Corn in Harvest time, they have ready at hand prepared, a pot with pitch in it, and a string or band hanging at it; for at that time of the year they are most afraid of Serpents, which then chiefly do hide themselves in dark holes, and caves of the earth, and under thick clots and turfs, for Egypt aboundeth with such venomous and poysonful creatures. When as therefore they have wounded either the foot or any other part, they that are present, do put the string into the pot of pitch, and binding the place, they fall to cutting it with some instrument round in compass as the string is tyed, after this done, they pour in of the pitch a sufficient quantity, then untying and loosing the band, they lastly anoynt it with Garlick and Onions.

A certain Countryman being bitten of a Serpent, perceived by and by his foot to swell, and by little and little the force of the poyson to swell up higher, and nearer to the heart, the Castle of life: who being taught and instructed of an old woman, to bury his foot under the earth, and to cut a Hen into two parts to apply to the wound, and to the Hen she wished him to lay a live Frog, who continually sucking the bloud from the Hens flesh, might by this means at length attract and draw all the poyson into it self. So when he had held his foot a whole night covered and buried under the earth, and finding no abatement, but rather an increase of his tormenting pain; at length by the advise and direction of a certain Noble Matron, he drank a good draught of *Theriaca* and Hony tempered in Ale, and so after a few hours fell on a great and continual vomiting, by which means he was perfectly freed from the pains of the upper parts of his body, his feet notwithstanding continuing in their former swelling: which was also taken clean away, only by drinking the milk of a black Goat, so much in quantity at a time as one Egge-shell would contain, his foot in the mean space being held or plunged in a sufficient quantity of the same milk. From which there issued and ran a foul stinking glutinous and snively matter, and this he was admonished to do by a certain Priest. But yet afterwards by chance, washing himself in a hot sunny day in a certain River, and

and sitting upon the bank, his feet hanging down into the water, and he falling fast asleep, (he knew not well how long time he so continued) at length awaking, he plainly perceived the water that was neer, on all sides to be filthy, stained and polluted with much stinking matter, and as it were dreggy, refuse and feculency, and from that time forwards, he remained well and lusty, and as sound as a Bell.

Another time a Maid being bitten of a Serpent, laid presently upon the wound some fresh Cheefe made of the milk of a white Goat, and pouring or sprinkling her foot with the milk of the same Goat, as a defensative for that part, was by this means restored to her former health, as a certain learned man testified in his Letters written to *Gesner*.

Vegetum affirmeth, that if any living creature be bitten and wounded of venomous Beasts, the place which is hurt, must first of all be suffumigated with Hens Egge-shells burnt, which first ought to be infused in Vinegar, with a little Harts-horn, or *Galbanum*. After fomentation, the place must be scarified, and the blood must be let out, or else the place must be seared with a hot Iron, so far as the venom stretcheth. And this care must be had, that the Cauter be never applyed and laid either above the joynts, or sinewy parts at any time, for the sinews or joints being seared and burnt, there must of necessity a continual weakness and debility follow. Therefore great diligence must be used, that neither a little above, nor a little beneath the nerves and joynts, we lay any Cauterizing medicine, yea, although necessity biddeth us. But it is also requisite that every one thus wounded, do gently and easily provoke sweating with warm clothes cast upon him, and afterwards to walk up and down, and to take Barley-meal in his meat, with some leaves of the Ash-tree, and the white Vine added to it. And to the wound it is good to apply *Attick* Honey, or Cummin heated and parched, and so mixed with old Wine. Some use to mix new Hogs dung and *Attick* Honey tempered together with Wine, and so being warmed, to apply it as a Cataplasme, adding to it some urine of a Man.

I have said before, that young Chickens being dissected or cut in pieces when they are warm, ought to be laid to the stinged part: and some there be that yeeld this reason why they should be good for this purpose, because (say they) there is a natural antipathy betwixt them, and venomous creatures. But this reason is reasonless, and I think rather, that Hens or young Birds, being of a very hot nature and complexion, do easily concoct and digest notable poyson, and their stomachs do consume most dry and hard seeds, which the strongest man living cannot do; which may easily also be proved by this argument, that many times by their ravening, they swallow down sand and little stones, which they do easily dissolve, and their crops very soon discharge, without any offence to them at all. And therefore the spirits of an invenomed person, being helped and refreshed with the lively and strong natural heat of these fowls thus applyed, and receiving and acquiring strength from the part wounded, and so hastily leaping out as it were, and quickly sparkling forth, they do expel, shut and draw out the poyson.

Now, after we have described the general method of curing this mischevius evil, we will now descend to particular remedies, observing ever this rule and order, that first I will speak of such means as are topical, or such as are outwardly applyed; and next of such as be taken inwardly, and in both of them I will first describe compound, before I speak of simple medicaments. This one Lesson you must carry with you, that many remedies are prescribed and set down, which be not only good for the bitings of Serpents, but also for the bitings and stings of all other venomous creatures, as namely, of Scorpions, Tarantulaes, Spiders, and the like. But yet, sith these do properly respect Serpents, I will in this place set them down: beginning first (according to my promise) with such compounded medicines, as are applyed outwardly for the help against the stinging of Serpents.

Theriaca Andromachi applyed Plaister-wise, is notable for this purpose. So there be other vehement strong Plaisters, whose vertue is to attract, expel, and discuss venom, of which are those which are made of Salt, Niter, Mustard-seed, and Rosemary-seeds, Dittany, or Dittander, and the root of Chamæleon: and this that followeth is of singular vertue. Take of the scum, froth, or spume of Silver one pound, Ceruse, and of the best Turpentine, of either as much as of the former, old Oyl three pounds, Wax six ounces, *Ammoniacum Thymiana*, four ounces, and of *Galbanum* as much: boyl the Ceruse, the scum of Silver, and the Oyl so long, that they will not cleave unto the hands, then melting the other ingredients, incorporate them all together, and use them when need is for any bitings, &c.

There is an Emplaister fathered upon one *Epigonus*, and bearing his name: for this *Epigonus* being in close Prison, and condemned to die, for revealing this Medicine had his Pardon granted him, and was freely discharged, because he therewith healed the daughter of the Emperour *Marcus*: for being sorely wounded by a Serpent in her breast, and all other Physitians despairing of help, yet with this she was recovered. It is also good for all new and old Ulcers, and for such as are either bitten by any kinde of venomous creeping Worms and Serpents. Take of *Squammaria*, (which is the scales and offal of Brasse, blown from it in melting) of *Ammoniacum*, *Aloes hepatica*, Verdigrease, of *Æsculum*, of Frankincense, *Sal ammoniacum*, *Aristolochia rotunda*, of every one half an ounce, Turnep-seeds three scruples, of the root of Dragon-wort half an ounce, seeds of Mugwort nine scruples, pure Wax five pound, of *Colophonia* one pound, old Oyl three ounces, sharp Vinegar half a spoonful, Mustard-seed three scruples, *Spodium* nine scruples, Stone-allum and *Opopanax*, of either half an ounce: Infuse the metalline ingredients for three days space in Vinegar,

Vinegar, and beat and powder them together, melting those that are to be melted, then sprinkle on those that are dry; and all of them being thoroughly wrought and made up, according to the form of an Emplaister, use them where necessity requireth.

Antonius Fumanellus, a late Physitian, prescribeth an experimented, and (as he calleth it) a divine Oyl against any poyson taken into the body, or the biting of any venomous Beasts and Serpents, whether it be received inwardly by drinking it down, or anointed outwardly upon the body, and this is it that followeth. Take of Oyl of Olives one pound, the flowers and the leaves of the herb called *S. Johnswort* bruised, boyl them for the space of three hours, and strain them, then boyl again other fresh flowers and leaves of the same herb and strain them hard, and do so again the third time, then add to them of the roots of *Gentian* and *Tormentil*, of either one ounce, boyl and strain them as you did before, and reserve this Oyl for your use.

Andreas Matthiolus in his Commentaries upon *Dioscorides*, doth exceedingly commend Oyl of *Scorpions*, because being anointed upon the pulses outwardly, it is (as he affirmeth) a singular remedy, not only against any poyson taken inwardly into the body by the mouth, but for the bitings and stings of any venomous creature whatsoever. The way to prepare and make it, he describeth at large, in his Preface upon the sixt Book of *Dioscorides*, which I think needles here to describe to avoid tediousness; therefore if any one be desirous to know the composition of it, let him read *Matthiolus* in the place before cited. Unquenched Lime mixed with Hony and Oyl, and applyed to the place the thicknes of a cerote, is good against the wounds that come by any venomous Beasts biting.

Now I think it meet to set down those simple medicaments which are outwardly to be applyed, either by laying on, or by anointing, against the sting and venomous biting of Serpents. It is best first to foment the sore place with hot Vinegar, wherein Catamint hath been boyled, and in stead of Vinegar, one may take Salt-water, or Southernwood, Maidenhair and Garlick, either in drink, meat, or to be used as an Ointment. The root of Aram, and Astrologe, and the leaves of the true Daffadil, and Oyl of Balm, is most effectual: also Bdelium, and the root either of the white or black Beet, is good against the bitings of Serpents.

Betony, Coleworts, especially the wilde Coleworts, Calamint, the leaves of the wilde Fig-tree, Centory, Onions, Germander, Chamæleon, the herb called Fleabane, wilde Carrets, Rocket, Heath, Fennil, Figs, Winter Cherries, *Enula Campana*, Barly-meal, the Day-lilly, Hyfop, the Flower-deluce-root, Horehound, Balm Water-creffes, Basil, Origan, Plantine, Leeks, Turneps, Madder, Rue, Vervain, Mustard-feed, Scabious, and Saint Johnswort, all these plants are greatly praised amongst the Writers of Physick, for the mischiefs abovesaid.

Pliny is of opinion, that the bowels or entrails of Serpents themselves, being applyed, will surely cure the wounds of all other Serpents, although they seem incurable. A live Serpent being caught, if it be bruised, beaten and stamped in water, and the hurt place fomented therewith, will assuredly help and do much ease.

*Quæ nocuit Serpens, fertur caput illius aptè
Vulneribus jungi, sanat quæ sauciat ipsa,
Ut Larissæ curatus Telephus hosta.*

Quæ Serpens.

Which may be thus thus Englished;

*What Serpent hurteib, Men say by long experience,
His head applyed doth cure: for where the wound,
The help is also made, as in Telephus sense,
Harm'd by Larissus spear, by it was cured found.*

And *Gul. Varignana* saith, divide or cut a Serpent, and lay it upon the place, and it will mitigate the anguish and pain. The seed of *Thraspi* and of *Tubimal* (which is a kinde of spurge) is greatly used for this; *Aut Tubimallus atrox, vulnus quæ iuta perungat.* Some besides these, do put the root of black Hellebore into the wound, because it draweth out the poyson, as I by mine own experience can testifie, saith *Matthiolus*.

There be also sundry Antidotes and Preservatives which are taken inwardly; that are very effectual against the bitings of Serpents and venomous beasts, as namely that, which is called *Theriaca Andromachi*, or Mithridate, and the like compositions. *Galen* in his Book *De Theriaca ad Pisonem*, preferreth *Theriaca Andromachi* before all other medicines either simple or compound, for virulent wounds; because it performeth that effect for which it is ministred. For it was never as yet heard, that ever any one perished of any venomous hurt or biting, who without any delay forthwith drank this medicine: and if any man had taken it before he received any such dangerous hurt, if he were set upon and assailed by any poysonous creature, it hath not lightly been heard that he hath dyed of the same. There be many Antidotes described by the Ancients, which they set down to be admirable for these passions: As for example, that which *Avicen* tearmeth *Theriaca mirabilis*, whose composition is as followeth. Take of *Opium* and of *Myrrhe*, of either of them a dram, Pepper one dram and a half, the root of *Aristolochia longa* and *rotunda*, of each of them three drams, Wine two drams; make them up with Hony and Rocket water, so much as is sufficient for an Electuary: the quantity to give, is four scruples, relented in some fit and convenient decoction.

King *Antiochus*, surnamed *Magnus*, had a kinde of *Theriaca* which he used against all poysons, which is described of *Pliny* in his 20. Book and last chapter in this wise: Take of wilde Thyme, *Opopanax*, and the herb called *Gromel*, of each a like much, two drams, *Thistle* one dram, of the seeds of Dill, Fennil, Smallage, Anise, and *Ameos*, of every one alike six drams, of the meal of *Orobis* twelve drams: all these being powned and finely searfed, must with Wine a sufficient quantity, be made into Trochiscs, whereof every one must weigh one dram, give thereof one dram at a time in a draught of Wine. There is another Antidote and preservative against any poyson, described by *Paulus Aegineta*, much like unto this, which is thus: Take of Bryony, *Opopanax*, of the root of *Iris Illirica*, and of the root of Rosemary, and of Ginger, of each of these three drams, of *Aristolochia* five drams, of the best Turpentine, of wilde Rue, of each three drams, of the meal of *Orobis* two drams, make them into Trochiscs with Wine, every one weighing one scruple and a half, or two scruples to be given in Wine.

Galen in his second Book *De antidotis*, chapter 49. discourseth of a certain *Theriacal* medicament, called *Zopyria antidotus*, (so taking the name of one *Zopyrus*) which was notable against all poysons, and bitings of venomous creeping creatures. This *Zopyrus* in his Letters written unto *Mitridates*, solicited him very much, that he would make some experiment of his Antidote: which as he put him in minde he might easily do, by causing any one that was already condemned to die, to drink down some poyson aforehand, and then to take the Antidote: or else to receive the Antidote, and after that to drink some poyson. And put him in remembrance, to try it also in those that were wounded any manner of way by Serpents, or those that were hurt by Arrows, or Darts, anointed or poysoned by any destroying venom: So all things being dispatched according to his pramonition, the Man (notwithstanding the strength of the poyson) was preserved safe and sound by this alexipharmatical medicine of *Zopyrus*.

Martiolus in his Preface upon the sixth Book of *Dioscorides*, entreating of Antidotes and preservatives from poyson, saith; that at length, after long study and travail he had found out an Antidote whose vertue was wonderful and worthy admiration; and it is a certain quintessence extracted from many simples, which he setteth down in the same place. He saith it is of such force and efficacy, that the quantity of four drams being taken either by it self, or with the like quantity of some sweet senting Wine, or else with some distilled water, which hath some natural property to strengthen the heart; if that any person hath either been wounded or stricken of any venomous living thing, and that the patients life be therewith in danger, so that he hath lost the use of his tongue, seeing, and for the most part all his other senses, yet for all that, by taking this his Quintessence, it will recover and raise him as it were out of a dead sleep, from sickness to health, to the great astonishment and admiration of the standers by. They that desire to know the composition of this rare preservative, let them read it in the Author himself, for it is too long and tedious to describe it at this time.

There be besides these compounds, many simple medicines, which being taken inwardly, do perform the same effect, as namely the Thistle, whereupon *Serenus* hath these verses following:

*Cardus & nondum dectis fullonibus aptus,
Ex illo radix tepido potatur in amni.*

That is to say;

*The root of Teasle young, for Fullers yet unfit,
Drunk in warm water, venom out doth spit.*

That Thistle which *Qu. Serenus* here understandeth, is properly that plant which of the *Greeks* is called *Scolymos*. Yet it is taken sometimes for other prickly plants of the same kinde, as for both the *Chamaeleons*, *Dipsacos*, or *Labrum Veneris*, *Spina alba*, *Eryngium*, and some other. But *Dioscorides* attributeth the chiefest vertue against poysons, to the Thistle called *Chamaeleon albus*, and to the Sea-thistle called *Eryngium marinum*, which some call Sea-hul, or Hulver: for in his third book and ninth chapter, entreating of *Chamaeleon albus*, he saith thus; The root of it taken with Wine inwardly, is as good as Treacle against any venom: and in the 21 chapter of the same Book, *Eryngium*, is (saith he) taken to good purpose with some Wine, against the biting of venomous creatures, or any poyson inwardly taken. And the same *Serenus* ascribeth to the same vertue to the Harts curd or rennet, as followeth.

*Cervino ex fetu commixta coagula viuo
Suntantur, quæ res membris agit atra venena.*

In English thus;

*Wine mixt with Rennet taken from a Hart,
So drunk, doth venom from the members part.*

He meaneth a young Hart, being killed in the Dams belly, as *Pliny* affirmeth also the same in his 8. Book and 30. chapter in these words; The chiefest remedy against the biting of Serpents, is made of the Coagulum of a Fawn, kill'd and cut out of the belly of his Dam. Coagulum, is nothing else but that part in the belly which is used to thicken the Milk.

Proderit

Proderit & caulem cum vino haurire sambuci.

Qu. Serenus.

Which may be Englished thus;

*In drink, the powder of an Elder-stalk,
Gainst poison profiteth, as some men talk.*

That vertue which *Serenus* here giveth to the stalk of Dwarf Elder, (for that is meant in this place) the same effect *Dioscorides* attributeth to the root in his fourth Book, and *Pliny* to the leaves. The herb called Betony is excellent against these foresaid affects, and by good reason, for the greatest part of poysons do kill through their excess of coldness, and therefore to overcome and resist them, such means are necessary, by which natural and lively heat is stirred up and quickned; and so the poyson hindered from growing thick together, and from coagulation.

Again, all men do agree, that those medicines are profitable which do extenuate, as all those do which have a property to provoke urine, and Betony is of this quality, and therefore being taken with Wine, it must needs do good in venomous bitings, and that not only in the bitings of Men and Apes, but in Serpents also. Radish also hath the same quality, being taken with Vinegar and Water boiled together, or else outwardly applied, as *Serenus* affirmeth.

*Sive homo, seu similis turpissima bestia nobis
Vulnera dente dedit, virus simul intulit atrum,
Vetonicam ex duro prodest assumere Baccho.*

*Nec non & raphani cortex decocta medetur;
Si trita admorsus fuerit circumlita membris.*

In English thus;

*If Man, or Ape (a filthy beast most like to us)
By biting wound, and therein poyson thrust,
Then Betony in hard Wine steeped long,*

*Or rinde of Radish sod as soft as pap,
Do heal, applyed to the members stong.*

There be certain herbs and simples, as wilde Lettice, Vervin, the root called Rhubarb, Agarick, Oyl of Oliander, and the leaves of the same, the seeds of Peony, with a great number a little before described, that being taken either inwardly or outwardly in juyce or powder, do cure poyson, yea though it be received by hurt from envenomed arrows, shafts, or other warlike engines and weapons: for the *Arabians*, *Indians*, the *Galls* (now termed French-men) and *Scythians*, were wont to poyson their arrows, as *Paulus Orosius* in his third Book testifieth of the *Indians*, where he writeth, how *Alexander* the Great, in his conquering and winning of a certain City, under the government of King *Ambira*, lost the greatest part there of his whole Army with envenomed darts and quarrels. And *Celsus* in his fifth Book saith, that the ancient *Galles* were wont to anoint their arrows with the juyce of white Hellebore, with which they they did great mischief. *Pliny* affirmeth the same to be used of the *Scythian* Nation. The *Scythians* (saith he) do anoint their Arrow-heads with the corrupt, poysonous, and filthy stained dreggy blood of Vipers, and with Mans blood mixed together: so that the wound seemeth to be incurable. And to this alludeth *Quintus Serenus*.

*Cuspide non quisquam, longa neque cade sarisse,
Fulmine non gladii, volucris nec felle sagitta,
Quam cito Vipereo potis est affligier ictu:
Quare aptam dicamus opem, succosque manentes.*

Which may be thus Englished;

*There is no Man with Spear or Launces point,
Sharp edge of Sword, or swift Arrows might,
To kill so soon, as Vipers force doth dint:
Then fit is the aid and means that it acquite.*

There is a certain kinde of people to whom it is naturally given, either by touching or sucking, to cure the wounding of venomous Serpents, called *Phylli*, (a people of *Lybia*) and *Marfi*, people of *Italy*, bordering upon the *Sammites*, and *Aequiculania*, and those that were called by the Ancient Writers *Ophiogenes*, which dwelt about *Hellepont*, as both *Pliny*, *Aelianus*, and *Aeneas Sylvius* do witness.

Callias in his tenth Book of the history which he wrote of *Agathocles* the *Syracusan* saith, that if any man were bitten of a Serpent, if either a *Lybian* by birth, or any *Phyllus*, whose body was accounted venom to Serpents, was either purposely sent for, or came that way by chance, and saw the wound but indifferently, and not very sore tormenting the Patient, that if he did lay but a little of his spittle upon the biting or stroke, that presently the aking and pain would be mitigated. But if he found the sick Patient in great and intolerable anguish and pain, he took this course in his curation, that first he would suck and draw up into his mouth a great deal of water, and first rinse and wash his own mouth therewith, and after this, pouring it all out of his own mouth into a cup, he would give it to the poor wounded person to sup off. Lastly, if the malignity and strength of the venom had crept and spread it self very far and deep into the body, so that there was danger of death, then would he strip himself stark naked, and so lie and spread his body upon

upon the naked body of the sick person, and so by this way of touching, break the malice and quality of the poyson, and give perfect cure to the man. For more confirmation hereof, *Nicander Colophonius*, is sufficient authority, whose verses I will here describe.

*Audivi Libyos Pſylos, quos aspera Syrtis
Serpentumque ferax patria alit populos,
Non idem inflictum diro, morsive venenum*

*Ledere : quin laſis ferre & opem reliquis,
Non vi radicem, proprio ſed corpore juncto.*

Which is in English thus ;

*The people Pſylli bred in Lybia Land
Neer Syrtis, where all Serpents do abound,
Are never ſtung nor bitten by that band*

*Unto their harm, or any bodies wound :
But ſtraight one naked man anothers hurt doth heal,
No roots, but bodies vertue danger doth repeal.*

Some of the *Greeks* have left in writing, that the Idolatrous Priests and Prelates of the God *Vulcan*, that dwelt in *Iſle Lemnos*, had a ſpecial vertue given them to cure thoſe who were wounded by Serpents : whereupon it is ſaid, that *Philoſtetes* being wounded by a Serpent before the Altar of *Apollo*, went thither to be remedied of his hurt. *Cornelius Celfus* ſaith flatly, that the people called *Pſylli* had no ſuch peculiar gift in healing them that were hurt of Serpents, either by ſucking or touching the place, but being boldly adventurous, had preſumed thereby to attempt and do that, which others of leſs courage had no ſtomach to do : for whoſoever durſt be ſo confident as to follow their example, ſhould be himſelf out of danger, and aſſure the other ſafe and free from fear of further hurt.

Galen in his book *De Theriaca ad Piſonem*, manifeſtly ſheweth, that the *Marſi*, who lived in his days, had no ſuch ſpecial quality againſt the poyſon of Serpents, but that with their crafty dealing, and knaviſh tricks, they beguiled the common people. For ſaith he, thoſe Juglers and Deceivers do never hunt Vipers at any convenient time, but long after the prime of the year and Spring, wherein they caſt their ſkins, when as they are weak, and have loſt their ſtrength, and are very faint : then do they take them, and ſo by long uſe and continuance, teach them, and inure themſelves one to another, and bring it ſo to paſs, that they wil feed them with ſtrange and unaccuſtomed meats to their nature ; yea they will permit them to taſt of fleſh, and conſtrain them to be continually gnawing and biting of the ſame, that by their ſo labouring and ſtriving, their poyſon may by little and little be ſpent, and purged out of their bellies. Beſides all this, they give them a kinde of bread made of milk and flour, that by this means the holes in their teeth may be ſtopped : and ſo by this laborious courſe of dieting them, they bring the matter ſo about, that their bitings are very weak, and do ſmall annoyance to any that they ſtrike at. So that the ſeers and lookers on, account it a thing exceeding common reaſon and nature, and blaze it abroad for a miracle.

Matthiolus alſo, a Phyſitian of late days, agreeeth with him in this point, affirming expreſly, that theſe kinde of trumperies and crafty fetches are much put in practice in theſe times, by ſuch bold and impudent Quackſalvers, Mountebanks, and couſeners of plain Countrey people, who dare face it out, lie, ſaign and cog, that they are deſcended from the race and lineage of *Saint Paul*, wherein they ſhew themſelves notorious lyers, &c. Thus far *Matthiolus*.

Serpents do ſometimes creep into the mouths of them that are aſleep, whereupon a certain Poet ſaith ;

Non mihi tunc libeat dorſo jacuiſſe per herbam.

Which may be Engliſhed thus ;

*Then would I not upon the graſs,
Lie on my back where Serpents paſs.*

For if a man ſleep open mouthed, they ſlily convey themſelves in, and winde and roll them round in compaſs, ſo taking up their lodging in the ſtomach, and then is the poor wretched man miſerably and pitifully tormented ; his life is more bitter then death, neither feeleth he any releaſe or mitigation of his pain, unleſs it be by feeding this his unwelcome gueſt in his gueſt-chamber, with good ſtore of milk, and ſuch other meats as Serpents beſt like of. The only remedy againſt this miſchief, is to eat good ſtore of Garlick, as *Erasmus* in his *Dial. De Amicitia* ſaith. *Cardan* ſaith, how that it was reported for a certain, that a Viper entring into a Mans mouth being aſleep and gaping with his mouth, the venomous Worm was expelled only with burning of Leather, and ſo receiving the ſtinking ſume at his mouth, the Viper not enduring it, he eſcaped with life. But of this more in our diſcourſe of the Viper.

A certain man called *Ciffus*, being very devout in the ſervice, and much addicted to the worſhip of the God called *Serapis*, being treacherouſly wound in and intrapped, by the crafty wileneſs of a certain woman, which firſt he loved and afterward married, when by her means he had eaten ſome Serpents egges, he was miſerably vexed, and torn and rent with diſquiet and torment through all his body, ſo that he ſeemed to be in great hazard of preſent death. Whereupon, forthwith repairing and praying heartily to this his God, for his help and deliverance, he received answer, that he muſt go and buy a live Lamprey, and thruſt his hand into the veſſel or place where it was kept and preſerved ; which he forthwith did, and the Lamprey caught faſt hold on his hand, biting hardly, and holding faſt by the teeth : and at length, when ſhe was pulled from her faſt hold, the ſickneſs and grievous torment of his body was plucked away, and he freely delivered from that threatening danger. Thus far *Eliaſus*.

The

All this medicinal deſcription of Serpents was written by *Tho. Bonham* Doctor in Phyſick.

The Conclusion of this General Discourse of SERPENTS.

HAVING thus discoursed of the medicinal qualities in Serpents, and the remedies which Almighty GOD in nature hath provided against their venom, now for a conclusion, I will add some other natural uses of them, and shut up all in Moralities, and in sundry ways to take them.

Herodotus.
Mela.
Pliny.

Solinus.
Scaliger.
Boemus.

Æneas Syl.
Nicander.
Venetus.
P. Martyr.

Florentinus.

Cælius Rho.
Ælianus.

Constantinus.

Pliny.
Tector.

Plutarch.
Pierius.

There were certain *Amazons*, as *Pierius* noteth, that in their warlike preparations and Arms, did use the skins of Serpents. And to the intent that this may not seem strange, the *Troglodytes* did eat Serpents and Lizards, for they lived in Caves in stead of Houses, and their voyce was not a significant voyce, but a kinde of scritchings, like gnashing. And for these causes, Serpents are very much afraid of any one of this Nation. Likewise certain of the *Candeans* were called *Ophiophagi*, that is, Eaters of Serpents; and one part of the people of *Arabia* eat Snakes. But in *India*, *Ethiopia*, and an Island in the Ocean, found out by *Jambolus*, there are Serpents which are harmless, and their flesh very sweet and pleasant to be eaten: So are there in *Macinum*, a Province of *Asia*. In *Manzæ* in the upper *India*, and *Caraia*, they sell the flesh of Serpents in open Markets. These Serpents are called *Juana*, and the common people are forbidden to eat them, because they are very delicate, even as Pheasants, Partridges and Peacocks are in *France*. Yet is there but one way to dress them, which is, to roul them in Lard, and so to seethe them. For first they bowle them, then wash them and fold them up together round, putting them into a pot no bigger then to receive their quantity; upon them they cast Pepper with water, and so seethe them upon wood and coals that will not smoak. With this Lard there is made a broth sweeter then any Nectar, which they use in many banquets of great account.

But for the taking of Serpents, I will yet add one or two more experiments, wherein the Ancients revenged themselves upon these irreconcilable enemies of Mankind. They did use to set in to the earth a deep pot, whereinto all venomous creatures would gather and hide themselves, then came they suddenly and stopped the mouth of that vessel, whereby they inclosed all that were taken, and so making a great fire, cast the said pot of venomous Serpents into the same, which consumed them all. Otherwise they took a living Serpent, and digged in the earth a deep Well or pit so steep, as nothing at the bottom could climbe up to the top thereof, into this pit they would cast this Serpent, and with her a brand of fire, by means whereof the enclosed Serpent would fall a hissing for her life, at the hearing whereof, her fellows of the same kinde, were thereby easily invited to come at her call to give her relief, (as we have shewed elsewhere) who finding the noise in the bottom of the pit, do slide down of their own accord, whereby they likewise intrap themselves in the same pit of destruction.

But the Juglers or Quack-salvers take them by another course, for they have a staffe slit at one end like a pair of tongs, those stand open by a pin, now when they see a Serpent, Viper, Adder or Snake, they set them upon the neck neer the head, and pulling forth the pin, the Serpent is inevitably taken, and by them loosed into a prepared vessel, in which they keep her, and give her meat. It is reported, that if a Serpent be stricken with a Reed, she standeth still at the first blow, as if she were astonished, and so gathereth herself together; but if she be so stricken the second or third time, as one delivered from her astonishment and fear, she recollecteth her wits and strength, and slideth away. The like observation unto this, is that of the Ancients, that a Serpent cannot be drawn out of her den by the right hand, but by the left; for they say, if one lay hold on her tail by the right hand, she will either slide farther into the earth from him, or else suffer herself to be pulled in pieces, never turning again, and therefore saith mine Author, *Non cedit trahenti, sed elabitur fugiens, aut certe abruptitur*, she yeeldeth not to him that draweth her, but slideth away, flying from him, or else suffereth herself to be pulled in pieces in the combate.

The sundry Hieroglyphicks, statues, figures, Images, and other moral observations about Serpents, are next here to be expressed, which the Ancients in their Temples, Shields, Banners, Theatres, and publique places had erected for their honours and dignity. And first of all in the Temple of *Delphos*, near the Oracle, there was placed the Serpent which provoked *Apollo* to fight with him, wherein it was by him slain. And the *Hermopolitans*, did reserve the Image of *Typhon*, in a Sea-horse, whereupon sat fighting a Hawk and a Serpent: by the Sea-horse they signified the Monster *Typhon*, by the other beasts, as namely the Hawk and the Serpent, how by this principality and government, which he had gotten by violence, he troubled both himself and others.

Hercules had in his shield certain Serpents heads, pictured with these verses.

*Bis sena hic videas, stridentibus effera flammis,
Colla venenato vultu maculosa draconum.
Tum magis offenso spirantia gutture virum,
Quam magis Alcides effuso sanguine pugnât.*

Which may be Englished thus;

*Of Dragons heads twice six here maist thou see,
Raging amongst the flames with poysoned spotted face:
Casting most venom forth when they enraged be,
As when Alcides saw his blood distill apace.*

And

And so *Virgil* saith of *Aventinus*.

*Clypeoque insigne parentum
Centum angues, cinctamque gerit Serpentibus Hydram,*

That is to say,

*His shield an hundred Snakes, his Fathers crest,
An Hydra in their compass is entest.*

Oscus which reigned among the *Tyrrhenians*, gave in his Standard and Coat of Arms a Serpent. *Pierius*.
Now the people *Osci* (from whom it may be he was sprung and derived) lived in *Campania* in *Italy*, as we have shewed already.

In ancient time we read, that when hostility began to be compounded, they had Heralds and Embassadors of Peace, which they called *Caduceatores*, which carryed upright a certain Rod or Staffe called *Caduceus*; this Rod was very straight, and at the either side were artificially joyned two Serpents figures, winding and crooking into each other as the manner of Serpents is. This Rod was so sacred, that it was a great offence to violate or offer any injury unto it: for by the straight Rod, was signified Perfect and Upright Reason or Understanding; by the two crooked Serpents at either side thereof, was figured the two Armies invading and assailing the Upright understanding, yet not prevailing: For this passed through and betwixt them without harm, by truce and entreaties of Peace. This Rod was therefore consecrated to *Mercury*, the tails of the Serpents reaching down to the handle or half of the Rod, where they were adorned with wings. *Alciatus* made these Emblematical verses upon the *Caduceus*. *Suidas*.

*Anguibus implicitis, geminus Caduceus alis,
Inter Amaltheae cornua rectus adest.
Pollentes sic mente viros, fandique peritos
Judicat, at rarum copia multa beet.*

In English thus;

*Twixt Ceres horns the Rod of Peace doth stand
Upright with winding Snakes, and double-winged tails,
To shew that mindes and tongues with Learnings brand,
Are blest with plenty in all wordly vails.*

But having thus entred into the Hieroglyphical Emblems, if I should say so much as I finde made ready, and squared for the architecture of this discourse, I might lose my self in a voluminous world of matter, therefore I will but give the Reader a taste hereof. By the Serpent in holy Writ, are many observative significations; and first, that the Devil himself, which is *Malus Deus mali Mundi*, an evil God of an evil World, should be teamed and expressed by a Serpent. The cause saith *Pierius*, is *linguae motatio*, the continual and never ceasing motion of a Serpents tongue: and so the continual and ever-working perswasions of Diabolical tentations, and a true mixture and limb of this old Serpent, speaketh otherwise with his tongue, then he thinketh with his heart. Therefore it is also said, that a natural Serpent hath a cloven or twisted tongue.

Clemens saith truly, that Serpents do also signifie Men given over to sins, and fraudulent impostures or malices, *Onos hybristes ho akotaios, lukos agrios ho pleonektikos, kai ophis ho apatroon*, that is, There is an insolent and an intemperate Ass, there is a raging Wolf which is covetous, and there is a Serpent which is an Impostor and fraudulent. The same learned man saith, that Riches are like to a Serpent: For as when an ignorant Man thinketh to take a Serpent without harm by the tail, she turneth back again and biteth him; but if he take her by the neck, she cannot execute any part of her malice: even so when a wise Man hath the managing of riches, by vertue of his discretion he so charmeth them, that there is not in them any harm at all: but the foolish Man is mortally stung by his imprudent possession and dispensation of them.

Of the ADDER.

IT falleth out in the particular Discourse of Serpents, that I expresse the most known Serpent to us in *England*, in the first place, according to alphabetical order, that is, the Adder. For although I am not ignorant, that there be which write it *Nadere*, of *Natrix*, which signifieth a water Snake, yet I cannot consent unto them so readily, as to depart from the more vulgar received word

of a whole Nation, because of some likelihood in the derivation from the *Latine*: For whereas *Nadere* may seem not improperly to be derived of *Natrix*, and *Natrix* of *Natando*, that is, swimming in the water, the first conjectural derivation is destroyed by the latter, because this Serpent whereof we now intreat, haunteth not the waters, except for drink in her time of thirst, and therefore I mislike the writing of *Nadere* for *Adder*: and rather take that word to signifie a Land Snake. And yet if there be any good argument of derivation of *English* from *Latine*, I would not have the Reader think, but that the *Adder* may as well be derived *à terra*, from the earth which it useth, or of *ater*, black, which is the colour that it beareth, or from *atrox*, fierce, (for there is no Serpent of that quantity, more fierce, angry, or hurtful,) as well as *Nadere* from *Natrix*.

Isidorus.

The *Latines* do express this kinde of Serpent by the word *Coluber*, whereof some give sundry reasons, either because *colit umbras*, it hanteth and liveth in hedges and shadowy places, or else *à lubricis tractibus*, of his winding pace or path. *Gelenius* deriveth it of the *Greek* word *Kolobouros*, which signifieth wanting a tail, because the Snakes which are about houses, are sometimes found without tails, which have been strook off by men: but this opinion hath no reason for the *Adder*, which is not domestical. Indeed I confesse that *Pliny* useth *Coluber* for a general word for Serpents, when he saith *Coluber in aqua vivens*, which deceived *Theophrastus* and *Gaza*, applying it to the water Serpent. And so *Erasmus* and others, translate *Ophis coluber*, that is, the general *Greek* word for a Serpent, an *Adder*. There is also *Colubra*, as in *Lucilius*, *Varro*, & *Nonius Marcellinus* appeareth; whereunto agree *Horace*, *Virgil*, and *Cornelius Celsus*. The *Italians* call this Serpent *Lo Scorzona*, *Scorson*, *Colubra*, *la Scorzona*, *la Scorsona*. The *French*, *Colenure*; the *Spaniards*, *Culebra*, and at this day the *Grecians*, *Nerophis*. And thus much for the name; except I may adde these verses of *Virgil* in his *Georgicks*.

*Aut tecto assuetus Coluber succedere & umbrae
Pestis acerba boum, pecorique aspergere virus
Fovet humum. Cape saxa manu, cape robora pastor.
Tollentemque minas, & sibi colla tumentem*

*Deiçe, jamque fuga tumidum caput abdidit altè
Cum medii nexu, extremæque agmina caudæ
Solvuntur, turdosque trahit sinus ultimus orbes.*

In English thus;

*Or when the Adder using house or shade
Bred in the earth, the bane of Sheep and Neat,
Then shepherd take both stone in hand and blade,
To quash his swelling neck and hissing threat.*

*Or when his fearful head he puts full deep in earth
To fly thy wrath, him sunder in the midst,
Or cut his tail, if no part else appeareth,
For that will stay his pace, while on't thou treadest.*

This is usual to call a Water-adder, a House-adder, a Land-snake, and such other, but catachrestically confounding one kinde with another. And thus much for the name of this Serpent. The parts differ not from the general description before recited, it is long like an Eele, and hath many Epithets, as *virides colubri*, green Adders, long, rough, venomous, divers coloured, swelling, sliding, winding, blew, terrible, secret, hurtful, *Medusean*, *Cynipian*, *Gorgonean*, *Lybissine*, biting, spotted, wreathing, black, bending, heavy, scaly, and divers such other, as the Grammarians have observed. But concerning the colour hereof, it is most commonly black on the back, sometimes greenish and yellowish. The scales of it are more sharp then of the Snake, and therefore the *Egyptians* were wont to say of the *Thebane* Adders, that they had a certain appearance of horns upon them, as we shall shew more at large in the story of *Cerastes*, or the horned Serpent.

Victorius speaking of the great worms which are bred in Mens bellies, doth call them *Cecæ Colubras*, blinde Adders; but otherwise, the Adder which is proper to the earth, is not blinde, but seeth as sharply as any other Serpent either by day or by night. They are hotter then the Snakes, and therefore live more in the shadows, and lye for the most part round, folded up together like a rope, as the Poet noteth saying;

*Hirtus & ut coluber, nodofo gramine tectus
Ventre cubat flexo, semper collectus in orbem.*

In English thus;

*As the rough Adder in knotty grass is covered,
Lyeth on her belly, and round in circle gathered.*

They are a crafty and subtil venomous Beast, biting suddenly them that pass by them, whereupon *Jacob* said that his son *Dan* should be *Coluber in via*, an Adder biting the Horse-heels. When the hath bitten, with her forked or twisted tongue she infuseth her poyson, whereof and the remedy serving thereunto, there is this History in *Ambrosius Pareus*. At what time (saith he) *Charles* the ninth lay at *Melines*, I and Doctor *Le Feure* the Kings Physitian, were sent for to cure a certain Cook of the Lady *Castropersee*, who was bitten by an Adder, as he was gathering wilde Hops in a hedge. The Cook assoon as he was bitten in the hand, sucked the wound with his mouth, thinking thereby to mitigate the pain, and draw out again the poyson; but assoon as his tongue touched the wound, presently it so swelled that he could not speak: and besides, his arm or shoulder swelled into a high bunch or tumour, which did put him unto painful torments, insomuch that he swooned twice in our presence; his face and colour changed as though he would presently die: Whereat we all despaired to cure him, yet did not forsake him, nor left to try some

some means to ease his torments. Then we washed his tongue with Triacle, mixed with an equal proportion of white Wine and *Aqua vite*; then also I caused the arm to be scarified all over, and launced the place where the Adder had bitten him, out of which flowed abundance of corrupt matterly blood. Then we washed the wound with Triacle and Mithridate, in *Aqua vite*; so we caused him to be laid into warm bed, there to sweat, and commanded to keep him awake, which was done accordingly; and so the next day the swelling was abated, and the malignant symptoms were all evacuated: so we gave order to keep the wound or launced place open, and afterward the Cook began to be well again. This one example in stead of many, I thought good to insert into this place, that hereby the general cure may be learned and followed.

It agreeth with all other Serpents in the changing or putting off the skin; for after that by fasting it hath made his flesh low and abated, then by sliding through a narrow passage, whereof *Virgil* thus writeth.

*Qualis ubi in lucem coluber, mala gramina passus,
Lubrica convolvit sublato pectore terga
Frigida sub terra, tumidum quem bruma tegebat:*

*Ardens ad solem & linguis micat orat trifurcis;
Nunc positus novus exuviiis, nitidusque juvena.*

Which may be Englished thus:

*Even as the Adder in the Spring ill fed and lean
Moveth her winding limbs, holding up her breast,
Whom Winters cold whites hid earth made swell,*

*In Sun shine with her treble tongue exprest
Doth lick and make to shine her skin, neat youth
Reneweth, and casts old coat, for heat ensueth.*

S. Jerom saith, that when the Adder is thirsty and goeth to drink, she first of all at the water side casteth up her venom, lest that by drinking it descend into her bowels, and so destroy herself, but after that she hath drunk, she licketh it up again; even as a Souldier re-armed after he was disarmed. The voice of this Serpent is hissing, although it be very seldom heard. And it is said, that when *Cræsus* undertook to wage war with *Cyrus*, the Suburbs of *Sardis* were all filled with Adders, which were devoured afterward by Horses in the pastures. Whereat the King and people were not a little moved: But the Priests, after consultation with the Oracle, told them that it signified, how strangers should devour the people of that City; because that Adders were bred in those coasts, therefore they took them to signifie natural Inhabitants, and because Horses came from other Countries, therefore strangers, (as *Cyrus* and his Souldiers) should be thereby signified. And this is to be noted, that the enemies of this Serpent, are the same that are common to other, and the Hart above all other beasts of the earth. Yet this Serpent (saith *S. Ambrose*) will kill a Lion and run away from a Hart.

Herodotus.

The Medicines arising out of this Beast, are briefly these; The water wherein an Adder is preserved alive, is a remedy against the poyson of a Toad: Also Adders or Vipers included in a pot with the scrapings of Vines, and therein burnt to ashes, do help the Wens or Kings-evill. And *Pliny* also affirmeth, that if a Man which hunteth Crocodils, bear about him any part of the fat of an Adder, or the gall mixed with the herb *Potamigon*, he cannot be hurt by that Beast.

Serpents and Adders, especially deaf Adders, signifie unrepentant wicked men, and also discord, as *Virgil* the Poet describeth it, when *Aleto* sent a Serpent, Snake or Adder, to move contention in the family of *Amata*. *Libro 7. Æneid.* And thus much for the Adder.

Of the AMMODYTE.

This Serpent I call after the Greek name, *Ammodytes*, an *Ammodyte*. It is also found to be called *Anmodyta*, and *Cenchrias*, or rather *Centrias*, or *Centrites*, because of the hardness of their tails, which are also cloven on the upper side. The *Italians* call it *Aspido del corno*, because it hath upon the upper chap a hard Wart like a horn. The head of this Serpent is longer and greater then a Vipers head, and her chaps wider; besides the late expressed difference upon the upper lip: and yet it may well be tearmed a kinde of Viper. It is *Immanis fera*, a fierce wilde Beast, in length not above a cubit, having divers black spots upon the skin, and certain appearances of strakes or small lines upon the back. The colour of the other parts is ever like the sand wherein it keepeth and maketh abode, according to these verses of *Lucan*.

*Olaus Mag.
Avicenna.*

*Concolor exuviiis, atque indiscretus arenis
Ammodytes.*

In English thus;

The Ammodyte, indiscreet on the Land,

Doth hold the colour of the burning sand.

The Countries most of all annoyed with these Serpents, are *Lybia*, *Italy*, and *Illyria*, especially about *Gortinium*, and the Mountains of *Lampidia*. Their harms are not inferiour to the stinging and poyson of Asps, for *Matthiæus* writeth, that he hath known some to die thereof within three hours after the wound received. And if they do not die within short time, then doth the blood issue forth in abundant manner out of the hurt, and the wound swelleth. Afterward, all is turned into

matter, and then followeth dulness in the head, and distraction in the minde; they live long which endure it three days, and it was never known that any lived above seven days: this also being observed, that those that be hurt by a female do die soonest. For together with their biting, they infuse a vehement pain, which causeth swelling, and the sore to run.

I finde the cure hereof in *Aetius* to be thus, first of all Triacle must be given to the sick person to drink, and also laid upon the wound, also drawing or attractive Plaisters, and such Poulteffes which are fit for running Ulcers. But first before the Plaisters, scarifie all the places about the hurt, and binde the upper parts hard, then launce the sore a little with a Pen-knife, and let him drink sweet water with Rungwort, Gourds, *Castoreum*, and *Cassia*. *Avicen* prescribeth in the cure of these Serpents venom *Castoreum*, Cinamon, the root of Centory, of each two ounces with Wine, and the root of long Hartwort, of *Assosier*, the juyce of the root *Gentian*. And for emplaister, Hony sod and dried, and so pounded, the roots of Pomgranates, and Centory, the seed of Flax, and Lettuce, and wilde Rue: And so I conclude with Doctor *Gesner*, *Percussus ab Ammodyte festinet ad remedium, sine quo nemo affugere*, He which is hurt by an *Ammodyte*, let him make hast for a remedy, without which never Man escaped death.

Of the ARGES and ARGOLÆ.

Galen.
Hippocrates.

There is mention made in *Galen* and *Hippocrates*, of a Serpent called *Arges*: Now *Arges* signifieth in Greek white, swift, idle, ill mannered: of this Serpent *Hippocrates* telleth this story. There was (saith he) a young man drunk, which lay asleep upon his back in a certain house, gaping: Into this Mans mouth entered a Serpent called *Argos*, the young Man perceiving it in his mouth, strived to speak and cry, but could not, and so suddenly gnawing his teeth, devoured and swallowed down the Serpent: After which he was put to intolerable pains, his hands stretching and quivering like as a Mans that is hanged or strangled, and in this sort he cast himself up and down and dyed. It seemeth therefore that this Serpent hath his name from the sudden destruction he bringeth to the creatures it smiteth, and therefore in ancient time we read that *Mercury* was called *Argiphon*, for killing of Serpents.

The *Argole* are only mentioned by *Suidas*, for he saith, that *Alexander* brought them to *Alexandria* from *Argos*, and cast them into the River to expel and devour the *Aspes*: where they continued a long time, till the bones of the Prophet *Jeremy* were brought out of *Egypt* unto *Alexandria*, which slew them, (as the same Author writeth:) And thus much of these two kinds of Serpents.

OF ASPES.

IN Hebrew as appeareth, Deut. 32. the Asp is called *Peihen*, in Psal. 58. *Akschub*, in Isa. 59. & Jer. 8. *Zipheoni*, an Asp or a Cockatrice, worse then a Serpent. The *Arabians*, *Hafos*, and *Hafos*; the *Greeks*, *Aspis*; the *Italians*, *Aspe*, and *Aspide*: the *Spaniards*, *Bivora*; the *French*, *Un aspic*; the *Germans*, *Ein selang gemant*; and the *Latines*, *Aspis*. About the notation or derivation of this word, there is some difference among Writers. *Aristophanes* deriveth it from *Alpha*, an intensive Particle, and *Spizo*, which signifieth to extend; either by reason of his sharp shrill hissing, or for the length of his body. Others derive *Aspis* from *Hias*, which signifieth venom or poyson, and therefore saith the Scripture; *The poyson of Aspis*, because that is a predominant poyson. The *Latines* call it *Aspis*, *quod venenum aspergit mor su*, because it sprinkleth abroad his poyson when it biteth. Besides we read of *Aspis* a Buckler, an Island in the *Lycian Sea*, a Mountain in *Africk*, and there is a fashion of camping Souldiers in the field called *Aspides*.

The

The Epithets declaring the nature of this pestiferous Serpent, are *luchetia*, rejoycing in poyson, *Elikessa*, winding, *Lichmeres*, putting out the tongue, *Smerdalee*, fearfull, *Phoinessa* cruelly killing. Likewise in *Latine*, dry, sleeping, drousie, deadly, swelling, and *Aspis Pharia*, a Pharian Asp, so called of the Island *Pharus*, where they abound. It is said that the Kings of *Egypt* did wear the Pictures of *Cal. Rhod.* Asps in their Crowns; whereby they signified the invincible power of principality in this Creature, whose wounds cannot easily be cured: And the Priests of *Egypt* and *Aethiopia* did likewise wear very long Caps, having toward their top a thing like a Navel, about which are the forms of winding Asps, to signifie to the people, that those which resist GOD and Kings, shall perish by irresistible violence. Likewise by an Asp stopping his ear, was figured and understood a Rebel, obeying no lawes or degrees of the Higher power: But let us leave this discourse of moralities, and come neerer to the naturall description of Asps. There are many kindes of Asps after the *Egyptian* division, for one kinde is called *Aspis sicca*, a dry Asp. This is the longest of all other kindes, and it hath eyes flaming like fire, or burning coals; another kinde is called *Asilus*, which doth not only kill by biting, but also with spitting, which it sendeth forth while it setteth his teeth hard together, and lifteth up the head. Another kinde is called *Irundo*, because of the similitude it keepeth with Swallows, for on the back it is black, and on the belly white, like as is a Swallow. We read also in *Albertus* of *Aspis Hipnalis*, and *Hippupex*, but it may be that both these names signifie but one kinde. This *Hypnale* killeth by sleeping, for after that the wound is given, the Patient falleth into a deep and sweet sleep, wherein it dyeth: and therefore *Leoniceus* saith; *Ulam fuisse, ex cuius veneno sibi Cleopatram suam mortem conscivit*, that it was the same which *Cleopatra* bought to bring upon her self a sweet and easie death. There is also an Asp called *Athas*, which is of divers colours: But I do consider that all the kindes may well be reduced to three, that is, *Ptyas*, *Chersia*, and *Chelidonia*; *Ptyas* hurteth by poysoning mens eyes, by spitting forth venom, *Chersia* liveth on the land, and *Chelidonia* in the waters.

The Asp is a small Serpent, like to a land Snake, but yet of a broader back, and except in this differeth not much from the Snake, their necks swell above measure, and if they hurt in that passion, there can be no remedy, for the stroak of their eyes are exceeding red and flaming, and there are two pieces of flesh like a hard skin which grow out of their foreheads, according to these Verses of *Nicander*;

*Præterea geminae calli instar fronte caruncle
Herent, sanguinea scintillant lumina flammis.*

That is to say;

*As hard as Brawn two bunches in their face
Do grow, and flaming bloody eyes their grace.*

And the dry Asp, so called because it liveth in mid-lands, farre from any water, hath a vehement strong sight, and these eyes both in one and other are placed in the Temples of their head. Their teeth are exceeding long, and grow out of their mouth like a Boars, and through two of the longest are little hollowes, out of which he expresth his poyson: They are also covered with thin and tender skins, which slide up when the Serpent biteth, and so suffer the poyson to come out of the holes, afterward they return to their place again. Of all which thus writeth *Nicander*;

*Quatuor huic intra Maxilla concava dentes,
Radices fixere suas, quas juncta quibusdam
Pelliculis tunica obducit, triste unde venenum
Effundit, si forte sua se appropinquet hosti.*

In English thus;

*Within the hollow of their cheeks fiery teeth are seen
Fast rooted, which a coat of skin doth joyn and over-bide,
From whence sad venom issueth forth when she is keen,
If that her so she chance to touch as she doth glide.*

The scales of the Asp are hard and dry, and red, above all other venomous Beasts, and by reason of her exceeding drought, she is also accounted deaf. About their quantity here is some difference among Writers: For *Ælianus* saith, that they have been found of two cubits length, and their other parts answerable: Again, the *Egyptians* affirm them to be four cubits long: but both these may stand together, for if *Ælianus* say true, then the *Egyptians* are not deceived, because the greater number containeth the lesser. The Asp *Ptyas* is about two cubits long: the *Chersian* Asps of the earth, grow to the length of five cubits; but the *Chelidonian* not above one, and this is noted, that the shorter Asp killeth soonest, and the long more slowly: one being a pace, and another a fathom in length. *Nicander* writeth thus;

*Tam proceram extensa querunt quam brachia duci,
Tantaque crassities est, quantum missile telum,
Quod faciens hastas dacta faber excolit arte.*

Which

Which may be thus Englished;

As wide as arms in force out-stretched,

So is the Asp in length,

And broad even as a casting Dart,

Made by a wise Smiths strength.

*Actius.
Olau.*

The colour of Asps is also various and divers, for the *Irundo* Asp, that is, the *Chelidonian*, resembleth the Swallow; the *Ptyas* or spitting Asp resembleth an Ash colour, flaming like Gold, and somewhat greenish: the *Chersæan* Asp of an Ash-colour or green, but this later is more rare, and *Pierius* saith, that he saw a yellow Asp neer *Bellari*: Of these colours writeth *Nicander*:

*Squalidus interdum color albet, sepe virenti,
Cum maculis sepe est cineres imitante figura,
Nonnunquam ardenti veluti succenditur igne,*

Thus overtherwise;

*Their colour whitish pale, and sometime lively green,
And spots which do the Ash resemble,
Some fiery red: in Æthiop black Asps are seen,*

*Idque nigra Æthiopum sub terra, quale refusus
Nilus sepe lutum, vicinum in Nerea volvit.*

*And some again like to Nerean mud,
Cast up by flowing of the Nilus flood,*

Am. Paræus.

Bellorinus.

The Countreys which breed Asps, are not only the Regions of *Africk*, and the Confines of *Nilus*, but also in the Northern parts of the World (as writeth *Olau Magnus*) are many Asps found: like as there are many other Serpents found, although their venom or poyson be much more weak then in *Africa*; yet he saith, that their poyson will kill a man within three or four hours without remedy. In *Spain* also there are Asps, but none in *France*, although the common people do style a certain creeping thing by that name. *Lucan* thinketh that the Originall of all came from *Africa*, and therefore concludeth, that Merchants for gain have transported them into *Europe*, saying;

*Ipsa coloris egest, gelidum non transit in orbem
Sponte sua, Niloque tenuis metitur arenas.*

Sed quis erit nobis lucri pudor? Inde petuntur,

Huc Lybicae mortes & fecimus Aspidæ merces.

In English thus;

*The Asp into cold Regions not willingly doth go,
But neer the banks of Nilus warm, doth play upon the sands.*

Oh what a frame, of wicked gain must we then undergo,

Which Lybian deaths and Aspidish wares have brought into our lands?

Ælianus.

Gillius.

Their abode is for the most part in dryest soyls, except the *Chelidonian* or Water Asp, which live in the banks of *Nilus* all the year long, as in a house and safe Castle, but when they perceive that the water will overflow, they forsake the banks sides, and for safeguard of their lives, betake them to the Mountains. Sometimes also they will ascend and climbe trees: as appeareth by an Epigram of *Anthologius*. It is a horrible, fearfull, and terrible Serpent, going slowly, having a weak sight, alwayes sleepy and drowsie, but a shrill and quick sense of hearing, whereby she is warned and advertised of all noyse, which when she heareth, presently she gathereth her self round into a circle and in the midst lifteth up her terrible head: Wherein a man may note the gracious providence of Almighty GOD, which hath given as many remedies against evil, as there are evils in the World. For the dulnesse of this Serpents sight, and slownesse of her pace, doth keep her from many mischiefs. These properties are thus expressed by *Nicander*;

*Formidabile cui corpus, tardumque volumen,
Quandoquidem transversa via est prolixæque ventris
Spira, veteris nique vivere videntur ocelli.*

At simul ac facili sorte abservaverit aure

*Vel minimum strepitum, segnes è corpore somnos
Excitat, & ceterem sinuat mox aspera traxum,*

Horrendumque caput, porrectaque pectora tollit.

In English thus;

This feared Asp hath slow and winding pace,

When as her way on belly she doth traverse,

Her eyes sprunk in her head winking, appear in face,

Till that some noise her watchfull ear doth ravish,

Then sleep shak'd off, round is her body gathered,

With dreadfull head, on mounted neck up lifted.

The voice of the Asp is hissing, like all other Serpents, and seldome is it heard to utter any voyce or sound at all, except when she is endangered, or ready to set upon her enemy. Whereupon saith *Nicander*;

Grave sibilat ipsa

Bestia, dum certam vomit ira conossa mortem.

In English thus;

This beast doth hisse, with great and lowdest breath,

When in her mood she threatneth certain death.

That

That place of *David*, Psalm. 58. which is vulgarly read a death Adder, is more truly translated *A deaf Asp*, which when she is enchanted, to avoid the voyce of the Charmer, she stoppeth one of her ears with her tail, and the other she holdeth hard to the earth: And of this incantation thus writeth *Vincentius Beduacensis*. *Virtute quorundam verborum incantatur Aspis, ne veneno interimat, vel ut quidam dicunt ut quieta capi possit, & gemma de fronte ejus auferri, quæ naturæ aliter in eo nascitur*, that is to say, The Asp is enchanted by vertue of certain words, so as she cannot kill with her poyson, or as some say, be taken quietly without resistance, and so the Gem or pretious Stone be taken out of her forehead, which naturally groweth therein. And from the words of the Psalm aforesaid, not only the certain and effectual use of charming is gathered by *Pierius*, but also by many justified in the case of Serpents. Whereof I have already given mine opinion in the former general Treatise, unto the which I will only adde thus much in conclusion, which I have found in a certain unnamed Author; *Dæmones discunt cum verbis ad Serpentes, & infestione interiori hoc faciunt, ut Serpentes ad nutum eorum moveantur, ac sine læsione tractabiles exhibeantur*: Which is thus much in effect; Devils run up and down with words of enchantment to Serpents, and by an inward or secret infection, they bring to pass that the Serpents dispose themselves after their pleasure, and so are handled without all harm. And indeed, that it may appear to be manifest, that this incantation of Serpents is from the Devil, and not from God, this only may suffice any reasonable man: because the Psalmist plainly expresseth, that the Serpent shifteth it off, and avoideth *Peritissimas mustantium incantationes*, the most skilful Charmers. Now if it came from the irresistible power of Almighty God, it should pass the resistance of them or Devils; but being a fallacy of the Devil, the Serpent (wiser in this point then Men that believe it) easily turneth tail against it: and in this thing we may learn to be wise as Serpents, against the enchanting temptation of the Devil or Men, which would beguile us with shadows of words and promises of no valuable pleasures.

If we may believe *Pliny*, *Ælianus*, and *Philarchus*, the Egyptians lived familiarly with Asps, and with continued kindeness wan them to be tame. For indeed among other parts of their savage beastliness, they worshipped Asps even as household Gods, by means whereof the subtil Serpent grew to a sensible conceit of his own honour and freedom, and therefore would walk up and down and play with their children, doing no harm, except they were wronged, and would come and lick meat from the table, when they were called by a certain significant noise, made by knocking of the fingers. For the guests after their dinner, would mix together Hony, Wine, and Meal, and then give the sign, at the hearing whereof they would all of them come forth of their holes; and creeping up, or lifting their heads to the table, leaving their lower parts on the ground, there licked they the said prepared meat, in great temperance by little and little without any ravening, and then afterward departed when they were filled. And so great is the reverence they bear to Asps, that if any in the house have need to rise in the night time out of their beds, they first of all give out the sign or token, lest they should harm the Asp, and so provoke it against them: at the hearing whereof, all the Asps get them to their holes and lodgings, till the person stirring be laid again in his bed.

The holy kinde of Asps they call *Thermusis*, and this is used and fed in all their Temples of *Isis* with the fat of Oxen or Kine. Once in the year they crown with them the Image of *Isis*, and they say that this kinde is not an enemy to Men, except to such as are very evill, whereupon it is death to kill one of them willingly.

It is reported of a certain Gardiner making a ditch or trench in his Vineyard, by chance and ignorantly, he set his spade upon one of these *Thermusis* Asps, and so cut it asunder, and when he turned up the earth, he found the hinder part dead, and the fore-part bleeding and stirring: at which sight his superstitious heart overcome with a vain fear, became so passionately distressed, that he fell into a vehement and lamentable frenzy. So that all the day time he was not his own man, and in the night, in his mad fits he leapt out of his bed, crying out with pitiful and eager complaint, that the Asp did bite him, the Asp did wound him, and that he saw the picture of the said Asp (by him formerly slain) following him, and tearing his flesh, and therefore most instantly craved help against it, saying still he perished by it, he was mortally wounded. And when he had now (saith *Ælianus*) continued a while in this superstitious fury and disease of the minde, his kindred and acquaintance brought him into the house of *Serapis*, making request unto that fained God to remove out of his sight that spectre and apparition; and so he was released, cured and restored to his right minde.

This kinde of Asp they also say is immortal and never dyeth, and besides it is a revenger of sacrilege, as may appear by such another History in the same place. There was a certain *Indian* Peacock sent to the King of *Egypt*, which for the goodly proportion and feature thereof, the King out of his devotion consecrated to *Jupiter*, and was kept in the Temple. Now there was (saith he) a certain young Man which set more by his belly, then by his God, which fell into a great longing for to eat of the said Peacock: and therefore to attain his appetite, he bribed one of the Officers of the Temple with a good sum of Money to steal the said Peacock, and bring it to him alive or dead. The covetous-wretch enraged with the desire of the Money, sought his opportunity to steal away the Peacock, and one day came to the place where he thought and knew it was kept, but when he came, he saw nothing but an Asp in the place thereof, and so in great fear leaped back to save his life, and afterward disclosed the whole matter. Thus far *Ælianus*.

The domestical Asps understand right and wrong, and therefore *Philarchus* telleth a story of such an Asp, which was a female, and had young ones: in her absence one of her young ones killed a

childe

Ælianus.

childe in the House : When the old one came again according to her custom to seek her meat, the killed childe was laid forth, and so she understood the harm : Then went she and killed that young one, and never more appeared in that house. It is also reported, that there was an Asp that fell in love with a little Boy that kept Geese in the Province of Egypt, called *Herculia*, whose love to the said Boy was so fervent, that the Male of the said Asp grew jealous thereof. Whereupon one day as he lay asleep, set upon him to kill him, but the other seeing the danger of her love, awaked and delivered him.

There is much and often mention made of Asps in holy Scripture, beside the forenamed place, Psal. 58. as in Esa. 59. the Jews are compared to Asps, and their labours to Spiders webs. And Esa. 11. *The sucking childe shall play upon the hole of the Asp.* Whereupon a learned man thus writeth ; *Quicunq; ex hominibus occulto veneno ad nocendum referti sunt, sub regno Christi mutato ingenio fore vel pueris innocios;* that is, whosoever by secret poyson of nature are apt to do harm to other, in the Kingdom of Christ their nature shall be so changed, that they shall not harm sucklings, not able to discover them. Great is the subtilty and fore-knowledge of Asps, as may appear by that in Psal. 58. against the Charmers voyce. As also it is strange, that all the Asps of *Nilus* do thirty days before the flood remove themselves and their young ones into the Mountains, and this is done yearly, once at the least, if not more often.

Pliny.

Suidas.

They sort themselves by couples, and do live as it were in marriage, Male and Female, so that their sense, affection, and compassion, is one and the same : for if it happen that one of them be killed, they follow the person eagerly, and will finde him out, even in the midst of many of his fellows : that is, if the killer be a beast, they will know him among beasts of the same kinde : and if he be a man, they will also finde him out among men : and if he be let alone, he will not among thousands harm any but he : breaking through all difficulties (except water,) and is hindred by nothing else, except by swift flying away. We have shewed already, how the *Phyllians* in *Asia* cast their children newly born to Serpents, because if they be of the right seed and kindred to their Father, no Serpent will hurt them, but if they be Bastards of another race, the Serpents devour them : these Serpents are to be understood to be Asps. Asps also we have shewed were destroyed by the *Argols*, which *Alexander* brought from *Argos* to *Alexandria*, and therefore those are to be reckoned their enemies. Shadows do also scare away & terrifie Asps, as *Seneca* writeth. But there is not more mortal hatred or deadly war betwixt any, then betwixt the *Ichneumon* and the Asp. When the *Ichneumon* hath espyed an Asp, she first goeth and calleth her fellows to help her, then they all before they enter fight do wallow their bodies in slime, or wet themselves, and then wallow in the sand, so harnessing, and as it were arming their skins against the teeth of their enemy : and so when they finde themselves strong enough, they set upon her, bristling up their tails first of all, and turning to the Serpent till the Asp bite at them, and then sodainly ere the Asp can recover, with singular celerity they flie to her chaps and tear her in pieces, but the victory of this combate resteth in anticipation, for if the Asp first bite the *Ichneumon*, then is he overcome, but if the *Ichneumon* first lay hold on the Asp, then is the Asp overcome. This hatred and contention is thus described by *Nicander* ;

*Solus eam potis est Ichneumon vincere pestem,
Cum grave cautus ei bellum parat, editaq; ova,
Que fovet in multorum hominum insuperabile lethum,
Omnia fracta terit, mordaceq; dente laceffit.*

That is to say ;

*Ichneumon only is of strength, that pest to overquell,
Gainst whom in wary wise his war he doth prepare,
Her egges, a deadly death to many men, in sand he doth out smell,
To break them all within his teeth, this nimble beast doth dare.*

Pliny, *Cardan*, and *Constantine* affirm, that the herb *Arum*, and the root of *Winterberry*, do so astonish Asps, that their presence layeth them in a deadly sleep : and thus much of their concord with other creatures.

Galen writeth, that the *Marsians* do eat Asps without all harm, although as *Mercurial* saith, their whole flesh and body is so venomous, and so repleat with poyson, that it never entereth into medicine, or is applyed to sick or sound upon any Physical qualification : the reason of this is given by himself and *Fracastorius*, to be either, because Asps under their Climate or Region are not venomous at all, as in other Countries, neither Vipers nor Serpents are venomous : or else because those people have a kinde of sympathy in nature with them, by reason whereof they can receive no poyson from them.

Textor.

The poyson of Asps saith *Moses*, Deut. 32. is *crudele venenum*, a cruel poyson, and Job, 20. cap. expressing the wicked mans delight in evil, saith ; *That he shall suck the poyson of Asps.* For which cause, as we have shewed already, the harm of this is not easily cured. We read that *Canopus*, the Master of *Menelaus* ship, to be bitten to death by an Asp at *Canopus* in Egypt. So also was *Demetrius Phalareus*, a Scholar of *Theophrastus*, and the Keeper of the famous Library of *Ptolemaus Soter*. *Cleopatra* likewise to avoid the triumph that *Augustus* would have made of her, suffered her self willingly to be bitten to death by an Asp. Wheu pon *Propertius* writeth thus :

Brachia

*Brachia spectavi sacris admosa colubris,
Et trahere occultum membra soporis iter.*

In English thus;

*Thus I have seen those wounded arms,
With sacred Snakes bitten deep,
And members draw their poysoned harms,
Treading the way of death's sound sleep.*

We read also of certain Mountebanks, and cunning Juglers in *Italy*, called *Circulatores*, to perish by *Ælianus*. their own devises through the eating of Serpents, and Asps which they carryed about in Boxes as tame, using them for ostentation to get Money, or to sell away their Antidotes. When *Pompeius Rufus* was the great Master of the Temple-works at *Rome*, there was a certain Circulator or Quack-salver, to shew his great cunning in the presence of many other of his own trade, which set to his arm an Asp, presently he sucked out the poyson out of the wound with his mouth: but when he came to look for his preservative water, or antidote, he could not finde it; by means whereof the poyson fell down into his body, his mouth and gums rotted presently, by little and little, and so within two days he was found dead. The like story unto this is related by *Amb. Parus*, of another, which at *Florence* would fain sell much of his medicine against poyson, and for that purpose suffered an Asp to bite his flesh or finger, but within four hours after he perished, notwithstanding all his antidotical preservatives.

Now therefore it remaineth, that we add in the conclusion of this History, a particular discourse of the bitings and venom of this Serpent, and also of such remedies as are appointed for the same. Therefore we are to consider, that they bite and do not sting, the females bite with four teeth, the males but with two, and when they have opened the flesh by biting, then they infuse their poyson into the wound. Only the Asp *Ptyas*, killeth by spitting venom through her teeth, and (as *Avicen* saith) the savour or smell thereof will kill, but at the least the touching infecteth mortally. When an Asp hath bitten, it is a very difficult thing to espy the place bitten or wounded, even with most excellent eyes, as was apparent upon *Cleopatra* afore said; and the reason hereof is given to be this, because the poyson of Asps is very sharp, and penetrateth suddenly and forcibly under the skin, even to the inmost parts, not staying outwardly, or making any great visible external appearance. Yet *Galen* writing to *Piso*, affirmeth otherwise of the wound of *Cleopatra*; but because drowsiness and sleep followeth that poyson, I rather believe the former opinion: and therefore *Lucan* calleth the Asp, *Somnifera*, that is, a sleep-bringing Serpent. And *Pictorius* also subscribeth hereunto.

*Mercurial.
Actius.*

*Apidis & morsu lesum dormire fatentur
In mortem, antid. tum nec valuisse ferunt.*

Which may be Englished thus;

*He that by rage of Asps tooth is bitten or is wounded,
They say doth sleep until his death cureless, he is confounded.*

The pricks of the Asps teeth, are in appearance not much greater then the prickings of a needle, without all swelling, and very little blood issueth forth, and that is black in colour; straightway the eyes grow dark and heavy, and a manifold pain ariseth all over the body, yet such as is mixed with some sense of pleasure, which caused *Nicander* to cry out, *Perimitque virum absque dolore*, it kills a man without pain. His colour is all changed, and appeareth greenish like grass. His face or forehead is bent continually frowning, and his eyes or eye-lids moving up and down in drowsiness without sense, according to these verses following.

*Nec tamen ulla vides impressi vulnera morsus,
Nec dignus fati tumor ictum corpus adurit.
Sed qui lesus homo est, citra omnem fata dolorem
Claudit, & ignavo moriens torpore fatiscit.*

Which I translate thus;

*Wounds of impressed teeth, none canst thou see,
Nor tumour worth the naming, smitten body burning,
But yet the hurt man painless taketh destiny,
And sleeping dyeth, sluggishly him turning.*

The true signes then of an Asps biting, is stupour or astonishment, heaviness of the head, and slothfulness, wrinking the fore-head, often gaping and gnawing, and nodding, bending the neck, and Convulsion: but those which are hurt by the *Ptyas*, have blindness, pain at the heart, deafness, and swelling of the face. And the signes of such as are hurt by the *Chalidonian* or *Chersæan* Asp, and the *Terrestrial* are all one, or of very little difference, except that I may adde the Cramp, and the often beating of the pulse, and frigidty of the members or parts, or pain in the stomach, but all of them in in general, deep sleep, and sometimes vomiting. But by this, that the blood of the place by them bitten turneth black; it is apparent and manifest, that the poyson of the Asp mortifieth

or

or killeth the natural heat, which is overcome by the heat of the poyson outwardly, and the darknesse or blindness of the eyes proceedeth of certain vapours which are infected, and ascend up to the disturbance of the brain: and when the humors are troubled in the stomach, then followeth vomiting or else the cramp, and sometimes a looseness when the knuckles are drawn in by the venomous biting, or the infected humors falling down into the intrails. To conclude, so great is the tabifical effect of this poyson of Asps, that it is worthily accounted the greatest venom, and most dangerous of all other; for *Aelianus* saith, *Serpentum venenum cum pestiferum sit, tum multo aspidis pestilentius*, the poyson of all Serpents is pestiferous, but the venom of the Asp most of all. For if it touch a green wound, it killeth speedily, but an old wound receiveth harm thereby more hardly. In *Alexandria*, when they would put a Man to a sudden death, they would set an Asp to his bosom or breast, and then after the wound or biting, bid the party walk up and down, and so immediately within two or three turns he would fall down dead. Yet it is reported by *Pliny*, that the poyson of Asps drunk into the body doth no harm at all, and yet if a Man eat of the flesh of any beast slain by an Asp, he dyeth immediately.

But concerning the cure of such as have been, or may be hurt by Asps, I will now entreat, not spending any time to confute those, who have wrote that it is incurable: on the contrary it shall be manifest, that both by Chirurgery and Medicines, compound and simple, this both hath been and may happily be effected. First it is necessary when a Man is stung or bitten by a Serpent, that the wounded part be cut off by the hand of some skilful Chirurgeon, or else the flesh round about the wound, with the wound it self to be circumcised and cut with a sharp Rasor; then let the hottest burning things be applyed, even the searing Iron to the very bone. For so the occasion being taken away from the poyson to spread any further, it must needs die without any further damage. Then also the holes in the mean time before the ejection must be drawn, either with Cupping-glasse or with a Reed, or with the naked rump of a Ringdove or Cock; I mean the very hole set upon the bitten place. And because the hole is very narrow and small, it must be opened and made wider, the blood be drawn forth by scarifications, and then must such medicinal herbs be applyed as are most opposite to poyson, as Rue, and such like. And because the poyson of Asps doth congeal the blood in the veins, therefore against the same must all hot things made thin be applyed, as *Mithridatum* and *Triacle* dissolved in *Aqua vite*, and the same also dissolved into the wound; then must the Patient be used to bathings, fricasing or rubbing, and walking, with such like exercises. But when once the wound beginneth to be purple, green, or black, it is a sign both of the extinguishment of the venom, and also of the suffocating of natural heat, then is nothing more safe then to cut off the member, if the party be able to bear it. After Cupping-glasses, and Scarifications, there is nothing that can be more profitably applyed then Centory, Myrrh, and *Opium*, or Sorrel after the manner of a Plaister. But the body must be kept in daily motion and agitation, the wounds themselves often searched and pressed, and Sea-water used for fomentation. Butter likewise, and the leaves of Yew, are very good to be applyed to the bitings of Asps. And in the Northern Regions, (as witnesseth *Olavus Magnus*,) they use nothing but Bran like a Plaister, and their Cattle they anoint with *Triacle* and Salt all over the bunch or swelling. And thus much for the Chirurgical cure of the biting of Asps. In the next place, we may also relate the medicinal cure, especially of such things as are compound, and received inwardly.

First, after the wound, it is good to make the party vomit, and then afterward make him drink juyce of Yew and *Triacle*, or in the default thereof, Wine, as much of the juyce as a groat weight, or rather more. But for the tryal of the parties recovery, give him the powder of Centory in Wine to drink, and if he keep the medicine, he will live, but if he vomit or cast it up, he will dye thereof. But for the better avoidance and purging out the digested venom, distributed into every part of his body, give the party Garlick beaten with *Zythum*, until he vomit, or else *Opoponax* in Wine allayed with water: also *Origan* dry and green. After the vomit, the former antidotal medicines may be used. And the Northern people use no other *Triacle* then Venetian. Whereas there are abundance of all manner of Serpents in the *Spanish* Islands, yet never are any found there to use *Triacle*, neither do they account of it as of a thing any whit vertuous, but instead thereof they use the bearded *Thapsia*, Gilly-flowers, and red Violets, and the herb *Avance*, boyled in Wine Vinegar, the sharpest that may be gotten, and a sound mans Urine, wherewithall they bathe the wounded part, although much time after the hurt received. But saith *Amb. Parvus*, it is much better for the Patient to drink thereof fasting, and before meat two hours, three ounces at a time. And by the help of this notable experiment, the Inhabitants of those Islands are nothing afraid to offer their bodies to be bitten by the most angry Asps. And thus much for compound medicines in general.

It is said, that the first and chiefest easie remedy for such as are bitten by Asps, is to drink so much of the sharpest Vinegar, as he can sensibly perceive and feel the same upon the right side of his midriff, because that poyson first of all depriveth the liver of sense. For *Pliny* saith, that he knew a man carrying a bottle of Vinegar to be bitten by an Asp, whiles by chance he trode thereupon, but as long as he bore the Vinegar and did not set it down, he felt no pain thereby, but as often as to ease himself he set the bottle out of his hand, he felt torment by the poyson, which being related to the Physicians, they knew thereby that Vinegar drunk into the stomach was a sovereign antidote against poyson. Yet some say, that the first knowledge of this vertue in Vinegar, grew from the necessity which a little boy bitten by an Asp had of drinking, and finding no other liquor but a bottle of Vinegar, drank thereof a full draught, and so was eased of his pain. For the reason is, that

that it hath both a refrigerative, and also a dissipating vertue, as may appear when it is poured on the earth, because it yeeldeth a froth, and therefore when it cometh into the stomach, it disperseth all the infected humors.

The Northern Shepherds do drink Garlick and stale Ale against the bitings of Asps. And some hold an opinion that Aniseed is an antidote for this fore. Others use Hart-wort, *Apium* seed, and Wine. *Aron* being burned, hath the vertue to drive away Serpents, and therefore being drunk with Oyl of bays in black Wine, it is accounted very soveraign against the bitings of Asps. The fruit of Balsam, with a little powder of Gentian in Wine, or the juyce of Mints, keepeth the stomach from the Cramp after a Man is bitten by an Asp. Others give *Castoreum*, with *Lignum Cassia*, and some the skin of a Storks stomach or maw. There be certain little filthy and corrupt Worms bred in rotten wood or paper, called *Cimices*, these are very profitable against poyson of Asps, or any other venomous biting beast, and therefore it is said that Hens and other Pullein do earnestly seek after these worms, and that the flesh of such fowl as have eaten thereof, is also profitable for the same purpose.

Athenæus also writeth, how certain Theeves were condemned to be cast to Serpents to be destroyed, now the morning before they came forth, they had given them to eat Citrons; when they were brought to the place of execution, there were Asps put forth unto them, who bit them, and yet did not harm them. The next day, it being suspected, the Prince commanded to give one of them a Citron, and the other none, so when they were brought forth again the Asps fell on them, and slew them that had not eaten Citron, but the other had no harm at all. The Egyptian *Clematis* or *Periwink* drunk in Vinegar, is very good against the poyson of Asps; so likewise is Corral in Wine, or the leaves of Yew. Henbane bruised with the leaves thereof, and also bitter Hops have the same operation. The urine of a Tortoise drunk, is a medicine against all bitings of wilde beasts, and the urine of a Man hurt by an Asp, as *Marcus Varro* affirmed in the eighty ninth year of his age, according to the observation of *Serenus* saying;

*Si vero horrendum vulnus fera fecerit Aspis,
Urinam credunt propriam conducere potu:
Varronis fuit ista senis sententia, nec non
Plinius ut memorat, sumpti juvat imber aceti.*

Which may be Englished thus;

*If that an Asp a mortal wound do bite,
It's thought his urine well doth cure again,
Such was the saying of old Varro hight,
And Pliny too, drink Vinegar like drops of rain.*

But it is more safe to agree with *Pliny* in the prescription of Mans urine, to restrain it to them that never had any beards. And more particularly against the Asp called *Ptyas*, and *Matthiolus* out of *Dioscorides* saith, that the quintessence of *Aqua vite*, and the usual antidote, both mixed together and drunk, is most powerful against the venoms of the deaf Asp. And thus much for the antipathy and cure of Asps biting venomous nature, whereunto I will add for a conclusion, that proverbial speech, of one Asp borrowing poyson of another, out of *Tertullian* against the Heretick *Marcion*, who gathered many of his absurd impieties from the unbelieving Jews. *Desinat nunc hereticus à Judæo aspis quod aiunt à Vipera mutuari venenum*, that is, let the heretick now cease to borrow his venom of a Jew, as the Asps do borrow their poyson from Vipers. And true it is, that this proverb hath especial use, when one bad man is help or counselled by another; and therefore when *Diogenes* saw a company of women talking together, he said merrily unto them, *Aspis par echidnes pharmacon dancizetai*, that is, the Asp borroweth venom of the Viper. Thus much of the Asp.

Of the Description and differences of B E E S.

Amongst all the sorts of venomous Insects, (or cut-wasted creatures) the soveraignty and preeminence is due to the Bees, who only of all others of this kinde, are made for the nourishment of mankinde, all other (cut-wasted) serving only for medicinal use, the delight of the eyes, delectation of the ears, and the ornament, trimming, and setting forth of the body, which they perform at the full. They are called of the Hebrews, *Deborah*; the Arabians term them, *Albara*, *Nabalea*, and *Zabar*; the Illyrians and Solavonians, *Wezilla*; the Italians, *Ape*, *Api*, *Una sticha*, *Moscatella*, *Ape* or *Scoppa*, *Pecchi*; the Spaniards, *Abeia*; Frenchmen, *Mousches au miel*; the Germans, *Een ymbe, apen*. The Flemings, *Bie*; the Polonians, *Pztzota*; the Irish men, *Camilii*. In Wales a Bee is called *Gweniv*. Amongst the Grecians they have purchased sundry names, according to the diversity of Nations, Countries and places, but the most vulgar name is *Melissa*, and in *Hesiodus*, *Melie*. Other some call a Bee *Plastis*, à *singendo*, of framing. Some again *Anthedon*: and of their colour, *Xanthai*. Of their Offices and charge, *Egemones*, ab *imperando*, from governing. *Sirenes*, à *suavi cantu*, from their sweet voyce. The Latines call them by one general name, *Apis* and *Apes*. *Varro* sometimes terms them *Aves*, but very improperly, for they might better be named *Volucres*, not *Aves*. So much for their names, now to the description.

in Bees.Differences of
Bees from na-
ture.Description of
the King.Differences in
regard of sex.

A Bee is a cut-wasted living creature, that can flye, having four wings, and bloudlesse, the only Crafts-master of Hony-making. Their eyes are somewhat of a horny substance; hid deep in their bodies, as is also their sting: they want neither tongue nor teeth, they have four wings, being of a bright and clear colour, growing to their shoulder-blades, whereof the two hinder-most are the lesser, because they might not hinder their flying: and out of their short feet or stumps there grow forth as it were two fingers, wherein they carry a little stone, for the poising and making weighty their small bodies in stormy, tempestuous, blustering or troublesome weather, for fear lest they might be driven from their house and home, by the contrary rage and violence of the windes. They do not breath (by *Plinies* good leave) but either pant, move, or stir (as the heart or brain doth) and by transpiration they are comforted, refreshed, and made lively. Their stomach is contexed and framed of the thinnest part of all their members, wherein they not only retain, and safely keep their Honey dew which they have gathered, but also digest, purifie, and cleanse it, which is the true and only reason, why the Honey of Bees is longer kept pure and fine, then any Manna or Meldew, or rather it is not at all subject to corruption.

Bees even by nature are much different: for some are more domestical and tame, and other again are altogether wilde, uplandish, and agrestial. Those former are much delighted with the familiar friendship, custom and company of men, but these can in no wise brook or endure them, but rather keep their trade of Honey-making in old trees, caves, holes, and in the ruders, and rubbish of old walls and houses. Of tame Bees again, some of them live in pleasant and delightful Gardens, and abounding with all sweet senting and odoriferous plants and herbs; and these are great, soft, fat, and big bellyed. Others again, there be of them that live in Towns and Villages, whose study and labour is to gather Honey from such plants as come next to hand, and which grow farther off, and these are lesser in proportion of body rough and more unpleasant in handling; but in labour, industry, wit and cunning, far surpassing the former. Of both sorts of these, some have stings (as all true Bees have:) others again are without a sting, as counterfeit and bastardly Bees, which (even like the idle, sluggish, lithier, and ravenous cloystered Monks, thrice worse then theeves) you shall see to be more gorbellied, have larger throats, and bigger bodies, yet neither excellent or markable, either for any good behaviour and conditions, or gifts of the minde. Men call these unprofitable cattle, and good for nothing, *Fuci*, that is Drones; either because they would seem to be labourers, when indeed they are not: or because that under the colour and pretence of labour (for you shall sometime have them to carry wax, and to be very busie in forming and making Honey-combes,) they may eat up all the Honey. These Drones are of a more blackish colour, somewhat shining, and are easily known by the greatnesse of their bodies. Besides some Bees are descended of the Kingly race, and born of the blood Royal: whereof *Aristotle* maketh two sorts; a yellow kinde, which is the more noble, and the black, garnished with divers colours. Some make three Kings, differing in colour, as black, red, and divers coloured. *Menecrates* saith, that those who are of sundry colours are the worser, but in case they have diversity of colour with some blacknesse, they are esteemed the better. He that is elected Monarch *Caesar*, and Captain General of the whole swarm, is ever of a tall, personable, and heroical stature, being twice so high as the rest, his wings shorter, his legs straight, brawny, and strong, his gate, pace, and manner of walking is more lofty, stately, and upright, of a venerable countenance; and in his fore-head there is a certain red spot or mark with a Diadem; for he far differeth from the popular and inferiour sort in his comeliness, beauty, and honour. The Prince of Philosophers confoundeth the sex of Bees, but the greatest company of learned Writers do distinguish them: whereof they make the feminine sort to be the greater. Others again will have them the lesser, with a sting: but the sounder sort (in my judgement) will neither know nor acknowledge any other males, besides their Dukes and Princes, who are more able and handsome, greater and stronger then any of the rest, who stay ever at home, and very seldom (unlesse with the whole Swarm) they stir out of doors, as those whom nature had pointed out to be the fittest to be stander-bearers, and to carry ancients in the camp of *Venus*, and ever to be ready at the elbows of their loves to do them right: Experience teaching us, that these do sit on Egges, and after the manner of birds, do carefully cherish and make much of their young, after the thin membrane or skin wherein they are enclosed is broken.

The difference of their age is known by the form, state, and habit of their bodies. For the young Bees have very thin and trembling wings, but they that are a year old, as they that are two or three years

years of age are very trim, gay, bright-shining and in very good plight and liking, of the colour of Oyl.

But those that have reached to seven years, have layed away all their flatness and smoothness, neither can any man afterwards either by their figure and quality of their bodies or skins, judge or discern certainly their age (as we say by experience in Horses:) For the elder sort of them are rough, hard, thin and lean scraggs, starvelings, loathsome to touch and to look upon, somewhat long, nothing but skin and bone, yet very notorious and goodly to see to, in regard of their gravity, hoariness and anciency. But as they be in form and shape, nothing so excellent, so yet in experience and industry they far out-strip the younger sort, as those whom time hath made more learned, and length of days joyned with use, hath sufficiently instructed and brought up in the Art or trade of Honey-making.

The place likewise altereth one whiles their form, and sometimes again their nature, (as their sex and age do both.) For in the Islands of *Molucca*, there be Bees very like to winged Pismires, but somewhat lesser then the greater Bees, as *Maximilian Transilvanus*, in an Epistle of his written to the Bishop of *Salspurge*, at large relateth it. *Andrew Thevet* in his book that he wrote of the New-found World, Chap. 51. amongst other matters reporteth that he did see a company of flies or Honey-bees about a tree named *Vhebebasen*, which then was green, with the which these Honey-bees do live and nourish themselves: of the which trees there were a great number in a hole that was in a tree, wherein they made Honey and Wax. There is two kinds of the Honey-bees, one kinde are as great as ours, the which cometh not only but of good smelling flowers, also their Honey is very good, but their Wax not so yellow as ours. There is another kinde half so great as the other: their Honey is better then the other, and the wilde men name them *Hira*. They live not with the others food, which to my judgement maketh their Wax to be as black as coals, and they make great plenty, specially near to the River *Vasser*, and of *Plate*. The Bees called *Chalcoides*, which are of the colour of brasse, and somewhat long, which are said to live in the Island of *Creta*, are implacable, great fighters and quarrellers, excelling all others in their stings, and more cruel then any others, so that with their stings they have chased the Inhabitants out of their Cities; the remainder of which Bees do remain and make their Honey-combes (as *Aelianus* saith) in the Mountain *Ida*. Thus much of the differences of Bees; now it remaineth to discourse of the Politick, Ethical, and Oeconomick vertues and properties of them.

Bees are governed and do live under a Monarchy, and not under a tyrannical State, admitting and receiving their King, not by succession or casting of lots, but by respective advice, considerate judgement, and prudent election; and although they willingly submit their necks under a Kingly government, yet notwithstanding they still keep their ancient liberties and priviledges, because of a certain Prerogative they maintain in giving their voices and opinions, and their King being deeply bound to them by an oath, they exceedingly honour and love.

The King as he is of a more eminent stature, and goodly corporature (as before we have touched) then the rest: so likewise (which is singular in a King) he excelleth in mildness and temperateness of behaviour. For he hath a sting, but maketh it not an instrument of Revenge, which is the cause that many have thought their King never to have had any. For these are the laws of nature, not written with Letters, but even imprinted and engraven in their conditions and manners: and they are very slow to punish offenders, because they have the greatest and Sovereign power in their hands. And although they seem to be slack in revenging and punishing private injuries, yet for all that they never suffer rebellious persons, refractorious, obstinate, and such as will not be ruled, to escape without punishment; but with their pricking stings they grievously wound and torment, so dispatching them quickly. They are so studious of peace, that neither willingly nor unwillingly they will give any cause of offence or displeasure. Who therefore would not greatly be displeased with, and hate extremely those *Dionysian* Tyrants in *Sicilia*, *Clearchus* in *Heraclea*, and *Apollodorus* the Thief, Pieler and spoiler of the *Cassandrians*? And who would not detest the ingratiouness of those Jewd claw-backs, and Trencher-parasites, and flatterers of Kings, which dare impudently maintain, that a Monarchy is nothing else but a certain way and rule for the accomplishing of the will, in using their authority as they list, and a science or skilful trade, to have wherewith to live pleasantly in all sensual and worldly pleasure: which ought to be far from a good Prince, who whilest he would seem to be a Man, he shew himself to be far worse then these little poor winged creatures. And as their order and course of life is far different from the vulgar sort, so also is their birth; for they of the Kingly race are not born after the manner of a little Worm, as all the Commynalty are, but is forthwith winged; and amongst all his younglings; if he finde any of his sons to be either a fool, unhandsome, that none can take pleasure in, rugged, rough, soon angry, fumish or too teasty, ill shaped, not beautiful or Gentleman-like, him by a common consent, and by a Parliamentary authority they destroy, for fear lest the whole Swarm should be divided and distracted into many mindes; and so at length the Subjects undone by factions, and banding into parts.

The King prescribeth laws and orders to all the rest, and appointeth them their rules and measures: for some he straightly chargeth and commandeth, (as they tender his favour, and will avoid his displeasure) to fetch and provide water for the whole Camp. He enjoyneth others to make the Honey-combes, to build, to garnish, and trim up the house well and cleanly, to finish perfectly the work, to finde and allow, to promote and shew others what to do. Some he sendeth

The difference of the form of Bees according to the place.

Bees of America.

The government of Bees.

forth to seek their living, but being worn with years, they are maintained at the common stock at home. The younger and stronger being appointed to labour, and take their turns as they fall. And although (being a King) he be discharged and exempt from any mechanical business, yet for all that, in case of necessity he will buckle himself to his task, never at any time taking the field or air abroad, but either for his healths sake, or when he cannot otherwise chuse, by means of some urgent business. If in respect of his years he be lusty and strong, then like a Noble Captain he marcheth before his whole winged-army, exposing himself first to all perils, neither with his good will will he be carryed of his Souldiers, unless he be wearied and weakened by means of crooked age, or mastered and clean put out of heart, by any violent sickness, so that he can neither stand on his legs, nor fly. When night approacheth, the sign and token being given by his Honey-pipe, or Cornet, (if you will so call it) a general Proclamation is made through the whole Hive, that every one shall betake himself to rest, so the watch being appointed, and all things set in order, they all make themselves ready and go to bed. So long as the King liveth, so long the whole swarm enjoy the benefit of peace, leading their lives without any disquieting, disturbance, vexation, or fear of future wars. For the Drones do willingly contain themselves in their own cells, the elder living contented with their own homes, and the younger not daring for their ears to break into their fathers Lands, or to make any inroads or invasion into the houses of their predecessors. The King keepeth his Court by himself, in the highest and largest part of the whole Palace, his lodging being workmanlike and very cunningly made of a fine round or enclosure of Wax, being thus as it were fenced and paled about as with a defensible wall. A little from him dwell all the Kings children, being very obedient to their parents beck. Their King being dead, all his subjects in an uprore, Drones bring forth their young in the cells of the true Bees, all are in a hurly burly, all being out of season and order. Aristotle saith, that Bees have many Kings, which I would rather term Viceroyes or Deputies, sithence it is certain (as *Antigonus* affirmeth) that as well the swarms do die and come to nought, by having of many Kings, as none at all. And thus to have spoken of good Kings let this suffice. Evill Kings are more rough, rugged, browner, blacker, and of more sundry colours: whose natures and dispositions you will condemn, in respect of their habit and manner of body and minde, the one and other are thus Physiognomically described by the Poet;

Namq; duarum facies, duo corpora gentis.

Alter erit maculis auro squalentibus ardens,

Et rutilis clarus squamis, insignis & ore.

Et dior est alter multo, quam pulvere abactio.

Quum venit & siccum terram spuit ore venator:

Desidia latamque trabens inglorius alium.

Dede neci, melior vacua sine regnet in aula.

In English thus;

The two aspects of Kingly Bees, two Nations do disclose,

One of them, Golden spotted red, burning with pale brow,

And having scales both red and clear, and great about the nose,

The other filthy to behold like dust, for it is true,

Which hunters spit upon dry land, when all is crusted and prest,

In sloth belly broad, doth travail worse then the least,

Him kill, let the other reign

Alone, in empty Court, do not disdain.

And thus hitherto have we spoken of their Kings and Dukes: now will we bend our discourse to the common sort of Bees.

Bees are neither to be accounted wilde, nor altogether calm and quiet creatures; but of a nature betwixt both: and of all other they are esteemed most serviceable and profitable. Their sting giveth both life and death to them, for being deprived of it, they surely die: but having it, they repell all hostility from their swarms. Of these there are none idle, although they be not all Honey-makers, neither are the most sluggish of them all, like unto the Drones in their inclination and manners: For they do not corrupt and mar the Honey-combes, neither do they lie in wait by treachery and deceit to filch Honey, but are nourished by flowers, and flying forth with their fellows, do get their living with them; although some of them want the skill to make and lay up the Honey finely and safely, yet notwithstanding every one hath his proper charge and business to use and practise; for these bring water to the King, and to the older Bees that cannot travail.

The elder sort if they be of a strong and robustious constitution, are chosen for the guard of the Kings person, as the fittest persons to be about him, in respect of their approved worth, faithful dealing, and uprightness of conscience, for the ordering and disposing of all matters. Some give Physick to those that are sick, by making and giving to them a medicinal aliment of Honey, that is drawn from Anise, Saffron and Hyacinths. But if any through age or sickness chance to die, then they whose office it is to carry forth the dead bodies to burying do forthwith flock together, carrying the dead body of their brother on their shoulders, as it were on a Beere, lest the pure Honey-combes might be tainted with any uncleanness, stink, or nastiness.

Bees have also their Ambassadors and Orators, sent with commission or authority, and put in trust to deal in their Princes affairs, their old beaten Souldiers, their Pipers, Trumpeters, Horn-winders, Watchmen, Scout-watches, and Septinels. Likewise Souldiers ever in a readi-

readinesse to defend, and look to their Hony-wealth and goods, as if it were a City committed to their trust and valiancy, and these do punish, torment, and throw to the ground all flying Theeves and Worms, that dare invade secretly by any cunning passage, or mine into their mansions. And that they might bear the world in hand, that they are no privy or secret Theeves in their flying, they make a noyse and humming, which together with their flight, is heard both to begin and end: Which sound, whether it proceedeth from the mouth, or from the motion of their wings, *Aristotle* and *Helychius* do much vary and contend.

Their Pipers and horn-blowers do *edere Ziggon*, as *Helychius* saith (the Englishmen term it *Sing*) and that they make to be the watch-word and privy token, for their watch and ward, sleep, and daily labour. They love their King so entirely, that they never suffer him to goe abroad alone, but their Army being divided into two parts, and by heaps winding themselves round, they do as it were enclose and fence him on all sides. If in any journey the King hap to wander from his company, and cannot be found, being driven away by the force of some stormy windes or weather, they all forthwith make a privy search, and with their quick-senting, persue and follow the chase so long, untill he be certainly found; and then because he is tyred with flying, and the tediousness of tempests, the common sort lift him upon their wings, and so triumphantly convey him home as it were in a Chariot. But if he die by the way, then they all mournfully depart, every one to his own place separating themselves, or peradventure for a while, they work up their Honey-combes not yet finished, but never make any more Honey; So that at length, growing to be lazy, sickly, wasted, consumed and distained with their own filth and corruption, they all miserably perish. For they cannot possible live without a King, against whom, none is so hardy as to lift up his finger to offer him any violence, much less to conspire his destruction, unless he (after the fashion of Tyrants) do overthrow and turn all things upside down, after his own will and lust, or neglecting carelessly the Weal publique, setteth all upon six and seaven. Yea, if he accustom himself to go often abroad, (which he cannot do without the great hurt and prejudice of his Citizens) they do not by and by kill him, but they take from him his wings, and if he then amend his life and look better to his office, they singularly affect and honour him.

When the King by flying away hath left his Bees, they fetch him again, and being a fugitive from his Kingdom, they follow him again by his smell, as it were with hue and cry, (for amongst them all the King smelleth best) and so bring him back to his Kingly house. None dare venture out of his own lodging first, nor seek his living in any place, except the King himself first going forth, do direct them the way of their flight. For I am hardly of *Aristotles* minde, who affirmeth that the King never cometh abroad, but when the whole swarm doth, which is seldom seen. But if by reason of his tyranny, cruelty, and violent rule, they be forced to seek some other dwelling places, then a few days before the time appointed, there will be heard a solitary, mournful, and peculiar kinde of voice, as it were of some trumpet, and two or three days before they flie about the mouth of the Hive; so when all things are in a readinesse for their flight, being all assembled, they flie all speedily away, and kill the Tyrant (whom they left behinde) if he attempt to follow them. But a good King they never forsake; and if at any time he pine and fall away by reason of sickness, any plague, or murrain, or through old age, all the meaner sort do make mone, the whole rout and multitude of Senators and Aldermen do greatly bewail him, not conveying any meat into their Hives, nor yet looking out of doors for meer grief, filling the whole house with sorrowful hummings and laments, and gathering themselves by heaps about the carcase of the dead King, they do with great noise tragically mourn for him. Neither doth continuance of time mitigate or take away their grief, but at length all of these faithful friends, partly through grief, and partly through famine, they are clean consumed and brought to death.

Whilest they have a King, the whole swarm and company is kept in awful order, but he being gone, they go under the protection of other Kings. They have not many Kings at once, neither can they endure usurpers, overthrowing their houses, and rooting out their stock and family. And if in one swarm there be two Kings, (as sometimes it falleth out) then one part adhereth to the one King, and the other side cleaveth to the other, so that sometimes in one hive you shall finde Honey-combes of sundry forms and fashions: where they behave themselves so honestly and neighbourly, that the one meddleth not with the others charge and business, having no minde to enlarge their Empire, to entice, draw, or win by fair means the subjects of the other side, but every one being obedient to his own King without contradiction. They honour him so highly, that being lost they complain; being decrepit, they preserve and keep him; being weary, they carry him round about with them; being dead, they bewail him with all funeral pomp and heaviness, yeelding up at length even their very lives for an assurance of their loves and faithful dealings. Oftentimes they arrear deadly war against strangers born, for the Honey that they have stoln from them, as for the catching and snatching up afore-hand those flowers whereon they purposed to sit on; so that sometimes the quarrel is determined by dint of sword in a just battail. Oftentimes again they wrangle about their Honey-combes and dwelling houses, but then the deadly and unappeaseable war is, when the contention is about the life, crown, and dignity of their King, for then they bestir themselves most eagerly, defending him most valiantly, and receiving the darts or stings that are bended against him, with an undanted courage, by the voluntary and thick interposing of their own bodies, betwixt the darts and the person of their King.

Neither are Bees only examples to men of Political prudence and fidelity, but also presidents for them to imitate in many other vertues. For whereas Nature hath made them *Zooa agelata*, that is, creatures living in companies and swarms, yet do they all things for the common good of their own rout and multitude, excepting ever the Drones and Theeves, whom if they take tripping in the manner, they reward with condign punishment. Their houses are common, their children common, their laws and statutes common, and their countrey common. They couple together without question as Camels do, privily and apart by themselves, which whether it proceed of modesty, or be done through the admirable instinct of Nature, I leave it to the dispute and quaint resolution of those grave Doctors, who being laden with the badges and cognizances of learning, do not stick to affirm that they can render a true reason even by their own wits, of all the causes in nature, though never so obscure, hid and difficult.

Flies and Dogs do far otherwise, whose impudency is such, that having no regard of times, persons, or places, they will not give place, or be disjoyned. Yea the *Massagets* (as *Herodotus* writeth) having their quiver of arrows on their carts, they dealt with their wives very unseasonably, and though all men beheld it, yet they most impudently contemned it. And that which is worser, this beastly fashion is crept amongst the usurpers, or at least professors of the Christian name, who shame not openly to kiss and embrace, yea even to play and meddle with filthy whores and brothelly queans. Bees surely will condemn these kinde of people of beaftial impudency and wanton shamelesnes; or causing them to blush if they have any grace, will teach them repentance. Neither are they altogether such creatures as cannot endure or away with musick, (which is the Princess of delights, and the delight of Princes) as many unlearned people cannot, but are exceedingly delighted with tune in any harmony wherein is no jarring, so the same be simple and unaffected.

And although they have not the skill to daunce according to due time, order and proportion in Musick, as they say Elephants can, yet do they make swifter or slower their flight, according to the Trumpetors minde, who with his sharp and shrill sound causeth them to bestir themselves more speedily; but beating slowly and not so loud upon his brazen instrument, maketh them more slow, and to take more leisure. Neither hath Nature made them only the most ingenious of all living creatures, but by discipline hath made them tame and tractable. For they do not only know the hand and voice of the Honey-man, or him that hath the charge and ordering of the same, but they also suffer him to do what liketh him best: which every man must needs confesse to be an argument of a generous and noble disposition, thus to undergo the rule of their Over-seers and Surveyors, but the hand and discipline of a stranger they will by no means endure.

As for æconomical vertues they excel also, and namely for moderate frugality and temperance, not profusely and prodigally wasting and devouring the great store of Honey which they gathered in the Summer season, but they sustain themselves therewith in Winter, and that very sparingly: And so whilst they feed upon few meats, and those of the purest sort, they purchase long life, (the reward of sobriety.) Neither are they so niggardly and sordidous minded, but when as they have gathered more Honey then their number can well spend, they communicate and impart some very liberally amongst the Drones. As for their cleanliness these may be certain arguments, that they never exonerate nature within their hives, (except constrained thereto by some sickness, foul weather, and for some urgent necessity) that they convey away the dead carcases, that they touch no rotten nor stinking flesh, or any other thing, no herb that is withered, nor no ill senting or decayed flowers.

They kill not their enemies within their hives, they drink none but running water, and that which is thoroughly defecated: they will not dwell in houses impure and foul, fluttish, black, or full of any feculent or dreggy refuse, and the excrements of the labourers and sickly, they gather on a heap without their pavilions, and as soon as their leisure serveth it is carryed clean away. Concerning their temperance and chastity, (although it hath been partly touched before,) yet this I will add, that it is wonderful what some men have observed. For whereas all other creatures do couple in the open sight of men, the Elephant only excepted, and Wasps likewise not much differing in kinde, do the same: yet Bees were never yet seen so to joyn together, but either within their hive, very modestly they apply themselves to that business, or else abroad do it without any witnesses. And they are no less valiant then modest and temperate, *Dum corpora bello obiectant, pulchramque petunt per vulnera mortem*. Their war is either civil or forain. Of the former there be divers causes, that is to say; the multitudes of their Dukes or Captains lying in wait to betray both King and Kingdom: scarcity of victual, straightness of place and room, corruption of manners and idleness. For if they have no Dukes, then it is expedient (as other whiles it happeneth) they stay the overplus, lest the number of them growing too great, either violence might be offered to the King, or the Commons drawn to some sedition.

They kill them most of all, when as they have no great store of young Bees to plant any new Colonies, overthrowing and spoiling withall their Honey-combs (if they have any.) They execute also Theeves and Drones, so often as they have not room enough to do their business in, (for they hold the more inward part of the Hive,) so taking from them at one time, both their Honey-combs and meat. The scarcity and lack of Honey, causeth them also to be at deadly feud, so that the short Bees do encounter the long with might and main. In the which bickering, if the short be Conquerors, it will be an excellent Swarm, but if fortune smile on the long Bees side, they live idly, making never any good Honey. Whosoever getteth the day, they are so given to rapine and revenge,

venge, as they take no prisoners, nor leave any place to mercy, but commit all to the sword.

Now concerning their forain wars, I must say they give place to no other living creature, either in fortitude, or hardy venturing: and if either men, four-footed beasts, birds, or Wasps, do either hinder, disquiet, or kill any of them, so that they be not well contented, against all these they oppose themselves very stoutly, according to their power wounding them. They hate extreemly adulterous persons, and such men as be smeared with any Ointment, those that have curled or crisped hair (as also all unfaithful and base raskally people) and all those that wear any red clothes of the colour of blood: as contrariwise they love and reverence exceedingly their Masters, Keepers, Tutors, Defenders, and Maintainers: so that sitting upon their hands, they do rather tickle and lick them in sporting wise, then either wound or hurt them, though never so little with their sting. Yea these men may safely without any touch of hurt, and without any covering to their hands, gather together the swarms in a very hot Summer; yea, handle, place them in order, heap up together, sit or stand before their Hives, and with a stick take clean away Drones, Theeves, Wasps, and Hornets.

If any Souldier loseth his sting in fight, like one that had his Sword or Spear taken from him, he presently is discouraged and despaireth, not living long, through extremity of grief. Going forth into the field to fight, they stay till the watchword be given, which being done, they flock in great heaps about their King (if he be a good one) ending all their quarrell in one set battel. In their order of fighting, how great vertue, courage, strength, and nobleness these poor creatures shew, as well we our selves can testifie, and they better who have assured us by their writings, that whole Armies of armed men have been tamed by the stings of Bees, and that Lions, Bears, and Horses, have been slain by means of them. And yet (how fierce and warlike soever they seem to be,) they are appeased and made gentle with continual or daily company, and unless they be too much netled and angered, they live peaceably enough without any great trouble, never hurting any one maliciously or deceitfully, that standeth before their Hives. If I should go about to declare at large their ingeny, natural inclination, cunning workmanship and memory; I should not only give unto them with *Virgil: Particulam aure divinae*, but also *haustus mentis aetherae*, and (*liceat Pythagoricè errare*,) the *Metempsychosis* of that ingenious Philosopher. For after that they are inclosed in a clean and a sweet hive, they gather out of gummy and moist liquor yeelding trees a kinde of glutinous substance, thick, clammy and tough, (called of the *Latines*, *Comosis*, and of the *Greeks*, *Mitys*,) especially from Elms, Willows, Canes or Reeds, yea even from stones; and this they lay for the first foundation of their work, so covering it all over as with a hard crust at first, bringing to it afterwards another layer of *Pissocera*, which is a kinde of juyce of Wax and Pitch, made with Gum and Rosin, and over that again they lay *Propolis*, which we call Bee-glew.

In this same three-fold tilie, and sure ground-work thus artificially begun, they do not only laugh to scorn, jest at, and mock the eyes of the over-curious spectators of their Common-wealth and works, but that which no man considers, they do hereby defend both themselves and theirs, against rain, cold, small vermin and beasts, and all their enemies. Then after this they build their Combes, with such an Architectonical prudence, that *Archimedes* in respect of them seems to be no body. For first of all they set up the cells of their Kings and Princes in the higher place of the Honey-combes, being large, fair, sumptuous, stately and lofty, being cunningly wrought, of the most tried, purest and refined Wax, trenching them round for the greater defence of the Regal Majesty, with a mound and enclosure as it were with a strong Wall, Bulwark, or Rampire.

And as Bees in regard of their age and condition, are of three sorts, so likewise do they divide their Cells: for to the most ancient they appoint houses next to the Court, (as those that are the fittest to be of his privy Councel, and guarders of his Person) next to these are placed the young Bees, and those that be but one year old. And they of middle years and stronger bodies, are lodged in the uttermost rooms, as those that are fittest and best able to fight for their King and Countrey. Yet *Aristotle* saith, that Bees in the making of their Tents or Cells, do first of all provide for themselves, and next for their King and his Nephews, and lastly for the Drones. And as in the fabricature of their Honey-combes, they make the fashion according to the magnitude and figure of the place, fashioning it either orbicular, long, square, sword-like, or foot-like, &c. according to their own liking, running out sometimes in length eight foot: so their little Cells contrariwise, are framed after a certain form in a Geometrical proportion and measure; for by rule they are justly Sexangular, and capable enough to hold the tenant.

The whole Combe containeth four orders of Cells; the first the Bees occupy; the next the Drones possess; the third, those that are called of the *Greeks*, *Chadoones*; of the *Latines*, *Apum soboles*, (call them if you please *Schadones*.) The last is appointed for the room of Honey-making. There be some who constantly aver, that the Drones do make combes in the same hive the labouring Bees do, but that they lack the skill and power of mellification, it being uncertain whether this comes to pass either through their grossness and big-bellied fatness, or through their settled and natural laziness. And if through the weightiness of the Honey the combes begin to shake and wag, and to lean and bend as though they were ready to fall, then do they rear them up, and under-prop them with pillars made Arch-wise, that they may the more readily dispatch their business, and execute their charges, (for it is necessary that to every combe there be a ready way.)

In some places, as in *Pontus*, and in the City of *Amisus*, Bees make white Honey, without any combs at all, but this is seldom seen. And if a man would consider the rare and admirable contexture and fabrick of their Honey-combes, far excelling all humane Art and conceit, who would not subscribe with the Poet, *Esse Apibus partem divine mentis, & haustus æthereos?* who will deny them (I say) either imagination, fantasie, judgement, memory, and some certain glimpse of reason? But I will not dispute of this, neither am I of *Pythagoras* minde, who conceited that the souls of wise men, and of other ingenious creatures, departed into Bees. But whosoever will diligently examine how they divide their labours, as some to make up the combs, some to gather Honey, to heap together their meat, to trim and dress up the houses, to cleanse the common draught, to under-shore the ruinous walls, to cover those places wherein any thing is to be kept, to draw out the very strength of the Honey, to digest it, to carry it to their cells, to bring water to the thirsty labourers, to give food at set and appointed hours to the old Bees that sit to defend their King with such over-sight and painful regard, to drive away Spiders, and all other enemies; to carry forth the dead, (that no stink or ill savour hurt,) every one to know and go to his own proper cell, and generally, all of them not to stray far from home to seek their living; and when the flowers are spent neer their lodgings, to send out their espials to look for more in places further distant, to lie with their faces upward under the leaves when they have set forth any voyage by night, lest their wings being much moistened by the dew, they should come tardy home the next day; to ballance and poyle their light bodies with carrying a stone in stormy weather, and when there is any whirl-winde, to flie on the further side of the hedge, for fear lest either they might be disturbed, or beaten down by the boysterous violence thereof. Whosoever (I say) will duly consider all this, must needs confess, that they observe a wonderful order and form in their Common-wealth and government, and that they are of a very strange nature and spirit.

I had almost omitted to speak of that natural love which they bear to their young, a great vertue, and seldom seen in the parents of this age. For Bees do sit upon their combs (when they have laid their increase) almost like unto birds; neither will they stir from thence but in case of pinching hunger, returning out of hand to their breeding place again, as though they were afraid lest that by any long stay and absence, the work of their little cell might be covered over by some Spiders web (which often happeneth) or the young by taking cold might be endangered. Their young ones be not very nice or tender, nor cockeringly brought up, for being but bare three days old, as soon as ever they begin to have wings, they enjoin them their task, and have an eye to them that they be not idle, though never so little. They are so excellent in divination, that they even feel aforehand, and have a sense of rain and cold that is to come, for then (even by Natures instinct) they flie not far from home: and when they take their journey to seek for their repast, (which is never done at any set and ordinary time, but only in fair weather) they take pains continually and diligently without any stay, being laden with such plenty of Honey, that oftentimes being over-wearied, they faint in their return to their own private cottages, not being able to attain them. And because some of them in regard of their roughness are unfit to labour, by rubbing their bodies against stones and other hard matter they are smoothed, afterwards addressing themselves most stoutly to their business. The younger sort bestir them right doubtely without dores bringing to the hive all that is needful. The elder look to the family, placing in due order that Honey which is gathered and wrought by the middle aged Bees. In the morning they be all very silent, till one of them awaken all the rest with his thrice humming noise, every one bustling himself about his own proper office and charge. Returning at night, they are as it were in an uproar at the first, and after that they make a little muttering or murmuring among themselves, until the principal Officer appointed for the setting of the watch, by his flying round about, and his soft and gentle noise, doth as it were covertly and privily charge them in their Kings name to prepare themselves to rest; and so this token being given, they are as silent as fishes, so that laying ones ear to the mouth of the hive, you shall hardly perceive any the least noise at all: so dutiful they are to their King, Officers, and Rulers, reposing themselves wholly in his books, favour, and pleasure. And now I will intreat of their excellency and use.

The use of
Bees.

Whereas the Almighty hath created all things for the use and service of Man, so especially among the rest hath he made Bees, not only that they should be unto us patterns and presidents of political and oeconomicall vertues, (of the which before I have discoursed) but even Teachers and School-masters instructing us in certain divine knowledge, and like extraordinary Prophets, premonstrating the success and event of things to come. For in the years 90. 98. 113. 208. before the birth of our blessed Saviour, when as great swarms of Bees, lighted in the publique and Ox-market, upon the houses of private Citizens, and the Chappel of *Mars*, many conspiracies and treasons were intended against the State at *Rome*, with which the Common-wealth was welnigh deceived, insnared, yea and overthrown. In the days of *Severus* the Emperour, Bees made their combs in the Ensignes, banners and standards of the Souldiers, and most of all in the camp of *Niger*, after which ensued divers conflicts betwixt the Armies of *Severus* and *Niger*, Fortune for a time imparting her favours equally to them both, but at length *Severus* side carryed away the bucklers. Swarms of Bees also filled the Statuæ which were set up in all *Hetruria*, representing *Antonius Pius*, and after that they fell in the camp of *Cassius*, and what hurly burlies after that followed, *Julius Capitolinus* will resolve you. At which time also a great number of *Romans* were intrapped and slain by an ambush of *Germans* in *Germany*, *P. Fabius* and *Q. Elius*, being Consuls. It is written that a swarm lighted

lighted in the tent of *Hostilius Rutilus*, who was in the Army of *Drusus*, and did there hang after such a manner, as they did enclose round his Spear which was fastened to his Pavilion, as if it had been a rope hanging down, *M. Lepidus* and *Munatius Plancus* being Consuls. Also in the Consulship of *L. Paulus* and *Caius Metellus*, a swarm of Bees flying up and down, presignified the enemy at hand, as the Soothsayers well divined. *Pompey* likewise warring against *Cesar*, when for the pleasuring of his friends he had set his Army in array, going out of *Dyrrbachium*, Bees met with him, and darkened even the very Ancients with their great multitude. We read in the Histories of the *Helvetians*, how that in the year of our Lord God 1385, when *Leopold of Austria* prepared to go against *Sempach* with an Host of men, being yet in his journey, a swarm of Bees fled to the Town, and there rested upon a certain great Tree called *Tilia*; whereupon the vulgar sort rightly foretold the coming of some strange people to them. So likewise *Virgil* in the seventh Book of his *Aeneids*, seemeth to describe the coming of *Aeneas* into Italy after this manner:

Lauri
Hujus Apes summum densa (mirabile dictu)
Stridore ingenti liquidum trans aethera vecta
Obfudere apicem, et pedibus per mutua nexis
Examen subito ramo frondente pendit.
Continuo vates: examen cernimus (inquit)
Adventare virum.

That is,

A tale of wonder to be told, there came a swarm of Bees,
 Which with great noise within the air a Bay-tree did attain,
 Where leg in leg they cleaved fast, and top of all degrees
 O're-spread, and suddenly a hive of them remain'd
 There hanging down: whereat the Prophet said,
 Some stranger here shall come to make us all afraid.

Which thing also *Herodotus*, *Pausanias*, and divers other Historiographers, have with greater observation then reason confirmed. *Laon Acrephiniensis*, when he could not finde the Oracle of *Trophonius*, by a swarm flying thither he found the place. In like sort, the Nurses being absent, *Jupiter Meliteus*, *Hiero* the Syracusan, *Plato*, *Pindarus*, and *Ambrosius*, were nourished by Honey, which Bees by little and little put in their mouths, as *Plutarch*, *Pausanias*, and *Textor* are Authors. *Xenophon* likewise in his *Oeconomicks*, termeth Honey-making the Shop of virtues, and to it sendeth mothers of Households to be instructed: Poets gladly compare themselves with Bees, who following Nature only as a School-mistresse, useth no Art. So *Plato* saith, that Poets ruled by Art, can never perform any notable matter. And for the same reason *Pindarus* maketh his brags, that he was superior to *Bacchilides*, and *Simonides*, having only Nature, not Art to his friend. Bees unless they be incensed to anger, do no hurt at all, but being provoked and stirred up they sting most sharply: and such is the disposition and naturall inclination of Poets, and therefore in his *Mino* strictly enjoyneth, that those who love their own quiet, must take great heed that they make no wars either with Poets or Bees. Finally, they have so many virtues which we may imitate, that the Egyptians, Chaldeans, and Grecians, have taken divers Hieroglyphicks from them. And he that will read over *Pierius*, shall there finde store of Emblems of them.

The Countrey people in like manner have learned of them *Aeromantie*, that is, Divination of things by the air, for they have a fore-feeling and understanding of rain and windes aforehand, and do rightly prognosticate of storms and foul weather; So that then they flye not far from their own homes, but sustain themselves with their own Honey-suck already provided. Which being true, we must then think it no strange matter, that *Aristotle*, *Philistus*, *Aristomachus Solensis*, *Menus* the Samnite, and six hundred others that have writ of the Nature of Bees, bidding adieu to all those pleasures and delicacies that are found in Cities, for fifty and eight years space together, inhabited the Woods and Fields, that they might more exactly come to the knowledge of their order of living, and naturall dispositions, leaving it as a monument for posterity to imitate. But what their bodies do work in ours, I judge worth the labour and pains taking to let you understand, that we may be assured there is nothing in Bees, but maketh to the furtherance of our health and good.

First therefore, their bodies being taken newly from the hives and bruised, and drunk with some diuretical wine, cureth mightily the Drop sicke, breaketh the stone, openeth the obstructed passages of the Urine, and helpeth the suppression thereof. Being bruised, they cure the wringings and gripings of the belly, if they be laid upon the place affected: and if any have drunk any poysonous Honey, Bees being likewise drunk do expell the same. They mollifie hard ulcers in the lips, and being bound to the part, they cure a Carbuncle and the Bloody fluxe, amending also the crudity of the stomach, and all spots and streaks in the face, being tempered with their own made Honey; as both *Hollerius*, *Alexander*, *Benedictus*, and *Pliny* have written.

Galen affirmeth, that if you take live Bees out of their Combes, and mix them with Honey wherein Bees have been found dead, you shall make an excellent Oyntment to be used against the shedding and falling of the hair in any place of the head, causing it to grow again, and come afresh. *Pliny* again willet us to burn many Bees, commixing the ashes with Oyl, and therewith to anoyne the bald places; but we must (saith he) take great heed that we touch no other place neer adjoyning. Yea, he affirmeth, that Honey wherein is found dead Bees, is a very wholesome medicine, serving

serving for all diseases. *Erotis*, cap. 61. *De morb. muliebrib.* commendeth highly the ashes of Bees beaten and tempered with Oyl, for the dealbation of the hair.

Bees also are very profitable, because divers living creatures are nourished by, and do feed full favorly on their Honey, as the Bear, the Badger or Brock, Lizards, Frogs, Serpents, the Woodpecker or Eat-bee, Swallows, Lapwings, the little Titmouse, which of some is called a Nunne, because his head is filleted as it were Nun-like, the Robin-red-breast, Spiders, and Wasps, as *Bellonius* hath well observed.

But to what end (you will say) serveth their sting, against whose poyson *Pliny* knew no remedy? I must needs confesse truly that which cannot be denied, that the stings of Bees are sometimes venomous, but that is when either they are mad and raging, and be exceedingly disquieted by means of anger, or some vehement Feaver, for otherwise they do not sting, but prick but a little: and therefore *Dioscorides* never made mention of the stinging of Bees, supposing it very unmeet for a man to complain of so small a matter as the sting of a silly Bee. But yet they that have succeeded him, have observed pain, rednesse, and swellings, as companions and effects of their malice, especially if the sting do stick in the flesh, which if it do very deep, then death hath sometimes followed, as *Nicander* writeth in his *Theriaca*. In like manner the people of the old World (that we may prove the sting of Bees to be converted to some good use) did (as *Suidas* writeth) punish those persons who were found guilty of couzenage, and deceitfull counterfeiting of merchandize, after this sort: First, they stripped the offender stark naked, anoynting his body all over with Honey, then setting him in the open Sun with his hands and feet fast bound, that by this means being tormented with Flies, Bees, and scorching beams of the Sun, he might endure punishment, pain, and death, due to his lewd and wicked life. With which kinde of punishment and torture, the *Spaniards* do grievously vex the poor naked Islanders of *America* at this day, (now called the *West-Indies*) who are under their rule and government, not for justice sake, (as those Ancients did) but for satisfaction and fulfilling of their barbarous wills, and beastly tyranny, that they might seem to be more cruell, then cruelty it self.

Nonius saith, that if the herb Balm (called *Apiastrum*) be beaten, and anoynted with Oyl upon the stinged place, that there will ensue no hurt thereby. *Florentius* counselleth the gatherer of Honey, to anoynt himself with the juice of Marsh-mallows, for by that means he may safely and without fear take away the Combes. But the juice of any Mallow will do as much, and especially if it be mixed with Oyl; for it both preserveth from stinging, and besides it remedieth the stinged. But admit that Bees by their stinging do vex and disease us, yet notwithstanding the dead Bees so found in the Honey do speedily bring cure to that hurt, if they be duly applyed, abating and taking away all the pain and poyson. What should I say? No Creature is so profitable, none lesse sumptuous. GOD hath created them, and a little money and cost will maintain them, and small provision will content them. They live almost in all places, yea, even in Forrests, Woods, and Mountains; both rich and poor by their good husbandry do gather good customs and pensions by them, they paying (as all men know) very large rents for their dwelling houses; and yet for all their tribute they pay, a man need neither keep one servant the more for the gathering of it, nor set on pot the oftner. *Merula* saith, that *Varro* gathered yearly five thousand pound weight of Honey: and that in a small Village of *Spain*, not exceeding one acre of ground, he was wont to gain by Honey there gathered, ten thousand Sesterces, which is of our *English* Coyn about fifty pounds. We are furnished also out of their workhouses or Shops, with Wax, *Sandriacha*, Bee-glew, Combs, and dregs of Wax, which no Common-wealth can well spare. To speak nothing of the examples of their vertues and noble properties, being no lesse wholesome for the soul, then these others are for the good provision and maintenance of our life, and for nourishment of our bodies necessary and commodious.

Now for the conservation of Bees, it is very meet (as *Pliny* writeth) that we come by them lawfully, and by honest means, that is, either by gift, or by buying of them; for being taken away by theft, they will not prosper with us, even as the hearb called Rue being stolne, will very hardly or never grow. Furthermore, to keep these good pay-masters, and to make them in love with you, you must remove from their Hives mouthes, unlucky, mischievous, and deceitfull people, and idle persons that have nothing to do, causing them to stand further off: As also all those that are disstayed with whoredome, or infected with the disease called Gonorrhoea, or the fluxe of menstres, bathes, or any thing that smelleth of smook, mud, dung, or ordure of Cattell, men or beasts, houses of Office, sinks, or kitchens. Mundifie and correct the air oftentimes, infected with the breath and vapour of Toads and Serpents, by burning of Balm, Thyme, or Fennel; having great care to keep them neat, clean and quiet. Destroy all Vermine, and seekers to prey upon their Honey, robbers, pillers and pollers, and if at any time they be sick, give them physick.

Now the signs of their unhealthinesse, as of all other living creatures, are known by three things; that is, from the action offended, the outward affect of the body, and excrements. For their cheerfulness being gone, sluggish dulnesse, a giddy and vertiginous pace, often and idle standing before the mouth of the Hive, lack of strength, wearinesse, litherness, languishing, and want of spirit to do any businesse, detestation of Flowers and Honey, long watchings, and continuall sleepings, unaccustomed noyses and hummings, are sure arguments, that Bees are not in good health. As also if they be somewhat rough, not fine and trim, dry and unpleasant in handling, not soft, harsh, and rugged, not delicate and tender, if their Combes be infected with any manner of

of filthy, corrupt, and noysome savour, and that their excrements melt, stink, and be full of worms, carrying dead carcases daily out of their houses, that they have no regard to their Bees and Bee-hives, it is a certain token that they are sick, and that some epidemical, generall Pestilence or plague rageth amongst them, whereof that famous Poet *Virgil* hath very elegantly, but confusedly touched some part, in the fourth Book of his *Georgicks*, in these following Verses.

*Si verò (quoniam lapsus Apibus quoque nostris
Vita tulit) tristi languebunt corpora morbo,
Illud non dubiis poteris cognoscere signis.
Continuò est agris alius color, horrida vultum
Deformat macies, tum corpora luce carentum
Exportant tegis, & tristia funera ducunt.
Aut illa pedibus connexa ad limina pendent,*

*Aut intus clausis cunctantur in ædibus omnes
Ignaveque fame, & contracto frigore pigre.
Tum sonus auditur gravior, traximque susurrant.
Frigidus ut quando silvis immurmurat auster,
Ut mare sollicitum stridet refluentibus undis,
Æstuat aut clausis, rapidus fornacibus ignis.*

In English thus;

*The life of Bees is subject unto fall,
Their bodies languish with diseases sad:
This by undoubted signs discern you shall,
Their bodies then with other colour is clad.
A leanness rough doth then deform their face,
Then doth the living bring dead bodies out,
And for their fellows make a funerall place,
Mourning sad exequies their dwellings all about.*

*Or else with feet in feet they hang upon
The threshold of their Hive, or else abide
Close within doors, not looking on the Sun,
Till sloth by cold and famine their life up dry'd:
Then also is their sound and voice more great,
Drawing soft, like a Southern winde in woods,
Or fire enclosed in burning furnace heat,
Or as int' Sea falls back the sliding floods.*

And so the sicknesses of Bees being evidently known, plainly perceived, and cured, they will live many yeers, although *Aristotle*, *Theophrastus*, *Pliny*, *Virgil*, *Varro*, *Columella*, *Cardan*, and finally all Authors, would make us beleieve, that they seldom attain to nine years, but never to ten. Although we know by good experience, knowledge of place, and the credible attestation of men worthy belief, that they have lived thirty years. Which only reason hath induced me to believe, that Bees (even by Natures appointment) are long lived, and that only with *Albertus* I only doubt, whether they die by means of old age.

I am not ignorant, how they are made away with the rage and violence of diseases, and other enemies, but if they have all things furnished fit for the preservation of their life, and prolongation of health, and the contrary far from them, I know no reason but that I should conclude them long lived, yea, more durable then any other living Creature, and never to die, but that I may not deny their time and turn to be mortall. For they only do feed upon Honey, that immortall Nectar, sent from heaven, and gathered from a divine dew (the very life and soul of all herbs, fruits, trees and plants.) Of whose nature, use and excellency, if you would know more, I must referre you to the learned writings of Physitians.

OF BEE S, called DRONES and THEEVES.

A Drone or a Dran in English, is of the Latines called *Fucus*, of the Greeks *Kephen*, and *Thronaz*, The Names, of the Illyrians *Czeno*, of the Germans *Traen*, of the Belgies *Besonder strael*, of the Spaniards *Zangane*, of the Italians, *Ape che non fa mele*, of the French *Baradon*, and *Fullon*, of the Panmonians (now called Hungarians) Here, of the Polonians *Czezew*. This kinde of Bee is called *Fucus*, as some think, *quasi Fur*, because he doth *furtim mella devorare*, devour Honey by stealth: although it be more agreeable to truth that it is termed *Fucus*, because he doth *Apibus fucum fraudemque facere*: And through the colour and pretence of keeping warm the Hives, he spendeth their stock and undoes all their Honey-making. And therefore for some to derive *Fucus* the Latin word from *Phagomai* the Greek, seemeth to be farre fetched: Some again will draw *Fucus*, à *fovendo*, quia incubando apum juvant saturas, and this in my minde is as harsh as the former.

Many men make the Drone to be one of the four sorts of Bees, which is very unadvisedly done, as some would make us beleieve: Because they bestow no pains in gathering the Honey, nor labour it thoroughly to have it perfectly wrought. He is twice so great as the common Bee, and greater then the Thief, so that in bignesse he eveneth, yea, surpasseth the King himself: and yet he attaineth unto this greatnesse, not by the gift of Nature, but by his custom and trade of life. For whereas Bees do prepare and make their Cells for the breeding of Drones: they make them lesser then the Drones, and not here and there through the Hive, but only in the uttermost, and as it were in the banished or most out-cast place of all in the whole Camp and lodged Army. Besides, the small Worms of the Drones are far smaller at their first bringing forth, then those that are of the Kingly race, and lineage of their Dukes: Who yet at length grow greater then any of them all, in regard that by labour and travail, they waste and diminish nothing of superfluous matter, and those grosse humours, wherewith they abound, as also that both day and night (like Oxen lying at Rack and Manger) they gluttonously raven and stufte themselves with the Honey-liquor, which they again pay for full dearly, in time of any general dearth and scarcity of victuall and provision.

Fur-

Further this is to be added, that the Drone is of a more shining black colour then the true labouring Bee, he is also greater then the greatest, without sting, sluggish, idle, slothfull, without heart or courage, cowardous, and unapt to war, not daring to venture life and limb in manly Martial trade, as the true legitimate Bees will.

Aristotle saith, that they breed and live amongst the true Bees, and when they fly abroad, they are carryed scatteringly, here and there aloft in the air as it were, with some violence or tempest; so exercising themselves for a time, they return from whence they came, there greedily feeding upon the Honey. Now why the Drones may be compared with the Dukes and Princes, in respect of their corporature, and Bees like unto them in their sting, let us hear *Aristotle's* reason. Nature would (saith he) there should be some difference, lest alwayes the same stock should encrease one of another confusedly, without order or consideration, which is impossible: For so the whole stock would either be Dukes or Drones. And therefore the true Bees in strength and power of engendering, and breeding, are comparable to their Dukes, and the Drones onely in greatnesse of body resemble them: to whom if you allow a sting, you shall make him a Duke. These Drones further of the *Grecians* are called *Cothouroi*, because he putteth not forth any sting: whereof *Hesiodus* hath these Verses thus interpreted;

*Arist. l. 3. de
gener. Anim.
c. 10.*

*Huic vero Dii succensent & homines quicunque otiosus
Vivat, fucis ac aculeo carentibus similis studio,
Qui apum laborem absument otiosi
Vorantes.*

In English thus;

Both God and men disdain that man
Which Drone like in the hive,
Nor good, nor ill, endeavour can
Upon himself to live,

But idle is, and without sting,
And grieves the labouring Bee
Devouring that which he home brings,
Not yeelding help or see.

So that either he hath no sting at all, or else maketh no use of it for revengement. *Pliny* saith flatly, that they are stingleffe, and would have them called imperfect Bees, and the famous Poet *Virgil* styleth them, *Ignavum pecus*: that is, idle, and unprofitable, good for nothing. *Columella* maketh them a race or stock of a larger size, very like unto Bees, and accounteth them very aptly to be placed in the rank of ordinary sorts of Creatures, of the same kinde and company with Bees. They suffer punishment and are scourged many times in the whole Bee-common-wealth, not only for pretence of idlenesse, gluttony, extortion, and ravenous greedinesse, to which they are too much addicted; but because lacking their sting, and by that defect, being as it were emasculated, they dare not shew themselves in publick.

Pliny doth not expresse their nature and quality. The Drones are stingleffe and so to be reckoned imperfect Bees, and of the basest sort, taking their Originall from tired and worn out Bees, and such as be past labour and service, living only upon a bare pension: we may call them the very slaves and bond-men of the true Bees, to whom they owe all due homage and subjection, wherefore they exercise their authority over them, thrusting them first out of doors by head and shoulders, like a company of drudges to their work; and if they be any thing negligent, not bestirring themselves quickly and lively, they give them correction, and punish them without all pity and mercy. For in the moneth of *June*, two or three Bees (especially of the younger sort) will hale out of the Hive one Drone, there beating of him with their wings, pricking and tormenting him with their stings, and if he offer any resistance to their Lordly rule, then they violently cast him down from the shelf or step whereon he holdeth, down to the earth as though they would break his neck. Thus when they have glutted their wills, and punished him at the full, they at length put him to a shamefull death, all which we have often beheld, not without great admiration and pleasure.

Sometimes the Drones remain like banished persons, before the entrance of the Hive, and dare not venture to presse in. For three causes specially the Bees do drive and cast out the Drones: either when they multiply above measure, or when they have not place enough left for their labourers, or that they be pinched with hunger and famine, for lack of Honey. And as they carry a deadly hatred against the Drones, so to make it more apparent they will not hurt such persons as offer either to take away with their bare hands any of the Drones, and to cast them away, yea, though they be in the greatest heat of their fight. *Aristotle* in his ninth Book, *De hist. Animal.* Cap. 40 affirmeth, that Bees are engendred apart one from another, if their Captain liveth: but in case their King and Captain dies, some say they breed in the Bees Cells, and that of all others of this kinde, they are the most noble and courageous.

Their generation.

The young Drones are bred without any King, but the true younger Bees never: for they derive their Originall and pedigree from the Kingly stock. Some will say that the young Drones do fetch their Originall from the flowers of the herb *Cerinth* (described by *Pliny*, which is a kinde of Honeysuckle, having the taste of the Honey and Wax together) from the Olive tree and Reed; but this opinion is weakly grounded, and standeth upon small reason.

Aristotle affirmeth, that they proceed from the longer and bigger Bees, yea, and those that are termed Thieves: which without question he received either from the ancient Philosophers, or some

some others that had the charge and were skilful of ordering Honey, that lived in his time. Some will have them to breed and come from putrefaction, as *Isidore* from stinking and putrefied Mules: *Cassian* from Asses, *Plutarch* and *Servius* from Horses. Othersome are of opinion, that they first proceed of Bees, and that afterwards they degenerate bastardlike from them, after they have lost their stings, for then they become Drones: neither are they afterwards known to gather any Honey, but being as it were deprived of their strength, they grow effeminate, ceasing either to hurt, or to do any good at all.

Some again hold the contrary side, assuring us upon their knowledge, that the true labouring Bee fetcheth his beginning from the Drone, because long experience (the Mistress of Wisdome) hath taught us, that there is yearly known to be the greater swarm, when there is the greater multitude of Drones. But this to me seemeth rather the devise and invention of some curious brain, than any true grounded reason. For because that many Drones breed (as it cometh always to passe in good and plentiful years) therefore there should be greater swarms, is no good consequent: but contrariwise, because the multitude of Bees do greatly increase through the moderatenesse of the pure air, and the plenty of the Honey-dropping dew, and through the abundance of this mellifluous moisture, there must needs follow a greater foison and store of Drones: as the Philosopher hath well observed. But admit that this be true, that whereas there is the greater encrease of Drones, there should yearly ensue the more swarmings: yet must we not thereupon conclude, that Bees do owe, and ought to ascribe their first original from Drones, but rather that they are indebted and bound in honesty to the Drones, because in time of breeding, they give much warmth and comfort to their young, (as *Pliny lib. 11. c. 11.* saith) conferring upon them a lively heat, fit for their encrease and prospering. Some divide them into male and female, and that by coupling together they make a propagation of their kinde, although (as *Athenæus* writeth) neither Drones nor Bees were ever yet seen of any one to couple together.

But whereas Wasps, Hornets, and other Cut-wasted creatures that make any combs, and breed in the same, have been sometimes (though seldom) seen, both by us and *Aristotle*, to joyn together, I can surely see no cause why we should utterly take from them the use of *Venus*, though in that respect they be very modest and moderate.

I have before in the discourse of their generation, said, that the Bees do make the male kinde, and the Drones to be but the female; but sith that in the of Honey-making, they punish them so sharply after they have ejected them from possession first, so that afterwards they put them to death, I can hardly be induced to believe that the Drones are but the female kinde, considering that one thing would eclipse and overcast all those resplendent vertues which all men know to be in Bees, to deal thus cruelly with their Parents. To what use therefore serve they in Hives? Seeing *Virgil* in the fourth book of his *Georgicks* thus describeth them;

Immunisque sedens aliena ad pabula fucus.

That is to say;

The Drones as free and bold doth sit,

And wast of others food commit.

Where *Festus* taketh *Immunis*, for lazy, idle, unserviceable, unprofitable, and such as are nothing worth, except perchance after the guise of wicked men, they so serve their own turns, as to live by the sweat of other mens labours, and to bring out of order, or utterly seek to overthrow the whole frame of the Common-wealth.

But the most approved Authors set down divers good use of Drones. For if there be but a few of them among the Bees, they make them the more careful about their affairs, and to look more duly to their task: not by their good example, (for they live in continual idlenesse) but because they might continue their liberality towards strangers, they work the more carefully in their Honey-shop. And (if *Bartholæus* do not deceive us) these Drones be not altogether idle: but they employ themselves about the building of the Kings House, which they make large, stately, and very sumptuous in the higher and middle part of the combs, being very fair to see to in respect of their covering.

So then they are but lazy, in respect of Honey-making and gathering: but if you look toward their Art or Science of building, they are to be accounted excellent devisers of the frame and chief Masters of the whole work. For as the Bees do fashion out the combs of the Drones nigh the Kings Palace: so again, for the like counterchange of kindenesse, the Drones are the sole inventors, and principal work-masters of the Kings Court; for which cause both they and their off-spring, kinsfolks and friends, (if they have any) are bountifully rewarded of the whole stock of Bees, by giving them frankly and freely their diet and maintenance which costeth them nothing.

The Lockers or holes of the up-grown Bees, are somewhat too large, if you respect the quantity of their bodies, but their combs lesser; for those they build themselves, and these other are made by the Bees, because it was not thought convenient and indifferent, so great a portion of meat to be given to such vile labourers and hirelings, as was due to their own sons and daughters, and those that are naturally subjects.

Tzetzes, and some other *Greeks* do besides affirm, that the Drones are the Bees Butlers or Porters to carry them water, ascribing moreover to them a gentle and kindly heat, with which they are said to keep warm, cherish and nourish the young breed of the Bees; by this means as it were, quickning them, and adding to them both life and strength.

The same affirmeth *Columella* in these words. The Drones further much the Bees for the procreation of their issue, for they sitting upon their kinde or generation, the Bees are shaped and attain to their figure, and therefore for the maintenance, education, and defence of a new issue, they receive the more friendly entertainment. And *Pliny lib. 11. c. 11.* differeth not from him. For not only they are great helpers to the Bees in any architectonical or cunning devised frame (as he saith) but also they do good in helping and succouring their young, by giving them much warmth and kindly heat, which the greater it is (unlesse there be some lack of Honey in the mean space) the greater will the swarm be.

In sum, except they should stand the Bees in some good stead, the Almighty would never have enclosed them both in one house, and as it were made them freemen of the same City. Neither doubtlesse would the Bees by main force violently break in upon them, as being the sworn and professed enemies of their Common-wealth, except when their slavish multitude being too much increased, they might fear some violence or rebellion, or for lack of provision: at which time who seeth not, that it were far better the Master work-men, free Masons, and Carpenters might be spared, then the true labouring Husbandman, and tiller of the earth? Especially since that missing these, our life is endangered for lack of meat, and other necessaries, and those other for a time we may very well spare without our undoing, and for a need every one may build his own lodging. But as they be profitable members, not exceeding a stinted and certain number, so if they be too many, they bring a sicknesse called the Hive-evil, as well because they consume the food of the Honey-making Bees, as for that in regard of their extream heat, they choke and suffocate them.

This disease is by the Author of *Geoponicon* thus remedied. Moisten with water inwardly the lid or covering of their Hive, and early in the morning opening it, you shall finde Drones sitting on the drops that are on the covers, for being glutted with Honey, they are exceeding thirsty, and by that means they will stick fast to the moist and dewie places of the cover: So that with small ado, you may either destroy them quite, or else if you please, take away what number you list your self. And if you will take away withall their young, who are not yet winged, and first pulling off their heads throw them among the other Bees, you shall bestow on them a very welcome dinner. But what the dreaning of Drones portended, and what matter they minister in the Hieroglyphical Art, let *Apomachus* reveal and disclose out of the Schools of the Egyptians and Persians. I think I have discharged my duty, if I have set down their true uses, true nature, generation, degeneration, description, and names.

Of Bees called
Theeves.

Fur in Latine, or Theef in English, is by *Aristotle* called *Phoor*, of *Hesychius* *Phoorios*: from whence I take the Latine word *Fur* to be derived. Some have thought that Theeves are one proper sort of Bees, although they be very great, and black, having a larger belly or bulk then the true Bee, and yet lesser then the drones, they have purchased this theevish name, because they do by theft and robbery devour Honey, belonging to others, and not to them. The Bees do easily endure, and can well away with the presence of the Drones, and do as it were greet and bid one another welcome, but the Theeves they cannot endure, in regard that the Bees do naturally hate them, for in their absence the Theeves privily and by stealth creep in, there robbing and consuming their treasure of Honey, so greedily and hastily (without chewing) swallowing it down, that being met withall by the true Bees in their return homewards, and found so unweildy by means of their fulness, that they cannot get away, nor be able to resist, but are ready to burst again, they are severely punished, and for their demerits by true Justice put to death. Neither thus only do they prodigally consume and spend the Bees meat, but also privily breed in their cells, whereby it often cometh to passe, that there are as many Drones and Theeves, as true and lawful Bees.

These neither gather Honey, nor build houses, nor help to bear out any mutual labour with Bees: for which cause they have Watch-men or Warders appointed to observe and oversee by night such as are over-wearied by taking great and undefatigable pains in the day time, to secure them from the Theeves and Robbers, who if they perceive any Theef to be stoln in a doors, they presently set upon him, beat, and either kill him outright, or leaving him for half dead, they throw him out. Oftentimes also it happeneth, that the Theef being glutted and over-cloyed with Honey, cannot flie away or get himself gone in time, but lyeth wallowing before the Hives entrance, until his enemies either in coming forth or returning home do so finde him, and so with shame, discredit and scoffing, scorn slay him.

Their uses.

Aristotle appointeth no office, charge or businesse to the Theef, but I think that he is ordained for this end, that he might be as it were a spur to prick forwards, and to whet and quicken the courage of the true Bees, when the other offer them any injury: and to stir and to encourage them to a greater vigilancy, diligence, and doing of right and justice to every one particularly. For I cannot see to what other purpose Theeves should serve in a Christian Common-wealth, or what use might be made of such as lie in wait to displeasure, and practice by crafty fetches, ambushes, and deceitful treacheries to wound their Neighbours, either in their estimation, credit, or goods. Thus having at large discoursed of the lesse hurtful and stinging sort of Bees, I will now apply my self to a more furiish, testy, angry, Wasplish, and implacable generation, more venomous then the former, I mean Wasps and Hornets.

OF WASPS.

A Wasp of the Chaldeans is tearmed *Deibrane*. Of the Arabians, *Zambor*. Of the Englishmen *D. Bonham*. Of the Germans, *Ein Wespe*. Of the Belgics, *Harfel*. Of the Gothes, *Bool Getingth*. The common people of Italy tearm it *Vespa*, and some of them do usually call it *Muscane*, and the Bononians, *Urespa*. The French, *Guespe*. The Spaniards, *Abispa*, and *Vespa*, imitating the Latines, who call it *Vespa*. The Polonians, *Ossa*. The Sclavonians, *Woff*. The Hungarians, *Daras*. *Calepine* saith, that it is called *Vespa*, quia *vesperi muscas venatur in cibum*. The Greeks do also name them diversly, for commonly they are called *Sphekes*. The Scholiast of *Nicander* calleth them *Lucaspades*; and *Suidas*, *Dellides*, and *Delithes*. Of *Hesychius*, *Auletai*, and *Passaleres*; and *Gaza* nicknameth them *Anthrenai*: for these ought rather to be called Bees. *Eustathius* deriveth *Tous spekas*, *apo tes diasphagon*, because they seem to be so much cut asunder in the waste or middle, as that they seem to gape and to be clean cloven asunder, as by the figure here set before your eyes you may plainly perceive. A Wasp is a kinde of insect, that is swift, living in routs and companies together, having somewhat a long body encircled, with four membranous wings, (whereof the two former are the greatest) without bloud, fringed inwardly, having also six feet, and a yellow colour, somewhat glistering like gold, garnished with divers black spots all over the body in form of a triangle. Whereupon peradventure *Pellio* would needs have it called *Diachrusos*.

The body of a Wasp seemeth to be fastened and tyed together to the midst of the breast, with a certain thin fine thread or line, so that by means of this disjoyned, and not well compacted composition, they seem very feeble in their loins, or rather to have none at all. Whereupon *Aristophanes* the Greek Poet, in his Comedy, entituled *Spheces* or Wasps, tearmeth all those Maids which are fine, slender, and pretty small in the waste, *Sphecodeis*, resembling them to Wasps, as if one should call them Wasp-wasted-wenches, whom *Terence* very quaintly and elegantly tearmeth *Junceas*, that is, slender, long, and small, like to a Bulrush. I think that all the whole pack of them have stings in general, although I am not ignorant that some Authors hold the contrary, affirming that the breeding female Wasps do want them: but thus much I can say of my own knowledge, that on a time finding a Wasps nest, and killing them every one by pouring hot scalding liquor into their holes, because I would bolt out the truth, I plainly perceived by long viewing of their bodies, that there was not one of them all but had a sting, either thrust out evidently, or closely and secretly kept and covered. So that:

— *Quid nobis certius ipsis*
Sensibus esse potest, quo vera ac falsa notemus?
 In English thus;
What can more certain be then sense,
Discerning truth from false pretence?

They make a sound as Bees do, but more fearful, hideous, terrible, and whistling, especially when they are provoked to wrath; from whence *Theocritus* fetcheth this proverb, *Sphex bomboom tettigos enantion*, that is, *Scilicet obstrepitans argute vespa cicada*: and this old said Saw may well be applyed to those who being themselves unlearned, will not stick to cry out, exclaim, and procure trouble to those that be more learned: or to such as be weak, feeble, and impotent persons able to do nothing, that will offer to contend with their betters and Superiors with their brawling speeches, and spiteful raylings. And this Latine proverb carryeth the same sense, *Catulus leonem adlatrans*. *Lucretius*.
In Hordiporis.

If you will have the gifts and ornaments of their mindes described, you must consider that a Wasp is a creature that liveth in companies together, one with another, subject to a civil government under one King or Ruler, industrious, mutual friends one to another, ingenious, crafty, subtle, quick, and cunning, of a very quarrelsome nature, and much subject to anger and testinesse. This is a good Argument of their Civil and Political manner of life, in that they live not solitarily in a Desert or Wildernesse where no man keepeth, but they build for themselves a City, both excellent and admirable for the notable buildings and houses in it, where they spend their time (for the most part) according to the mutable and never-failing laws of Nature, observing and keeping ever the Golden mean, as well in their daily tasks, as in their dispositions and affections of minde.

Besides, they are governed with a Kingly, not with a tyrannical government, (as *Aelianus* saith) although by nature they are great fighters, eager, boysterous, and vehemently tempestuous: and he is led to say this, because their Dukes or Generals are stinglese, or rather having stings as their subjects, they will not use the same to the hurt of their inferiors, by thrusting it forth, or striking in passion.

Now although they be twice so great, and harder and rougher then the other Wasps, yet are they not unfurnished of the vertue of patience and clemency, or gentle and debonair behaviour, by which means they keep in order, and contain in their lists, as it were by gentle language, their unruly rout, and mutinous companies. There is no man but will confesse, that this is an evident token and argument of their mutual love, and great good liking which they bear one to another: for whosoever dare be so knock-hardy as to come near their houses or dwelling places where

where they have to do, and to offer any violence or hurt to the same, at the noyse of some one of them, all the whole swarm rusheth out, being put into an amazed fear, to help their fellow-Citizen, and do so busily bestirre themselves about the ears of their molesters, as that they send them away packing with more then an ordinary pace: and if we will credit *Ælianus*, the *Phasellus* in times past were constrained to forsake their City, for all their defence, munition, and Armour, only through the multitude and cruel fierceness of the Wasps, wherewith they were annoyed.

Again, this manifestly proveth that they want not a hearty and fatherly affection, because with more then heroical courage and invincible fury, they set upon all persons, of what degree or quality soever, that dare attempt to lye in wait to hurt or destroy their young breed, no whit at all dreading *Neoptolemus*, *Pyrrhus*, *Hector*, *Achilles*, or *Agamemnon* himself, the Captain generall of all the whole *Grecians*, if he were present. Yea, the Divine Poet *Homer*, in 12. lib. of his *Iliades*, when he would expresse the haughty and generous spirits of the *Greekish* Chieftains, he likeneth them to Wasps in these words, *Spekessin ajolois cradien kai Thumon echousais*, that is, having the hearts and stomachs of Wasps, when they are to fight for their private dwellings, their dear Progeny and offspring. The love that Bees carry to their issue is great, but it cannot be greater then that of Wasps, neither can they have a greater promptitude, alacrity, or desire to defend their young ones, if they be any way offended by passengers. Which thing *Homer* in his *Iliads*, lib. 12. insinuateth by the example of the chafing god *Jupiter*, who took it marvellous angry, and much repined at the sturdy stomachs of the *Grecians*, adding, that the *Greeks* did defend themselves as valiantly, and endured the shock and assault of their enemies, as ever Wasps or Bees would in defence of their children or issue; in these Verses following;

Non enim ego putavi heros Achivos
Sustentaturos nostrum robur, & manus invictas:
Illi autem quasi visse acres atque apes,

That is to say,

I did not think our noble Grecian Lords could bear
Our force, and with unconquered hands maintain
Our right: but they like Wasps and Bees devoid of fear,
Which by high-ways their houses use to frame,

Quæ nidos faciunt ad viam pulverulentam,
Neque deserunt cavam domum: sed expectantes
Viros venatores pugnant pro filiis.

De not forsake their hollow dusty homes,
What ere they be that come to hunt them out:
Fighting with valor, (not fearfully like Drones)
To rid their young ones both from death and doubt.

Besides this, they further build for them very large dwellings, with Chambers and floors, in a round and orbicular form, with rooms one above another, finely and wittily compacted, so that there is space enough of ingresse and regresse, and very defensible against all windes and weather, and yet their nests or houses are not all made after one fashion, but very different, some of them representing a Harp, some made much after the fashion of a Pear, a Toadstool, a Bottle, or budget of Leather, and some like a standing Cup with handles.

Some affirm, that the matter of their Combes is confused, rude, and ilfavouredly heaped up, full of bark and sand, but I could never as yet see it otherwise then light, slender, and thin like paper, dry, transparent, gummy and thin, as though it were thin leaves of gold, shaken very easily hither and thither with the winde, and rising many times from the foot or foundation very small, and broad above like unto a Top. The place of this their building is divers, and much different for some respects. For if they have lost their Duke or principall Leader, then do they make them nests of clay in the high holes of walls and hollow Trees; and as some say (although hitherto I could never see it) they make Wax there also.

But in case they have a Generall or Duke, then they make their nests under the earth, their Cells or Chambers being formed with six angles or corners, much like unto Bees. They make their Combes round, much after the fashion of a broad Toad-stool, from whose centers there goeth forth as it were a short stalk or tying, by which the Comb cleaveth, and is fastened hard to the earth, or some tree, or peradventure to some other Combe. They have such a tender care over their females, (especially at such time as they are great with young) and suffer them so much to have their own wills, as they will neither permit them to take any pains abroad for their living, nor yet to seek for their meat at home: But the males flying about, (like good Purveyers) bring all home to their own dwellings, thereby as it were strictly enjoyning the females to keep themselves within doors.

All which fore-cited particulars, if a man would duly enter into consideration of them, he must needs confesse, (will he nill he) the admirable industry, diligence, wit, prudence, Art, sweat, and labour that is in these poor vermine. Their naturall inclination to anger, and the hasty fumes of Wasps, not only Cocks, which do scratch and scrape up with their spurs their nests, do finde implacable, but even all other disturbers and provokers: From whence I take it that proverb hath sprung, *Spekian erithizein*, which the *Latines* as *Plautus* almost in the same sense useth, *Irritare Crabrones*: For *Crabro* among the Poets, is used sometimes for a Hornet, and otherwhiles for a Wasp.

In like manner *Clemens Alexandrinus*, *Stromaton* 2. when he would expresse and declare the foulness and abominable hurt of such sins that do lie in wait as it were to deceive, and watch to do displeasure to the life of man, hath these words, *Houtoi gar (inquit) oi antagonistai pacheis koi*
Olympi-

Olympicoi, *ſphecon* hos *eipein* eſt *diimuterai*, *kai* *malista* *hedone*. That is, theſe fat, dull, groſſe, and Olympick enemies of ours, are worſer then Waſps, more cruel and diſpleaſant, and eſpecially ſenſuall and worldly pleaſure. Yea, whoſoever dare adventure to challenge into the field this hardy and couragious little Creature, he ſhall (I dare be bold to ſay) but *Cadmeam viſtoriam reportare*, loſe more then he ſhall get, whet his ſword againſt himſelf, and return home by weeping croſſe, conſidering that beſides the nobleneſſe of their ſtout ſtomacks, and armed ſtings, they are withall ſo ſtiſſe and obſtinate, as that they will never give over.

They differ alſo in their firſt breeding, ſtock, ſex, place, feeding, and manner of labour. *Iſidore* ſaith, (although perhaps not ſo truly) that Waſps do firſt proceed from the rotten Carcaſes of dead Aſſes: for all hold opinion, that the black Flies called Beetles, do take their Originall from them. But I am rather moved to think that they were firſt bred from the dead body of ſome warlike and fierce Horſe, and ſo alſo thinketh *Pliny*, in his eleventh book and twentieth Chapter. And the *Grecians* have uſually this famous and vulgar Verſe in their ordinary talk.

*Hippoi men ſphecon geneſis, Tauroi de meliſſon,
Equi enim veſparum generatio, Tauri verò Apum.*

In Engliſh thus;

Waſps do firſt come from Horſes, and Bees are bred from Bulls.

And ſurely their incredible ſwiftheſſe in their flight, their ardent and burning deſire they have to fighting, are ſufficient inducements to move me to think, that they took their firſt beginning from ſome gallant Horſe, and not from Aſſes, Oxen, or Cowes, and much leſſe from the fearfull Deer. For dame Nature hath ſeldome been ſo indulgent and friendly to any one beaſt beſides an Horſe, as to excell both in ſwiftheſſe of pace, quickneſſe of ſpirit, courage of ſtomack, and magnanimity. And I rather lean to this ſide, becauſe elſe I do not know what ſenſe I ſhould give to that *Ariſtotelean* Proverb;

*Chairete aellopodoon thugateres ippon,
Salvete volucripedum filia Equorum:*

Which may be Engliſhed thus;

All hail ye daughters of ſwiſt footed Horſes.

For beſides the truth that lyeth in the bare words, I take the morall of it to be uttered as a witty check, or a figurative ſhout, conceitedly to rebuke and hit in the teeth thoſe ſhrewd women, curſt and ſcolding wives, which are ſo peeviſh that they will not be pacified, who are like unto Waſps in their ſullen diſpleaſant humours, tempeſtuous madneſſe and pelting chafe.

Some Waſps do proceed from the ſtinking Carcaſe of a Crocodile, if we may give any credit to the *Egyptians* and their fellowes; and for that cauſe, when they imagine or think a Waſp, they paint and draw out the ſhape and form of a Crocodile or a Horſe. From hence *Hierom Cardan* would make this collection, that of every corrupted living Creature another doth proceed: which in my conceit is very abſurd and againſt all reaſon. For this being granted, the generation of Waſps would be infinite, and daily experience would read a Lecture of contradiction againſt him, upon the progreſſe of Natures works. Many times Waſps do breed by the mutuall company of the male and female together, which though *Athenens* counteth but a fable, yet for all that, ſith the Philoſopher doth plainly tell us, that he hath been an eye-witneſſe to the ſame, (as in his firſt book *De generat. Animal.* cap. 16. and in his ninth book *De hiſtor. Animal.* cap. 41.) I will wholly incline to his judgement. But what manner of beginning they have by joyning together, and how it is perfected and accompliſhed, let us a little lend our liſtning ears to *Ariſtotle*, and *Pliny* his Interpreter.

The Princes or Ring-leaders of the Waſps, when they have made choice of a fit place for themſelves under the earth, either in the holes, chinks, or clefts of the Rocks, or in thatched houſes, (as I have often ſeen) there they make their Combes in the beginning of Summer, faſhioning their ſmall Cells with four little doors, wherein ſmall Worms do breed, who when they are more grown, they make yet other greater doors or hatches, and then again when their young are at the greateſt, they make others, ſo that towards the end of Autumn, you ſhall finde many, and thoſe very large neſts; wherein their principal Commander doth breed, not with every Waſp indifferently, but only with thoſe of his own race and princely lineage. They are bred in the moſt eminent and higheſt place of the Waſp-neſt, like unto great Worms, their Cells being four or five in number, cloſe joyned and couched together, for otherwiſe they would increaſe after the ſame ſort in all reſpects, as the common Waſps do.

The excrement is only in the ſmall Worms, and their young increaſe remaineth immoveable without any ſtirring before they be able to flie, and whileſt they are covered as it were with a thin membrane, and yet in the ſame ſeaſon of the yeer, and in the ſpace of one day, you ſhall manifeſtly perceive a great difference: for one flyeth out, another ſticketh ſtill as it were in the ſhell, another rolleth and tumbleth, and a fourth cannot ſtir one whit. All theſe have their beginning and increaſe for the moſt part in Autumn, not in the Spring, and eſpecially in the full of the Moon. This one thing here is to be noted, that Waſps do not ſwarm, and that in Summer-time they are ſubject to Kings, and in Winter, *Gunaicorateia*, the females regiment, or *Muliebre imperium*.

imperium prevaileth. And when they have renewed and repaired their issue with a great supply, and that they be fresh and lusty, the Empire again returneth to the Masculine kinde, and yet it is but a short, brittle, and ruinous Empire, not able to bear up it self, although by Natures immutable decree orderly ruled, and rightfully governed.

Aristotle saith, that it is not likely that the young Wasps are brought forth as a brood, because they be so great in bulk, as that in reason it should not seem probable, that so small a flie as a Wasp, should have such great young ones. But this is a bare and weak reason, not befitting the dignity of so great a Philosopher. For what can any man alleadge to the contrary, why Nature in a lawful birth and breeding, should not as soon and as speedily finish, and make to grow and increase, as she doth in generation that proceeds of rottenness or corruption, which I hold to be but illegitimate? Let us but call to minde young birds, in how short time after they be out of the shell, they be feathered, they be able to go, to eat, yea quickly increased in strength, and grown to their full greatnesse, so that they are in their full flowre ere one be a ware. All which when one hath thoroughly considered, he will easily judge that famous Philosopher *Aristotle*, to have relyed but upon a weak prop, having scarce probability to stand on his side for the maintenance of his opinion. His credit therefore at this time must not be sufficient to barre us the liberty of contradicting him.

The same *Aristotle*, the Monarch of our modern learning, saith that the small worms of Wasps, before they have any wings at all, are somewhat long, not much unlike those worms which *Hippocrates* calleth *Eulai*, that breed in flesh, called (as I judge) Maggots, but in our Countrey, Gentiles: and these Waspsish worms are somewhat white, known and easily discerned by their flits or dashes, the hinder part of their body being very thick and grosse, having a black list or line running along their backs, without feet, not creeping, but rolling and tumbling themselves this way and that way confusedly. When they have disburthened themselves of their breed, they close up their cells with a certain thin small skin, which again being broken when they come to any perfection or growth, they get themselves out of dores into the clear light, and at two days end will be able to flie round about. The Philosopher maketh two kindes of Wasps, the one wilde and fell, the other more meek and quiet. The wilder sort is seldom seen, for they live and breed in Mountains and Woods, in Oke-trees, and not in the earth, and this kinde is greater, blacker, more diversly coloured, and stingeth more cruelly then the other. After they have lived one whole year, they are seen to flie away, if in the Winter the tree be cut down. These kinde of Wasps I did once see in a Wood in *Essex*, where going unwarily to gather simples with another Physitian, and offending one of this fummish generation, the whole swarm of them presently rushed forth about mine ears, and surely had I not had in my hand some sprigs or branches of broom for my defence, I had undoubtedly paid dearly for this my unadvisednesse, if it had not cost me my life, for they pursued me in every place of the Wood, with a vehement rage for a long season, insomuch that I was faine to take me to my heels, and so to seek to save my self from further danger. And if our own Countryman *Sir Francis Drake* himself had been there, although he was (as *Meteranus* a stranger, (and so unpartial) in his *Belgick History* right truly observed,) *Omnium ducum nostri seculi fortissimus ac famosissimus*, yet I make no doubt, but he would have taken my part, and been a companion with me in this my fearful flight.

Some of these Wasps, as well those of the crueller kinde as those of the gentler, do lack a sting, (or rather I think they use it not.) Othersome again of both sorts, are furnished with stings, and those that want them, are ever the lesser and weaker, neither revenging themselves any way, nor offering to make resistance. Contrariwise, those who have stings are greater, stronger, more quarrellous, contentious, stubborn and eager. Some account these the males, and those other stinglese to be the females. Many of those which have stings, do forgoe and quite lose them when Winter draweth on, as some make reckoning, but it was never my hap to see this, saith the Philosopher in his 9. Book *De hist. Animal. capit. 41.*

If you catch a Wasp, holding her fast by the feet, suffering her to make her usual humming sound, you shall have all those that lack stings presently come flying about you, which the stinged Wasps never are seen to do. Therefore some hold this as a good reason, to prove that the one should be the male, the other the female. Both these sorts, both wilde and unwilde, have been seen to couple together after the manner of flies. Besides, (in respect of sex) both kindes of Wasps are divided into Captains or Ring-leaders, and into labourers: those former are ever greater in quantity, and of more calm disposition; these other, both lesser, more froward, testy, peevish, and divers. The males of labourers, never live one whole year out, but all of them die in the Winter time, which is evident by this, because in the very beginning of cold weather, they are as it were frozen or benumbed, and in the depth or midst of hard winter, a man shall hardly or never see any of them.

But yet for all that, their Dukes or principal Chieftains, are seen all the Winter long to lie hid in their lurking holes under the earth: and indeed many men when they plowed or broke up the ground, and digged in Winter, have found of this sort. But as for the labouring Wasp, I never as yet heard of any that could finde them. Their Principal or Captain, is broader, thicker, more ponderous and greater then the male Wasp, and so not very swift in flight, for the weightinesse of their bodies is such an hinderance to them, that they cannot flie very far: whereby it cometh to passe, that they ever remain at home in their hives, there making and devising their combs, of a certain glutinous matter or substance, brought unto them by the Work-wasps: thus spending their time in executing and doing all those duties that are meet, in their Cells.

Wasps are not long lived, for their Dukes (who live longest,) do not exceed two years. And the labouring, that is the male Wasps, together with Autumn, make an end of their days. Yea which is more strange, whether their Dukes or Captains of the former year, after they have ingendered and brought forth new sprung up Dukes, do die, together with the new Wasps, and whether this do come to passe after one and the self same order, or whether yet they do and may live any longer time, divers men do diversly doubt. All men hold the wilder kinde to be more strong of nature, and to continue and hold out the longer. For why, these other making their nests neer unto common highways and beaten paths, do live in more hazard, lie open to divers injuries, and so more subject to shortnesse of life.

The brevity of their life, is after a sort recompensed, and some part of amends made by the rare clammy glewishnesse of the same: for if you separate their bulks from the head, and the head from the breast, they will live a long while after, and thrust out their sting almost as strongly as if they were undivideable, and free from hurt and deaths harm.

Apollonius calleth Wasps *Omoboroi*, and *Aristotle*, *Meloboroi*; although they do not only feed on raw flesh, but also on Pears, Plums, Grapes, Raisins, and on divers and sundry sorts of flowers and fruits; of the juyce of Elms, Sugar, Honey, and in a manner of all things that are seasoned, tempered, made pleasant, or prepared with either of these two last rehearsed.

Pliny in his 11. Book capit. 53. is of opinion that some Wasps, especially those of the wilder and feller kinde, do eat the flesh of Serpents, which is the cause that death hath sometimes ensued of their poysonous stinging. They also hunt after great flies, not one whit sparing the harmlesse Bees, who by their good deeds have so well deserved. According to the nature of the soyl and place, they do much differ in their outward form and fashion of their body, and in the manner of their qualities and dispositions of their minde: for the common Wasps being acquainted, and familiarly used to the company of Men and Beasts, are the gentler; but the Hermites and solitary Wasps are more rude, churlish, and tempestuous: yea *Nicander* tearmeth them *Oloous*, that is, pernicious. They are also more unhappy, dangerous, and deadly in very hot Countries, as *Ovidius* reporteth, and namely in the *West-Indies*: where both in their magnitude and figure, there is great difference betwixt theirs and ours, so that they are accounted far more poysonous and deadly, then either the *English*, *French*, *Spanish*, or *Barbarian* Wasps. Some of these dangerous generation do also abound in exceeding cold Countries, as *Olaus Magnus* in his 22. Book telleth us.

Their use is great and singular: for besides that they serve for food to those kind of Hawks which are called Kaistrels or Fleingals, Martinets, Swallows, Owls, to Brocks or Badgers, and to the Camelion: they also do great pleasure and service to men sundry ways, for the kill the *Phalangium*, which is a kinde of venomous Spider, that hath in all his legs three knots or joynts, whose poyson is perilous and deadly, and yet Wasps do cure their wounds.

Raynard the Fox likewise, who is so full of his wiles and crafty shifting, is reported to lie in wait to betray Wasps after this sort. The wily thief thrusteth his bushy tail into the Wasps nest, there holding it so long until he perceive it to be full of them, then drawing it slyly forth, he beateth and smiteth his tail full of Wasps against the next stone or tree, never resting so long as he seeth any of them alive; and thus playing his Fox-like parts many times together, at last he setteth upon their combs, devouring all that he can finde.

Pliny greatly commendeth the solitary Wasp to be very effectual against a Quartain Ague, if you catch her with your left hand, and tie or fasten her to any part of your body, (always provided, that it must be the first Wasp that you lay hold on that year) *Mizaldus* memor. Cent. 7. attributeth great vertue to the distilled water, and likewise to the decoction of common Wasps, affirming expressly, that if any part be therewith anointed, it straight ways causeth it to swell monstrously, and to be puffed up, that you would imagine them to be sick of a Dropsie: and this course crafty drabs and queans use to perswade their sweet hearts, that they are forsooth with childe by them: thus many times beguiling and blinding the eyes of wary and expert Midwives. Whereupon we may very confidently conclude, that their poyson is very hot, flatulous or windy. Some do prole after Wasps, and kill them by other sleights and devises. For when the labourers do much use and frequent Elms, which they do very often about the Summer solstice, to gather from them some gummy and clammy matter, their Dukes and Princes being at home, not standing still, but settling themselves to their businesse or trade, and helping to hatch up their young, they are suddenly choked with the fume of Brimstone, Garlick, the branches of Coleworts, or other pot-herbs, or else by breaking down and overthrowing their combs, they dye through famine.

When you are minded to defend the Bees from the invasion and spoil of Wasps, you must set a pot with some pieces of flesh in it neer the Hive, and when the Wasps (in hope of some prey) are entered, suddenly clap over the cover, and so destroy them, or else by pouring in some hot water at the top, you may scald them all to death in the pot. In like sort, some do gently breath upon Raisins, Fruits, Sugar, Honey, Oyl, by which, either the Wasps are chased away, or by tasting the Oyl do die. And again, some do mix corrosives with Honey, (as for example, *Sublimate*, *Vitriol*, *Auripigmentum*, &c.) that they by taking this venomous or poyson infected drink, may suffer condign punishment for their intemperate and insatiable gluttony.

Of the stinging of Wasps there do proceed divers and sundry accidents, passions and effects, as pain, disquieting, vexation, swelling, rednesse, heat, sweatings, disposition or will to vomit, loathing and abhorring of all things, exceeding thirstinesse, and now and then fainting or swoounding; especially

Mizaldus.

especially when after the manner of venomous creatures, they have infected their stings either by tasting the flesh of some Serpents, or by gathering their food from venomous plants.

Allens wife.

I will now set before your eyes and ears one late and memorable example of the danger that is in Wasps, of one *Allens* wife, dwelling not many years since at *Lowick* in *Northamptonshire*, which poor woman resorting after her usual manner in the heat of the Summer to *Drayton*, the Lord *Mordant's* house, being extreemly thirsty, and impatient of delay, finding by chance a black Jack or Tankard on the Table in the Hall, she very inconsiderately and rashly set it to her mouth, never suspecting or looking what might be in it, and suddenly a Wasp in her greedinesse passed down with the drink, and stinging her, there immediately came a great tumor in her throat with a rednesse, puffing and swelling of all the parts adjacent; so that her breath being intercepted, the miserable wretch whirling herself twice or thrice round, as though she had had some *Virtiginy* in her brain, presently fell down and dyed. And this is known for a truth, not only to me, but to most of the Inhabitants thereabouts, being as yet fresh in their memories, and therefore their authorities as I take it, is unrepoveable.

Salomon.

Now, for fear lest I should lose my self in this troublesome and vast Ocean of Natures admirable fabricature, I will now discourse of such medicinal means, as will defend from their furious malice. The vertue of Mallows, and of *Althea*, (called *Marsh-mallow*) is notable against the prickings of Wasps. For the softest and most emollient herb, is applyed as a contrary to a warlike and hurtful creature, whose juyce being anointed with Oyl, either abateth the rage of Wasps, or so blunteth and dulleth their sting, that the pain is not very sharp or biting. *Pliny lib. 21. capit. 171.* And of the same minde is *Avicen*: Wasps (saith he) will not come near any Man if he be anointed with Oyl and the juyce of Mallows. For as a soft answer doth *frangere iram*, and as the *Grecians* have a saying, *Edus Megiston est in orges pharmakon logos*: So also in natural Philosophy we see, that hard things are quailed, and their edge even taken off with soft and suppling: as Iron with a fine, small, and soft feather, the Adamant stone with bloud, and the sting of Wasps, Hornets and Bees, with Oyl and Mallows.

What is softer then a Caterpillar? and yet if *Aetius* credit be of sufficiency, the same being beaten with Oyl, and anointed upon any part preserveth the same from the wounds and stings of Wasps. And of the same vertue is the herb called Balm, being stamped and mixed with Oyl. The same symptomes or accidents do follow the stinging of Wasps, as of Bees, but far more painful, and of longer continuance, to wit, rednesse, and intolerable pain, and Apostumes. And if any be stricken of the Orange or yellow coloured Wasps, especially in a finewy or some sensible part, there will follow a Convulsion, weaknesse of the knees, swoounding, yea, and sometimes death, as before I have touched.

The curation of their stings.

Gilbertus Anglus.

Against the stinging of Wasps divers medicines are prescribed by Physitians, but I will speak of such only as I have made proof of, and such as are confirmed by long experience. *Gilbert the Englishman*, saith, that Wasps being bruised and applyed to the place affected, do cure their own wounds very strangely. The same vertue peradventure, not only the Scorpion, but the greater part of Insects have, if any one would make any diligent trial thereof. If a man be stinged of any venomous Wasps (which is easily known by the blewnesse of the place, madnesse, raving and fainting of the party, and coldnesse of the hands and feet) after you have given him inwardly some *Alexipharmacal* medicine, the place agrieved must be lanced, or rather opened with a Cautery, so being thus enlarged and opened, the venom must be well sucked out, and the paring or shaving of that earth wherein the Wasps build their nests, must be wrought and kneaded with Vinegar, and so applyed like a Cataplasim.

Haly Abbas.

A plaister also made of Willow-leaves, Mallows, and the combe of Wasps, is very medicinable for the same, as by the counsel of *Haly Abbas* I have experimented. The *English* Northern men, do prepare most excellent emplaister worth gold, against all stings of Wasps, only of that earth whereof their Ovens are made, having Vinegar and the heads of Flyes commixed therewith. Let the place be very well rubbed with the juyce of Citrals, and withall, let the party that is pained drink of the seed of *Marjoram* beaten to powder the quantity of two drams: or thus, Take of the juyce of *Marjoram* two ounces, of *Bole Armony* two drams, with the juyce of unripe Grapes so much as is sufficient, make an emplaister. Another. Anoint the place with the juyce of *Purcelane*, Beets, or sweet Wine, and Oyl of Roses, or with Cows bloud, or with the seeds of the Spirting or wilde Cucumber (called *Noli me tangere*) beaten with some Wine. Thus far *Galen*. Barley Meal wrought up with Vinegar, and the Milk or juyce of a Fig-tree, Brine, or Sea-water, are excellent for these griefs (as *Dioscorides lib. 8. cap. 20.* writeth) if the wound be often fomented, bathed, or soaked with any of them. To drink, give two drams of the young and tender leaves of Bays with harsh Wine, and if the part affected be only anointed with any of these, they are much available. In like sort the decoction of *Marsh-mallows* drunk with Vinegar and water, are much commended, and outwardly salt with Calves fat: Oyl of Bays draweth out the poyson of Wasps. The leaves of *Marsh-mallows* (as *Aetius* saith) being bruised and applyed, do perform the same.

The juyce of Rue or Balm, about the quantity of two or three ounces drunk with Wine, and the leaves being chewed and laid on with Honey and Salt, or with Vinegar and Pitch, do help much. Water-creffes, Rosemary, with Barley meal, and water with Vinegar sod together, the juyce of Ivy leaves, Marigolds, the bloud of an Owl, all these are very effectual against the stings of Wasps: as *Pliny lib. 31. cap. 9.* telleth us; the buds of the wilde Palm-tree, Endive with the root, and wilde

Thyme

Thyme being applyed plaister-wise, do help the stinging of Wasps. After the venom is drawn out by sucking, the place affected must be put into hot water the space of an hour, and then suddenly they must be thrust into Vinegar and Brine, and forthwith the pain will be asswaged, the tumor cease, and the malice of the venomous humor clean extinguished. *Rhazes* saith, that the leaves of Nightshade, or of Sengreen, do very much good in this case. And in like sort Bole Armony with Vinegar and Camphire, and Nuts beaten with a little Vinegar and *Castoreum*.

Also take the Combe with Honey applying to the place, and hold the grieved place neer the fire immediately, and laying under them a few ashes, binde them hard, and forthwith the pain will be swaged. *Serapio* saith, that Savory, or Cresses applyed, and the seed thereof taken in drink, and the juyce of the lesser Centory mixt with Wine, are very meet to be used in these griefs; he also commendeth for the same purpose the leaves of Basil, the herb called Mercury, and Mandrakes, with Vinegar. *Ardoynus* is of opinion, that if you take a little round ball of Snow, and put it into the fundament, the pain will cease, especially that which proceedeth by Wasps. Let the place be anointed with Vinegar and Camphire, or often fomented and bathed with Snow-water. Take of *Opium*, of the seed of Henbane and Camphire, of each alike much, and incorporate them with Rose-water, or the juyce of Willows, and lay it upon the wounded place, applying on the top a linnen cloth, first thoroughly wetted in wine. *Johannes Mesue* (who of some is called *Evangelista medicorum*) prescribed this receipt of the juyce of *Sisymbrium* two drams and a half, and with the juyce of *Tartcitrons* make a potion. The juyce also of *Spina Arabica*, and of Marjoram are nothing inferiour to these forementioned. *Aaron* would in this grief have water Lintels (called by some Ducks mear) to be stamped with Vinegar, and after to be applyed.

Constantine assureth us, that *Alcama* tempered with Barley meal and Vinegar, and so bound to the place, as also Nuts, leaves of Wall-nuts, and Blets, are very profitable in this passion. Item, apply very warm to the wound a Spiders web, bruised with a white Onion, and sufficient Salt and Vinegar, will perfectly cure it. *Guil. Placentinus* will warrant, that a plate of cold Iron laid upon the wound, or Lead steeped in Vinegar, will do the deed. *Gordonius* counsel is to rub the place with Sage and Vinegar, and afterwards to foment it with water and Vinegar sod together. *Varignana* would have us to apply Chalkin powder, and inwardly to take the seeds of Mallows boiled in Wine, Water, and a little Vinegar.

Matthiolus much commendeth Sperage being beaten and wrought up with Honey, to anoint the place. Likewise flies beaten and anointed on the place, winter Savory, Water-cresses, with Oyl of *Momerdica*, give most speedy help. *Arnoldus Villanovanus* assureth us, that any fresh earth, especially Fullers earth, is very available, and the herb called *Poley*, used as an Unguent, or else Goats milk. And *Marcellus Empiricus* is not behind his commendations for the use of Bullocks dung, to be applyed as a poultesse to the stinged part.

These and many others may any Man ascribe that hath had but an easie tast of the infinity of Physicks speculation, for the store-house of Nature, and truly learned Physitians, which way soever you turn you, will minister and give sufficient store of alexiterial medicines for the expulsiſg of this grief. In conclusion one and the self same medicament will serve indifferently for the curation of Wasps and Bees, saving that when we are stung with Wasps more forcible remedies are required, and for the hurts that Bees do us, then weaker and gentler are sufficient. In the hundreth and nintieth year before the birth of our blessed Saviour, an infinite multitude of Wasps came flying into the Market place at *Capua*, (as *Julius* witnesseth) and lighted on the Temple of *Mars*, all which when with great regard and diligence they were gathered together and solemnly burnt, yet for all that they presignified the coming of an enemy, and did as it were fore-tell the burning of the City, which shortly after came to passe. And thus much for the History of the Wasp.

OF HORNETS.

A Hornet is called of the Hebrews, *Tsirbah*. Of the Arabians, *Zabor*, and *Zambor*. Of the Germans, *Ein hornauff*, *Horlitz*, *Froisln*, *Ofertzwuble*. Of the Flemings, *Horsele*. Of the Frenchmen, *Trelons*, *Foirlons*. Of the Italians, *Calauron*, *Crabrone*, *Scaraffon*, and *Galanron*. Of the Spaniards, *Tabarros* & *Moscados*. Of the Illyrians, *Irsen*. Of the Slavonians, *Sierszen*. Of us Englishmen, Hornets, and great Wasps. The Grecians call them *Anthrénas*, and *Anthrenois*, because with their sting they raise an *Anthrax* or Carbuncle, with a vehement inflammation of the whole part about it. The Latines call them *Crabrones*, peradventure of *Crabra*, a Town so named in the Territory of *Tusculanum*, where there is great plenty of them: or it may be they are tearmed *Crambrones* of *Caballus* (a Horse) of whom they are first engendered: according to that of *Ovid*, 15. *Metamorphos*.

Pressus humo bellator equus Crabronis origo est.
That is to say;
When War-horse dead upon the Earth lies,
Then doth his flesh breed Hornet flies.

Albertus tearmeth a Hornet *Apis citrina*, that is a yellow or Orange coloured Bee. *Cardan* laboureth much to prove that dead Mules are their first beginners. *Plutarch* is of opinion, that they first

Their descrip-
tion.

first proceed from the flesh of dead Horses, as Bees do out of a Bulls belly: and I think that they have their breeding from the harder, more firm and solid parts of the flesh of Horses, as Wasps do from the more tender or soft. Hornets are twice so great as the common Wasps, in shape and proportion of body much resembling one another. They have four wings, the inward not being half so large as the outward, being all joyned to their shoulders, which are of a dark, brownish, and of a Cheltnut-like colour, these wings are the cause of their swift flight: they have also six feet of the same colour and hew, that their breast and shoulders are of. There is somewhat long, of the colour of Saffron, their eyes and looks are hanging or bending downwards, crooked and made like a half Moon, from which grow forth two peaks like unto Sithes or two sickles, nothing varying in colour from their feet. Their belly is as though it were tyed to their shoulders with a very fine thred, the forward and middle part whereof is overcast with a brown colour, and begirt as it were with a girdle of Saffron. The hinder part is altogether yellow, easily discerned and remarkable for those brown pricks or specks, every one of them being much like unto a small triangle, besides they have certain clefts or flits on both sides, both before and behinde, by which they can at their pleasure when they list, either shrink up themselves, or draw and gather themselves together, and with the same again lengthen and stretch out their bodies. They have also neer to their belly on both sides four black spots, and in their tail they are armed with a strong piercing sting, and the same very venomous. They make a sound or a buzzing strange noise, more hideous and dreadful then Wasps do. They are shrewd, fierce and cruel, quickly angry and wrathful, and although they live in companies together, yet notwithstanding they are ever known to be but of an homely, rude, curst, and untractable disposition and nature, and will never be brought by any Art or fashioning to lay aside their uplandish wildnesse, (as some herbs will do that are transplanted into Gardens.)

They are besides this of such a mischievous malignity and venomous quality, that as some affirm, nine of their stings will kill a Man, and three times nine will be able to kill a strong Horse; especially at the rising of the Dog-star, and after, at which time they have a more fiery, halty, and inflaming nature, and men at that season, by reason of their large exaltation and sending forth of spirits, grow more weak and faint.

And therefore it is no marvail though in holy Scripture, they are compared or likened to most fierce and cruel enemies, which should put and cast forth the *Canaanites*, *Hittites*, and *Chevites*, *Exod. 23. 28.* So likewise *Ovid* in the eleventh Book of his *Metamorphos.* hath these words, *Spicula carbo-num ardentia*, The burning stings of Hornets: And *Virgil* in the fourth Book of his *Georgicks*, calleth them *Asperima*, most sharp and violent. *Terence* (the most eloquent of all Comical Poets) in his Comedy intituled *Phormio*, and *Plautus* in his *Amphitryo*, have this Proverb, *Iritavi crabrones*, I have provoked or incensed the great Wasps to anger: which I suppose they used as a by-word against the properties, natures, and froward behaviours of women, who being in their wonted fuming mood, if once you go about to overthwart them, or a little to contrary their wilfulnesse, you shall pull an old house over your own head by a further provocation, and perhaps if you get you not the sooner out of their sight and reach of their clutches, you may chance have somewhat more flying about you ears then you would.

It is good therefore if you have a Wife, that is *Calcato immitior hydra*, unquiet and contentious, to let her alone, not to wake an angry Dog: and when a mischief is well quieted and brought asleep, to go your ways and say never a word. Whereas among Bees, their Drones and Kings do want stings; yea, and some Wasps too, as before I have writ: yet notwithstanding all Hornets in general, as well the greater sort of them that build their houses in trees, as the lesser sort that dwell in the earth, are provided of stings, neither do their Ring-leader seem to be unarmed. For Wasps have their Presidents of their own society, and their Captains general as well as Bees and Wasps, whatsoever *Pliny lib. 11. cap. 21.* dream to the contrary: which in proportion and quantity are far greater (if you respect the bodies of other Hornets) then either the Captains of the Bees and Wasps are in comparison of their subjects. These also spend their time within doors, as the Captain of Wasps do, not having many but one head to guide and rule over them, left by banding into parties and factions, some civill war (wherein all things are miserable, as *Tully* saith) or other mutiny might arise to their final destruction. They are great vexers and troublers, and even like such as had sworn the death of their enemies, robbers, and thieves: And yet at home they nourish peace, excelling even the very Bees themselves in their painful, earnest, and willing desire to maintain their stock and common society.

For neither do they chide, brail, or contend, nor yet make any stir or rustling when any is promoted to any office or place of preferment in their corporation; neither are they distracted into divers mindes with their businesses, neither yet do they raise any tumult, make any uprore, or keep a coil or rustling at the election of their Prince and Captain general, but with common consent they use but one Table, taking their commons together like good friends and fellows, and whatsoever they kill, they carry some part of it home, frankly imparting it to their neighbors, children, and companions.

Neither do they yearly drive and expel forth of the doors to seek new habitations, where they can, (as some Bees deal very churlishly and unnatural with their young) but they contrarywise in their bosome defend and keep warm their new springed up progeny and race, building for them greater Houses, and raising of more Sellers and stores, bording and planking the same in case of necessity, never ceasing till they be fully rear'd and made fit for defence and safety. But as for their

King

In bellis civili-
bus omnia sunt
misera. *Tul. ep.*
femal.

King and Captain (whom they exceedingly honor and highly esteem) they make choyce of such a one, as neither seemeth to be a King without a Kingdom, nor a Prince without people and possessions, and yet he so behaveth himself, and carryeth himself so evenly, as though he had but little to do in this his Empire. And yet in largenesse of body and greatnesse of his heart, in stoutnesse and statelinesse of stomach and person, he staineth all the rest, carrying away the prize from them all: and when there is Proclamation of War to be made against any forain foes, and that their flags and ancients be displayed by sounding his deadly blast, he giveth defiance to his enemies, most courageously bestirring himself more then any of his followers, shewing himself both most vehement, warlike, and skilful in fight, and yet again at home towards his subjects, (like a true noble spirit) he is very gracious, gentle, and temperate, tractable, easie to be intreated, and most ready to forgive. They make for themselves certain holes or dwelling places under the ground, casting forth the earth much after the fashion of Pismires: for you must understand that neither Wasps nor Hornets do send forth any Swarms as Bees do, but those young Hornets which spring from them now and then, do there remain among their breeders, making their beds or hives much greater, by means of the earth formerly cast out.

They enlarge their combs exceedingly, by adding more and more unto them, so that of a strong and healthy stock of Hornets, it hath been known they have gathered three or four trays or baskets full of combs. If any Hornets stray from their own home, they repair to some tree, and there in the top of it make their combs, so that one many times may very easily and plainly perceive them, and in these they breed one Captain General, or great Commander, who when he is grown to be great, he carryeth away the whole company, placing them with him in some convenient lodging. Wilde Hornets (as *Pliny* saith) do live in the hollow trunks or cavities of trees, there keeping themselves close all the Winter long, as other Cut-wasps do.

Their life is but short, for they never exceed the age of two years. Their combs are wrought with greater cunning, more exquisite Art, and curious conceit, then those either of Wasps or Bees, and these excellent devisers do make them one while in the trunks of trees, and sometimes again in the earth, encreasing them at their pleasure with more floors and buildings, according to the encrease of their issue, making them smooth and bright, decking and trimming them with a certain tough or binding slime or gelly gathered from the gummy leaves of plants. Neither do any of the little mouths or entries of their cells look upwards, but every one bendeth downwards: and the bottom is placed upwards, lest either the rain might soke through them in long showers, or the head of them being built upwards, they might lie open and be the more subject, and exposed to the unruly rage and furious blasts of windes and storms.

If you eye well their nests, you shall finde them all for the most part exactly sexangular or six cornered, the outward form and fashion whereof is divided with a murry coloured partition: and their membranous substance is much like unto the rinde or bark of Birch, which in the parching heat of Summer cleaveth and openeth it self into chaps. The stinging of Wasps is for the most part accompanied with a Fever, causing withal a carbuncle, swelling, and intolerable pain.

I my self being at *Duckworth* in *Huntingtonshire*, my native soyl, I saw on a time a great Wasp or Hornet making after, and fiercely pursuing a Sparrow in the open street of the Town, who at length being wounded with her sting, was presently cast to the ground, the Hornet satisfying her self with the sucked blood of her quelled prey, to the exceeding admiration of all the beholders and considerers of this seldom seen combate. *Aristotle*, whom I so greatly reverence, and at whose name I do even rise and make curtesie, knows not of a surety how Hornets do engender, nor after what manner they bring forth their young breed. But since we are assured of this, that they bring forth their young by the sides of their Cells, as Wasps and Bees, we need not doubt, but that they do all other matter after their manner, and if they couple together, they do it by night, as Cats do, or else in some seeret corner, that *Argus* with his hundred eyes can never espy it.

Hornets gather meat not from flowers, but for the most part they live upon flesh, whereby it cometh to passe, that you shall often finde them even in the very dunghills, or other ordure. They also proul after great Eyles, and hunt after small Birds, which when they have caught into their clutches, after the manner of hungry Hawks, they first wound them in the head, then cutting it asunder, or parting it from the shoulders, carrying the rest of the body with them, they betake themselves to their accustomed flight. The greater sort of them die in the hard Winter, because they store not themselves sufficiently aforehand with any sustenance as Bees do, but make their provision but from hand to mouth, as hunger enforceth them, as *Aristotle* enformeth us. In like sort *Landius* hath well observed, that Hornets both day and night keep watch and ward besides the hives of Bees, and so getting upon the poor Bees backs, they use them instead of a Waggon or carriage: for when the silly Bee laboureth to be discharged of his cruel Sitter: the Hornet when he hath sucked out all his juyce, and clean bereft him of all his moisture, vigour and strength, like an unthankful Guest and the most ingrateful of all winged creatures, he spareth not to kill, and eat up his fosterer and chief maintainer.

They feed also upon all sweet, delicious, and pleasant things, and such as are not untoothsome and bitter, and the *Indian* Hornets are so ravenous, and of such an insatiate gluttony (as *Ordinus* reporteth) that they flie upon Oyl, Butter, greasie Cooks, all sorts of sharp sawce used with meats, and all moist and liquid things, not sparing the very Napkins and Table clothes, and other linnen that is any way soiled, which they do filthily contaminate with the excrements of their belly, and with their Viscous laying of their egges.

Their uses.

But as they get their living by robbery, and purloining of that which others by the sweat of their brows, by their own proper wits and invention, and without the aid and help of any do take great pains for: so again they want not revenge to punish, and a provost Marshal to execute them for their wrongful dealings: teamed of some a Gray, Brock, or Badger, who in the full of the Moon maketh forcible entrance into their holes or lurking places, destroying and turning topsie-turvy in a trice their whole stock, family, and linage, with all their household stuffe and possessions.

Neither do they only minister food to this passing, profitable, and fat beast, but they serve in stead of good Almanacks to Countrey people, to foretell tempests and change of weather, as Hail, Rain, and Snow: for if they flie about in greater numbers, and be oftner seen about any place, then usually they are wont, it is a signe of heat and fair weather the next day. But if about twilight they are observed to enter often their nests, as though they would hide themselves, you must the next day expect rain, winde, or some stormy, troublesome or boysterous season: whereupon *Avienus* hath these verses;

*Sic & crabronum rauca agmina si volitare
Fine sub Autumni conspexeris aethere longo,
Jam verspertinos primos cum commover ortus
Virgilius, pelago dices instare porcellam.*

In English thus;

*So if the buzzing troup of Hornets boarse to flie,
In spacious air bout Autumns end you see,
When Virgil star the evening lamp espie,
Then from the Sea some stormy tempest sure shall be.*

Remedies
against their
stings.

Furthermore, since it is most certain that those remedies which do heal the stings of Wasps, do also help those wounds and griefs which Hornets by their cruel stinging cause, yet notwithstanding, as *Aggregator* hath pronounced, the Zabor is the Bezoar, or proper antidote of his own hurt, if he be oftentimes applyed with Vinegar and Water, Oyl and Cow-dung tempered together. In like sort all manner of soils and earths that are miry and muddy, are much commended in this case, such as *Bacchus* applyed to bald *Selenus*, who was wounded with Hornets, when longing for a little Honey, he jogged and shaken their nests, thinking he had lighted upon some Bees Honey, which *Cvid* most elegantly 3. *Fastum* hath described in these verses;

*Millia crabronum coeunt, & vertice nudo
Spicula desigunt, ora; prima notant.
Ille cadit praeceps, & calce feritur a selli:
Inclamat socios, auxiliumq; vocat.*

*Concurrunt Satyri, turgentiaq; ora parentis
Rident, percusso claudicat ille genu.
Ridet & ipse Deus, limumque inducere monstrat;
Hic parat monitis, & limi ora luto.*

In English thus;

*Of Hornets thousands on his head full bare,
And on his face their poison'd spears stick fast,
Then headlong down he fell, and Asses foot him smote,
Whiles he for help his voyce to fellows cast.
The Satyres flock came run apace, and did deride
Their fires swollen mouth, whiles Ass had made him lame.
The God himself did laugh, yet shewed an earth to hide
The wound which he received, and so did heal the same.*

If any one be desirous of more medicines against the perillous and transpiercing stinging of these horn-mad Hornets, he shall finde store of them digested together in the History of Wasps: for their remedies are common, belonging as well to the one as to the other, there being no other difference but this, that here they must be given in a greater measure or quantity, and their use ought longer to be continued. And let this suffice to have spoken thus much of such Insects or Cut-wasted vermine as are winged, and live in companies and routs together. Now will I make choice to describe such as are winged and live solitarily, lest I should seem to lose my self in this troublesome and vast Ocean of Physical contemplation.

Of CANTHARIDES or Spanish Flies.

This kinde of Cut-wast is called of the Grecians, *Kantharis*, and among the Latines it changeth not his name. Of the Frenchmen, *Cantharide*. Of the Italians, *Canarella*. Of the Spaniards, *Cubillo*. Of the Germans, *Grune Kifer*, *Goldkaefer*. Amongst the Belgies or Netherlanders, it is termed *Spaensche Vlieghe*; and of us English men, *Cantharides*, and *Spanish Flies*. I have seen two sorts of *Cantharides*, the one great, and the other small. Of the greater sort some are thick, and long bodied, which are found among wheat, and these are thick, grosse, and unwieldy, like unto Beetles, they are also of sundry colours, and changeable hew, with golden streaks or lines crossing their wings, and these are best to be used in Physick. They of the other lesser kinde, are lean and thin

scrag

scraggs and starvelings, broad, hairy, heavy, and sluggish, and for physical uses little worth.

The greater sort also are not always of a glittering green colour, but otherwhiles you shall have them somewhat reddish or murrey coloured, but yet all of them of a glittering brightnesse, and marvellous shining glosse, piercing the eyes with singular delight. The lesser sort are not so common as the greater, somewhat differing from them in shape and proportion of body, but in vertue, quality, and manner of breeding, there is no disagreement at all to be found.

Those of the lesser sort have their bodies and heads somewhat long and hooked, their eyes very black, and hanging out, their wings growing out from the midst of their Loyns, being marked with two silver specks or pricks, and some few white spots.

They are commonly found in the Summer Season, in the herb that is called *Cicutaria*, or wilde Hemlock. Their feet and legs are very small and long, finely decked and garnished, as it were with a Vermillion red, or beautiful purple. There is also another sort of these answerable to the former, in colour of their bodies in every respect, saving that their eyes are green: their head very little; and the hinder part of their shoulders round and crooked.

The third sort have their head and shoulders all one, being so closely and confusedly joyned together, as if they were but one thing and could not by any means be separated, unlesse in imagination, and these are of a rusty colour, and their small pink eyes as black as Jet, their wings as well as their heads are nothing differing in colour, saving that their wings do glitter with some strakes of the colour of gold, their feet also are short, and as black as Pitch.

The fourth is very like to the third sort, but it is rather of a greenish, then of a rusty Iron colour, but in all other respects there is no difference to be seen, saving in their magnitude, for this last described is the least of them all. But these kindes of *Cantharides* as well the greater as the lesser, do first proceed not from any beasts, as some have thought, but they rather take their Original from some rotten, stinking, and corrupt moisture and siccity, *Titeſtai gar en tois toon paroon leisiois kai tan ageirai, kai tous Sukais profeti to toon Kantharidoom phulon*, the meaning whereof is, that the whole stock and kindred of *Cantharides* do bring forth or lay their young in the vile, base, and imperfect force of heat or warmth: and further in moist Figs, as *Aelianus* in his ninth Book and thirty nine Chapter, word for word hath exscribed out of *Aristotle*.

They do also breed from a certain little Worm which is found in the sponge of the Dog-bryer (called of the Physitians *Bedeguar*) and from Caterpillars of the Fig-tree, Popler, Pear-tree, Ash, Olive-trees and Roses: for in all these there be found certain Worms, the very Founders and Parents of *Cantharides*, but yet in the white Rose these Worms are of much lesser force, power, and sufficiency, then in the former.

Cantharides do couple together and generate, but yet not any living creature of their own kinde, but only a little small Worm. They feed upon all manner of pulse and Corn, but especially Wheat, and then they are best for medicinal uses. The smell like unto Tar, and in their taste they much resemble the Cedar-tree, as *Nicander* reporteth. Their vertue and quality is to burn the body, to parch and to bring a hard scale or crustinesse upon any part they shall be applyed to, or as *Dioscorides* saith, to gnaw or eat into, to raise blisters, exulcerate and raise an inflammation, for which respect, they mix them with such medicaments as are appointed to heal Leprosies, any dangerous Tetters and Ring-worms, or those that be Cancrous.

They are applyed to hard, Scurvy, or Mangy nails, being first tempered with some fit plaisters or Cerotes tending to the same purpose, taking them so clean away, that they fall off by the roots. Some use also to temper them with such convenient medicines as are warranted to take away Warts, Corns, or any hard knobs or pieces of flesh growing in the hands or feet. Some again use to pulverise *Cantharides*, and then mixing them with Tar, do make an Unguent to cure the falling away of the hair, or the shedding of it, either in the head or beard, but herein there must be good advice required, lest at any time by their caustick faculty they exulcerate too deep into the flesh.

Cantharides mingled with Lime, serve in stead of a Pen-knife to eradicate and take away those little hard and red swellings rising chiefly in the crown of the head, armpits, or privy parts, called of some Physitians *Pani*: and some there be again that will adventure a little of them in powder, to give with such Medicines whose property is to provoke Urine: But yet there is hard hold and tough reasoning on both sides, whether they ought to be given inwardly with Diuretiques or no, considering that being so drunk, they are accounted amongst strong poysons, tormenting the bladder without any ceasing: othersome again hold the contrary, assuring us upon their own experience, that not exceeding their due quantity, they may be taken with other Correctories, to serve as a Retricle to transport them to the place affected, so that you see either side hath his strength and reasons.

Iusta pari premitur veluti cum pondere libra,

Prona nec hac plus parte sedet, nec surgit ab illa.

That is to say;

As when an even scale with equal weight is peized;

Nor falls it down this way, or is it that way raised.

But being mingled and wrought up with the juyce of *Una Taminea*, (which is a kinde of Berry, growing on the herb called *Ampelos angria*, a kinde of Briony) Sheeps or Goats sewer, there is no doubt but that they do great good. Some of my Masters (saith *Galen*, the Prince of all Physitians next to *Hippocrates*) did use to put Cantharides amongst such medicines as they prepared to move urine, taking only their wings with the feet, but I (saith he) am wont to take Cantharides wholly, as well as some parts of them, and so I judge them the more safe to be used and prepared this way, especially I misse not to make choyce of such are found among Corn, and have as it were a yellow circle or enclosure crossing overthwart their wings, lib. 3. lib. 6. 11. de Simplic. facult.

Being applyed rightly, they do also provoke the monthly terms, and that very effectually, and put into Antidotes, they are thought of many to help Hydropical persons, as not only *Hippocrates* and *Dioscorides*, but also *Galen*, *Avicenna*, *Rhazes*, *Pliny*, and other Physitians of best note and worth have witnessed: I cannot here sufficiently enough commend their assured, tryed, and approved use, being commixed with Leaven, Salt, and Gum *Ammoniacum*, for the diversion of Rhumes or Catarrhs, the taking away of all Goutish pains, out of the hanch or hip (called the *Sciatica* of the popular sort) whilest they draw forth and consume from the center of the body, (being theré thoroughly and deeply impacted) to the surface the matter or offending humours causing these griefs above said.

They are also good against the venom of a *Salamandra*, as *Pliny* in his 29. Book. and 24. Chapter assureth us. They are also highly esteemed of some, being duly prepared and orderly mixed with certain other medicines, to take away and correct the remisse negligence, falling-faintnesse, and heartlesse casting down of the Virile part, yea they do (as they say) very much provoke to venereous incitements.

But here I would counsel each one not to be knock-hardy bold, in meddling with them, for these or the like intentions: for as they bring both health and help, being duly commixed, and orderly tempered, not exceeding their dose and first quantity; so again, if you fail in their due and skilful application or propination, they induce and drive men into most intolerable grievous symptoms and accidents, and otherwhiles to death it self. *John Langius* setteth down a true and very pleasant story, which in this place, because it maketh greatly for our matter in hand, I will not refuse briefly to describe it.

There was (saith he) at *Bonony* in *Italy*, a certain rich and Noble young man of *France*, (which *Gallus*, to use his own words, was *Gallo quovis galinaceo salacior*) who falling extreemly in love with a certain Maid in the same City, prevailed so far at length through his earnest importunities and incessant sollicitations, that at length they appointed and agreed upon the time and place of their meeting, to keep their Revels for one night. So this lusty Gallant being thus insnared in the inextricable labyrinth of her beauteous Phisnomy, fearing deadly, lest his heart should turn into Liver, or that he might faint and lose his courage before he should attain to his journeys end; in this his doubtful cooping, and dangerous skirmishing conflict, like a wise man fearing the worst, casting all dangers beforehand what might ensue. would needs know of a fellow-souldier, and Countreyman of his, who had as one may guesse born a standard in the Camp of *Venus*, what were best to be done, to move him to a more vigorous courage, and to keep his credit for that time, lest either he should turn Craven like an overtired Jade, or else be utterly non-suited, which was worst of all: who presently wished him to take some Cantharides in his Broath, which the other at all adventures forthwith did.

But it was not long before this jolly Yonker felt an itching about his lower parts, then being fro-like above measure, supposed it to be the operation of his medicine that caused this Colt-evil, he without any more ado hyed him to his Love, minding there indeed to draw the matter to a set battel, and to end all controversies by dint of sword.

Tunc animis opus, Aenea, tunc pectore firmo.

In English thus;

Of courage then indeed,

Then of stout breast is need.

But yet for all this, in the still of the night, when every one besides were at rest, my restless *Frank* felt his whole body to be pockily torn, and miserably rent with sundry cruel prickings and stings, feeling moreover a strange tast in his mouth, like the juyce or liquor that issueth from the Cedar tree, stamping and staring, raging and faring like a furious, mad, frantike Bedlam, being almost besides himself through the extremity of his pain, vertiginy and giddinesse of his brain, with inclination to fainting or swoounding: so being troubled, tost, and perplexed, all sad, melancholike and male-content, destitute of counsel and comfort, like a silly Miser, and an impotent Suiter, and not like a couragious hot-spur, he let his action fall, turning his back like a Novice and fresh-water Souldier, full sore against his will you may be sure, but there was no remedy, and so with as much speed as he could, bidding his Love adieu, he trudged home to his own lodging; whither being come, and finding no relief, but rather an encrease of his torments, with a continual burning of his Urine and Strangury, he lamentably besought, and with weeping and tears most humbly craved and cryed out for help, requiring the

the favour and furtherance, both of my self and of another Physitian for the cure: so I being admitted to visit this poor patient, I first gave him some Oyl to drink, thereby to provoke vomiting: then was there prepared a Glyster, made of the herbs *Mercurialis*, Mallows, and the root of *Althea* decocted, wherein was dissolved *Cassia*, with Oyl of Violets and Lillies. After the administering of this, I commanded him to take a good draught of Cows or Goats milk once in every hours space, and if Milk could not be had, then I willed him to take an Almond Milk made *Ex nucleis pinæ*, seeds of Mellons, Gourds, and Poppy bruised with the distilled Water of Mallows, and *Alkekengi*, and this would I have given to him in good quantity in stead of the Milk if it were wanting.

But after that my fiery Frenchman had recovered his former health with these and the like remedies, and that the unadvised Author of this rash counsel had very humbly intreated pardon at our hands for this his great fault, he protested solemnly with a great oath, that he would never hereafter prescribe any Physick to any man living. Thus far *Jobannes Langius* in his first Book *Epistola Medica*. forty eight.

There is also very profitable use to be made of Cantharides; for if you beat them to powder, and convey a little of it into Apples, Pears, Plums, Figs, Peaches, or Quinces: especially those that be fairest and ripest, and those that hang the lowest, finely closing it up again with the pill, which if any Theeves or Robbers of Orchards shall tast of, they fall within a while after into an intolerable burning in their Urine and Strangury, making it only in dropping wise, whereby their theft is soon found out, and they well rewarded with sowre Sawce for their sweet meat: And this is an excellent night-spell, and therefore I was loath to pretermitt it, but to make you acquainted withall.

There is also another excellent medicinal use of Cantharides, if they be duly, and according to trueart administred, and with great warinesse for that passionate grievance, which at this time though some foolish Physitians never heard tell of any such, I will call *Pessuli infirmitas*, yet I may not set it down in English, because I would have but a few acquainted with secrets. *Habeo enim ego singulare quoddam contra penis Languorem remedium, quo cum promiscue uter, utramque multis nobilibus (qui veneris vulgo studiosiores videntur) animos & vires adauxit absque noxa. Uni tamen inter ceteros sic obfuit, ut à venere (cui nimum litarat) sanguinem continuo mingeret, & lipothymia frequenti laboret. Sanè nisi lacris copia in procinctu fuisset, omnino interisset venereus pulvis, & meritis salacitatis cupidinisq; pœnas luisset.*

And let this suffice to have spoken of their medicinal vertues and qualities; Now will I proceed to tell you of their ill name, naughty, venomous, and pernicious properties. They are reckoned and scored up in the number of most deadly and hurtful poysons, not only because they cause erosion and inflammation, but more in regard of their putrefactive quality and making rotten, wherein they exceed. Their juyce being taken into the stomach, and so piercing into the veins, or laid upon the skin outwardly so long till it hath entred the veins, is a most strong poyson, whereupon *Ovid* when he wished ill unto, or cursed his enemy, writ this; *Cantharidum succos dante parente bibas. lib. Trist. Cicero ad Parum*, in his ninth Book of his familiar Epistles hath these words, *Catus accusante L. Crasso, Cantharidas sumpsisse dicitur*, as if he purposed by that way to make an end of himself by death. *Galen* in his third Book *De Simplic. medicam. facult.* writeth thus:

If they be taken inwardly into the body, though but in small quantity, and mixed with other convenient correctories, they do mightily provoke urine, and sometimes corrode and fret the bladder, so that it is as clear as the noon-day, that what things soever do overthrow nature, by reason of their extreme frigidity, if they be taken but in a very small quantity, yet will nourish the body: so on the other side, whatsoever is contrary, repugneth or goeth against humane nature, by means of corrupting or any putrefactive quality like unto Cantharides, can never do so. *Bartholomeus Montegnana*, a learned Physitian, assureth us, that he once knew one *Francis Bracca* a Citizen of *Padua* in *Italy*, who having but outwardly applyed Cantharides to his knee, yet their poyson spreading to other inwards parts, he voided five pintes of bloud by way of urine: and this may any man see, if he will take the pains to read over *Montegnana Consil. 182. Cap. 10.*

The same accident hath also befallen them, who to be remedied of rough, hard, mangy, or leprolike nails, have adventured to apply them to their great toe. So that Cantharides must not rashly be applyed and used, as common deceivers, blinde Empericks, and coufening Land-lopers would make plain Countrey people believe. *Pliny* relateth a story of one *Cossinus* a Roman Knight, who was deerly beloved of *Nero* the Emperor, who having a very dangerous Tetters (a disease in times past peculiar to the people of *Egypt*) a Physitian of that Countrey in stead of curing, did kill him by giving him Cantharides to drink.

But I should rather think that *Cossinus* dyed by the outward application of Cantharides, because by their burning and caustick quality, they clean eat and consume away filthy Tetters or Ring-worms, Manginess, Scurviness, Lepries, and all hard Callous Warts, Corns, or pieces of flesh that grow in the hands or feet; for I can see no reason why any would be so wilfully blinde, as to give them inwardly for the curation of any Tetters or such like griefs: or at leastwise I must think that the right use of Cantharides was unknown to the ancient Physitians of the old world, as by *Galen* it may appear in his 11. Book *De Simplic. Med. fac.* and in his fourth Book *De vita Acut.*

The same *Pliny* (in his twenty nine Book and fortieth Chapter) witnesseth, that *Cantharides* were reproachfully laid to *Cato Uticensis* charge, and that he was sorely blamed for offering to make a price of poysons, and to sell them openly, as in Port-fail to any that would give most, so that their price rose to threescore sesterities. Being drunk in too large a quantity, or else applied outwardly to any part, either too long or too deep, they produce these or the like symptomes, accidents, and effects.

The party to whom they are any way given, feeleth a pricking pain and torment in his bowels and inward parts, extending from the mouth down to the lower parts about the Bladder, Reins, and the places about the waste and short ribs: they do also ulcerate the bladder very dangerously, inflaming the yard, and all other parts neer the same with a vehement apostumation: after this, they pisse blood, and little pieces of flesh.

Otherwhiles there will follow a great lask or Bloudy-flux, fainting and swoounding, a numnesse or dulnesse of moving or feeling, debilitation, or feeblenesse of the minde, with alienation of the wit, as though they were bestraght; likewise lothing or abhorring of meat with a disposition to vomiting, and often an ordinary desire to make water, and to exonerate nature, but all in vain. He that taketh them findeth in his mouth the tast or tallage of Pitch: and all these symptomes, passions, or effects, that they work, have I with much labour faithfully collected out of the sixth Book of *Dioscorides*, and the first Chapter. And out of *Galen Lib. de Theriaca ad Pisonem Cap. 4. and Lib. 5. de Temperam. cap. 3.* And out of ancient *Rhazes* (who practised Physick one hundred years, if truth be truly related) *Tit. 8. chap. 17.* If any one be either affected or infected with any accidents, by means of *Cantharides*, *Dioscorides* doth thus cure them, as you may readily finde in the Book and Chapter before cited.

First of all he causeth them to vomit often and much: and after that he prescribeth Glysters to be made for the scouring of the belly with Nitre, and to preserve the bladder inwardly, to take Milk and *Psyllum*: and then he would have the matter of Glysters to be somewhat different from those which were taken in the beginning: as namely to be made of Barley water, Marsh-mallows, the white of an Egge, the Musciling of Line-seeds, Water of Rice, the decoction of Fenugreek, Hydromel, fat Broaths, Oyl of Almonds, the fat of a Goose, and the yelks of Egges. And inwardly to take at the mouth, he biddeth them to use Cows milk, Hydromel, the grains or fruit of the Pitch-tree, both the greater and the lesser sort, Wine sod to the half, Ducks fat, a decoction with some diuretical seeds (namely with the four greater cold seeds, which are Cucumbers, Gourds, Citrals, and Melons) and likewise some decoction made of Figs, with syrup of Violets. Oyl of Quinces is highly commended of some as a proper and special Antidote in this case, and so is Oyl of Lillies, and *Terra Samia*.

Rhazes counsel is, after the taking of some Glysters made of any fat broaths, to make an injection into the yard with Oyl of Roses, and the sick person to sit in a warm Bath. *Tit. 8. Chap. 17.* The Writers and Authors of Physick and Philosophy cannot agree, in what part of the *Cantharides* their poyson chiefly lurketh: for some will have it to be principally in the head and feet, and others again will none of that: And yet they all agree upon this point, that in what part of the body soever their poyson is seated, that their wings are a soveraign remedy and preservative, and if they be wanting, that their poyson is deadly: so that although they be never so poysonous, yet have they their own remedy which in themselves they contain and carry about: Thus saith *Pliny* in his 11. Book and 35. chapter.

And peradventure for the same cause, *Galen* in his eleventh Book, which he intituled *De Simplic. Medicament. facultatibus*, adviseth us expressly and learnedly, that *Cantharides* should be taken whole as they are, and so to be used either for inward or outward uses. For why it is far better, even in the outward application of them, that they should more gently and slowly corrode, gnaw, or fret asunder, and that their burning vertue and quality should be a little corrected and weakened, then to perform their full effect to the great danger of the patient, and many times to his utter undoing and destruction. Therefore they are clean out of the way, who when they would use them for any inward cause, do cast away their wings and feet, whereas indeed they ought to take all of them, not rejecting any one part of them. For being given whole, they need not so much any correctives to bridle and lessen their powerful operation in regard of their wings and feet, the proper resisters and expellers of their own or other poyson.

The safest course is to use all, and every part of them without exception, unlesse you would have them to corrode, fret, inflame, or burn any part. *Lycus Neapolitanus* is of opinion, that Purcelane is their proper counter-poyson, which vertue *Pliny* in his twentyeth Book, Chap. 13. ascribeth to the herb called wilde Basil: who also many ways commendeth *Acetum Scylliticum*, *Oleum Oenanthium*, Cows milk and brethes made of Goats flesh for these intentions, in his 23. Book, Chapter the second and fourth, and likewise in his 28. Book and tenth Chapter. And for our History of *Cantharides*, let this for this time suffice, which I much wonder that the famous learned *Gesner* hath in such deep silence passed over, never so much as mentioning them: whereof notwithstanding so many Authors, both of the Ancients and Neotericks, do so much ring.

Many more authorities could I have alleadged concerning this my discourse of *Cantharides*, but that I suppose it a labour as endlesse in toyl, as needlesse in use; the one favouring of too much curiosity, the other of a frivolous affectation: so that I hope even amongst the whole College

The error of
some medi-
cine-givers.

of Physicians, wheresoever in England (if their ears be not too dainty) to finde some few grains of their good words, and such courteous construction, as that I may neither be charged with partiality of concealing (where it is meet I should be mute) nor be suspected of unsufficiency, for not pursuing where I can finde no good footing.

OF CATERPILLERS, or PALMER-WORMS,
called of some Cankers.

NOW I am come to speak of Caterpillers, sometimes the destroyers and wasters of Egypt: as well Their names
in regard of the great difference that is found in their several sorts; as for their great dignity and use, wherein some of them are most notable and excellent. Some think that *Eruca*, which is Englished a Caterpillar, hath his derivation *ab erodendo*, which is not altogether improbable: For they gnaw off and consume by eating, both leaves, boughs, and flowers: yea, and some fruits also, as I have often seen in Peaches.

Ovidius the famous Poet, stileth them by the name of *Tinea agrestes*:

*Quaeque solent canis frondes intedere filis;
Agrestes Tinea, res observata colonis;
Feraci mutant cum papilione figuram.*

In English thus;

*And those wilde Mothes by husbandmen observed,
Which fold themselves in hoary springing leaves,
Gainst force of famine, and storm to be preserved,
A shape from fruitful Butterflies receives.*

The Grecians call a Caterpillar *Kampe*, by reason of his crooked winding or bending pace in waving sort, whereby in creeping they bow, wry, and lift up themselves. Of the Hebrews it is termed *Ghazain*, because it sheareth, pillesh, and devoureth the fruits of the earth, as *Kimhi* upon the first of *Joel* writeth. The Italians call it *Rugaverme*, and *Bruchio*, for so *Marcellus Virgilius* upon *Dioscorides* saith expressly, that in his time all the people of Italy, named it *Eruca*, *Bruchi*. The Spaniards term it *Oruga*. The Frenchmen, *Chenille*, and *Chattepeuse*. Of the English they are commonly called Caterpillers, of what kinde soever they be of. But the English Northern men, call the hairy Caterpillers, *Oubuts*, and the Southern men usually term them *Palmer-worms*. Of the Polonians it is called by the name of *Ruphansenka*. In the German tongue *Eia Raup*. In the Belgian, *Ruipe*. Of the Illyrians, *Gastienica*. And *Silvaticus* will have it called *Certris*, and *Cedebroa*.

If I should go about to describe and set down all the differences and varieties of Caterpillers, I Their differences
might perhaps undertake an endless and tedious labour. I think it therefore fittest to bend my slender skil, and to imploy my best forces, in speaking of such as are more notable and common with us in this Countrey: For some of them in touching are rough, hard, and stiffe; and other some again, are soft, smooth, and very tender. Some are horned either in the head or in the tail; and again, others have no horns at all. Some have many feet, and some fewer, & none at all have above sixteen feet. Most of them have a bending swift pace, and like unto waves, and others again keep on their way very plainly, softly, by little and little, and without any great hast. Some change their skins yearly, others again there be that neither change nor cast their old dry skins, but keep them still. Some of them ceasing altogether from any motion, and giving over to eat any thing at all, are transformed very strangely into a kinde of vermin or worms, who being covered with a hard crust or shell, lie as it were dead all the Winter; and from these come in the beginning of hot weather, our usual Butter-flies.

Many of these Caterpillers are bred of the eggs of Butter-flies; and some again do breed in the leaves of trees, of their own proper seed, being left there in the time of Autumn, included in a certain web, or else by means of the dew or air, therein shut and putrefied, as commonly the little hairy Cankers or Caterpillers which are so full of feet, do breed. Besides, some of them do feed on leaves, some on flowers, and there are some which devour fruits.

All smooth Caterpillers which are not hairy, are of a yellow or green colour: some again are found of a reddish colour, or brownish, or else they be of sundry hews. But of all others, the most excellent is the green coloured Caterpillar, which is found upon that great bushy plant, usually termed Privet, or Primprint, which hath a circle enclosing round both his eyes and all his feet, having also a crooked horn in his tail: these Caterpillers are blackish-red, with spots or streaks going overthwart their sides, being half white, and half purplish, the little pricks in these spots are inclining to red: The rest of their body is altogether green.

There is another Caterpillar feeding altogether upon Elder-trees; not much differing from the former, saving that this is altogether of a green colour, and wanting those overthwarting cross white marks or spots, and the other small white pricks which we described in the former.

There is also a third sort of green Caterpillers, which when Autumn or the fall of leaf draweth on, are turned into a certain sheath or case, being of a very hard and horny substance, of colour very brown, and this feedeth altogether upon Pot-herbs, especially those that be soft, as Lettice: whereupon it may not unfitly be termed, *Eruca Lactucaria*.

Lastly, there is to be seen another sort, of a green colour, which is the least of them all, and this kinde liveth and feedeth upon trees, (especially in the Oke) there drawing out their web, by means of which being stirred and shaken, they easily fall down upon the heads of travellers and passengers by the way side, cleaving to their hats and garments. And this kinde of Caterpillar is too well known and found in the Summer time, and when cold weather approacheth, they fold themselves into a rude, plain, and nothing curious web. And thus being included in a greenish scabbard or case tending to red, they all die in Winter, and all these have ten feet, as all they have that go bending themselves upwards. But to leave the green, and come to them that are yellow, there is to be found a certain Caterpillar called *Vinula*, being as the word soundeth, a very elegant and fine insect to look upon, and passing beautiful: and this kinde have I often found amongst Willows, full favourly feeding upon their leaves. His lips and mouth are somewhat yellow, his eyes black as a cole, his fore-head purple coloured, the feet and hinder-part of the body, of a green grassie hue, his tail two-forked, and somewhat black. The whole body is as it were stained and dyed with thick Red-wine, which runneth alongst the neck and shoulder-blades, as it were in form of a *Burgonian* crosse, or of the letter X, made crosse-wise down unto the tail with a white line, addeth no small grace to the other parts.

There is yet another Caterpillar of yellow-blackish colour, called *Porcellus*, we may in English call it Pigs-snout, in respect of the fashion of the head, especially the greater sort of these, for the lesser have round white specks upon their sides, and these live and are altogether to be found amongst the leaves of the Marsh Trifoly, which they consume and devour with an incredible celerity. In the wilde Night-shade, (which the *Italians* call *Belladonna*) there is found a smooth Caterpillar of a yellow-greenish colour, having a horn in his fore-head the length of a finger, which *Hierom Cardan*, the learned Physitian, reporteth that he had often seen.

The description
of Pityo-
campes.

The hairy Caterpillars are most mischievous and dangerous amongst them all, and these are either thick or thin haired, and the most venomous is that which is called *Pityocampe*, whose biting is poyson: and this is ever found in the Pine-apple-tree, being as thick as three little fingers, and three fingers long being laid a crosse. They consist of eleven slits or cuts betwixt the head and the tail, and they have sixteen feet, according as all other hairy Palmer-worms have. That is to say, neer the head on both sides, there, in the midst of their body on both sides, four, and at the end of the tail on both sides, one. Their former feet are crooked and small, with which they feel, try and assay the way whether it be passable or no, their other feet are broader, with many jags and notches like a saw, to take the faster hold, and stay with surer footing upon smooth and slippery leaves. Their head is much like a Pismires, and the rest of their bodies like other common Caterpillars. They are rough, and full of bristly standing up hairs on all sides, and those in their sides are white, but those on their backs do shine, being very bright and glistering, the midst whereof is garnished with many spots, as though it were full of eyes.

Their skin is black which is soon seen, their hairs being cut or taken clean away. All their hairs are but small, and yet they sting more vehemently than any nettle, whereby is caused intolerable pain, burning itching, a Fever, and much disquietnesse: when as their poyson is suddenly in a moment sent and conveyed without any manifest appearance, or sense of any wound to be judged by the eye, unto those parts that are next the entrails, as the heart, liver, and the rest. They weave their webs after a fine and exquisite manner, as Spiders do, drawing out in length, framing and trimming in good order, their hairy small threads. And under these when night draweth on, they lie as in their own proper tent and pavillion, aswell to avoid cold, as the discomforts of furious blasts and storms: for the matter and substance of this their tent is so handsomely wrought, so firm, stiffe, clammy and sure, that they neither care for furious windes, nor yet any rain or storm will ever soke through. Besides, the largeness of this house is such, and of so great receipt, as it will easily receive and lodge many thousands of Caterpillars. They make their nests or buildings in the highest branches of the Pitch and Pine-trees, where they live not solitarily (as other Palmer-worms do) but in flocks or companies together. Which way soever they take their journey, they are still spinning and drawing out their threads for their web, and early in the morning (if it be likely to prove fair) the younger sort by heaps attend the elder, and having first bared and robbed the trees of all their boughs and leaves, (for they make clean riddance of all wheresoever they come) they afterwards dexterously bend themselves to their weaving craft. They are the only plague and destruction of Pitch and Pine-trees, for unto any other rozy or gummy trees they never do harm.

There is great plenty of them to be found in the Mountain of *Athos*, situate betwixt *Macedonia* and *Thrace*, in the Woods of *Trident*, and in divers Valleys beyond the *Alpes*, in which places there is store of these fore-named trees, (as *Matthiolus* saith.) They are doubtlesse most poysonous and venomous vermine, whether they be crushed outwardly with the hands, or taken inwardly into the body: yea they are so known, manifest, and so never failing a poyson, and so esteemed of in times past, as that *Ulpian* the famous Lawyer, interpreting the Law *Cornelia de Sicariis*, or privy murderers, that he in that place, calleth and esteemeth the giver of any Pityocampie in drink or otherwise to any one, to be doomed a murderer, and their punishment to be equallized. *Sect. Alium ff. ad Leg. Corn. de sic.*

As soon as this kinde of Caterpillar is received into the body, there followeth immediately a great pain, extremely tormenting the mouth and palate, the tongue, belly, and stomach are grievously inflamed by their corroding, and gnawing poysonous quality, besides the intolerable pain the receiver

ceiver feeleth, although at first the party seemeth to feel a certain pleasant itching, but it is not long before he perceiveth a great burning within, loathing and detesting of meat, and a continual desire to vomit and go to the stool, which neverthelesse he cannot do. At length, unlesse speedy succour be given, they so miserably burn and parch the body, that they bring a hard crustinesse, skurfie or scald upon the stomach, as though the sides thereof had been plastered with some hard shards, or other like things, after the manner of Arsenick, as *Dioscorides*, *Aetius*, *Pliny*, and *Celsus* do assure us. In like manner *Galen* in his eleventh Book *Simp. cap. 50.* and *Avicen* 505. cap. 25. have testified the same.

And for this cause *Aetius* and *Aegineta* do say, that it is nothing wholesome for any to sit down to meat, to spread the Table, or make any long tariance under any Pine tree, lest peradventure through the savour or smell of the meats, the reek or vapour of their broaths, or noise of men, the Pityocampies being disturbed from their homes and usual resting places, might fall down either into their meats beneath, or at least-wise cast down, or let fall any of their seed, as poysonous as themselves. They that receive hurt by them, must have recourse to those preservatives and medicines, as were prescribed to those that were poysoned by Cantharides, for by them they are to be cured, and by no other means. Yet for all that, Oyl of Quinces is properly commended to vomit withall in this case, which must be taken twice or thrice, even by the prescript of *Dioscorides* and *Aetius*. They are generated, or to speak more aptly, they are regenerated (after the manner of Vine-fretters, which are a kinde of Caterpillers, or little hairy Worms with many feet, that eat Vines when they begin to shoot) of that Autumnal seed of theirs, left and reserved in certain small bags or bladders within their webs.

There is another sort of these Caterpillers, who have no certain place of abode, nor yet cannot tell where to finde their food, but like unto superstitious Pilgrims, do wander and stray hither and thither, and (like Mice) consume and eat up that which is none of their own: and these have purchased a very apt name amongst us Englishmen, to be called Palmer-worms, by reason of their wandering and roguish life, (for they never stay in one place, but are ever wandering) although by reason of their roughnesse and ruggednesse, some call them Bear-worms. They can by no means endure to be dieted, and to feed upon some certain herbs and flowers, but boldly and disorderly creep over all, and tast of all plants and trees indifferently, and live as they list.

There are sundry other sorts of these Cankers or Caterpillers to be found, in the herbs called Cranesbil, Ragwort, Petie-mullen, Hops, Coleworts, Hasels, Marigolds, Fennil, Lycorice, Basil, Alder, Nightshade, Water-betony, Garden-spurge, and other sorts of that herb; in Elm-trees, Pear-trees, Nettles, and Gilliflowers. Yea there is not any plant to be found, which hath not his proper and peculiar enemy and destroyer: all which because they are so commonly known of all, though perhaps not of all observed, I will (lest I should seem to be infinite) passe over with silence. But yet I will adde a word or two of a strange and stinking Caterpillar, which it was never my hap as yet to see, described by *Conradus Gesner*, in these words following: This stinking Caterpillar (saith he) is very like to those that are horned, but yet it wanteth horns, differing from them all in colour. I first epyed it creeping upon a wall toward the end of *August, Anno 1550.* there cometh from it a lothsome and an abominable savour and smell, so that you would verily believe it to be very venomous. It went forwards very frowningly, and with a quick, angry, and despihtful countenance, as it were in bending wise, the head always stretched up aloft with the two former feet: I judge her to be blinde. She was the length and breadth of a mans finger, with a few scattering and rugged hairs, somewhat bristly and hard both on her back and sides, the back was very black, the colour of her belly and sides was somewhat red, enclining to yellow, and the whole body was distinguished, divided, and easily discerned with fourteen joynts or knots, and every joynt had a certain furrow like a kinde of wrinkle running all along the back. Her head was black and somewhat hard: her mouth crookedly bending like hooks, having teeth notched like a saw, and with these teeth as with pincers or nippers, whatsoever she laid hold on, she (as famished) did bite. She went on sixteen feet, as for the most part all the sorts of Palmer-worms do. Without doubt, she must be concluded to be exceeding venomous.

The learned man *Vergerus*, took it to be a Pityocampe, and others thought it a Scolopendra: but that could not be, by reason of the number of her feet. I could hardly with much ado endure her vile smell, till I had drawn out her description. She so infected two Hot-houses with her abominable savour and stink, that my self and they that were with me, could not endure in the place. Thus far *Gesner*, as I have to shew out of certain scroles of paper of his, never as yet imprinted.

Now will I proceed to discourse of the original, generation, aliment, and metamorphosis of Caterpillers.

*Chare liber, nostrum testis benefide laborum,
Ne tua purpureo suffuderis ora rubore
Agrestes ab acis tineas si expressero nostris,
Vermiculosq; levem qui in thecam vellera mutant.
Hi siquidem artificis prudenti pollice Divi
Finguntur, tenui qui non tenuatur opella*

*Et qui vermiculis, dextra miranda potentis
Signa sua prodit, potius quam corpore vasti
Molifero Barphi, tumido vel robore Ceti
Squamantisq; aliis; qui lata per equora tentant.
Fulmineas sine mente minas: Et nostra profundo
Lintea qua mergant, largo mare gutture rulant.*

Which

Which may be Englished thus ;

Deer Book, a witnesse of my labour true,
Be not ashamed to write of little worms,
Nor Caterpillers, which from base things ensue,
And into easie cases again returns :
For these are fram'd by hand of God most wise,
Never abased in any work so small :

For out of Worms his wonders do arise,
As well as from great Beasts so tall,
Tower bearing Elephant, huge Whale,
And other monsters swimming in the Seas,
Ireful beasts, in hills and deepest dale,
Death threatning to all that them displease.

For so I think it best to begin with the verses of a good Poet, who indeed did see and admire the inscrutable wisdom and divine Providence of the Almighty, in the generation and breeding of Caterpillers. Which whilest divers Authors laboured to expresse and set down diversly, I know not what clouds of errors they have thrust us into ; for swarving themselves besides the way, although they pretend a matchlesse understanding in these mysteries of Philosophy, they have caused others to tread awry as much as themselves, and to be blinded with the mascarados of absurdities. And first, if we will begin to rife in the monument of former times, I will here produce *Aristotles* opinion in his fifth Book, *Histor. cap. 19.* who there expressly saith, that they take their beginning from the green leaves of herbs, and namely of Radish and Coleworts, by means of their small seed of generation, being like unto Millet-seed, which is there left about the end of Autumn, from which female Worms proceed : and of these little Worms in the space of three days a Caterpillar is formed, about the Spring time, or toward the later end thereof, which growing to their due quantity, and well fed withall, they cease at length from any further motion, and when Autumn beginneth, they change both form and life.

Pliny is of this minde, that Caterpillers fetch all their pedegree, race, parentage and birth, from a dew thickned and incrassated by the heat of the Sun, and so still left behinde in leaves : and *Arnoldus de Villa nova* is of the same judgement. Othersome derive them wholly from Butter-flies, and will have them to proceed of no other beginning, which as soon as they are crept out of their hard shells or scabbards, wherein they had lain as it were dead all the Winter, as soon as Summer and warm weather draweth on, they cast certain eggs either under or above the leaves of certain herbs, which egges according to the quantity of their bodies, are either greater or lesser, and some of these shells wherein they are included, are of a sky colour ; others yellow, white, black, green, or red : and so being at length about fourteen days quickned and nourished with the lively and kindly heat of the Sun, their shell-house being broken, first cometh forth small Caterpillers, like unto little Worms, saving that they are diversly coloured, who at their first appearance, being as it should seem very hungry, do altogether bend themselves to devour and eat up both leaves and flowers, especially of those trees and plants whereon they were whilest they were in egges.

But I am of opinion, that not only this, but by divers other ways and means they may proceed and increase, for although the doctrine of *Aristotle* in this point seemeth to be unfavoury, and nothing relishing divers taites, because he affirmeth, that that little Worm which is found upon Coleworts, doth turn into a Caterpillar : yet for all that, it is not so much without smack of salt, or so abhorrent to reason as they would make some believe. For Nature, as she is able, and doth produce and bring forth a living creature from an Egge, so likewise from a Worm she breedeth a more perfect living creature, by many degrees ; and that not by way of corruption, but by way and means of her excellent perfection. For although a Worm afterwards be not that thing which before it was, (so far as is apparent to outward sense) yet for any thing we can gather or perceive, it is that which it was, and this *That*, is more by a great deal now, then before it was. For a Worm dyeth not, that a Caterpillar may thereby spring, but to the old body, Nature addeth a greater magnitude : as for example, feet, colours, wings : so that whilest life remianeth, it acquirith other parts and other offices.

There be some also that deride the opinion of *Pliny*, because he contendeth that Caterpillers have their beginning and production from dew. But it may not be denied in my conceit, that some imperfect small creatures are bred and take life from dew, and not without great reason. For the Sun by his kindly heat and warming quality, worketh and acteth, being as it were the form, and the moisture or humor is *Passive*, as the matter or the subject, for the heat of the Sun is different from that of the fire : for it either quickneth and inspireth with life, or at least-wise conserveth and maintaineth our life, by means of likeness, proportion, or symmetry, wherein our lives and spirits respect each other. Besides, there is nothing more nourishing then Dew, for with it only some certain small creatures are fed, and do thereby live : which thing the divine Poet very well observed, when he uttered these words ;

Quantum nos nocte reponit.

So that in respect that it is humour, it is matter, in respect it is thin, it pierceth and easily entreteth in, and in respect it is attracted and thoroughly concocted by the Sun, it is the apter made to generation. For the preparation of the form, carryeth with it the matter or stufte, as his mate and companion : So these two meeting together, there consequently followeth the quickning or taking life of some one creature. And not only are some Caterpillers the off-spring and breed of dew, as common experience can witnesse, but even the greatest part of Caterpillers do fetch their stock and pedegree

pedegree from Butter-flies, unlesse it be those that live upon Coleworts and Cabbages, and those that are called Vine-fretters; with some few other. For those that live and breed in Vines, (called of the Grecians, *Ipes*;) do proceed from dew, or some dewy and moist humor, which is included in their webs, and there grown to putrefaction. For then do they swarm so exceedingly in some Countries, as I dare neither affirm, nor otherwise imagine, but that they must needs have such a mighty increase from putrefaction. And this for the most part happeneth when the Eastern winde bloweth, and that the warmth of the air furthereth and hasteneth forwards any corruption.

All the whole pack of them are great destroyers and devourers of herbs and trees: whereupon *Philippus* the Parasite, as *Athenæus* saith in *Pythagorista*, braggeth of himself in this wise, *Apolausa thumon lachanoute kampe. Vescens thymo olereq; eruca sum.* I am (saith he) a Caterpillar that eateth both Thyme and Pot-herbs. And to this sense speaketh *Martial*, *Erucam male pascit hortus unam.* A Garden hardly and slenderly can suffice to feed one Caterpillar. I think he meaneth, when the time of their waiting and devouring is gone and past, for they commonly leave but little behinde. For that being past, they go wandering hither and thither, up and down uncertainly, wasted and hunger-starved, and so at length pining away by little and little through famine, some seek them fit places within, other some above the earth, where they transform themselves, either into a bare and empty bag or case, or hanging by a thread into an *Aurelia* covered with a membrane.

If this happen in the midst of Summer, the hard rinde or shell wherein they are inclosed being broken, about the time of 24. days, there flieth out a Butter-fly: but if it come to passe in the midst, or toward the end of Autumn, the *Aurelia* continueth a whole Winter, neither is there any exclusion before the vernal heat. And yet notwithstanding, all Caterpillars are not converted into *Aureliaes*, but some of them being gathered and drawn together on a heap (as the Vine-fretters) do grow at length to putrefaction, from which sometimes there falleth as it were three blackish Egges, the true and proper mothers and breeders of Flies and Cantharides. When the Butter-flies do joyn together very late, or after the time it ought to be, they do lay or cast their Egges, which will continue vital, and that may live till the next Spring, (if a diligent care be had of them) as well as is often seen in Silk-worms, whose Eggs the Spaniards sell, and that very usually by whole ounces and pounds. I have now according to my cunning, discoursed of the transmutations and variable changes of Caterpillars; it followeth next that I write of the qualities and use of Caterpillars, together with those preservatives which experienced Physitians have warranted for true and infallible.

All Caterpillars have a burning quality, and such as will readily fetch off the skin, and flea it quickly, and raise blisters. If any one drink the Caterpillar that liveth in the Pitch trees, there will forthwith follow a great pain about his mouth and jaws, vehement inflammation of the tongue, strong griping and wringing of the Stomach, belly and intestines, with a sensible itching about the inward parts, the whole body is as it were burned and scalded with heat and hot vapours, and the stomach abhorreth all meat: all which are to be remedied with the same means, as those that have taken Cantharides. Yet properly, (as heretofore I have touched) Oyl of Quinces given to cause vomiting, is the best and safest. And if we may credit *Pliny*, new Wine boyled to the third part; and Cows milk being drunk, are very effectual. There is not any one sort of Caterpillars, but they are malign, naught, and venomous, but yet they are least hurtful who are smooth and without hairs; and the most dangerous of all the rest, is that which heretofore I termed a Pityocampe, whose poyson for the most part is deadly.

Their qualities.

The daughter of *Calius Secundus* living at *Basil* in *Germany*, (as *Gesner* saith) when she had unwarily and greedily eaten some Colewort-leaves, or Cabbage in a Garden, and with them some Caterpillars, after a strong vomit that was given, her belly began to swell, which swelling, having continued these many years, could never as yet receive any cure. If you will have your Gardens and Trees untouched and preserved from their mischievous quality, you must first take clean away in the Winter time their webs, or any part thereof (though never so little) that you can finde cleaving to the bare boughs: for if you let them alone till the Spring, you shall sooner see them, then finde them removed, for in a short space of time they devour up all that is green both leaves and flowers. Some use to anoint their trees with the gall of a green Lizard, and some with a Bulls gall, which as some constantly report, they can by no means away withall.

The Countrey people choke them with the vapour of a little Brimstone, with straw being fired under the tree, and so to smother them. Some there be that make a fumigation with *Galbanum*, Harts-horn, the shavings of Ivory, and Goats hoofs, and Ox-dung. *Didymus* in *Georgicis* saith, that if you bare the roots of your trees, and besmear or soyl them with Doves dung, they shall never be hurt by any Worms.

I should willingly have omitted, and not renewed with any fresh discovery *Columellæ* remedy against Caterpillars, (or rather the immodest deceit and deluding trick of *Democritus*;) unlesse experience, which is, *Iterata ejusdem eventus observatio*, a repeated observation of the same event, had approved the verity thereof, especially in the Countrey of *Stiria*. And *Palladius* in his first Book, ch. 35. and *Constantinus* neer the end of his 11. and 12. Books, whose words be these;

At si nulla valet medicina repellere pestem,
Dardaniæ veniunt artes, nudataque plantis
Fœmina, quæ jussu tum demum operata juvencæ

Legibus, obscæno manat pudibunda cruore,
Sed resoluta sinus, resoluto mœsta capillo
Ter circum areolas, & sepe ducitur hortu:

Quæ

*Que cum lustravit gradiens (mirabile visu)
Non aliter decussa puit quam ex arbore nimbus,*

Which may be Englished thus;

But when no medicine can that plague expell
Then use they Arts, which once the Trojans found,
A woman which had Virgin-laws observed well,
Her bare and naked bring they to the ground,
Flowing with Natures shameful filthy bloud:
Her bosome open, and her hair untrimmed falling

*Vel teretis mali, vel testæ cortice glandis,
Voluitur ad terram distorto corpore campe.*

Like one ore prest with grief, forgetting good,
Three times about the plots and hedges walking.
Which done, a wonder tis for to be told,
As rain drops from the trees, ripe Apples fall,
Walnuts out of husks: so cast you may behold
These Worms from trees, all torn, and cannot crall.

Theophrastus saith, that Caterpillers will touch no plants which are moistened or besprinkled with Wine. They will die if they take the fume, or be any way smoaked with the herb *Pfora*. *Aetius*. Whereby it is apparent (saith *Silvius*) that the herb commonly termed Scabious is not the true *Pfora*. Caterpillers that live and feed on Coleworts, if they be but touched with that kinde of Worm which is found in the Fullers Teasel, they die. *Pliny*. All to besprinkle a Colewort whilest it hath but only three leaves, with Nitre, or with saltish and brinish earth, and by means of the saltnesse, the Caterpillers will be quite driven away. *Geopon*. *Palladius* in this case preferreth the ashes of Fig-leaves. The Sea-onion called *Squilla*, being sown or hanged up in Gardens, hindereth the breeding of Caterpillers. Othersome in the most places of their Gardens, and round about them, sow and set Mints, the pulse called *Orobos*, which is somewhat like Vetches, and some Wormwood, or at least-wise hang them in bunches in divers places of the same, to expell this kinde of noysome creature.

Some very advisedly take dry leaves and stalks of Garlick, and with the same do smoke and perfume their whole Garden, so that by this way the smoke being conveyed into all places thereof, the Caterpillers will fall down dead, as *Palladius* hath written, in whose writings any man may read of plenty of such Antidotes and Alexipharmical medicines, as may serve to destroy Caterpillers.

Their use in
Physick.

Now will I speak of their use in Physick, and in the Common-wealth. The web of Caterpillers being taken inwardly, stayeth womens fluxes, as *Matthiolus* saith. Being likewise burnt and put into the nostrils, it stancheth bleeding at the nose. The Caterpillers that are found amongst the herbs called Spurges of all sorts, (by the judgement of *Hippocrates*) are notable for purulent and mattery Wombs, especially if they be first dried in the Sun, with a double quantity of Earth-worms, and a little Aniseed finely powdered, and so all of them to be relented, and taken in some excellent White-wine. But in case they feel any heaviness or aking in the belly after the taking of this medicine, then it were good to drink a little Mulse thereupon. This saith *Hippocrates* in his Book *De Superfætat*.

Dioscorides in his first Book and 90. chapter, giveth in drink those common Caterpillers that live in companies together, against the disease called the Squinsie. But unlesse by some hid and secret property, they do good in this grief being received inwardly, it were needful (in regard of their manifest venomous nature) that they were utterly rejected and contemned. *Nicander* useth them to provoke sleep, for thus he writeth;

*Ei de suze tripsas oligo ex hammati kampen
Kepeien drosocastan epichloreida noto, &c.*

Which *Hieremias Martius* hath thus translated;

*Quod si rodentes olus & frendentia vermes
(Lueva quibus virides depingunt terga colores)
In medio sacra de Palladis arbore succo
Triveris, hincq; tuum colleveris undiq; corpus,
Tuta dabis dulci securus membra quieti.*

Which may be Englished thus;

With herb-eating, or green-leaf-gnawing Worms,
Whose backs imprinted are with colours lively green,
All bruised, mixed with juyce from Pallas tree that runs,
Anointed body brought to sound sleep is often seen.

There are to be seen in divers thorny, prickly, sharp and rough herbs, (as for example in Nettle) sundry hairy or lanuginous Caterpillers, which being tyed or hanged about some part of the body, do by and by (as the report goeth) heal those Infants which have any stopping of the meats passage when they cannot swallow.

A Caterpillar breeding in Pot-herbs, being first bruised and then anointed upon any venomous bitings of Serpents, is of great efficacy: and if you rub a naughty or a rotten tooth with the Colewort-caterpillers, and that often, within a few days following, the tooth will fall out of his own accord. *Avicenna*. Caterpillers mixt with Oyl, do drive away Serpents. *Dioscorides*. If a man anoint his hands, or any other part with Oyl, it will cause that he shall receive no hurt by the stinging of Bees, Wasps, or Hornets, as *Aetius* saith. *Pliny* citeth many fond and superstitious fained matters, and lying tales, devised by those who in his time were called *Magi*, Soothsayers or Diviners, concerning the admirable vertues of Caterpillers. All which, because I see them hissed out of the School of

Divinity,

Divinity, and that in heart secretly I have condemned them, I will at this time let them passe without any further mention.

They are also a very good meat to divers Birds and Fowls, which are so needful for the use, benefit, and food of mankind, as to Starlings, Peacocks, Hens, Thrushes, Daws or Choughes: and to sundry fishes likewise, as to the Tench, Pike or Pikerel, and to a certain Sea-fish called a Scorpion: also to the Trout, and some others, who are easily deceived with a Caterpillered hook. Which kind of fishing fraud, if you would better be instructed in, I must refer you to *Tarentinus* in his *Geoponicks*, and to a little Book dedicated to *Robert Dudley*, late Earl of *Leicester*, written by Master *Samuel Vicar* of *Godmanchester* in *Huntingtonshire*.

It is not to be passed over in silence, how that not many years since, there came infinite swarms of Caterpillers out of *Thracia* into *Polonia*, *Hungaria*, and beyond the limits of *Germany*, which did not only devour the fruits of trees, but whatsoever was green either in the meadows and tilled fields, besides the Vines: which was taken for an evident prognostick and sign (as many divined) of some great *Turkish* Army to come swarming into those parts: neither herein did this their gheffing and mistrust deceive them, for the next year following was the siege of *Vienna* in *Austria*, the waisting, spoyling and over-running of *Hungaria*; and the deadly English-sweating could not contain it self in an Island, but must spread it self among them of the Continent, whereupon ensued the destruction of many thousands of people, before any remedy could be found out. In the year of grace 1573. there rushed infinite swarms of Caterpillers into *Italy*, where they spoyled and made havock of all green buds and grasse growing upon the face of the earth, so that with their unquenchable and insatiate voracity, they left nothing but the bare roots of trees and plants: and this hapned chiefly about *Mantua* and *Brixia*. And upon the neck of this, followed a terrible and fearful pestilence, of which there dyed about 50. thousand persons.

Also in the year of our Lord GOD 1570. there were two great and sudden swarms of Caterpillers that came rushing into *Italy* in the space of one Summer, which put the *Romans* into an exceeding great fear, for there was nothing left green in all their fields that could be preserved from their ravine, and from their gluttonous and pilling maw. And although the fertility of the year immediately following, did almost blot and rase out the memory of this their heavy punishment, and that many seemed as it were to repent them of their repentance; yet are we not to doubt, but that many were truly penitent, and seriously were drawn to amendment of life by a due consideration hereof. God grant that we may be warned by other mens punishments, lest that poor creature, which we imagine to be the silliest and least able to do us harm, we finde the most heavy.

Of the BOAS.

IT was well known among all the *Romans*, that when *Regulus* was Governor or General in the *Punic* wars, there was a Serpent (neer the River *Bagrade*) killed with slings and stones, even as a Town or little City is overcome, which Serpent was an hundred and twenty foot in length: whose skin and cheek bones were reserved in a Temple at *Rome*, until the *Numantine* war.

And this History is more easie to be believed because of the Boas Serpent bred in *Italy* at this day: for we read in *Solinus*, that when *Claudius* was Emperor, there was one of them slain in the *Vatican* at *Rome*, in whose belly was found an Infant swallowed whole, and not a bone thereof broken. The *Germans* call this Serpent *Uncke*, and besides them I do not read of any other Name. Some have ignorantly confounded it with *Chersydrus*, an Adder of the earth, but upon what reason I do not know, only *Solinus* discoursing of *Calabria*, might give some colour to this opinion, when he saith, *Calabria Chersydris est frequentissima, & boam gignit quem Anguem ad immensam molem ferunt coalescere*: that is to say, *Calabria* is full of Earth-adders, and it breedeth the Boas, which Snake some affirm will grow into a monstrous stature. Out of which words, there is no wise man can collect, that the Boas and the Adder of the earth are all one thing.

The *Latins* call it *Boa* and *Bova* of *Bos*, because by sucking Cows milk it so increaseth, that in the end it destroyeth all manner of herds, Cattel and Regions. And our domestical Snakes and Adders, will also suck milk from Kine, as in all the Nations of the world is most manifest to them that will observe the same.

The *Italians* do usually call them, *Serpeda de Aqua*, a Serpent of the water, and therefore all the Learned expound the *Greek* word *Hydra* for a Boas. *Cardan* saith, that there are of this kinde in the Kingdom of *Senega*, both without feet and wings, but most properly they are now found in *Italy*, according to these verses;

*Boa quidem Serpens quem tellus Italia nutrit
Hunc bubulum plures lac enutrire docent.*

Which may be Englished thus;

*The Boas Serpent which Italy doth breed,
Men say, upon the Milk of Cows doth feed.*

Their fashion is in seeking for their prey among the herds, to destroy nothing that giveth suck so long as it will live, but they reserve it alive until the milk be dried up, then afterward they kill and

eat

and eat it, and so they deal with whole flocks and herds. The poyson of it, saith *Festus*, maketh tumor and swelling in the body, whereunto all other agree, except *Albertus*, who in this point agrees not with himself, for in one place he saith, that they are venomous, and their teeth also like other Dragons, in another place he saith, their poyson is very weak, and not to be regarded, because they be Dragons of the third order or division. They go all upon their belly, and so I will conclude their story with *Mantuan*.

Turpi Boa flexilis alio.

That is to say;

The filthy Boas on his belly moves.

Of the CHAMÆLEON.

IT is very doubtful whether a Chamæleon were ever known to the ancient *Hebrews*, because there is no certainty among them for the appellation thereof, some affirming one thing, and some another. We read *Levit. 11.* among other beasts there forbidden to be eaten of, *Koab*, or *Koach*, which *Rabbi Kimbi* interpreteth a kinde of Crocodile, (*Hazab*), *Rabbi Jonas* in the *Arabian*, *Hardun*, and so also doth *Avicen*. The *Chaldee*, *Koaba*; the *Persians*, *An Sanga*; the *Septuagints* and *S. Jerom*, a Chamæleon. The self same word is found *Levit. 14.* which the *Jews* do vulgarly at this day take for *Senicus*, a Crocodile of the earth. The word *Oab* or *Oach*, seemeth to come neer to this, which is sometimes interpreted a Tortoise, a Dragon, or a Monkey. And *Oas* by *Sylvaticus*, is translated a Salamander. *Kaath* by the *Jews*, is translated a Cuckow, a Jay, a Pelican and an *Onocratua*: and in the second of *Sephoni* for a Chamæleon. Some have framed an *Hebrew* word *Gamalion*, which is absurd, for *Gamelon*. *Zamelon*, *Aamelon*, *Hamaleon*, and *Meleon*, are but corrupted terms of Chamæleon, as *Isidorus* well observeth, or else signifieth some of the kindes of Lizards or Stellions, as is manifest in *Albertus*, and other learned Writers. Therefore I will not blot more paper about the *Arabian* beasts, *Harbe* and *Alharbe*, *Alarbian* or *Hardon*, *Hardun*, or *Alharba*, but leave them to the judgement of those, who delight in the investigation of such secrets.

Chamæleon is a *Greek* word, from whence the *Latines*, and almost all Nations have borrowed the name of this Serpentine or creeping beast, except the *Germans*, and they only have fained names, as *Lindwarm* in *Albertus*, that is, a Worm of the Wood, and *Rattader* by *Gesner*, that is, a Ratmouse, because in quantity and composition it resembleth both those creatures. Some *Latines* by reason of the similitude it holdeth with a Lizard, call it *Muri Lacertius*, a Mouse Lizard. The *Greek* word *Chamæleon*, signifieth a low and humble Lion, because in some parts and members, he resembleth that lofty and courageous beast. So do they derive the name of certain low and short herbs, from great and tall trees, as *Chamæcyparissus*, *Chamædris*, and *Chamæpitys*. Shrubs of Plumtree, Heath, Cypres, Germanander, and ground Ivy, from the Cherry, the Cypres, the Cedar, and the Pine tree. And thus much for the name of the Chamæleon.

The Countries breeding Chamæleons, are *Africa*, *Asia*, and *India*, and for the quantity thereof I do finde divers descriptions, some particular, as in *Belonius*, and *Sealiger*, and some general in other Writers, all which I purpose briefly and successively to expresse in this place. It is said (saith *Belonius*) that the Frog and the Chamæleon are like one to the other, because they use the same Art and industry in taking their meat: and to the intent that this thing may more evidently appear, both by the description and the picture, I have thought good to entreat of the Chamæleon, amongst the Water-beasts, because it liveth for the most part in moist, marshy, and Fenny places. I have seen of them two kindes, one, a lesser kinde in *Arabia*, being of a whitish colour, all set over with yellowish or reddish spots, and in quantity not exceeding the green Lizard. The other, in the hot places of *Egypt*, being twice as big in quantity as the *Arabian*, and of a changeable colour, betwixt white, green, brown and yellow, for which occasion some have called it *versicolor Chamæleon*, that is, a turn-coat-coloured Chamæleon. But both these kindes of Chamæleons have a copped head, like to a Camel, and two bones at the top of their brows standing up on either side, and hanging out: their eyes are most clear and bright, about the bignesse of a pease, only covered with a skin, so that their appearance outward, exceedeth not the quantity of a Millet-seed. They are very flexible, turning upwards and downwards, and are able at one time to look two several ways, distinctly upon two several objects, wherein they exceed all other beasts. It is a heavy and dull beast, like the Salamander, neither can it run, but like a Lizard, wherefore it is not afraid of the sight of men, neither doth it run from their presence, neither is it easily provoked to harm or bite a man: it climbeth little trees for fear of Vipers and horned Serpents.

Some have thought that it never eateth meat, but is nourished with the winde, because it draweth in very eagerly many times the winde into the belly, whereby it swelleth; for it hath great lights stretched all along the sides of the belly: but this opinion is false, as shall be shewed hereafter, although it cannot be denied that it is *Oviparum patientissimum famis*: that is, The most induring famin among all other Egge-breeding-beasts, for it fasteth many times eight moneths: yea, a whole year together. In stead of nostrils and ears, it hath certain passages in those places, whereby it smelleth and heareth.

The opening of the mouth is very large, and it hath teeth on the neather and upper chap like saws, such as are in a Slo-worm, the tongue very smooth, half a hand breadth long, where withal it licketh in those insect Flyes, Horse-flies, Locusts, and Emets whereupon it feedeth: For it keepeth at the mouth a certain some, or moisture, and also upon the tail or backer parts, wherewithal those Flyes and other Creatures are so much delighted, that they follow the Chamæleon, and as it were bewitched with the desire thereof, they fall upon the moisture to their own perdition; and this is to be noted, that this moisture or some in the backer parts of the belly is like a Sponge. It hath a line or strake under the belly, indented as it were with scales, white in colour, and stretched out to the tail; but the feet seem to be of an artificial work of Nature, wherein is a curious difference betwixt the former and the hinder: for the forefeet have three fingers or claws within, and two without: the hinder-feet on the contrary, have two without and three within. It layeth twelve long Egges, such as Lizards do; the heart is not much greater then the heart of a domestical Mouse or Rat: it hath two laps of a Liver, whereof the left is the greater, unto which cleaveth the skin of the gall, the which skin exceedeth not in quantity a Barley corn. And thus far the description by *Belonius*.

In the next place for the better manifestation of the nature of this beast, I will also adde the description that *Scaliger* maketh thereof. For he saith, that when *Johannes Landius* was in the farthest parts of *Syria*, he saw five Chamæleons, whereof he bought one, which with his tongue did very suddenly take off a Fly from his breast: Wherefore in the dissection of the said Chamæleon, he found that the tongue thereof was as long as a hand breadth, hollow and empty, in the top whereof there was a little hole with filthy matter therein, wherewithal he took his prey: which thing seemed new and strange unto them which heretofore thought that a Chamæleon lived only by the air. His back was somewhat crooked, rising with spotted bunches like a Saw, like the Turbut-fish, his belly closed with short ribs, his eyes most beautiful, which he turneth every way without bending his neck: his colour white, green, and dusky: naturally green, somewhat pale on the back, but paler and neerer to white on the belly, yet was it beset all over with red, blew, and white spots.

It is not true that the Chamæleon changeth her self into all colours, upon green groweth greenesse, upon the dusky is tempered a dusky colour; but upon blew, red, or white, the native greenesse is not blemished or obscured, but the blew, white, and red spots yeeld a more lively and pleasant aspect; upon black, standeth brown, yet so as the green hew seemeth to be confounded with black, and it doth not change his own colour into a supposed colour, but when it is oppressed with fear or grief. That it liveth sometime of the air, a whole year or more, doth appear, because it eateth no meat during that time, but gaping with a wide mouth draweth in the air, and then shutting his chaps again his belly swelleth. Yea, I found one that constantly affirmed, that they turn themselves to the beams of the Sun, and gaping wide after them, follow them hard as it were to draw them in. They have five distinct claws upon every foot, with two of which they clasp the round boughs or twigs of trees, as Parrats do when they sit upon their perches, and these claws stand not as other Birds do, three together and one by it self, but in imparity or dissimilitude, three on the one side, and two on the other, and

so are parted with an inverse order, for the hinder and former are contrary one to the other, so as if there be three claws on the inside, and two on the outside of the leg before, then are there three on the outside behinde, and two on the inside: And thus much I received from *Langius*. So far *Scaliger*.

Aristotle.
Solinus.

Now we will proceed to the particular description of their parts, as we finde them recorded in other Writers, leaving those brief and pregnable Narrations of *Bellonius* and *Scaliger*. And first of all for the figure and outward shape of their bodies, then for their colour, and the reasons of their mutability and variation of colour. For the figure and shape of their bodies, *Pliny* is of opinion, that a *Chamæleon* is like to a *Crocodile* of the earth, except in the sharp bending of the back-bone, or the length or greatnesse of the tail. Some say that the whole parts of the body doth represent a *Lizard*, excepting that the sides are joyned to the belly, and the back-bone standeth up as in *Fishes*. *Arnoldus* saith it resembleth a *Stellion* if the legs were not straighter and higher: but the truth is, it is a four-footed-beast, much like to a *Lizard*, yet it goeth higher from the earth, and always gapeth, having a rough skin all over the body like a *Crocodile*, and is also full of scabs.

The length of it from the tip of the nose to the rump of the tail is seven or eight fingers, the height of them five fingers, and the legs alone, three fingers and a half. The length of the tail eight or nine fingers, the back-bone eminent and standing up, crested or indented all throughout to the tip of the tail, but near the rump, the crests are more low and lesse visible. On either side at the root of the ribs stand bony eminent bunches, from which descendeth a line, and is extended throughout the length of the tail on both sides, and if it were not for these bunches the turnings about, and the other three in the lower part, it would be so exasperated or extenuated toward the end like to the tail of a *Rat* or great *Mouse*. The middle place betwixt the bottom of the belly and the top of the back, containeth an angle or flexure of sixteen ribs, after the fashion or proportion of a *Greek Lambdas*, except that the angle thereof be more wide and patent, which looketh backward toward the tail, and within these ribs is the whole hanch of the body and belly, contained in a round compass on either side. Being black, it is not unlike the *Crocodile*, and being pale, it like to the *Lizard*, set over with black spots like a *Leopard*. It changeth colour both in the eyes, tail, and whole body, always into the colour of that which is next it, except red and white, which colours it cannot easily undertake, so that it deceiveth the eyes of the beholders, turning black into green, and green into blew, like a *Player*, which putteth off one person, to put on another: according to these verses of *Ovid*;

*Id quoque quod ventis animal nutritur & aura,
Protinus assimilat, tetigit quoscunq; colores.*

In English thus;

*The Beast that liveth by winde and weather,
Of each thing touched taketh colour.*

The reasons of this change or colour are the same which are given of the *Buffe* and *Polypus* Fish; namely, extremity of fear, the thinnesse, smoothnesse, and baldnesse of the skin. Whereupon *Tertullian* writeth thus; *Hoc soli Chamæleonti datum quod vulgo dictum est de suo corio ludere*: That is to say, This is the only gift of nature to a *Chamæleon*, that according to the common Proverb it deceiveth with his skin: meaning that a *Chamæleon* at his own pleasure can change the colour of his skin. Whereupon *Erasmus* applyeth the proverb, *de alieno corio ludere*, to such as secure themselves with other mens peril. From hence also cometh another proverb, *Chamæleontos rumei aboloomatos*, more mutable then a *Chamæleon*, for a crafty, cunning, inconstant fellow, changing himself into every mans disposition; such a one was *Alcibiades*, who was said to be in *Athens*, and of such a man resembling this beast, did *Alciatus* make this emblem against flatterers:

*Semper hiat, sumper tenuem qua vescitur auram,
Reciprocatur Chamæleon,
Et mutat faciem, varios sumitque colores,
Præter rubrum vel candidum.*

*It alway gapes, turning in and out that breath
Whereon it feeds: and often changeth hew:
Now black and green, and pale, and other colors bath,
But red and white Chamæleons do eschew:*

*Sic & adulator populari vescitur aura,
Hiansque cuncta devorat.
Et solum mores imitatur principis atros,
Albi & pudici nescius.*

That is to say;

*So Clawbacks feed on vulgar breath as bread,
With open mouth devouring fame and right,
Princes black-voices praise, but virtues dread,
Designed in nature by colours red and white.*

A *Chamæleon* of all Egge-breeding Beasts is the thinnest, because it lacketh bloud, and the reason hereof is by *Aristotle* referred to the disposition of the soul: For he saith, through overmuch fear, it taketh upon it many colours, and fear through the want of bloud and heat is a refrigeration of this Beast.

Plutarch also calleth this Beast a meticulous and fearful beast, and in this cause concludeth the change of his colour, not as some say, to avoid and deceive the beholders and to work out his own happinesse, but for meer dread and terrour. *Johannes Ursinus* assigneth the cause of the change

change of Chamæleons colour, not to fear, but to the meat and to the air, as appeareth by these verses ;

Non timor, imò cibus, nimirum limpidus aer,

Ambo simul vario membra colore novant.

Which may be thus Englished ;

Not fear, but meat which is the air thin,

New colours on his body doth begin.

But I for my part do assign the true cause to be in the thinnesse of their skin, and therefore may easily take impression of any colour, like to a thin fleak of a horn, which being laid over black, seemeth black, and so over other colours : and besides, there being no hinderance of blood in this Beast, nor Intrails, except the lights, the other humors may have the more predominant mutation, and so I will conclude the discourse of the parts and colour of a Chamæleon, with the opinion of *Kiranides*, not that I approve it, but to let the Reader know all that is written of this Subject, his words are these ; *Chamælem singulis horis diei mutat colorem*, A Chamæleon changeth his colour every hour of a day.

This Beast hath the face like a Lyon, the feet and tail of a Crocodile, having a variable color, as you have heard, and one strange continued nerve from the head to the tail, being altogether without flesh, except in the head, cheeks, and uppermost part of the tail, which is joyned to the body ; neither hath it any blood but in the heart, eyes, and in a place above the heart, and in certain veins derived from that place, and in them also but a very little blood.

There be many membranes all over their bodies, and those stronger then in any other Beasts. From the middle of the head backward, there ariseth a three square bone, and the fore part is hollow and round like a pipe, certain bony brims, sharp and indented, standing upon either side. Their brain is so little above their eyes, that it almost toucheth them, and the upper skin being pulled off from their eyes, there appeareth a certain round thing like a bright ring of Brasse, which *Niphus* calleth *Palla*, which signifieth that part of a Ring, wherein is set a pretious stone.

The eyes in the hollow within are very great, and much greater then the proportion of the body, round and covered over with such a skin as the whole body is, except the apple, which is bare, and that part is never covered. This apple stands immoveable, not turned, but when the whole eye is turned at the pleasure of the Beast. The snout is like to the snout of a Hog-ape, always gaping, and never shutting his mouth, and serving him for no other use but to bear his tongue and his teeth : his gums are adorned with teeth as we have said before, the upper lip being shorter and more turned in then the other. Their throat and artery are placed as in a Lizard : their lights are exceeding great, and they have nothing else within their body. Whereupon *Theophrastus* as *Plutarch* witnesseth, conceiveth, that they fill the whole body within, and for this cause it is more apt to live on the air, and also to change the colour.

It hath no Spleen or Milt, the tail is very long, at the end and turning up like a Vipers tail, winded together in many circles. The feet are double cloven, and for proportion resemble the thumb and hand of a man, yet so, as if one of the fingers were set neer the side of the thumb, having three without and two within behinde, and three within, and two without before ; the palm betwixt the fingers is somewhat great : from within the hinder-legs, there seem to grow certain spurs. Their legs are straight, and longer then a Lizards, yet is their bending alike, and their nails are crooked and very sharp. One of these being dissected and cut asunder, yet breatheth a long time after, they goe into the caves and holes of the earth like Lizards, wherein they lie all the Winter time, and come forth again in the Spring, their pace is very slow, and themselves very gentle, never exasperated but when they are about wilde Fig-trees.

They have for their enemies the Serpent, the Crow and the Hawk. When the hungry Serpent doth assault them, they defend themselves in this manner, as *Alexander Mindius* writeth ; they take in their mouths a broad and strong stalk, under protection whereof as under a buckler, they defend themselves against their enemy the Serpent, by reason that the stalk is broader then the Serpent can gripe in his mouth, and the other parts of the Chamæleon so firm and hard, as the Serpent cannot hurt them : he laboureth but in vain to get a prey, so long as the stalk is in the Chamæleons mouth. But if the Chamæleon at any time see a Serpent taking the air, and sunning himself under some green tree, he climbeth up into that tree, and setleth himself directly over the Serpent, then out of his mouth he casteth a thread like a Spider, at the end whereof hangeth a drop of poyson as bright as any pearl, by this string he letteth down the poyson upon the Serpent, which lighting upon it, killeth it immediately. And *Scaliger* reporteth a greater wonder then this in the description of the Chamæleon, for he saith, if the boughs of the tree so grow as the perpendicular line cannot fall directly upon the Serpent, then he so correcteth and guideth it with his fore-feet, that it falleth upon the Serpent within the mark of a hairs breadth.

The Raven and the Crow are also at variance with the Chamæleon, and so great is the adverse nature betwixt these twain, that if the Crow eat of the Chamæleon being slain by him, he dyeth for it, except he recovereth his life by a Bay-leaf, even as the Elephant after he hath devoured a Chamæleon, saveth his life by eating of the Wilde-olive-tree. But the greatest wonder of all is, the hostility which *Pliny* reporteth to be betwixt the Chamæleon and the Hawk. For he writeth,

that when a Hawk flyeth over a Chamæleon, she hath no power to resist the Chamæleon, but falleth down before it, yeelding both her life and limbs to be devoured by it; and thus that devourer that liveth upon the prey and blood of others, hath no power to save her own life from this little Beast.

A Chamæleon is a fraudulent, ravening and gluttonous Beast, impure, and unclean by the law of GOD, and forbidden to be eaten: in his own nature wilde, yet counterfeiting meeknesse, when he is in the custody of man. And this shall suffice to have spoken for the description of this Beast, a word or two of the Medicines arising out of it, and so a conclusion.

I finde that the Ancients have observed two kinde of Medicines in this Beast, one magical, and the other natural, and for my own part, although not able to judge of either, yet I have thought good to annex a relation of both to this History. And first of the natural medicines, *Democritus* is of opinion that they deserve a peculiar Volume, and yet he himself telleth nothing of them worthy of one page, except the lying vanities of the *Gentiles*, and superstitions of the *Grecians*. With the gall, if the suffusions and leprous parts of the body be anointed three days together; and the whitenesse of the eyes, it is believed to give a present remedy: and *Archigenes* prescribeth the same for a medicine for the taking away of the unprofitable and pricking hairs of the eye-brows. It is thought if it be mixed with some sweet composition that it hath power to cure a quotidian Ague. If the tongue of a Chamæleon be hung over an oblivious and forgetful person, it is thought to have power to restore his memory.

Marcellus.

Rhazes.

Kiranides.

Trallianus.

The Chamæleon from the head to the tail, hath but one Nerve, which being taken out and hung about the neck of him that holdeth his head awry, or backward, it cureth him. The other parts have the same operation as the parts of the Hyæna and the Sea-calf. If a Chamæleon be sod in an earthen pot, and consumed till the water be as thick as Oyl, then after such seething take the bones out, and put them in a place where the Sun never cometh, then if you see a man in the fit of the Falling-sicknesse, turn him upon his belly, and anoint his back from the *Os sacrum* to the ridge-bone, and it will presently deliver him from the fit: but after seven times using, it will perfectly cure him. The Oyl thus made must be kept in a Box. This medicine following is a present remedy against the Gowt. Take the head and feet of a Chamæleon, cut off also the outward parts of the knees and feet, and then keep by themselves those parts: that is to say, the parts of the right leg by themselves, and the parts of the left leg by themselves, then touch the Nail of the Chamæleon with your thumb and right finger of your hand, dipping the tips of your fingers of the right hand in the blood of the right foot of the Beast: and so likewise the fingers of the left hand in the blood of the left foot, then include those parts in two little pipes, and so let the sick person carry the right parts in the right hand, and the left parts in the left hand, until he be cured: and this must be remembered, that he must touch every morning about the Sun-rising the said Chamæleon, yet living and lapped in a linnen cloth, with those parts that are oppressed with the Gowt.

The like superstitious and Magical devises are these that follow, as they are recorded by *Pliny* and *Democritus*. The head and throat being set on fire with wood of Oak, they believe to be good against Thunder and Rain, and so also the liver burned on a Tyle. If the right eye be taken out of it alive, and applyed to the whitenesse of the eyes in Goats milk, it is thought to cure the same. The tongue bound to a woman with child, preserveth her from danger in childe-birth, if the same tongue be taken from the Beast alive, it is thought it fore-sheweth the event of judgement. The Heart wrapped in black Wooll of the first shearing, by wearing it cureth a quartane Ague; the right claw of the fore-feet bound to the left arm with the skin of his cheeks, is good against robberies and terrors of the night, and the right pap against all fears. If the left foot be scorched in a furnace with the herb Chamæleon, and afterward putting a little Ointment to it, and made into little Pasties, so being carried about in a wooden box, it maketh the party to go invisible. The right shoulder maketh a man to prevail against his adversaries, if they do but tread upon the nerves cast down upon the earth. But the left shoulder they consecrate the same to monstrous dreams, as if that thereby a man might dream what he would in his own person and effect, the like in others.

With the right foot are all Palsies resolved, and with the left foot all Lethargies: the Wine wherein one side of a Chamæleon hath been steeped, sprinkled upon the head, cureth the ach thereof. If Swines Grease be mingled with the powder of the left foot or thigh, and a mans foot be anointed therewith, it bringeth the Gowt, by putting the gall into fire, they drive away Serpents; and into Water, they draw together Weasels, it pulleth off hair from the body, so also doth the Liver, with the lights of a Toad; likewise the Liver dissolveth amorous Inchantments. Melancholy men are cured by drinking the juyce of a Chamæleon out of a Chamæleons skin. They also say, that the Intrails and dung of this Beast washed in the urine of an Ape, and hung up at our enemies gates, causeth reconciliation.

With the tail they bring Serpents asleep, and stay the flowing of the floods and waters: the same mingled with Cedar and Myrrhe, bound to two rods of Palm, and struck upon water, causeth all things that are contained in the same water to appear; but I would to GOD that such Magicians were well beaten with Rods of stronger wood, until they forsook these magical fooleries: And thus much for the story of the Chamæleon.

of the COCKATRICE.

THIS Beast is called by the *Grecians*, *Basiliscos*, and the *Latines* *Regulus*, because he seemeth to be the King of Serpents, not for his magnitude or greatnesse. For there are many Serpents bigger then he, as there be many four-footed Beasts bigger then the Lyon, but because of his stately pace, and magnanimous minde; for he creepeth not on the earth like other Serpents, but goeth half upright, for which occasion all other Serpents avoid his sight. And it seemeth nature hath ordained him for that purpose: for beside the strength of his poyson which is uncurable, he hath a certain combe or Coronet upon his head, as shall be shewed in due place. It is also call'd *Sibilus*, as we read in *Isidorus*, *Sibilus enim occidit antequam mordeat vel exurat*: The Cockatrice killeth before it burneth. The *Hebrews* call it *Petben*, and *Curman*, also *Zaphna*, and *Zaphnaini*. The *Chalde*, *Harmene*, and also *Carmene*: The *Egyptian*, *Urem*; the *Germans*, *Ein Ertz Schlengle*; the *French*, *Un Basilic*; the *Spaniards* and *Italians*, *Basilisco*.

There is some question amongst Writers, about the generation of this Serpent: for some (and those very many and learned) affirm him to be brought forth of a Cocks Egge. For they say that when a Cock groweth old, he layeth a certain Egge without any shell, in stead whereof it is covered with a very thick skin, which is able to withstand the greatest force of an easie blow or fall. They say moreover, that this Egge is laid only in the Summer time, about the beginning of Dog-days, being not long as a Hens Egge, but round and orbicular: Sometimes of a dusty, sometimes of a boxy, sometimes of a yellowish muddy colour, which Egge is generated of the putrefied seed of the Cock, and afterward set upon by a Snake or a Toad, bringeth forth the Cockatrice, being half a foot in length, the hinder-part like a Snake, the former part like a Cock, because of a treble combe on his fore-head.

But the vulgar opinion of *Europe* is, that the Egge is nourished by a Toad, and not by a Snake; howbeit in better experience it is found that the Cock doth sit on that Egge himself: whereof *Levinus Lemnius* in his twelfth Book of the hidden miracles of nature hath this discourse, in the fourth Chapter thereof. There happened (saith he) within our memory in the City of *Pirizaa*, that there were two old Cocks which had laid Egges, and the common people (because of opinion that those Egges would engender Cockatrices) laboured by all means possible to keep the said Cocks from sitting on those Egges, but they could not with clubs and staves drive them from the Egges, until they forced to break the Egges in sunder, and strangle the Cocks. But this point is worth inquiry, whether a Cock can conceive an Egge, and after a certain time lay the same without a shell. I for my part am perswaded, that when a Cock groweth old, and ceaseth to tread his female in the ordinary course of nature, which is in the seventh or ninth year of his age, or at the most in the fourteenth, there is a certain concretion bred within him by the putrefied heat of his body, through the staying of his seed generative, which hardeneth unto an Egge, and is covered with such a shell, as is said already: the which Egge being nourished by the Cock or some other beast, bringeth forth a venomous Worm, such as are bred in the bodies of men, or as Wasps, Horse-flies, and Caterpillers engendered of Horse-dung, or other putrefied humors of the earth:

and so out of this Egge may such a venomous Worm proceed, as in proportion of body, and pestiferous breath, may resemble the *African Cockatrice* or *Basilisk*, and yet it is not the same whereof we purpose here to intreat, but will acknowledge that to be one kinde of *Cockatrice*, but this kinde is generated like other Serpents of the earth, for as the ancient *Hermes* writeth, it is both false and impossible, that a *Cockatrice* should be hatched of a *Cocks* Egge. The same writer maketh mention of a *Basilisk* ingendered in dung, whereby he meaneth the *Elixir* of life, wherewithal the *Alchymists* convert metals.

The *Egyptians* hold opinion, that these *Cockatrices* are ingendered of the Egges of the Bird called *Ibis*, and therefore they break those Egges wheresoever they finde them: and for this cause in their Hieroglyphicks, when they will signifie a lawful execution after an upright judgment, and sound institution of their fore-fathers, they are wont to make an *Ibis*, and a *Cockatrice*.

Pliny.
Tector.
Avicenna.
Ælianus.
Solinus.

The Countries breeding or bringing forth these *Cockatrices*, are said to be these: First *Africk*, and therein the ancient seat or land of the *Turks*, *Nubia*, and all the Wildernesse of *Africa*, and the Countries *Cyrenes*. *Galen* among the Physitians only, doubteth whether there be a *Cockatrice* or no, whose authority in this case must not be followed, seeing it was never given to mortal man to see and know every thing, for besides the holy Scriptures unavoidable authority, which both in the prophesie of *Esay* and *Jeremy*, maketh mention of the *Cockatrice* and her Egges: there be many grave humane Writers, whose authority is irrefragable, affirming not only that there be *Cockatrices*, but also that they infect the air, and kill with their sight. And *Mercurialis* affirmeth, that when he was with *Maximilian* the Emperor, he saw the carcase of a *Cockatrice*, reserved in his treasury among his undoubted monuments. Of this Serpent the Poet *Georgius Pictorius* writeth on this manner;

*Rex est Serpentum Basiliscus, quem modo vincunt
Mustela insultus, sevaque bella fera.
Lernaum vermem Basiliscum fœda Cyrene
Producit cunctis maxime perniciem.*

*Et nasci ex ovo galli, si credere fas est,
Decrepiti, infimo, sole nitente, docent.
Sed quoniam olfactu lœdit, visuque ferarum
Omne genus, credas nulla tenere bona.*

That is to say;

*The Basilisk the Serpents King I finde,
Yet Weasels him do overcome in warre,
The Cyren land him breeds of Lernaes kinde,
They to all other a destruction are:*

*And if we may believe, that through the heat of Sun,
In old Cocks Egges this beast is raised first,
Or beasts by sight or smell thereof are all undone,
Then is't not good, but of his kinde the worst.*

We do read that in *Rome*, in the days of Pope *Leo* the fourth, there was a *Cockatrice* found in a Vault of a Church or Chappel, dedicated to Saint *Lucea*, whose pestiferous breath had infected the air round about, whereby great mortality followed in *Rome*: but how the said *Cockatrice* came thither it was never known. It is most probable that it was created and sent of *GOD* for the punishment of the City, which I do the more easily believe, because *Sigonius* and *Julius Scaliger* do affirm, that the said pestiferous beast was killed by the prayers of the said *Leo* the fourth.

I think they mean that by the authority of the said Bishop, all the people were moved to general fasting and prayer, and so Almighty *GOD* who was moved for their sins, to send such a plague amongst them, was likewise intreated by their prayers and suits, not only to reverse the plague, but with the same hand to kill the beast, wherewithal it was created: even as once in *Egypt* by the hand of *Moses*, he brought Grasse-hoppers and Lice, so by the same hand he drove them away again.

There is some small difference amongst the Writers, about the quantity and parts of this Serpent: which I will briefly reconcile. First *Ælianus* saith, that a *Cockatrice* is not past a span in compasse, that is as much as a man can gripe in his hand. *Pliny* saith, that it is as big as twelve fingers. *Solinus* and *Isidorus* affirm, that it is but half a foot long.

Avicen saith, that the *Arabian Harmena*, that is, the *Cockatrice*, is two cubits and a half long. *Nicander* saith, *Et tribus extenso porrectus corpore palmis*, that is, it is in length but three palms. *Aetius* saith, that it is as big as three handfuls. Now for the reconciliation of all these. It is to be understood, that *Pliny* and *Ælianus* speaketh of the Worm that cometh out of the *Cocks* Egge, in regard of the length, but not of the quantity, and so confound together that Worm and the *Cockatrice*. For it is very reasonable, that seeing the magnitude and greatnesse of the Serpent is concluded to be at the least a span in compasse, that therefore the length of it must needs be three or four foot at the shortest; else how could it be such a terror to other Serpents, or how could the fore-part of it arise so eminently above the earth, if the head were not lifted at the least a foot from the ground. So then we will take it for granted, that this Serpent is as big as a mans wrist, and the length of it answerable to that proportion.

It is likewise questionable whether the *Cockatrice* have wings or no: for by reason of his conceived generation from a *Cock*, many have described him in the fore-part to have wings, and in the hinder part to have a tail like a Serpent: And the conceit of wings seemeth to be derived from holy Scripture, because it is written *Esay* 14. vers. 29. *De radice colubri egredietur regulus & seminis ejus absorbens volucres*: That is to say, Out of the Serpents roots shall come a *Cockatrice*, and the fruit thereof shall be a fiery flying Serpent, as we translate it in English: but *Tremellius* the best Interpreter, doth render the *Hebrew* in this manner: *De radice Serpentis prodiit hemorrhas & fructus illius prester volans*: That is to say, word for word, Out of the root of the Serpent shall come the *Hemorrhe*,

Hemorrhoe, and the fruit thereof a flying *Prester*. Now we know, that the *Hemorrhoe* and the *Prester* are two other different kinds of Serpents from the Cockatrice; and therefore these Interpreters being the more faithful and learned, we will rather follow the holy Scripture in their translation, then the vulgar *Latine*, which is corrupted in very many places, as it is also *Esay* the 30. vers. 6. For *Prester* there is again in the vulgar translation the Cockatrice: and for this cause we have not described the Cockatrice with wings, as not finding sufficient authority to warrant the same.

The eyes of the Cockatrice are red, or somewhat inclining to blacknesse, the skin and carcase of this beast have been accounted precious, for we do read that the *Pergameni* did buy but certain pieces of a Cockatrice, and gave for it two pound and a half of silver: and because there is an opinion that no Bird, Spider, or venomous beast, will indure the sight of this Serpent, they did hang up the skin thereof stuffed, in the Temples of *Apollo* and *Diana*, in a certain thin net made of gold: and therefore it is said, that never any Swallow, Spider, or other Serpent durst come within those Temples: And not only the skin or the sight of the Cockatrice worketh this effect, but also the *Solinus*, flesh thereof, being rubbed upon the pavement, posts or walls of any House. And moreover, if *Scaliger*, Silver be rubbed over with the powder of the Cockatrices flesh, it is likewise said, that it giveth it a tincture like unto gold: and besides these qualities, I remember not any other in the flesh or skin of this Serpent.

The hissing of the Cockatrice which is his natural voyce, is terrible to other Serpents, and therefore as soon as they hear the same, they prepare themselves to fly away, according to these verses of *Nicander*;

*Illius auditis expectant nulla susurros,
Quantumvis magnis sinuent animalia spiras,
Quando vel in postum, vel opace devia silve,*

*Irriguisse locos, media sub luce diei
Excandescunt succensa furore feruntur,
Sed turpi conversa fuga dant terga retrorsum.*

Which may be Englished thus;

*When as the greatest winding Serpents bear,
(Feeding in Woods or pasture all abroad,
Although inclos'd in many spires, yet fear:
Or in mid-day the shadows near Brooks road,*

*The fearful hissing of this angry beast,
They run away, as fast as feet can lead them,
Flying his rage unto some other rest,
Turning their backs whereby they do escape him.*

We read also that many times in *Africa*, the Mules fall down dead for thirst, or else lye dead on the ground for some other causes, unto whose Carcase innumerable troops of Serpents gather themselves to feed thereupon: but when the Basilisk windeth the said dead body, he giveth forth his voyce: at the first hearing whereof, all the Serpents hide themselves in the near adjoining sands, or else run into their holes, not daring to come forth again, until the Cockatrice have well dined and satisfied himself. At which time he giveth another signal by his voyce of his departure: then come they forth, but never dare meddle with the remnants of the dead beast, but go away to seek some other prey. And if it happen that any other pestiferous beast come unto the waters to drink near the place wherein the Cockatrice is lodged, so soon as it perceiveth the presence thereof, although it be not heard nor seen, yet it departeth back again, without drinking, neglecting his own nutriment, to save it self from further danger; whereupon *Lucanus* saith;

Ælianus

Latet sibi submovet omne

Vulgus, & in vacua regnat Basiliscus arena.

Which may be thus Englished;

He makes the vulgar far from him to stand,

While Cockatrice alone reigns on the sand.

So then it being evident that the hissing of a Cockatrice is terrible to all Serpents, and his breath and poyson mortall to all manner of Beasts; yet hath God in nature not left this vile Serpent without an enemy; for the Weasel and the Cock are his triumphant Victors; and therefore *Pliny* saith well: *Huic tali monstro quod sapa enethum concupivere reges videre, mustelatum virus exitio est, adeo natura nihil placuit esse sine pari*: That is to say, This monster which even Kings have desired to see when it was dead, yet is destroyed by the poyson of Weasils, for so it hath pleased Nature, that no Beast should be without his match.

The people therefore when they take Weasils, after they have found the Caves and lodging places of the Cockatrices, which are easily discerned by the upper face of the earth, which is burned with their hot poyson, they put the Weasil in unto her; at the sight whereof the Cockatrice flyeth like a weakling overmatched with too strong an adversary, but the Weasil followeth after and killeth her. Yet this is to be noted, that the Weasil both before the fight and after the slaughter, armeth her self by eating of Rue, or else she would be poysoned with the contagious air about the Cockatrice: and besides this Weasil, there is no other beast in the World which is able to stand in contention against the Cockatrice, saith *Lennius*.

Again, even as a Lyon is afraid of a Cock, so is the Basilisk, for he is not only afraid at his sight, but almost dead when he heareth him crow, which thing is notoriously known throughout all *Africa*. And therefore all Travellers which go through the Deserts, take with them a Cock for their safe conduct against the poyson of the Basilisk: and thus the crowing of the Cock is a terror to Lyons, and a death to Cockatrices, yet he himself is afraid of a Kite.

There

There are certain learned Writers in *Saxony*, which affirm, that there are many kindes of Serpents in their Woods; whereof one is not unlike to a Cockatrice: for they say it hath a very sharp head, a yellow colour, in length not exceeding three Palms, of a great thicknesse, his belly spotted and adorned with many white pricks: the back blew, and the tail crooked and turned up: but the opening of his mouth is far wider then the proportion of his body may seem to bear. These Serpents may well be referred to Cockatrices: for howsoever their poyson is not so great as the Basilisks of *Africa*, (even as all other Serpents of the hot Countries are far more pestiferous then those which are bred in the cold Countries:) the very same reason perswadeth me, that there is a difference among the Cockatrices, and that those of *Saxonia* may differ in poyson from those in *Africa*, and yet be true Cockatrices: Besides this, there is another reason in *Lemnius*, which perswadeth the Reader there are no Cockatrices; because when the Countrey men set upon them to kill them with Clubs, Bills, or Forks, they receive no hurt at all by them, neither is their any apparent contagion of the air: but this is answered already, that the poyson in the cold Countrey is nothing so great as in the hot; and therefore in *Saxony* they need fear the biting, and not the airs infection.

Cardan relateth another story of a certain Serpent, which was found in the walls of an old decayed House in *Millan*, the head of it (saith he) was as big as an Egge, too big for the body, which in quantity and shape resembled a Stellion. There were teeth on either chap, such as are in Vipers. It had two legs, and those very short, but great, and their feet had claws like a Cats: so that when it stood it was like a Cock, for it had a bunch on the top of the head, and yet it wanted both feathers and wings: The tail was as long as the body, in the top thereof there was a round bunch as big as the head of an *Italian* Stellion. It is very likely that this beast is of the kinde of Cockatrices.

Now we are to intreat of the poyson of this Serpent, for it is a hot and venomous poyson, infecting the air round about, so as no other creature can live near him; for it killeth, not only by his hissing and by his sight, (as is said of the Gorgons,) but also by his touching, both immediately and mediately; that is to say; not only when a man toucheth the body it self, but also by touching a Weapon wherewith the body was slain, or any other dead beast slain by it; and there is a common fame, that a Horse-man taking a Spear in his hand, which had been thrust through a Cockatrice, did not only draw the poyson of it into his own body and so dyed, but also killed his Horse thereby. *Lucan* writeth;

*Quid prodest miseri Basiliscus cuspide Mauri
Transactis? velox currit pertela venenum,
Invadit manum equumque.*

In English thus;

*What had the Moore to kill
The Cockatrice with Spear,
Sith the swift poyson him did spill,
And Horse that did him bear.*

Ponzettus.

The question is in what part of this Serpent the poyson doth lie; some say in the head alone, and that therefore the Basilisk is deaf, because the Air which serveth the Organ of hearing, is resolved by the intensive calidity: but this seemeth not to be true, that the poyson should be in the head only, because it killeth by the fume of the whole body, and besides when it is dead it killeth by only touching it, and the Man or Beast so slain, doth also by touching kill another: Some again say, that the poyson is in the breast, and that therefore it breatheth at the sides, and at many other places of the body, through and betwixt the scales; which is also true, that it doth so breath: for otherwise the burning fume that proceedeth from this poysonful beast, would burn up the Intrails thereof, if it came out of the ordinary place; and therefore Almighty GOD hath so ordained, that it should have spiraments and breathing places in every part of the body, to vent away the heat, lest that in very short time, by the inclusion thereof, the whole compage and juncture of the body should be utterly dissolved, and separated one part from another.

But to omit inquiry in what part of his body the poyson lyeth, seeing it is most manifest that it is universal, we will leave the seat thereof, and dispute of the instruments and effects.

First of all therefore it killeth his own kinde, by sight, hearing, and touching. By his own kinde, I mean other Serpents, and not other Cockatrices, for they can live one beside another, for if it were true (which I do not believe) that the *Arabian Harmene* were any other Serpent then a Cockatrice, the very same reason that *Ardoynus* giveth of the fellowship of these two Serpents together, (because of the similitude of their natures) may very well prove that no divers kindes can live so well together, in safety without harming one another, as do one and the same kinde together. And therefore there is more agreement in nature betwixt a Cockatrice and a Cockatrice, then a Cockatrice and *Harmene*, and it is more likely that a Cockatrice doth not kill a Cockatrice, then that a Cockatrice doth not kill an *Harmene*: And again, Cockatrices are engendered by Egges, according to the holy Scripture; and therefore one of them killeth not another by touching, hissing, or seeing, because one of them hatcheth another. But it is a question whether the Cockatrice dye by the sight of himself: some have affirmed so much, but I dare not subscribe thereunto, because in

reason

reason it is impossible that any thing should hurt it self, that hurteth not another of his own kinde, yet if in the secret of nature GOD have ordained such a thing, I will not strive against them that can shew it.

And therefore I cannot without laughing, remember the old Wives tales of the Vulgar Cockatrices that have been in England; for I have oftentimes heard it related confidently, that once our Nation was full of Cockatrices, and that a certain man did destroy them by going up and down in Glasse, whereby their own shapes were reflected upon their own faces, and so they dyed. But this fable is not worth refuting, for it is more likely that the man should first have dyed by the corruption of the air from the Cockatrices, then the Cockatrices to die by the reflection of his own similitude from the glasse, except it can be shewed that the poysoned air could not enter into the glasse where the man did breath.

Among all living creatures, there is none that perisheth sooner then doth a man by the poyson of a Cockatrice, for with his sight he killeth him, because the beams of the Cockatrices eyes, do corrupt the visible spirit of a man, which visible spirit corrupted, all the other spirits coming from the brain and life of the heart, are thereby corrupted, and so the man dyeth: even as women in their monthly courses do vitiate their looking-glasses; or as a Wolf suddenly meeting a Man, taketh from him his voyce, or at the least-wile maketh him hoarse.

To conclude, this poyson infecteth the air, and the air so infected killeth all living things, and likewise all green things, fruits, and plants of the earth: it burneth up the grasse whereupon it goeth or creepeth, and the fowls of the air fall down dead when they come near his den or lodging. Sometimes he biteth a Man or a Beast, and by that wound the blood turneth into choler, and so the whole body becometh yellow as gold, presently killing all that touch it, or come near it. The symptoms are thus described by Nicander, with whose words I will conclude this History of the Cockatrice, writing as followeth:

*Quod ferit hic, multo corpus succenditur igne,
A membris resoluta suis caro defluit, & fit
Lurida & obscuro nigrescit opaca colore.
Nullæ etiam volucres quæ sædæ cadavera pascunt,
Sic occisum hominem tangunt, ut vultur, & omnes:
Huic similes alia, pluvie quoque nuntius aure*

Which may be Englished thus;

*When he doth strike, the body hurt is set on fire,
And from the members falleth off the flesh, with ball,
It rotten is, and in the colour black as any mire.
Refus'd of carrion-feeding-birds both great and small
Are all men so destroy'd, No Vulture or Biter fierce,
Or Weather telling-crow, or Desarts wildest beast,*

*Corvus, nec quæcumq; fera per devia lustra
Degunt, è tali capium sibi tabula carne.
Tum teter vacuum odor hinc exhalat in auras,
Atque propinquantes penetrant non segniter artus:
Sin cogente fame veniens approximet alet,
Tristia fata refert, certamq; ex aere mortem.*

*Which live in dens sustaining greatest famines force,
But at their tables do this flesh detest.
Then is the air repleat with's loathsome smell,
Piercing vital parts of them approaching neer,
And if a bird it tast to fill his hunger fell,
It dies assured death, none need it fear.*

Of the CORDIL.

Although I finde some difference about the nature of this living creature, and namely whether it be a Serpent or a Fish, yet because the greater and better part make it a Serpent, I will also bring it in his due order in this place for a venomous Beast. Gesner is of opinion, that it is no other but a Lizard of the Water; but this cannot agree with the description of Aristotle and Bellonius, who affirm the Cordil to have Gills like a Fish, and these are not found in any Lizard. The Grecians call this Serpent *Kordule*, and *Kordulos*, whereof the Latines derive or rather borrow their *Cordulus*, and *Cordyla*. Numenius maketh this a kinde of Salamander which the Apothecaries do in many Countries falsely sell for the *Scincus* or Crocodile of the earth, and yet it exceedeth the quantity of a Salamander, being much lesse then the Crocodile of the earth, having gills, and wanting fins on the sides, also a long tail, and according to the proportion of the body, like a Squirrels, although nothing so big, without scabs: the back being bald and somewhat black, and horrible rough, through some bunches growing thereupon, which being pressed do yeeld a certain humor like milk; which being laid to the Nostrils doth smell like poyson, even as it is in a Salamander. The beak or snout is very blunt or dull, yet armed with very sharp teeth. The claws of his fore-legs are divided into four, and on his hinder-legs into five: there is also a certain fleshy fin growing all along from the crown of his head, unto his tail upon the back, which when he swimmeth he erecteth, and by it is his body sustained in the water from sinking, for his body is moved with crooked winding, even as an Eel or a Lamprey.

The inward parts of this Serpent are also thus described. The tongue is soft and spungy, like as is the tongue of a Water-frog, wherewith as it were with glew, he draweth to his mouth, both Leeches and Worms of the earth, whereupon it feedeth. At the root of his tongue there is a certain bunch of flesh, which as I think supplyeth the place of the lights, for when it breatheth, that part is especially moved, and it panteth to and fro, so that thereby I gather, either it hath the lights in that place, or else in some other place near the jaws. It wanteth ribs as doth the Salamander, and it hath certain bones in the back, but not like the ordinary back-bone of other such Serpents. The heart is also all spungy, and cleaveth to the right side, not to the left: the left ear whereof supplyeth the place of the Pericardium,

The

The liver is very black, and somewhat cloven at the bending or sloap side: the milt somewhat red, cleaving to the very bottom of the ventricle. The reins are also very spongy, joynd almost to the legs, in which parts it is most fleshy, but in other places, especially in the belly and breast, it is all skin and bone. It also beareth egges in her place of conception, which is forked or double, which are there disposed in order, as in other living gristly creatures. Those Egges are nourished with a kinde of red fat, out of which in due time come the young ones alive, in as great plenty and number as the Salamanders. And these things are reported by *Bellonius*, besides whom I finde nothing more said, that is worthy to be related of this Serpent, and therefore I will here conclude the History thereof.

of the CROCODILE.

BEcause there be many kindes of Crocodiles, it is no marvel although some have taken the word *Crocodilus* for the Genus, and the several Species, they distinguish into the Crocodile of the earth and the water. Of the earth are sub-divided into the Crocodiles of *Bresilia*, and the *Scincus*: the Crocodiles of the water into this here described, which is the vulgar one, and that of *Nilus*; of all which we shall entreat in order, one successively following another. But I will not contend about the Genus or Species of this word, for my purpose is to open their several natures, so far as I have learned, wherein the works of Almighty God may be known, and will leave the strife of words to them that spend their wits about tearms and syllables only. Thus much I finde, that the Ancients had three general tearms for all egge-breeding Serpents. Namely, *Rana*, *Testudo*, *Lacerta*: And therefore I may forbear to entreat of *Crocodilus* as a Genus, and handle it as a Species, or particular kinde. The Hebrews have many words which they use for a Crocodile. *Koah*, Levit. 11. which the *Arabians* render *Hardun*; and the *Persians*, *Sanga*, which word cometh near the Latine word *Scincus* for a Crocodile of the earth, and yet that word *Koah* by Saint *Jerom*, and the *Septuagints* is translated a Chameleon.

In the same place of Leviticus the word *Zab* is interpreted a kinde of Crocodile wherewithall *David Kimhi* confoundeth *Greschint*, and *Rabbi Solomon*, *Faget*. The *Chaldees* translate it *Zaba*; the *Persians*, *An Rasu*; the *Septuagints*, a Crocodile of the earth; but it is better to follow Saint *Hierom* in the same, because the Text addeth according to his kinde, wherefore it is superfluous to adde the distinction of the Crocodile of the earth, except it were lawful to eat the Crocodiles of the water.

In *Exod. 8.* there is a fish called *Zephardea*, which cometh out of the waters and eateth men, this cannot agree to any fish in *Nilus*, save only the Crocodile; and therefore this word is by the *Arabians* rendered *Al Timasch*. Some do hereby

by understand *Pagulera*, *Grenelera*, and *Batrachoi*, that is great Frogs. *Aluka* by the most of the Jews understand a Horseleach, Prov. 30. but *David Kimbi* taketh and useth it for a Crocodile. For he saith, it is a great Worm, abiding neer the Rivers sides, and upon a sudden setteth upon men or cat-tel as they passe beside him. *Tisma* and *Alinsa* are by *Avicen* expounded for a Crocodile; and *Tenchea* for that Crocodile that never moveth his neather or under chap.

Strabo saith, that in the Province of *Arfinoe* in *Egypt*, there is a holy Crocodile, worshipped by the Inhabitants, and kept tame by the Priests in a certain Lake, this sacred Crocodile is called *Suchus*, and this word cometh neer to *Scincus*, which as we have said, signifieth any Crocodile of the earth, from which the *Arabian Tinsa* semeth also to be derived, as the *Egyptian Thampfai* doth come neer to the *Arabian Trenisa*. *Herodotus* calleth them *Champfai*, and this was the old *Ionian* word for a Vulgar Crocodile in hedges. Upon occasion whereof *Scaliger* saith, he asked a *Turk* by what name they call a Crocodile at this day in *Turky*, and he answered *Kimpfai*, which is most evidently corrupted from *Champfai*.

The *Egyptians* vulgarly call the Crocodile of *Nilus*, *Cocatrix*, the *Grecians*, *Neilokrokodelos*, generally *Krocodelos*, and sometimes *Dendrites*. The *Latines*, *Crocodylus*; and *Albertus*, *Crocodylus*, and the same word is retained in all languages of *Europe*. About the Etymology of this word, I finde two opinions not unprofitable to be rehearsed: the first, that *Crocodylus* cometh of *Croesus*, Saffron, because this Beast, especially the Crocodile of the earth, is afraid of Saffron, and therefore the Countrey people, to defend their Hives of Bees and Honey from them, strow upon the places Saffron. But this is too far fetched, to name a Beast from that which it feareth, and being a secret in nature, it is not likely that it was discovered at the first, and therefore the name must have some other investigation.

Isidorus saith, that the name *Crocodylus* cometh of *Croceus color*, the colour of Saffron, because such is the colour of the Crocodile: and this seemeth to be more reasonable. For I have seen a Crocodile in *England* brought out of *Egypt* dead, and killed with a Musket, the colour whereof was like to Saffron growing upon stalks in fields. Yet it is more likely, that the derivation of *Varinus* and *Eustathius* was the original, for they say that the shores of sands on the Rivers, were called *Croce* and *Crocule*: and because the Crocodiles haunt and live in those shores, it might give the name to the Beasts, because the water Crocodiles live and delight in those sands, but the land or earth Crocodiles abhor and fear them.

It is reported that the famous Grammarian *Artemidorus* seeing a Crocodile lying upon the sands, he was so much touched and moved therewith, that he fell into an opinion that his left leg and hand were eaten off by that Serpent, and that thereby he lost the remembrance of all his great learning and knowledge of Arts. And thus much for the name of this Serpent. *Aurelianus.*

In the next place we are to consider the Countries wherein Crocodiles are bred, and keep their habitation, and those are especially *Egypt*, for that only hath Crocodiles of both kinds, that is, of the water and of the land, for the Crocodiles of *Nilus* are *Amphibii*, and live in both elements: they are not only in the River *Nilus*, but also in all the pools near adjoining. The River *Bambotus* neer to *Atlas* in *Africa*, doth also bring forth Crocodiles: and *Pliny* saith, that in *Darat* a River of *Mauritania*, there are Crocodiles ingendered. Likewise *Apollonius* reporteth, that when he passed by the River *Indus*, he met with many Sea-horses and Crocodiles, such as are found in the River *Nilus*, and besides these Countries I do not remember any other, wherein are ingendered Crocodiles of the water, which are the greatest and most famous Crocodiles of all other. *Aristotle.*
Mela.
Diod. Sicul.

The Crocodiles of the earth, which are of lesser note and quantity, are more plentiful, for they are found in *Lybia*, and in *Bythinia*, where they are called *Azavitia*, and in the Mountain *Syagrus* in *Arabia*, and in the Woods of *India*, as is well observed by *Arianus*, *Dioscorides*, and *Hermolans*, and therefore I will not prosecute this matter any further.

The kinds being already declared, it follows that we should proceed to their quantity and several parts. And it appeareth that the water Crocodile is much greater, and more noble then the Crocodiles of the earth; for they are not above two cubits long, or sometimes eight at the most, but the other are sixteen, and sometimes more. And besides, these Crocodiles, if they lay their eggs in the water (saith *Bellunensis*) then their young ones are much greater, but if on the land, then they are lesser, and like the Crocodiles of the earth. In the River *Ganges* there are two kinds of Crocodiles, one of them is harmlesse, and doth no hurt to any creature, but the other is a devouring unsatiabable Beast, killing all that he layeth his mouth on, without all mercy or exorable quality, in the top of whose snout there groweth a bunch like a horn. *Marcellinus.*
Herodotus.
Isidore.

Now a Crocodile is like a Lizard in all points (excepting the tail, and the quantity of a Lizard,) yet it layeth an Egge no greater then a Gooses Egge, and from so small a beginning ariseth this monstrous Serpent, growing all his life long, unto the length of fifteen or twenty cubits. And as *Phalaris* witnesseth in the days of *Psammetichus* King of *Egypt*, there was one found of five and twenty cubits long: and before that, in the days of *Amasis*, one that was above six and twenty cubits long, the reason whereof was their long life, and continual growth.

We have shewed already, that the colour of a Crocodile is like to Saffron, that is betwixt yellow and red, more inclining to yellow then red, not unlike to the blacker kinde of *Chamaeleon*: but *Peter Martyr* saith, that their belly is somewhat whiter then the other parts. Their body is rough all over, being covered with a certain bark or rinde, so thick, firm, and strong as it will not yeeld (and especially about the back) unto a cart-wheel when the cart is loaded, and in all the upper parts,

parts, and the tail, it is impenetrable with any dart or spear, yea scarcely to a pistol or small gun, but the belly is softer, whereon he receiveth wounds with more facility: for as we shall shew afterwards, there is a kinde of Dolphin which cometh into *Nilus*, and fighteth with them, wounding them on the belly parts.

Cælius Rho.

The covering of their back is distinguished into divers divided shells, standing up far above the flesh, and towards the sides they are lesse eminent, but on the belly they are more smooth, white, and very penetrable. The eyes of a Crocodile of the water, are reported to be like unto a Swines, and therefore in the water they see very dimly, but out of the water they are sharp and quick sighted, like to all other four-footed Serpents that lay egges. They have but one eye-lid, and that groweth from the neather part of the cheek, which by reason of their eyes never twinckleth. And the Egyptians say, that only the Crocodile among all the living creatures in the water, draweth a certain thin bright skin from his fore-head over his eyes, wherewithall he covereth his sight: and this I take to be the only cause of his dim sight in the waters.

Herodotus.

Pliny.

Solinus.

Marcellinus.

The head of this Beast is very broad, and his snout like a Swines. When he eateth or biteth, he never moveth his neather or under chap. Whereof *Aristotle* giveth this reason, that seeing Nature hath given him so short feet, as that they are not able to hold or to take the prey, therefore the mouth is framed in stead of feet, so as it may more vehemently strike and wound, and also more speedily move and turn after the prey, and this is better done by the upper then the neather chap. But it is likely that he was deceived, for he speaketh of *Crocodilus marinus*, a Crocodile of the Sea: whereas there is no Crocodile of the Sea, but rather some other monster like a Crocodile in the Sea, and such peradventure *Albertus* saw, and thereupon inconsiderately affirmed, that all Crocodiles move their under-chaps, except the *Teuchea*. But the learned *Vessalius* proveth it to be otherwise, because that the neather-chap is so conjoynd and fastened to the bones of the temples, that it is not possible for to be moved. And therefore the Crocodile only among all other living creatures, moveth the upper-chap, and holdeth the under-chap unmoveable.

Albertus.

Herodotus.

The second wonder unto this, is that the Crocodile hath no tongue, nor so much as any appearance of a tongue. But then the question is, how it cometh to distinguish the saviours and tast of his meat. Whereunto *Aristotle* answereth, that this Crocodile is such a ravening Beast, that his meat carryeth not in his mouth, but is carryed into his stomach, like as other water Beasts, and therefore they discern saviours, and relish their meat more speedily then other; for the water or humor falleth so fast into their mouths, that they cannot stand long upon the tast or distast of their meat. But yet some make question of this, and they answer that most men are deceived herein, for whiles they look for his tongue upon his neather-chap, as it is in all other Beasts, and finde none, they conclude him to want that part: but they should consider, that the tongue cleaveth to the moveable part, and as in other Beasts the neather-chap is the seat of the tongue, because of the motion, so in this the tongue cleaveth to the upper-chap, because that it is moveable, and yet not visible as in other, and therefore is very hardly discerned. For all this, I rather conclude with the former Authors, that seeing it liveth both in the waters and on the land, and therefore it resembleth a fish and a beast, as it resembleth a Beast, *locum obtinet lingue*, it hath a place for a tongue; but as it resembleth a fish, *Elinguis est*, it is without a tongue. It hath great teeth standing out, all of them stand out before visibly when the mouth is shut, and fewer behinde. And whereas *Aristotle* writeth, that there is no living creature which hath both *dentes prominentes, & serratos*, that is, standing out, and divided like a saw, yet the Crocodile hath both. These teeth are white, long, sharp, and a little crooked and hollow, their quantity well resembling the residue of the proportion of the body: and some say, that a Crocodile hath three rows of teeth, like the Lyon of *Chins*, and like the Whale, but this is not an approved opinion, because they have no more then sixty teeth. They have also sixty joynts or bones in the back, which are also tyed together with so many nerves. The opening of his mouth reacheth to the place of his ears, and there be some Crocodiles in *Ganges* which have a kinde of little horn upon their noses or snout. The milt is very small, and this some say is only in them that bring forth egges, their stones are inward and cleave to their loyns. The tail is of the same length that the whole body hath, and the same is also rough and armed with hard skin upon the upper part and the sides, but beneath it is smooth and tender. It hath fins upon the tail, by the benefit whereof it swimmeth, as also by the help of the feet. The feet are like a Bears, except that they are covered with scales in stead of hair; their nails are very sharp and strong, for if it had a thumb as well as it hath feet, the strength thereof would over-turn a ship. It is doubtful whether it hath any place of excrement except the mouth: And thus much for the several parts of the Crocodile.

P. Martyr.

Ælianus.

The knowledge also of the natural actions and inclinations of Crocodiles is requisite to be handled in the next place, because that actions follow the members as sounds do instruments. First therefore, although *Aristotle* for the most part speaking of a Crocodile, calleth it *aquatilis & fluvialis*, yet it is not to confine it to the Waters and Rivers, as though it never came out of them like fishes, but only to note that particular kinde which differeth from them of the earth, for it is certain that it liveth in both elements, namely earth and water: and for the time that it abideth in the water, it also taketh air, and not the humor or moistnesse of the water, yet can they not want either humor of the water or respiration of the air: and for the day time it abideth on the land, and in the night in the water, because in the day, the earth is hotter then the water, and in the night the water warmer then the earth: and while it liveth on the land, it is so delighted with the Sun-

Herodotus.

Pliny.

shine,

thine, and lyeth therein so immoveable, that a man would take it to be stark dead. The eyes of a Crocodile (as we have said) are dull and blinde in the water, yet they appear bright to others, for this cause, when the *Egyptians* will signifie the Sun-rising, they picture a Crocodile looking upward to the earth, and when they will signifie the West, they picture a Crocodile diving in the water, and so for the most part the Crocodile lyeth upon the banks, that he may either dive into the water with speed, or ascend to the earth to take his prey.

By reason of the shortnesse of his feet, his pace is very slow, and therefore it is not only easie to escape from him by flight, but also if a man do but turn aside and winde out of the direct way, his body is so unable to bend it self, that he can neither winde nor turn after it. When they go under the earth into their caves, like to all fore-footed and egge-breeding Serpents, as namely Lizards, Stellions, and Tortoises, they have all their legs joyned to their sides, which are so retorted as they may bend to either side; for the necessity of covering their egges; but when they are abroad, and go bearing up all their bodies, then they bend only outward, making their thighs more visible. It is somewhat questionable, whether they lye hid within their caves four months or sixty days, for some Authors affirm one thing, and some another, but the reason of the difference is taken from the condition of the cold weather, for which cause they lye hid in the Winter time. Now forasmuch as the Winter in *Egypt* is not usually above four months, therefore it is taken that they lie but four months, but if it be by accident of cold weather prolonged longer, then for the same cause the Crocodile is longer time in the earth. During the time they lie hid, they eat nothing, but sleep (as it is thought) immoveably, and when they come out again, they do not cast their skins as other Serpents do.

The tail of a Crocodile is his strongest part, and they never kill any beast or man, but first of all they strike him down and astonish him with their tails, and for this cause, the *Egyptians* by a Crocodiles tail do signifie death and darknesse. They devour both men and beasts if they finde them in their way, or neer the bankes of *Nilus*, wherein they abide, taking sometimes a calf from the Cow his Dam, and carrying it whole into the waters. And it appeareth by the pourtraiture of *Neacles*, that a Crocodile drew in an Asse into *Nilus* as he was drinking, and therefore the Dogs of *Egypt* by a kinde of natural instinct, do not drink but as they run, for fear of the Crocodiles: whereupon came the proverb, *Ut Canis à Nilo bibit & fugit*, as a Dog at one time drinketh and runneth by *Nilus*.

When they desire fishes, they put their heads out of the water as it were to sleep, and then suddenly when they espy a booty, they leap into the waters upon them and take them. After that they have eaten and are satisfied, then they turn to the land again; and as they lie gaping upon the earth, the little bird *Trochilus* maketh clean their teeth, and is satisfied by the remainders of the flesh sticking upon them. It is also affirmed by *Arnoldus*, that it is fed with mud, but the holy Crocodile in the Province of *Arfinoe*, is fed with bread, flesh, wine sweet and hard, sod flesh and cakes, and such like things as the poor people bring unto it when they come to see it. When the *Egyptians* will write a man eating or at dinner, they paint a Crocodile gaping.

They are exceeding fruitful and prolificall, and therefore also in Hieroglyphicks they are made to signifie fruitfulness. They bring forth every year, and lay their egges in the earth or dry land. For during the space of thescore days they lay every day an Egge, and in the like space they are hatched into young ones, by sitting or lying upon them by course, the male one while, and the female another. The time of their hatching is in a moderate and temperate time, otherwise they perish and come to nothing, for extremity of heat spoyleth the egge, as the buds of some trees are burned and scorched off by the like occasion. The egge is not much greater then the egge of a Goose, and the young one out of the shell is of the same proportion. And so from such a small beginning doth this huge and monstrous Serpent grow to his great stature, the reason whereof (saith *Aristotle*) is, because it groweth all his life long, even to the length of ten or moe cubits. When it hath laid the egges, it carryeth them to the place where it shall be hatched, for by a natural providence and forelight; it avoideth the waters of *Nilus*, and therefore ever layeth her egges beyond the compasse of her floods: by observation whereof, the people of *Egypt* know every year the inundation of *Nilus* before it happen. And in the measure of this place it is apparent, that this Beast is not indued only with a spirit of reason, but also with a fatidical or propheticall geographical delineation, for so she placeth her egges in the brim or bank of the flood (before the flood cometh) that the water may cover the nest, but not her self that sitteth upon the egges. And the like to this is the building of the Beaver, as we have showed in due place before in the History of four-footed Beasts.

So soon as the young ones are hatched, they instantly fall into the depth of the water, but if they meet with Frog, Snail, or any other such thing fit for their meat, they do presently tear it in pieces, the dam biteh it with her mouth, as it were punishing the pusillanimity thereof, but if it hunt greater things, and be greedy, ravening, industrious and bloody, that she maketh much of, and killing the other, nourisheth and tendereth this above measure: after the example of the wisest men, who love their children in judgement, fore-seeing their industrious inclination, and not in affection, without regard of worth, vertue, or merit. It is said by *Philes*, that after the egge is laid by the Crocodile, many times there is a cruel stinging Scorpion which cometh out thereof, and woundeth the Crocodile that laid it. To conclude, they never prosper but neer the waters, and they live thescore years, or the age of a mans life.

The nature of this beast is to be fearful, ravening, malicious, and treacherous in getting of his prey, the subtilty of whose spirit, is by some attributed to the thinnesse of his bloud, and by other to the hardnesse of his skin and hide. How it dealeth with her young ones, we have shewed already, as it were trying their nature whether they will degenerate or no, and the like things are reported of the Asps, Cancers, and Tortoyfes of Egypt.

From hence came the conceit of *Pietas Crocodili*, the piety of the Crocodile. But as we have said, it is a fearful Serpent, abhorring all manner of noise, especially from the strained voyce of a man, and where he findeth himself valiantly assaulted, there also he is discouraged, and therefore *Marcellinus* saith of him, *Audax Monstrum fugacibus, at ubi audacem senserit timidissimum*: An audacious Monster to them that run away, but most fearful where he findeth resistance.

P. Martyr.

Some have written, that the Crocodile runneth away from a man if he wink with his left eye, and look stedfastly upon him with his right eye, but if this be true, it is not to be attributed to the vertue of the right eye, but only to the rarenesse of sight, which is conspicuous to the Serpent from one eye. The greatest terrour unto Crocodiles, as both *Seneca* and *Pliny* affirm, are the Inhabitants of the Isle *Tentyrus* within *Nilus*; for those people make them run away with their voyces, and many times pursue and take them in snares. Of these people speaketh *Solinus* in this manner: There is a generation of men in the Isle *Tentyrus* within the waters of *Nilus*, which are of a most adverse nature to the Crocodile, dwelling also in the same place. And although their persons or presence be of small stature, yet herein is their courage admired, because at the sudden sight of a Crocodile they are no whit daunted: for one of these dare meet and provoke him to run away. They will also leap into the Rivers and swim after the Crocodile, and meeting with it, without fear cast themselves upon the beasts back, riding on him as upon a Horse. And if the beast lift up his head to bite him, when he gapeth they put into his mouth a wedge, holding it hard at both ends with both their hands, and so as it were with a bridle, lead, or rather drive them captive to the land, where with their noise they so terrifie them, that they make them cast up the bodies which they had swallowed into their bellies: and because of this antipathy in nature, the Crocodiles dare not come neer to this Island.

The like thing we have before in our general discourse of Serpents, shewed to be in the *Indian Psylli* against the greatest Serpents. And *Strabo* also hath recorded, that at what time Crocodiles were brought to *Rome*, these *Tentyrites* followed and drove them. For whom there was a certain great pool or fish-pond assigned or walled about, except one passage for the beast to come out of the water into the Sun-shine: and when the people came to see them, these *Tentyrites* with nets would draw them to the land, and put them back again into the water at their own pleasure. For they so hook them by their eyes, and bottom of their bellies, which are their tenderest parts, that like as Horses broken by their Riders, they yeeld unto them, and forget their strength in the presence of these their Conquerors.

Peter Martyr in his third Book of his *Babylonian Legation*, saith, that from the City *Cair* to the Sea, the Crocodiles are not so hurtful and violent as they are up the River *Nilus* into the land, and against the stream. For as you go further up the River, neer the mountain and hilly places, so shall you finde them more fierce, bloody and unresistible, whereof the Inhabitants gave him many reasons. First, because that part of the River which is betwixt the City *Cair* and the Sea, is very full of all sorts of fishes, whereby the beasts are so filled with devouring of them, that they list not come out of the water on the land to hunt after men or cattel, and therefore they are the lesse hurtful, for even the Lyon and Wolf do cease to kill and devour when their bellies are full. But sometimes the Crocodiles beneath the River, follow the gales or troups of fish up the River, like so many fisher-men, and then the Countrey Fisher-men inclose them in nets, and so destroy them. For there is a very great reward proposed by the law of the Countrey, to him that killeth a Crocodile of any great quantity; and therefore they grow not great, and by reason of their smalnesse are lesse adventurous. For so soon as a great Crocodile is discovered, there is such watch and care taken to interrupt and kill him for hope of the reward, that he cannot long escape alive.

Thirdly, the Crocodiles up the River, towards the Mountains, are more hurtful, because they are pressed with more hunger and famine, and more seldom come within the terror of men, wherefore they forsake the waters, and run up and down to seek preys to satisfie their hunger, which when they meet withall, they devour with an unresistible desire, forced and pressed forward by hunger, which breaketh stone walls. But most commonly when the River *Nilus* is lowest, and sunck down into the channel, then the Crocodiles in the water do grow most hungry, because the fish are gone away with the floods; and then the subtile beast will heal and cover himself over with sand or mud, and so lie the bank of the River, where he knoweth the women come to fetch water, or the cattel to drink, and when he espyeth his advantage, he suddenly taketh the woman by the hand that she taketh up water withall, and draweth her into the River, where he teareth her in pieces and eateth her. In like sort dealeth he with Oxen, Cows, Asses, and other cattel. If hunger force him to the land, and he meet with a Camel, Horse, Asse, or such like beast, then with the force and blows of his tail he breaketh his legs, and so laying him flat on the earth, killeth and eateth him: for so great is the strength of a Crocodiles tail, that it hath been seen that one stroke thereof hath broken all the four legs of a beast at one blow.

There is also another peril by Crocodiles, for it is said that when *Nilus* falleth, and the water waxeth low, the Barks through want of winde, are fain by the Mariners to be tugged up the

the stream with long lines and cords: the subtle Crocodile seeing the same, doth suddenly with his tail smite the same line with such force, that either he breaketh it, or by his forcible violence cumbleth the Mariner down into the water, whom he is ready to receive with open mouth before he can recover. Yea many times by means thereof the Birk it self is tottered and reeleth; that the violent beast taketh a man out of it, or else clean over-turneth it, to the destruction of all that are in it.

Ælianus saith, that among the *Ombita* which are in *Arfinoe*, the Crocodiles are harmlesse, and having several names when they are called, do put their heads out of the water and take meat gently, which meat is the head and garbage of such sacrifices as are brought thither. But in another place he writeth, that among the *Ombita* or *Coptite*, it is not safe for a man, to fetch water from the River, or to wash their feet, or walk on the Rivers side, but with great caution and warinesse. For even those beasts which are most kindly used by men, do rage against their Benefactors, as namely the Crocodile, the *Ichneumon*, the Wilde-cats, and such like. And yet *Plutarch* in his Book *Utrahini*. *Marcellinus*. *malium*, saith, that the Priests, by the custom of meat-giving, have made some of them so tame, that they will suffer their mouths and teeth to be cleansed by men. And it is further said, that during the seven Ceremonial days of the nativity of *Apis*, there is none of them that sheweth any wilde trick or cruel part, but as it were by compact betwixt them and the Priests, they lay aside all cruelty and rage during that time.

And therefore *Cicero* writeth most excellently, saying, *Ægyptiorum morem quis ignoret? quorum imbuta mentes pravitate erroribus, quantum carnis cinam potius subierint, quam libum, aut aspidem, aut Crocodilum violenti*. That is to say, Who is ignorant of the custom of the *Ægyptians*? whose mindes are so seasoned and indued with erroneous wickednesse, that they had rather undergo any torment, then offer violence to an *Ibis*, an *Asp*, or a holy Crocodile. For in divers places, all these, and Cats also, were worshipped by the people, according to the saying of *Juvenal*.

Crocodilon adoratur pariter Ægypti,

— Illa pavet saturam Serpentibus Ibiu.

Which may be Englished thus, *Crocodiles are adored, they are afraid of a full belly of Serpents.*

This part of Egypt Crocodiles adore,

That, the Ibis, fed with Serpents store.

But the reason of divine worship or honour given to the Crocodiles are worth the noting, that the diligent Reader may the better have some taste of that ancient blindness whereby our forefathers were misled and seduced, to forsake the most glorious and ever-blessed principles of Divinity, for arguments of no weight.

First therefore the Idolatrous Priests thought there was some divine power in the Crocodile, because it wanted a tongue, for the Deity or Divine speech hath no need of a voyce to expresse his meaning, according to the saying of the *Greeks*, *Kai di apophon bainoon keleuthan kai dikes, ta thura agrikata diken*: For by a mute and silent way it ascendeth, and bringeth all things mortal to a vocal justice, which speaketh in action though not in voyce, even as all that is in the Crocodile, is action and not voyce.

Secondly, by reason of a certain thin smooth skin coming from the midst of his fore-head, *Calius*. wherewithall it covereth his eyes, so that when it is thought to be blinde, yet it seeth: even so is it with the Divine power, for even then when it is not seen, yet doth it see perfectly all mortal things.

Again, by their egges and nests they usually fore-shew the over-flowing of *Nilus*, to the infinite benefit of their Countrey wherein they live, for thereby the husband-men know when to till their land, and when not, when to sow and plant, and lead forth their flocks, and when not: which benefit is also ascribed to Divinity, and therefore the Crocodile is honoured with divine power.

Again, it layeth threescore egges, and liveth threescore years, which number of threescore, was in ancient time the first dimension of heaven and heavenly things.

Cicero also speaking against this *Ægyptian* vanity, saith, that they never consecrated a beast for a God, but for some apparent utility, as the *Ibis* for devouring of Serpents, and the Crocodile for being a terror to theeves; and therefore the *Arabian* and *Lybian* theeves durst not come over the River *Nilus* to rob the *Ægyptians* for fear of the Crocodiles.

There is a tale in *Diodorus Siculus* of the original of a Crocodiles divine worship, which although it cannot be but fabulous, yet I have thought good to insert it in this place, to shew the vanity of superstition and Idolatry. There was a King of *Egypt* called *Minus*, or as *Herodotus* calleth him *Menes*, who following his Hounds in hunting into a certain marsh of *Meris*, fell in with his Horse, and there stuck fast, none of his followers daring to come after him to release him, so that he had there perished, had not a Crocodile come and taken him up upon his back, and set him safe upon the dry land. For which miracle, the said King built there a City, and caused a Crocodile to be worshipped, which was called *Sychus* by all the Inhabitants of that City, and also gave all the said Marsh of *Meris*, for the sustenance of the same. It was nourished with bread, flesh, and Wine, Cakes, sod flesh, and sweet new Wine: so that when any man came to the Lake wherein it was kept, the Priests would presently call the beast out of the water, and being come to the land, one of them opened his mouth, and the other put in meat, delicacies, and Wine.

N n n 2 This

Hierodotus.

This Crocodile of *Maris*, is the same that is called *Arfinoe*, and like to that at *Thebes*, about which they did hang jewels of gold, silver, and jems of ear-rings, bracelets, and such other things of price. When it dyed, they did season the body thereof with salt, and buried it in the holy Tombes or burying Pors. The same also are called *Ombite*, I mean the people of that *Egypt* which dwell in *Arfinoe*, and for the love of the Crocodiles, they abandon all manner of Hawks their enemies, in so much that many times they take them and hang them up in publique upon gallows for that purpose erected. And further, they keep certain days of triumphs like the *Olympiades*, and games of honour, and so far they were blinded with that superstition, that they thought themselves exceedingly blessed if they lost their children by them, and thought themselves much honoured, if they saw them with their eyes fetched out of the streets and playing places by Crocodiles.

Again, all the *Egyptians* hold opinion, that the Crocodile is a Divinator, which they prove by the testimony of *Ptolomeus*, who calling one of the sacred Crocodiles, which was the oldest and best of all, he would not answer him, and afterward offering him meat, he also refused it, whereat many wondered, and some of the Priests said, it was some prognostical sign either of the Kings death or his own, and so it fell out shortly after, for the same Crocodile dyed. As though a Swine might not as well be accounted divine, seeing it also refuseth all meat and provocation at the time of their sickness, and before death.

There is a City in *Egypt* called *Apollinopolis*, the City of *Apollo*, where the Inhabitants abhor and condemn the worship of Crocodiles, for when they take any of them they hang them up and beat them to death, notwithstanding their tears and cryings, and afterwards they eat them: but the reason of their hatred is, because *Typhon* their ancient enemy was clothed with a Crocodiles shape. Others also say, the reason of their hatred is, because a Crocodile took away and devoured the daughter of *Pjammutes*, and therefore they enjoyed all their posterity to hate Crocodiles.

Orus.

To conclude this discourse of Crocodiles inclination, even the *Egyptians* themselves account a Crocodile a savage and cruel murdering Beast, as may appear by their Hieroglyphicks, for when they will decipher a mad man, they picture a Crocodile, who being put from his desired prey by forcible resistance, he presently rageth against himself. And they are often taught by lamentable experience, what fraud and malice to mankind liveth in these Beasts, for they cover themselves under willows and green hollow banks, till some people come to the Waters side to draw and fetch water, and then suddenly, or ever they be aware, they are taken and drawn into the water. And also for this purpose, because he knoweth that he is not able to over-take a man in his course or chase, he taketh a great deal of water in his mouth, and casteth it in the path-ways, so that when they endeavour to run from the Crocodile, they fall down in the slippery path, and are over-taken and destroyed by him. The common proverb also, *Crocodili lachryma*, the Crocodiles tears, justifieth the treacherous nature of this Beast, for there are not many brute Beasts that can weep, but such is the nature of the Crocodile, that to get a man within his danger, he will sob, sigh, and weep, as though he were in extremity, but suddenly he destroyeth him. Others say, that the Crocodile weepeth after he hath devoured a man. Howsoever it be, it noteth the wretched nature of hypocritical hearts, which before-hand will with fained tears endeavour to do mischief, or else after they have done it be outwardly sorry, as *Judas* was for the betraying of Christ, before he went and hanged himself.

Ælianus.

The males of this kinde do love their females above all measure, yea even to jealousy, as may appear by this one History of *P. Martyr*. About the time that he was in those countries, there were certain Mariners which saw two Crocodiles together in carnal copulation upon the sands neer the River, from which the water was lately fallen into a certain Island of *Nilus*, the greedy Mariners forsook their ship, and betook themselves to a long boat, and with great shouting, hollowing and crying, made towards them in very courageous manner: the male at the first assault fell amazed, and greatly terrified ran away as fast as he could into the waters, leaving his female lying upon her back, (for when they ingender, the male turneth her upon her back, for by reason of the shortness of her legs she cannot do it herself) so the Mariners finding her upon her back and not able to turn over her self, they easily slew her, and took her away with them. Soon after the male returned to the place to seek his female, but not finding her, and perceiving blood upon the sand, conjectured truly that she was slain, wherefore he presently cast himself into the River of *Nilus* again, and in his rage swam stoutly against the stream untill he over-took the ship wherein his dead female was, which he presently set upon, lifting up himself and catching hold on the sides, would certainly have entered the same, had not the Mariners with all their force battered his head and hands with clubs and staves, untill he was wearied and forced to give over his enterprise, and so with great sighing and sobbing departed from them. By which relation it is most clear what natural affection they bear one to another, and how they choose out their fellows, as it were for wives and husbands for procreation.

And it is no wonder if they make much of one another, for besides themselves they have few friends in the world, except the Bird *Trochilus* and Swine, of whom I can say little, except this that followeth. As for the little Bird *Trochilus*, it affecteth and followeth them for the benefit of his own belly; for while the Crocodile greedily eateth, there sticketh fast in his teeth some part of his prey, which troubleth him very much, and many times ingendereth Worms, then the Beast to help himself taketh land, and lyeth gaping against the Sun-beams westward, the Bird perceiving it,

flyeth

flyeth to the jaws of the Beast, and there first with a kinde of tickling-scratching, procureth (as it were) licence of the Crocodile to pull forth the Worms, and so eateth them all out, and clenseth the teeth throughly, for which cause the Beast is content to permit the Bird to go into his mouth. But when all is clenfed, the ingrateful Crocodile endeavoureth suddenly to shut his chaps together upon the Bird, and to devour his friend, like a cursed wretch which maketh no reckoning of friendship, but the turn served, requiteth good with evill. But Nature hath armed this little Bird with sharp thorns upon her head, so that while the Crocodile endeavoureth to shut his chaps and close his mouth upon it, those sharp thorns prick him into his palate, so that full sore against his unkinde nature, he letteth her flye safe away. But whereas there be many kindes of *Trochili*, which are greedy of these Worms or clenfings of the Crocodiles, some of them which have not thorns on their heads pay for it, for there being not offence to let the closing of the Crocodiles mouth, they must needs be devoured: and therefore this enforced amity betwixt him and the Crocodile, is only to be understood of the *Cledororynchus*, as it is called by *Hermolaus*.

Aristotle.
Marcellinus.
Ælianus.
Leo Afric.

There be some that affirm, that he destroyeth all without exception that thus come into his mouth, and other some say he destroyeth none, but when he feeleth his mouth sufficiently clenfed, he waggeth his upper chap, as it were to give warning of avoidance, and in favour of the good turn, to let the bird flie away at his own pleasure. Howbeit, the other and the former narration is more likely to be true, and more constantly affirmed by all good Authors except *Plutarch*. And *Leo Afric.* saith, that it was the constant and confident report of all *Africa*, that the Crocodile devoureth all for their love and kindenesse, except the *Cledororynchi*, which they cannot, by reason of the thorns upon their head.

Plutarch.

That there is an amity and natural concord betwixt Swine and Crocodiles is also gathered, because they only among all other living four-footed Beasts, do without danger dwell, feed and inhabit upon the banks of *Nilus*, even in the midst of Crocodiles; and therefore it is probable that they are friends in nature. But oh how small a sum of friends hath this Beast, and how unworthy of love among all creatures, that never in nature hath but two, in heaven or earth, air or water, that will adventure to come neer it, and one of these also, which is the best deserving, it devoureth and destroyeth if it get it within his danger.

Calpagninus.

Seeing the friends of it are so few, the enemies of it must needs be many, and therefore require a more large catalogue or story. In the first rank whereof cometh, (as worthy the first place) the *Ichneumon*, or *Pharaohs-mouse*, who rageth against their Egges and their persons, for it is certain that it hunteth with all sagacity of sense to finde out their nests, and having found them, it spoileth, scattereth, breaketh and emptieth all their egges. They also watch the old ones asleep, and finding their mouths open against the beams of the Sun, suddenly enter into them, and being small, creep down their vast and large throats before they beware, and then putting the Crocodile to exquisite and intolerable torment, by eating their guts asunder, and so their soft bellies, while the Crocodile tumbleth to and fro sighing and weeping, now in the depth of water, now on the land, never resting till strength of nature faileth. For the incessant gnawing of the *Ichneumon* so provoketh her to seek her rest in the unrest of every part, herb, element, throws, throbs, rowlings, tossings, mournings, but all in vain, for the enemy within her breatheth through her breath, and sporteth her self in the consumption of those vital parts, which waste and wear away by yeelding to unpacificable teeth, one after other, till she that crept in by stealth at the mouth, like a puny thief, come out at the belly like a Conqueror, through a passage opened by her own labour and industry, as we have also shewed at large in the story of *Ichneumon*. But whether it be true or no, that the *Trochilus* doth awake the sleeping Crocodile, when he seeth the *Ichneumon* lie in wait to enter into her, I leave it to the credit of *Strabo* the reporter, and to the discretion of the indifferent Reader.

Diod. Sicul.

Strabo.

Monkeys are also the haters of Crocodiles, as is shewed in the story, and lie in wait to discover, and if it were in their power to destroy them. The Scorpion also and the Crocodile are enemies one to the other, and therefore when the *Egyptians* will describe the combat of two notable enemies, they paint a Crocodile and a Scorpion fighting together, for ever one of them killeth another: but if they will decipher a speedy overthrow to ones enemy, then they picture a Crocodile; if a slow and slack victory, they picture a Scorpion. And as we have already shewed out of *Philes*, that out of the egges of Crocodiles, many times come Scorpions, which devour and destroy them that lay them.

Fishes also in their kinde are enemies to Crocodiles, the first place whereof belongeth to the most noble Dolphin. Of these Dolphins it is thought there be two kindes, one bred in *Nilus*, the other forrain and coming out of the Sea, both of them professed enemies to the Crocodile: for the first, it hath upon the back of it sharp thorny prickles or fins, as sharp as any spears point, which are well known to the fish that beareth them, as her armour and weapons against all adversaries. In the trust and confidence of these prickles, the Dolphin will allure and draw out the Crocodile from his den or lodging place, into the depth of the River, and there fight with him hand to hand. For the Dolphin as it knoweth his own armour and defence, like other Beasts and Fishes, so doth it know the weakest parts of his adversary, and where his advantage of wounding lyeth. Now, *Strabo*, as we have said already, the belly of the Crocodile is weak, having but a thin skin, and penetrable with small force, wherefore when the Dolphin hath the Crocodile in the midst of the deep waters, like one afraid of the fight, underneath him he goeth, and with his sharp fins or prickles

Strabo.
Solinus.

prickles on his back, giveth his weak and tender belly mortal wounds, whereby his vital spirits, with his guts and entrails, are quickly evacuated. The other Dolphins of the Sea being greater, are likewise armed with these prickles, and of purpose come out of the Sea into *Nilus* to bid battel to the Crocodiles.

Seneca.

When *Bibillus* (a worthy Roman) was Governor of *Egypt*, he affirmed that on a season the Dolphins and the Crocodiles met in the mouth of *Nilus*, and bade battel the one to the other, as it were for the sovereignty of the waters, and after that sharp combat, it was seen how the Dolphins by diving in the waters, did avoid the biting of the Crocodiles, and the Crocodiles dyed by strokes received from the Dolphins upon their bellies. And when many of them were by this means as it were cut asunder, the residue betook themselves to flight, and ran away, giving way to the Dolphins. The Crocodiles do also fear to meddle with the Sea-hog, or Hog-fish, because of his bristles all about his head, which hurt him also when he cometh nigh him: or rather I suppose, as it is friend to the Swine of the earth, and holdeth with them a sympathy in nature, so it is unto the Swine of the water, and forbeareth one in the Sea, as it doth the other on the land.

Strabo.

There is likewise a certain wilde Ox or Bugil among the *Parthians*, which is an enemy to the Crocodile, for as *Albertus* writeth, if he finde or meet with a Crocodile out of the water, he is not only not afraid of him, but taketh heart and setteth upon him, and with the weight and violent agitation of his body, treadeth him all to pieces: and no marvel, for all Beasts are enemies to the Crocodiles on the land, even as the Crocodile lyeth in wait to destroy all them in the water. Hawks are also enemies to Crocodiles, and especially the *Ibis* bird, so that if but a feather of the *Ibis* come upon the Crocodile by chance, or by direction of a mans hand, it maketh it immoveable and cannot stir. For which cause, when the *Egyptians* will write or decipher a ravening, greedy, idle-fellow, they paint a Crocodile, having an *Ibis* feather sticking in his head. And thus much for the enmity betwixt the Crocodiles and other living creatures.

Orus.

Ælianus.

It hath been seldom seen that Crocodiles were taken, yet it is said that men hunt them in the waters, for *Pliny* saith, that there is an assured perswasion, that with the gal & fat of a Water-adder, men are wonderfully holpen, and as it were armed against Crocodiles, and by it enabled to take and destroy them, especially when they carry also about them the herb *Potamegeton*. There is also a kinde of thorny wilde Bean growing in *Egypt*, which hath many sharp prickles upon the stalks, this is a great terrour to the Crocodile, for he is in great dread of his eyes, which are very tender and easie to be wounded. Therefore he avoideth their sight, being more unwilling to adventure upon a man that beareth them, or one of them, then he is to adventure upon a man in compleat Armour; and therefore all the people plant great store of these, and also bear them in their hands when they travail.

Crescenti.

There be many who in the hunting and prosecuting of these Crocodiles, do neither give themselves to run away from them, nor once to turn aside out of their common path or road, but in a foolish hardinesse, give themselves to combat with the Beast, when they might very well avoid the danger, but many times it hapneth that they pay dearly for their rashnesse, and repent too late the too much reputation of their own manhood: for whiles with their spears and sharp weapons they think to pierce his sides, they are deceived, for there is no part of him penetrable except his belly, and that he keepeth safe enough from his enemies, blunting upon his scales (no lesse hard then plates of Iron) all the violence of their blows and sharpnesse of weapons, but clubs, beetles, and such like weapons are more irksome to him, when they be set on with strength, battering the scales to his body, and giving him such knocks as doth dismay and astonish him. Indeed there is no great use of the taking of this Serpent, nor profit of merchandize cometh thereby, his skin and flesh yeelding no great respect in the world.

Diodorus.

In ancient time they took them with hooks baited with flesh, or else inclosed them with nets as they do fishes, and now and then with a strong Iron instrument cast out a boat down in the water upon the head of the Crocodile. And among all other there is this one worthy to be related. The Hunter would take off the skin from a Swines back, and therewithal cover his hook, whereby he allured and inticed the Serpent into the midst of the River, and there making it fast, he went afterward to the next watering place, and there holding another Hog, did beat and smite him, till he cryed ardently, with which voyce or cry, the Crocodile being moved, goeth presently to the bait and swalloweth it up, and maketh after the noise: at last, coming to the land, the Hunter with valiant courage and diligence, casteth mud and dirt into his eyes, and so blindeth him that he may oppresse and kill him with ease.

Herodotus.

Leo Afric. relateth also this means or way to take Crocodiles: There be many Trees planted upon the banks of *Nilus*, unto one of these there is a long and strong rope tyed, and at the end of the same there is fastened a hook of a cubit long, and a finger in quantity: unto this hook for a bait is tyed a Ram or a Goat, which being set close to the River, and tormented with the hook upon which it is fastened, cryeth out amain, by hearing of whose voyce, the hunger-greedy Crocodile is raised out of his den, and invited as he thinketh to a rich prey, so he cometh (although it self of a trecherous nature, yet suspecteth not any other) and swalloweth the bait, in which he findeth a hook not to be digested. Then away he striveth to go, but the strength of the rope stayeth his journey, for as fast as the bait was to the rope and hook, so fast is he also ensnared and tyed unto it, which while he waveth and straineth to unloose and break, he wearyeth himself in vain. And to the intent that all his strength may be spent against the tree and the rope, the Hunters are at one end thereof, and cause

cause it to be cast to and fro, pulling it in, and now letting it go again, now terrifying the Beast with one noise and fear, and anon with another, so long as they perceive in him any spirit of moving or resistance: so being quieted, to him they come, and with clubs, spears, beetles, staves, and such manner of instruments, pierce through the most tenderest parts of his body and so destroy him.

Peter Martyr hath also other means of taking Crocodiles. Their nature is, that when they goe to the land to forrage and seek after a prey, they cannot return back again but by the same footsteps of their own which they left imprinted in the sand: whereupon, when the Countrey people perceive these footsteps, instantly with all the hast they can make, they come with spades and mattocks and make a great ditch, and with boughs cover the same, so as the Serpent may not espy it, and upon the boughs they also again lay sand to avoid all occasion of deceit or suspicion of fraud at his return: then when all things are thus prepared, they hunt the Crocodile by the foot untill they finde him, then with noises of bells, pans, kettels, and such like things, they terrifie and make him return as fast as fear can make him run towards the waters again, and they follow him as neer as they can, untill he falleth into the ditch, where they come all about him, and kill him with such instruments or weapons as they have prepared for him, and so being slain, they carry him to the great City Cair, where for their reward they receive ten pieces of gold, which amounteth to the value of ten nobles of our English coin.

There have been some brought into that City alive, as *P. Martyr* affirmeth, whereof one was as much as two Oxen and two Camels could bear and draw, and at the same time there was one taken by this devise before expressed, which had entered into a Village in *Saetum* neer *Nilus*, and swallowed up alive three young Infants sleeping in one Cradle, the said Infants scarcely dead were taken again out of his belly, and soon after when no more tokens of life appeared, they were all three buried in a better and more proper grave of the earth. Then also there was another slain, and out of his belly was taken a whole Ram not digested, nor any part of him consumed, and the hand of a woman which was bitten or torn off from her body above the wrist, for there was upon the same a Bracelet of Brasse.

We do read that Crocodiles have been taken and brought alive to *Rome*. The first that ever brought them thither, was *Marcus Scaurus*, who in the games of his ædility, brought five forth and shewed them to the people in a great pond of water, (which he had provided only for that time) and afterward *Helioabalus* and *Antoninus Pius*. The *Indians* have a kinde of Crocodile in *Ganges*, which hath a horn growing out of his nose like a *Rhinocerot*: unto this Beast they cast condemned men to be devoured, for in all their executions, they want not the help of men, seeing they are provided of Beasts to do the office of Hang-men.

Aurelius Festus writeth, that *Firmus* a Tyrant of *Egypt*, being condemned to *Nilus* to be devoured by Crocodiles, beforehand bought a great quantity of the fat of Crocodiles, and so stripping himself stark naked, laid the same over his body, so he went among the Crocodiles and escaped death: for this savage Beast being deceived with the savour of its own nature, spared the man that had but so cunningly carryed it. And this is a wonderful work of Almighty GOD, that so ordereth his actions in the nature of this Beast, that he beguileth the cruel nature of the living, by the tast and savour of the dead: howbeit some think that the water Crocodile is daunted with the savour of the fat from the land Crocodile, and the land Crocodile by the water again.

And some again say, that all venomous Beasts run away from the savour of the fat thereof; and therefore no marvail if it also be afraid, being venomous as well as any other. Wherefore the saying of *Firmus* was not to be attributed to any indulgence of the Crocodile toward their own kinde, but rather to a deadly antipathy reflecting themselves upon themselves, though not in shape and figure as the Cockatrice, yet in sense, savour, and rancknesse of their pestiferous humor.

The use of Crocodiles taken, is for their skin, flesh, caul and medicine arising out of it. Their skin as it is exceeding hard upon their backs while they are alive, so is it also when they are dead, for with that the common people make them better armour then coats of Mail, against Darts, Spear, or Shield, as is well known in all *Egypt* at this day. For the flesh of Crocodiles, it is also eaten among those people that do not worship it: as namely the people about *Elephantina Apollinopolis*. Notwithstanding by the Law of God, *Levit. 11.* it is accounted an unclean Beast, yet the tast thereof being found pleasant, and the relish good, without respect of GOD or health, the common people make use thereof.

The medicines arising out of it are also many. The first place belongeth to the caul, which hath moe benefits or vertues in it then can be expressed. The blood of a Crocodile is held profitable for many things, and among other it is thought to cure the bitings of any Serpent. Also by anointing the eyes, it cureth both the dregs or spots of blood in them, and also restoreth soundnesse and clearnesse to the sight, taking away all dulnesse or deadnesse from the eyes. And it is said, that if a man take the liquor which cometh from a piece of a Crocodile fryed, and anoint therewithall his wound or harmed part, that then he shall be presently rid of all pain and torment. The skin both of the land and water Crocodile dryed into powder, and the same powder with Vinegar or Oyl, laid upon a part or member of the body, to be seared, cut off, or lanced, taketh away all sense and feeling of pain from the instrument in the action.

Capitolinus.
Lampridius.

Vadianus.

Aetius.

P. Martyr.

Herodotus.

Dioscorides.

Pliny.

Arnoldus.

Aetius.
Rhazes.

All the *Egyptians* do with the fat or sewer of a Crocodile anoint all them that be sick of Feavers; for it hath the same operation which the fat of a Sea-dog or Dog-fish hath, and if those parts of men and beasts which are hurt or wounded with Crocodiles teeth, be anointed with this fat, it also cureth them. Being concocted with water and Vinegar, and so rowled up and down in the mouth, it cureth the tooth-ach: and also it is outwardly applyed against the biting of Flies, Spiders, Worms, and such like, for this cause, as also because it is thought to cure Wens, bunches in the flesh, and old wounds. It is sold dear, and held pretious in *Alcair*. *Scaliger* writeth, that it cureth the Gangren. The canine teeth which are hollow, filled with Frankincense, and tyed to a man or woman which hath the Tooth-ach, cureth them, if the party know not of the carrying them about: And so they write, that if the little stones which are in their belly be taken forth and so used, they work the same effect against Feavers. The dung is profitable against the falling off of the hair, and many such other things.

Aetius.

The biting of a Crocodile is very sharp, deep, and deadly, so that wheresoever he layeth his teeth, seldom or never followeth any cure. But yet the counsel of Physitians is, that so soon as the patient is wounded, he must be brought into a close chamber where are no windows, and there be kept without change of air, or admission of light, for the poyson of the Crocodile worketh by cold air and light; and therefore by the want of both is to be cured. But for remedy (if any be) they prescribe the same which is given for the cure of the biting of a mad Dog, or (as *Avicen*) the biting of a Dog not mad. But most proper is the dung of a man, the Fish *Garum* and *Mysy* pounded together, and so applyed, or else the broth of salt sod flesh, and such other things as are vulgarly known to every Physitian: and therefore seeing we live in a countrey far from the annoyance of this Serpent, I shall not need to blot any paper to expresse the cure of this poyson.

Arnoldus.

The Crocodile of *Nilus* only liveth on land and water, all other are contented with one element: the picture of the Crocodile was wont to be stamped upon coin, and the skin hanged up in many famous Cities of the world, for the admiration of the people, and there is one at this day at *Paris* in *France*.

Belonius.

of the Arabian or Egyptian LAND CROCODILE.

The figure of this Crocodile sheweth evidently the difference betwixt him and the other of *Nilus*; and beside it is neither so tall or long as is the other, the which proportioned Beast is only particular to *Egypt* and *Arabia*, and some because of his scaly head, legs, articles, and claws, have observed another difference in it from the former: yet in his nature, manner of living and preying upon other cattel, it differeth not from that of the water. The tail of this Crocodile is very sharp, and standeth up like the edges of wedges in bunches above the ground, wherewithal when he hath mounted himself up upon the back of a Beast, he beateth and striketh the beast most cruelly, to make him go with his Rider to the place of his most fit execution, free from all rescue of his Heard-man or Pastor, or annoyance of passengers, where in most cruel and savage manner he tear-eth the limbs and parts one from another till he be devoured. The Apothecaries of *Italy* have this Beast in their shops to be seen, and they call it *Caudiverbera*, that is, a Tail-bearer, for the reason aforesaid. And thus there being nothing in this Beasts nature different from the former, besides his figure, and that which I have already expressed, I will not trouble the Reader with any more Narration about it.

of the LAND CROCODILE of Bresilia.

The figure and proportion of this Serpent was altogether unknown in this part of the world, till of late our discoverers and Navigators brought one of them out of Bresilia. The length of it is about a fathom, and the breadth as much as ten fingers broad: the fore-legs have ten claws, five upon a foot, the hinder-legs eight, and both before and behinde they are of equal length. The tail exceeding long, far exceeding the quantity and proportion of his body, being marked all over with certain white and yellowish spots. The skin all covered with an equal, smooth and fine coloured scale, which in the midst of the belly are white, and greater then in other parts. It can abide no water, for a little poured into the mouth killed it, and after it had been two or three days dead, being brought to the fire, it moved and stirred again faintly, even as things do that lye a dying. It is not venomous nor hurtful to eat, and therefore is digged out of the cave by any body safely without danger.

of the CROCODILE of the Earth called Scincus, & Scink.

There have been some that have reckoned Scinks and Lizards among Worms, but as the Greek words *Erpeix*, and *Scolex*, differ in most apparent dialect, and signification, and therefore it is an opinion not worth the confuting, for there are no Worms of this quantity. But for the better explication of the nature of this Beast, because some have taken it for one kinde, and some for another: some for a Crocodile, and others for a Beast like a Crocodile; we are to know that there are three kindes of Crocodiles: the first is a water Beast or Serpent, and vulgarly termed a Crocodile, the second is a Scink or a Crocodile of the earth, which is in all parts like that of the water, except in his colour and thicknesse of his skin: the third kinde of Crocodile is unknown to us at this day, yet *Pliny* and others make mention of it, and describe it to be a beast having his scales like a Gorgon, growing or turning to his head from the tail, and not as others do, from the head to the tail.

The *Grecians* call this Beast *Skinkos*, and some unlearned Apothecaries *Stincus*, and *Myrepsus* *Sikk*. It is also called *Kikeros*, and the *Hebrew* *Koach*, doth more properly signifie this Beast, then any other Crocodile or Chamæleon, or Lizard. Some of the *Hebrews* do expound *Zab* for a Scink; and from thence the *Chaldees* and the *Arabians* have their *Dad* and *Aldab*, turning *Z* into *D*: So we read *Guaril* and *Adhaya*, for a Scink or Crocodile of the earth: *Alarbian* is also for the same Serpent among the *Arabians*, *Balecola*, and *Ballecara*, *Schanchur*, and *Aschanchur*, and *Askincor*, and *Serantum*, and *Nudalep*, and *Nudalepi*, are all of them Synonymæ, or rather corrupted words for this Crocodile of the earth. But there are at this day certain *Pseudoscinks* set out to be seen and sold by Apothecaries, that are nothing else but a kinde of water Lizard: but the true difference is betwixt them, that these water Lizards are venomous, but this is not, and neither living in the Northern parts of the world, nor yet in the water: and so much shall suffice for the name and first entrance into this Serpents History.

They

They are brought out of the Eastern Countries, or out of Egypt: yet the Monks of *Meſuen* affirm, that they had ſeen Scinks or Crocodiles of the earth about *Rome*. *Sylvaticus* and *Platearius* in *Apulia*. But howſoever their affections may lead them to conjecture of this Serpent, I rather believe that it is an *African* beaſt, and ſeldom found in *Aſia* or *Europe*. They love the banks of *Nilus*, although they dare not enter the water, and for this cauſe ſome have thought (but untruly) that when the Crocodile layeth her egges in the water, the young is there alſo engendered and hatched, and is a Crocodile of the water, but if they lay their egges on the dry land, from thence cometh the Scink or Crocodile of the earth. This folly is evidently refuted, becauſe that they never lay eggs in the but all upon the dry land. They are found (as I have ſaid before) in *Egypt*, and alſo in *Africa*, and among the *Lydians* of *Mauritania*, otherwiſe called *Lodya*, or rather *Lybia*, among the Paſtoral or Plow-men *Africans*; among the *Arabians*, and neer the Red-ſea, for all thoſe at this day ſold at *Venice*, are brought from thoſe parts. The greateſt in the world are in *India*, (as *Cardan* teacheth) who are in all things like Lizards, ſaving in their excrements, which ſmell or ſavour more ſtrongly, and generally the difference of their quantity ariſeth from the countrey which they inhabit, for in the hotter and moiſter countrey they are greater, in the hotter dryer Region they are ſmaller, and generally they exceed not two or three cubits in length, with an anſwerable proportionable body, which is thus deſcribed.

There be certain croſſe lines which come along the back one by one, ſomewhat white, and of a dusky colour, and thoſe that be dusky have alſo in them ſome white ſpots. The upper part of the neck is very dusky, the head and the tail are more white, the feet and all the neather part of the breaſt and belly are white, with appearance upon them of ſome ſcales, or rather the ſkin figured in the proportion of ſcales: upon either feet they have five diſtinct fingers or claws, the length of their legs is a thumb and a half: that is, three inches, the tail two fingers long, the body ſix ſo that the whole length from the head to the tip of the tail, (which is firſt thick, and then very ſmall at the end) is about eight fingers. When they have taken them they bowel them, and fill their bodies with Sugar, and Silk of Wooll, and ſo they ſell them for a reaſonable price. That which I have written of their length of eight fingers, is not ſo to be underſtood, as though they never exceeded or came ſhort of that proportion: for ſometimes they are brought into theſe parts of the World twenty or four and twenty fingers long, ſometimes again not above five or ſix fingers long.

Aristotle.

When they lay their Egges, they commit them to the earth, even as the Crocodiles of the water do. They live upon the moſt odoriferous flowers, and therefore is his fleſh ſo ſweet, and his dung or excrements odoriferous. They are enemies to Bees, and live much about Hives, inſomuch as ſome have thought they did lay their Egges in Hives, and there hatch their young ones: But the occaſion of this error was, that they ſaw young ones brought by their parents into ſome Hive, to feed upon the labouring Bee. For the compaſſing of their deſire they make meal of any tree, which they have ground in the Mill of their own mouths, and that they mix with black *Hellebore* juyce, or with the liquor of *Mallows*, this meal ſo tempered they lay before the Hives, whereof aſſoon as the Bees taſt, they die, and then cometh the Crocodile with her young ones, and lick them up; and beſide Bees, I do not read they are hurtful to any. The *Indians* have a little Beaſt about the quantity of a little Dog, which they call *Phattage*, very like to a Scink or Crocodile of the earth, having ſharp ſcales, as cutting as a ſaw.

Ælianus.

Rhazes.

There is ſome hurt by this beaſt unto men, for which cauſe I may juſtly reckon it among the venomous, for if it chance to bite any man, if the wounded man falleth into a Fever before he make water, he dyeth for it, but if he firſt make water, the beaſt dyeth and the man eſcapeth.

It is thought that it containeth a kinde of natural magick, witch-craft, or ſorcery; and therefore they ſay it hath a ſtupifying power, changing the minde from love to hatred, and from hatred to love again. The powder of this Serpent drunk in Wine, if it ſtir venereous luſt, it hurteth the nerves and ſinews. There be certain magical deviſes raiſed out of this Serpent which are not worth the writing, as not having in them any dram of wit, learning, or truth; and therefore I will not trouble the Reader with them, but follow on the concluſion of this Crocodiles ſtory in the Narration of the medicinal vertues, which are far moe and more operative then thoſe in the former Crocodile, for I think Almighty GOD bleſſeth meekneſſe and innocency with exceſſe of grace in men and beaſts, as may be ſeen in theſe two kindes of Crocodiles, the dung and excrement of the one, being more worth then the body of the other, through harmleſſe innocency.

The body of this Serpent to be dried, after it hath lyen long in Salt, and to be preſerved in Noſewort, as *Kuellius* and *Marcellus* write: (but truth is, there is no need of Salt where Noſewort is applied, becauſe the Acrimony of this hearb doth eaſily dry up the moiſture of this beaſt, keeping Worms from breeding in it.) With the powder thus prepared, venereous men ſtir up their luſts. Mithridate is called *Diaſcenn*, becauſe it is compounded of the Scink or Crocodile of the earth, and it containeth in it a moſt noble Antidote againſt all poyſons. *Galen* had an Antidote againſt Scorpions, which among other things containeth in it the fleſh of a Crocodile of the earth, wherewithall he cured all them that had been ſtung with Scorpions in *Lybia*. It is alſo good againſt the bitings of mad beaſts, and pleuriſies; againſt poyſoned Honey, or the crudity and loathing that cometh in the ſtomack by eating of ſound Honey: It is profitable againſt empoyſoned Arrows or Darts, being taken immediately before or after the wound, as *Apeller* hath obſerved.

Serapio did make a medicine compounded of the dung of this Crocodile, and applyed the same against the Falling-sicknesse. Of the body of this Scink, except the head and feet being sod or roasted, and eaten by them that have the *Sciatica*, and old cough (especially children,) or the pain of the loins, giveth them much ease. They are also mixed with medicines against the pain of the feet, as *Galen* did for *Amarantus* the Grammarian. They are also good in medicine against the coldnesse of the sinews. This beast is very hot, and therefore increaseth the seed of man, and provoketh lust; and for this purpose the greatest and fattest, and such a one as is taken in the Spring time, when they burn in lust for copulation, is preferred. But this is not to be meant of the fleshy parts, but only of those parts that are about the reins, if a man drink thereof the weight of a groat in Wine afterwards, for the alaying of the heat thereof, the Physicians do prescribe a decoction of Lentils with Honey, and the seed of Lettice drunk in Water. The snout of this Crocodile with the feet drunk in white Wine, hath the same operation: but we have shewed already, that these parts are to be cut off and thrown away, because if there be any venom in the beast it lyeth in them.

A perfume being made of the body and intrails of this Crocodile under the womb of a woman labouring with childe, is thought to yeeld much help, for her safe, speedy, and easie travail, or flocks of Wool perfumed therewith, and laid to her belly. But it is the part of good Physicians to be wary in giving of medicines for stirring up of lust in any, except in married persons, and then also when they are young, to procure a lawful issue and posterity into the world: otherwise they shall both decay the body, for all violent helps of carnal copulation, do in the end prove detriments to nature, if they continue any time, and also they are hurtful to the Soul, when not only the unnatural desire of lust, but also the intemperate pleasure of sin is increased thereby; and that is a miserable cure, which killeth the Soul to help one part of the body. Besides all kindes of medicines for this purpose, (amongst which this Crocodile is the chief) have their peculiar venom, and when they are ministred, either they have no effect at all through age or overmuch impotency, or else they work too violently, which is most dangerous, or some one hurt or other followeth the poyson: and so I will leave the prosecution of this part.

The dust of the skin of this Crocodile being anointed with Vinegar or Oyl upon any part or member which is to be cut off, taketh away the sence of pain in the time of execution. The bloud is good for the eyes, and taketh away the filthy skin of the body, with the spots and burls in the face, restoring the first, true, native, and lively colour. The fat taketh away the pain in the reins, and causeth a distillation of the seed of man, yet this fat touching the hair of a man, maketh it to fall off; and a man anointed herewith, is safe from the annoyance of Crocodiles, although they play with him. It also cureth the bitings of Crocodiles; the instillation of this Crocodile, folded up in the Wooll of a black Sheep of the first birth, and wherein is no other colour, hath power to drive a quartane Ague. And *Rhasis* saith, that it being hung over the head of a woman in travail, keepeth her from delivery. In the gall of this Serpent there is a power against the falling off of the hair, especially if the medicine be made of the roots of Beets to neese withall; and besides, the eyes being anointed therewith, and with Honey, there is nothing more profitable against suffusions. The stones and reins have power to provoke generation; and *Aetius* prescribeth an Antidote to be made of the tail of this beast, against the Gout.

Great is the vertue of the dung or excrement of this Serpent, if the same could be easily found, but while it is sought for, it loseth the vertue. It is called *Grocodillia*, and is profitable to give a good colour to womens faces, that is the best which is whitest, short, and not heavy, feeling like leaven betwixt the fingers, that is, smelling somewhat sharp like leaven.

It is adulterated with meal, chalk, white-earth, or painting, but it is discerned by the heaviness. The reason of the vertue of this is, because it feedeth upon the sweetest and best smelling herbs, whereby it cometh to passe, that it doth not only smell fragrantly, but also contain in it many excellent vertues. First therefore it is good for the comeliness of the face, to give colour to it, according to the saying of *Horace*: *Colorque stercore fucatus Crocodili*: A colour in-grained with the dung of a Crocodile; and for this cause also is the verse of *Ovid*, *Nigrior ad Pharii confuge pisces opem*: That is, The black Woman goeth to crave help of the Fish *Pharius*, to become more beautiful; for by the fish *Pharius* is understood a Crocodile. As some think, eight grains of this dung, or rather the weight of eight groats, with half so much Mustard-seed and Vinegar, cureth the falling off of the hair. *Arnoldus* doth prescribe a composition of the dung and Cantharides, for the regenerating and bringing again of hair that is decayed. If a perfume hereof be made and infused by a Tunnel into the holes of Serpents, it will drive them away, by reason of the sharp and leavenish savour thereof.

Tralianus maketh a medicine thereof for an Eye-salve against the whitenesse and blond-eyes. It is good also against dimnesse and suffusions, being anointed with the juyce of Leeks: and to conclude, it is drunk in sweet Wine and Vinegar, against the Falling-sicknesse, and also being applyed unto women, stirreth up their monthly courses. And thus much shall suffice for the story of the Crocodile.

Of the DART.

Among the divers kindes of Serpents, there is one of special note, which the Græcians call *Acontia*. The Latines, *Faculares*, or *Faculi*, or *Sagitta*, a Dart or Arrow. The Græcians at this day *Saetta*. The Turks, *Orchilanne*: In Calabria and Sicilia, *Saetione*, and of the Germans, *Ein schoßz oder angelsch lang*. The reason of this name is taken from his swift leaping upon a man to wound and kill him; and therefore the Poets say, *Faculiq; volucres*, speaking of these kindes of Serpents. *Albertus* and *Avicen* also, calleth them *Cafezati*, and *Cafezaci*, *Altararat*, *Acoran*, and *Altinanti*.

The manner of this Serpent is to get up into trees or hedges, and from thence to flie like an Arrow upon the upper parts of men, and so to sting, bite, and kill them: and of this kinde it is thought that was, which came upon the hand of the Apostle Paul, whereof the Poet writeth;

*Ecce proci savus sterilis derobore trunci
Torfit, & immisit (Faculum vocat Africa) Serpens:
Perque caput Pauli transaëaque tempora fugit.*

In English thus;

*Loe from afar, a cruel Serpent from an Oke
Came flying like a Dart, in Africa the same
A Dart is cold, the head and temples stroke
Of Paul, by winding spires to work his bane:*

*Nil ibi virus agit: rapuit cum vulnere fatum,
Depressum est, quæ sanda rotat, quàm lenta volarent,
Quàm segnis Scythiæ strideret arundinis ær.*

*But nothing could the poyson there avail,
For with the wound he put away his death
Faster then swiftest flye, or turning ball,
Or Scythian reed remov'd with windy breath.*

*Marcellinus.
Bellonius.
Olaus Mag.*

This kinde of Serpent is for the most part in *Lybia*, in *Rhodes*, in *Lemnus*, in *Italy*, *Calabria*, and *Sicilia*, and in many of the Northern Countries, and also in *Germany*, whereof *Gesner* telleth this story following. There is neer the Coasts of *Zurich* a River called *Glat*, and a Village or Town upon that River *Glatfelden*. Near this River, as a poor man was gathering wood, there was a Serpent of some three or four foot long, which from a tree endeavoured to leap upon the poor man, by gathering his body together, (as it were into four spires or risings like half hoops) the man seeing it, left his sack and ran away: nevertheless, the Serpent leaped after him at the least sixteen or seventeen foot; but yet for that time he last turned about him, and not seeing the Serpent to follow him, gathered courage and comfort, and would come back again for his sack that he had left behinde him. The crafty Serpent expecting so much, had set himself again in another tree, and privily lay till the man came for his sack, and then ere he was aware came flying at him as he did before, and presently winded about his left arm; all his body except his tail hung down, and his neck which he held up hissing in the mans face: the man having no sleeve on his arm except his shirt, yet did the Serpent so presse the skin and flesh, that the circles of his winding spires and prints of his body appeared therein after he was taken off, yet did he not bite the man, for the poor Countrey fellow did presently with his other hand take him by head and cast him away, notwithstanding he had so folded himself about his arm: shortly after that arm began to grow mattery, and all the flesh to the bone consumed, yet was all the rotten putrified envenomed flesh and substance, by the skill of a worthy learned Physician taken away, and as good flesh brought in the room thereof as ever was before; yet was the man every year prescribed to let that arm bleed, and then issued forth black thick blood: some of the wounds or rather scars, of the poyson outwardly remaining.

Olaus Mag.

In the Northern parts they leap ten foot at a time, first gathering themselves into the similitudes of Bows or half hoops, and then fight with those that they would devour, making many times a noise among the herbs or flowers, which are parched or withered by the Sun; and therefore by the bounty of GOD in nature, their own noise bewrayeth them to their suspicious adversaries, and so many times are avoided in safety. Like unto these are certain in *Hungary*, (as *Johannes Vitus* reported unto *Gesner*.) whose bodies of an equal crassitude or thicknesse, so as they appear without tails, being for that purpose called *Decurtati*, Curtails, these in the same manner do leap upon men as these Darters do, but they are very short, seldom exceeding the length of two hands breadth.

There

There is some difference among Authors about the nature of this Serpent: for *Ælianus* confoundeth it with the Snake of the Earth, called *Chersydrius*, and saith it liveth sometime in the water, and sometime on the land, lying in wait to destroy all living creatures. And (he saith) it useth this fraud; it ever lyeth hid in secret neer the high-ways, and many times climbeth up into trees where it roundeth it self round into a circle, and hideth his head within the folds of his own body, so soon as ever it espyeth a Passenger, either a Man or Beast, it leapeth upon him as swift as a Dart flyeth. For it is able to leap twenty cubits space, and so lighting upon the Man or Beast, sticketh fast unto it without falling off of his own accord, until they fall down dead.

But herein *Ælianus* seemeth to be deceived, because he maketh but one Serpent of twain: namely, this Dart and the Land-snake, which are most apparently different in nature, kinde, and quality.

Aetius also confoundeth this Serpent with the Millet-serpent, called *Cenchrites*, and saith it is of the quantity of two cubits, great on the head, and the fore-part smaller at the tail, being of a greenish colour. And he saith further, that at such time as the Millet-seed groweth and flourisheth, this Serpent is most strong and hurtful, and so with the residue he agreeth with *Ælianus*, but herein he is also deceived, writing by hear-say as himself confesseth, and therefore it is more safe for us to have recourse to some eye-witnesse for the description of this Serpent, then to stand upon the opinions of them which write by the relation of others.

Bellonius saith, that he saw one of these in *Rhodes*, being full of small round black spots, not greater then the seeds of Lentiles, every one having a round circle about him like an eye, after such a fashion as is to be seen in the little Fish called the *Torpedo*. In length it exceedeth not three palms, and in bignesse no greater then the little finger. It was of an Ash-colour, coming neer to the whitenesse of milk, but under the belly it was altogether white: upon the back it had scales, but upon the belly a thin skin, as in all other Serpents.

The upper part of the back was somewhat black, having two black lines in the middle, which begin at the head, and so are drawn along the whole body to the tail. As for the *Cafezati*, and *Alterati* or *Altinatyri*, those are red Serpents, (as *Avicen* saith) which are but small in quantity, yet as deep and deadly in poyson as in any other, for they hurt in the same manner that these Darts do. Some of them do so wound with their poyson, as the afflicted person dyeth incontinent without sense or pain: Some again die by languishing pain after many hopes of recovery, losing life. Among all the people of the World, the *Sabeans* are most annoyed with this kinde of red Serpents; for they have many odoriferous and sweet smelling Woods, in the which these Serpents do abound, but such is their rage and hatred against men, that they leap upon them and wound them deadly, whensoever they come within their compasse. And surely if it be lawful to conjecture what kinde of Serpents those were, which in the Scripture are called fiery Serpents, and did sting the *Israelites* to death in the Wildernesse, until the Brazen Serpent was erected for their cure; among all the Serpents in the world, that kinde of pain and death can be ascribed to none more properly then to these *Cafezati*, or Red-dart-serpents.

For first the Wildernesse which was the place wherein they annoyed the people, doth very well agree to their habitation. Secondly, those fiery Serpents are so called by figure, not that they were fiery, but as all Writers do agree, either because they were red like fire; or else because the pain which they inflicted, did burn like fire, or rather for both these causes together which are joyntly and severally found in these red Serpents; and therefore I will conclude for my opinion, that these Serpents (as the highest poyson in nature) were sent by GOD to afflict the sinning *Israelites*, whose poyson was incurable, except by Divine miracle.

Matthiolus also telleth a story of a Shepherd which was slain in *Italy* by one of these, as he was sleeping in the heat of the day under the shadow of a tree, his fellow Shepherds being not far off looking to their flocks, suddenly there came one of these Dart-serpents out of the tree, and wounded him upon his left pap, at the biting whereof the man awaked and cryed out, and so dyed incontinently: his fellow Shepherds hearing this noise, came unto him to see what he ailed, and found him dead, with a Serpent upon his breast; now knowing what kinde of Serpent this was, they forsook their flocks and ran away for fear.

The cure of this Serpents biting, if there be any at all, is the same which cureth the Vipers, as *Aetius* and *Avicen* writeth, and therefore I will not relate it in this place. The gall of this Beast mixed with the *Scythian* Stone, yeeldeth a very good Eye-salve. The which gall lyeth betwixt the back and the liver: And thus much shall suffice for this Serpent.

Of the DIPSAS.

THIS Dipsas hath many names from many occasions: First *Dipsas* in *Greek* signifieth thirst, as *Sitis* doth in *Latine*, and thereof also it is called *Situla*, because whosoever is wounded by this Serpent dyeth. It is also called by some *Prester*; and by some *Causon*, because it setteth the whole body on fire: but we shall shew afterwards, that the *Prester* is a different Serpent from this. It is called likewise *Melanurus*, because of his black tail, and *Amnoatis*, because it lyeth in the sand, and there hurteth a man. It is not therefore unfitly defined by *Avicen*, to be

Vipera sitim faciens, that is, A Viper causing thirst, and therefore *Ovid* sporting at an old drunken woman named *Lena*, calleth her *Dipsas* in these verses;

*Est quedam nomine Dipsas anus,
Ex re nomen habet, nigri non illa parentem
Memnonis in roseis sobria vidit equis.*

In English thus;

*There is a woman old, which Dipsas may be hight,
And not without some cause, thirsty she ever is,
For never Memmons fire, all black and seldom bright,
Did she in water sweet behold in sobernesse.*

They live for the most part neer the waters, and in salt marishy places: whereupon *Lucan* said:

*Stant in margine sicæ
Aspides, & mediis sitiebant Dipsades undis.*
That is to say;
*Upon pits brink dry Aspes there stood,
And Dipsads thirst in midst of water flood.*

It is called *Torrída Dipsas*, and *Arida Dipsas*, because of the perpetual thirst, and therefore the Egyptians when they will signifie thirst, do picture a *Dipsas*: whereupon *Lucianus* relateth this story, there is (saith he) a statue or monument upon a Grave, right over against the great *Syrtis* betwixt *Silya* and *Egypt*, with this Epigram:

*Talia passus erat quoque Tantalus Æthiope ortus,
Qui nullo potuit fonte levare sitim.
Tale nec è Danao natus implere puellas
Assiduis undis vas potuisse reor.*

That isto say;

*Such Tantalus indured in Æthiope bred,
Which never could by water quench his thirst,
Nor could the Grecian Maids with water sped,
That with dayly pourings till the vessel curst.*

The statue was the picture of a man like unto *Tantalus*, standing in the midst of a water ready to drink, by drawing in of the water, about whose foot was folded a *Dipsas*: close by stood certain women bringing water, and pouring it into him to make it run into his mouth; besides, there were certain Egges as it were of *Estriches* lay pictured beside them, such as the *Garamants* in *Lybia* seek after. For it is reported by *Lucianus*, that the people of that Countrey do earnestly seek after the *Estriches* Egges upon the sands, not only to eat the meat that is in them, but also to make sundry vessels or instruments of the shell, and among other things they make Caps of them. Near unto these Egges do these treacherous Serpents lie in wait, and so while the poor Countrey man cometh to seek for meat, suddenly he leapeth upon him, and giveth him a mortal wound.

Alciatus hath an Embleme, which he seemeth to have translated out of Greek from *Antipater Sidonius*, of a Falconer, which while he was looking up after Birds for meat for his Hawk, suddenly a *Dipsas* came behinde him and stung him to death. The title of his Embleme is, *Qui alta contemplatur cadere*, he that looketh high may fall, and the Embleme it self is this that followeth:

*Dum turdos visco, pedica dum fallit alaudas,
Et jacta altivolam figit arundo gruem,
Dipsada non prudens auceps pede perculit, ultrix*

*Illam mali, emissum virus ab ore jacit.
Sic obit, extento qui sidera respicit arcu,
Securus fati quod jacet ante pedes.*

Which may be thus Englished;

*Whiles Thrush with line, and Lark deceived with net,
And Crane high flying pierced with force of reed,
By Falconer was: behold a Dipsas on the foot did set,
As if it would revenge his bloody foul misdeed,*

*For poyson out of mouth it cast, and bit his foot,
Whereof he dyed, like Birds by him deceived,
Whiles bending bow aloft unto the stars did look,
Saw not his fate below, which him of life bereaved.*

This *Dipsas* is inferior in quantity unto a Viper, but yet killeth by poyson, much more speedily, according to these verses;

*Exigua similis spectatur Dipsas echidne,
Sed festina magis mors iclus occupat egros.
Parva & lurida cui circa ultima cauda nigrescit.*

That

That is to say ;

*This Dipsas like unto the Viper small,
But kills by stroke with greater pain and speed,
Whose tail at end is soft and black with ball,
That as your death avoid, with careful heed.*

It is but a short Serpent, and so small (as *Arnoldus* writeth,) it killeth before it be espyed, the length of it not past a cubit, the fore-part being very thick, except the head which is small, and so backward it groweth smaller and smaller : the tail being exceeding little, the colour of the fore-part somewhat white, but set over with black and yellow spots, the tail very black. *Galen* writeth, that the ancient *Marsi* which were appointed for hunting Serpents and Vipers about *Rome*, did tell him that there was no means outwardly to distinguish betwixt the Viper and the Dipsas, except in the place of their abode, for the Dipsas (he saith) keepeth in the salt places ; and therefore the nature thereof is more fiery, but the Vipers keep in the dryer Countries, wherefore there are not many of the Dipsades in *Italy*, because of the moistnesse of that Countrey, but in *Lybia*, where there are great store of salt marshes. As we have said already, a man or beast wounded with this Serpent, is afflicted with intolerable thirst, insomuch as it is easier for him to break his belly, then to quench his thirst with drinking, always gaping like a Bull, casteth himself down into the water, and maketh no spare of the cold liquor, but continually sucketh it in till either the belly break, or the poyson drive out the life, by overcoming the vital spirits. To conclude, beside all the symptoms which follow the biting of Vipers, which are common to this Serpent, this also followeth them, that the party afflicted can neither make water, vomit, nor sweat, so that they perish by one of these two ways ; first either they are burned up by the heat of the poyson, if they come not at water to drink, or else if they come by water, they are so unsatiable, that their bellies first swell above measure, and soon break about their privy parts. To conclude, all the affections which follow the thick poyson of this Serpent are excellently described by *Lucan* in these verses following ;

*Signiferum juvenem Tyrrheni sanguinis Aulum
Torta caput retrò Dipsas calcata momordit.
Vix dolor aut sensus dentis fuit : ipsaque leti
Frons caret invidia : nec quicquam plaga minatur.
Ecce subit virus tacitum, carpitque medullas
Ignis edax, calidaque incendit viscera tabe.
Ebibit humorem circum vitalia fusum
Pestis, & in sicco linguam torrete palato
Capit, defessos iret qui sudor in artus
Non fuit, atque oculos lachrymarum vena refugit.
Non decus imperii, non mæsti jura Catonis
Ardentem tenuere virum, quin spargere signa*

In English thus ;

*Tyrrhenian Aulum, the ancient-beaver young,
Was bit by Dipsas, turning head to heel, (strong,
No pain or sense of s. teeth appear'd, though poyson
Death doth not frown, the man no harm did feel,
But loe s/he poyson takes the marrow, and eating fire
Burning the bowels warm till all consumed,
Drinking up the humor about the vital spire,
And in dry palat was the tongue up burned.
There was no sweat the sinews to refresh,
And tears fled from the vein that feeds the eyes,
Then Cato's law, nor Empires honor frish,
This fiery youth could hold: but down the streamer flies,*

*Auderet, totisque furens exquireret agris,
Quas poscebat aquas, sitiens in corde venenum.
Ille vel in Tanaim missus, Rhodanumque Padumque,
Auderet, Nilumque bibens per raras vagantem :
Accessit morti Libye : fatigue minorem
Famam Dipsas habet teritis adjuta perustis.
Scrutatur venas penitus squallentis arena :
Nunc redit ad Syrtis & fluxus accipit ore :
Æquoreusque placet, sed non & sufficit humor.
Nec sentit fatigue genus, mortemque veneni :
Sed putat esse suum : ferroque aperire tumentes
Sustinuit venas, atque os implere cruore. Lucan. lib. 9.*

*And like a mad man about the fields he runs,
Poysons force in heart did waters crave :
Though unto Tanais, Rhodanus, Padus he comes,
Or Nilus : yet all too little for his heat to have.
But dry was death, as though the Dipsas force
Were not enough, but help by heat of earth,
Then doth he search the sands : but no remorse,
To Syrtis floud he hies, his mouth of them he fillets,
Salt water pleaseth, but it cannot suffice,
Nor knew he fate, or this kinde venoms death,
But thought it thirst, and seeing his veins arise
Them cut, which bloud stopt mouth and breath.*

The signes of death following the biting of this Serpent, are extreme drought and inflammation both of the inward and outward parts, so that outwardly the parts are as dry as Parchment, or as a skin set against the fire, which cometh to passe by adustion and commutation of the bloud, into the nature of the poyson. For this cause many of the ancients have thought it to be incurable ; and therefore were ignorant of the proper medicines, practising only common medicines prescribed against Vipers : but this is generally observed, that if once the belly begin to break, there can be no cure but death. First therefore they use scarification, and make unction in the body, cutting off the member wounded. If it be in the extremity, they lay also playsters unto it, as Triacle, liquid Pitch with Oyl, Hens cut asunder alive, and so laid to hot, or else the leaves of Purslain beaten in Vinegar, Barley meal, Bramble leaves pounded with Honey, also Plantain, Hysop, white Garlick, Leeks, Rue and Nettles. Then muil the government of their bodies be no lesse looked unto ; first, that they be kept from all sharp and salt meats, then, that they be made continually to drink Oyl, to procure vomit, and with their vomits which they cast out of their stomach, to give them glysters ; that so the waters may be drawn to their lower parts. Besides,

some take medicines out of Fishes, especially such as are salt, and the leaves, bark, or sprigs of Laurel: and to conclude, there is nothing better then Triacle compounded of Vipers flesh. And thus much for the Dipsas.

Of the DOUBLE-HEAD.

BEcause the Grecians call this Serpent *Amphisbaina*, and the Latines from thence *Amphisbena*, because it goeth both ways, as if it had two heads and no tail: and for this purpose it is never seen to turn his body, as it were turn about his head. When it hath a purpose to avoid that thing which it feareth, or wherewithal it is offended, he doth but only change his course backward as he went forward; so that it is as happy as *Lyceus*, whom the Poets faine to be very quick-sighted, or as those Monsters which are said to have eyes in their backs, or rather like to *Janus*, which is said to have two faces, one forward, and another backward, and therefore I have called it Double-head, I trust fitly enough to expesse the Greek word, although compounded of two words together, for so is the Greek word also, which the French do expresse by a like compounded word, *Double-marcheur*, that is, going two ways. It is likewise called *Anakesime*, *Achismus*, and *Amphisilene*. And thus much may suffice for the name.

It is said that this Serpent is found in the Island *Lenius*, but among the Germans it is unknown. There is some question whether it may be said to have two heads or no. *Galen* affirmeth, that it is like a Ship having two fore-parts, that is, one behinde, and another before. *Pliny* also subscribeth hereunto, and maketh it a very pestilent Serpent, *Geminum habet caput* [*Amphisbena*, *tangquam parum esset, uno ore fundi venenum*, saith he; It hath a double-head, as though one mouth were not enough to utter his poyson, according to the saying of the Poet:

*Est gravis in geminum surgit caput Amphis-bena
Serpens qui visu necat & sibilo.*

Which may be Englished thus;

*This Serpent Double-head, is grievous to be seen,
Whose cloven-head doth kill with sight and hissing keen.*

Unto this also *Aelianus* subscribeth, that it is a true Serpent, and hath two heads, so that whensoever it is to go forward, one of them standeth in the place of the tail, but when it is to go backward, then the head becometh the tail, and the tail the head. So also *Mantuan* saith it is a double-headed Serpent, and a fearful stinging Asp. And so generally all the Ancients, until *Matthiolus* and *Grevinus* time, who first of all began to contrary this opinion, affirming it to be impossible in nature, for one Serpent to have two heads, except it be monstrous, and exceed the common course of nature. Such a one was that Serpent with two heads that *Aristotle* speaketh of, which doth easily happen to all those creatures which at one birth bring forth many young ones; for so their bodies may be conjoynd into one, while theit heads stand asunder like twain. And they say that this Serpent doth resemble a Worm of the earth, whose head and tail is hard to be distinguished asunder except you see it going. And they say further, that this Serpent is like to the *Scytal*, of which we shall speak afterwards, differing from it in nothing except in going backward and forward, and this is all that they can bring against the opinion of the Ancients, whom I will not stand to confute, but leave the Reader to believe one or other: for it shall not bring to me any great disadvantage, except the losse of this new English name, for I have dealt faithfully with the Reader in setting down the opinion of both sides, and if I do fail in a fit name, yet will I not swerve from the best description of his nature.

The whole proportion of his body is of equal magnitude or greatnes, and the two extremities do answer the middle. His eyes are for the most part shut, the colour like earth, not black, but tending to blacknesse, the skin rough and hard, and set over with divers spots: all which properties, or rather parts are thus described by *Nicander*.

*Cujus perpetua est caecum caligine lumen,
Quod latas utrinq; genas porrectaq; menta,
Terrens est illi color, & densissima pellis
Plurima quam varii distinctam signa figurant,
Plus aliis alio Serpentibus aggere tendat.*

In English thus:

*Whose eye is ever void of light, because
Two cheeks both broad and standing up it hides,
The colour earth, thick skin, with spots in rows,
Then other Serpents with greater bulk it glides.*

Solinus Polibistor affirmeth, that they ingender and bring egges forth of the mouth, that is, out of that mouth which is toward the tail, if there be any such. There is no Serpent that doth more boldly adventure to indure the cold then this doth, for it cometh out of his den not only before other Serpents, but also before the Cuckoe sing, or the Grasshopper cometh forth. They are exceeding

exceeding careful of their egges, and therefore seldom depart from them until they be hatched, whereby also may be collected their great love to their young ones. And further, by their forward and timely coming out of their holes, Grevinus maketh a good observation, that their temperament or constitution, is more hot then any other Serpent.

The Grecians have all observed, that this kinde of Serpent is hard to be killed, except with a Vine-branch, which they say was demonstrated by Dionysius, who being turned by Juno into madnesse, one day falling fast asleep, this Serpent leaped upon him and awaked him, whereat he being angry, presently killed it with a Vine-branch. Some have affirmed that a small rod or bat covered with the skin of this Serpent, and so laid beside a man, driveth away all manner of venomous Beasts. A wilde Olive-branch or sprig wapped in this skin, doth cure the senselesse and benumbed estate of the sinews, and also is good for many things, as Nicander expresseth in these verses

*Hæc ubi jam crevit, cadentes ligna coloni
Sciamdeglabrant oleastri ex arbore virgam,
Quale pedum, stricti q; prehensi pellibus Anguis
Insectam obvolvunt, quas certis deinde diebus
Exarere sinunt, cantantes ante cicadas.*

*Utilis hio baculus frigentibus artibus esse
Fertur, ubi ex animis digitos torpedo fatigat,
Tunc quia constrictos, & eorum vincula, nervos
Calfacit immisso, fovet extendiq; calore.*

Which may be Englished thus;

*When this is grown, the Peasants cutting wood,
Do peel a branch taken from Olive-wilde,
A foot in length, of strained Snakes-skin good,
Rowling it up herein, till days fullild,*

*And let it dry before Grasshoppers green:
Thus made, is good for Sinews cold,
Or nummed fingers, whose force hath been
By heat extending what cold band did hold.*

The wounds that come by the biting or stinging of this Serpent, are not great, but very small, and scarcely to be discerned outwardly, yet the accidents that follow, are like to those which ensue the bitings of Vipers, namely, inflammation, and a lingering death. The cure thereof must be the same which is applyed unto the sting of Vipers. And peculiarly I finde not any medicine serving for the cure of this poyson alone, except that which Pliny speaketh of, namely Coriander drunk by the patient, or laid to the sore.

It is reported by Galen and Grevinus, that if a woman with childe do chance to go over one of these Double-headed Serpents dead, she shall suffer abortment, and yet that they may keep them in their pockets alive without danger in boxes. The reason of this is given by Grevinus, because of the vapour ascending from the dead Serpent, by a secret antipathy against humane nature, which suffocateth the childe in the mothers womb. And thus much for this Serpent.

of the DRAGON.

AMong all the kindes of Serpents, there is none comparable to the Dragon, or that affordeth and yeeldeth so much plentiful matter in History for the ample discovery of the nature thereof: and therefore herein I must borrow more time from the residue, then peradventure the Reader

would be willing to spare from reading the particular stories of many other. But such is the necessity hereof, that I can omit nothing making to the purpose, either for the nature or morality of this Serpent, therefore I will strive to make the description pleasant, with variable history, seeing I may not avoid the length hereof, that so the sweetness of the one, (if my pen could so expresse it) may countervail the tediousness of the other.

The Hebrews call it *Tbanin*, and *Wolphius* translateth *Oach* a Dragon, in his Commentaries upon *Nehemiah*. The Chaldees call it *Darkon*, and it seemeth that the Greek word *Dracon* is derived of the Chaldees. We read of *Albedysimon*, or *Abedysimon*, for a kinde of Dragon, and also *Albatraf*, and *Hauden*, *Haren carnem*, and such other terms, that may be referred to this place. The Grecians at this day call it *Drakos*; the Germans, *Trach Lindturm*; the French, *Un Dragon*; the Italians, *Drago*, and *Dragone*. The derivation of the Greek word, beside the conjecture afore expressed, some think to be derived from *Derkein*, because of their vigilant eye-sight, and therefore it is faigned that they had the custody not only of the Golden-fleece, but also of many other treasures. And among other things, *Alciatus* hath an emblem of their vigilancy standing by an unmarried Virgin.

Vera hæc effigies innuptæ est Palladis : ejus.

Hic Draco, qui domina constitit ante pedes.

Cui Diva comes hoc animal? custodia rerum

Which may be Englished thus;

This Dragon great which Lady Pallas stands before,

Is the true picture of unmarried Maids :

But why a consort to the Goddess is this? and more

Then other beasts more meek, who never fades?

Huic data, sic lucos sacraque templa colit.

Innuptas opus est cura asservare puellas

Pervigili : laqueos undique tendit amor.

Because the safeguard of all things belong to this, (Set,

Wherefore his house in Groves and sacred Temples

Unmarried Maids of guards must never misse,

Which watchful are to void loves snares and net.

For this cause the Egyptians did picture *Serapis* their God with three heads, that is to say, of a Lyon in the middle, on the right hand a meek fawning Dog, and on the left hand a ravening Wolf, all which forms are joyned together by the winding body of a Dragon, turning his head to the right hand of the God; which three heads are interpreted to signifie three times; that is to say, by the Lyon the present time; by the Wolf, the time past; and by the fawning Dog, the time to come; all which are guarded by the vigilancy of the Dragon. For this cause also among the fixed Stars of the North, there is one called *Draco*, a Dragon, all of them ending their course with the Sun and Moon, and they are in this Sphear called by Astronomers the Intersections of the Circles, the superior of these ascending, is called the head of the Dragon, and the inferior descending, is called the tail of the Dragon. And some think that GOD in the 38. of Job, by the word *Gneish*, meaneth this Sign or Constellation.

To conclude, the ancient Romans (as *Vegetius* writeth) carryed in all their Bands the Escutchion of a Dragon, to signifie their fortitude and vigilancy, which were born up by certain men called for that purpose *Draconarii*. And therefore when *Constantius* the Emperor entered into the City of Rome, his souldiers are said to bear up upon the tops of their spears, Dragons gaping with wide mouths, and made fast with golden chains and pearl, the winde whistling in their throats, as if they had been alive, threatening destruction, and their tails hanging loose in the air, were likewise by the winde tossed to and fro, as though they strove to come off from the spears, but when the winde was laid, all their motion was ended, whereupon the Poet saith :

Mansuescunt varii vento cessante Dracones.

In English thus;

When whistling winde in air ceaseth,

The Dragons tamed then did rest.

The tale also of the Golden-fleece, if it be worth any place in this story, deserveth to be inserted here, as it is reported by *Diodorus Siculus*. When *Aetes* reigned in *Pomus*, he received an answer from the Oracle, that he should then dye when strangers should come thither with ships and fetch away the Golden-fleece. Upon which occasion he shewed himself to be of a cruel nature, for he did not only make Proclamation that he would sacrifice all strangers which came within his Dominions, but did also perform the same, that by the fame and report of such cruelty, he might terrifie all other Nations from having access unto that Temple. Not contented herewith, he raised a great strong wall round about the Temple wherein the Fleece was kept, and caused a sure watch or guard to attend the same day and night, of whom the Grecians tell many strange fables. For they say there were Bulls breathing out fire, and a Dragon warding the Temple and defending the Fleece, but the truth is that these watchmen because of their strength were called Bulls, because of their cruelty, were said to breath out fire, and because of their vigilancy, cruelty, strength and terror, to be Dragons.

Some affirm again, that in the Gardens of *Hesperides* in *Lybia*, there were golden Apples, which were kept by a terrible Dragon, which Dragon was afterward slain by *Hercules*, and the Apples taken away by him, and so brought to *Euryfibeus*. Others affirm that *Hesperides* had certain flocks of sheep, the colour of whose wooll was like gold, and they were kept by a valiant shepherd called *Draco*: but I rather agree with *Solinus*, who giveth a more true reason of this fable, *Ne fama licentia*

vulneretur

vulneretur fides, lest (as he saith) faith and truth should receive a disgrace or wound by the lavish report of fame. There was among the *Hesperides* a certain winding River coming from the Sea, and including within it the compasse of that land which is called the Gardens of *Hesperides*, at one place whereof, the falling of the water broken by a Rock, seemeth to be like the falling down of Snakes, to them that stand a far off, and from hence ariseth all the occasion of the fable aforesaid.

Indeed there was a statue of *Hercules*, in the left hand whereof were three Apples, which he was said to have obtained by the conquest of a Dragon, but that conquest of the Dragon did morally signifie his own concupiscence, whereby he reigned over three passions, that is to say, over his wrath by patience; over his cupidity by temperance; and over his pleasures by labour and travail: which were three vertues far more precious then three golden Apples. But I will stay my course from prosecuting these moral discourses of the Dragon, and return again to his natural History, from which I have somewhat too long digressed.

There are divers sorts of Dragons, distinguished partly by their Countries, partly by their quantity and magnitude, and partly by the different form of their external parts. There be Serpents in *Arabia* called *Sirene*, which have wings, being as swift as Horses, running or flying at their own pleasure, and when they wound a man, he dyeth before he feelth pain. Of these it is thought the Prophet *Ejaj* speaketh, chap. 13. vers. 22. *Serpens clamabit in Templis voluptariis*: and for Serpents the old Translators read *Syrène*, and so the English should be, the *Syrène* Dragons should cry in their Temples of pleasure: and the ancient distinction was, *Angues aquarum*, *Serpentes terrarum*, *Dracones Templorum*: that is to say, Snakes are of the water, Serpents of the earth, and Dragons of the Temples. And I think it was a just judgement of God, that the ancient Temples of the Heathen Idolaters were annoyed with Dragons, that as the Devil was there worshipped, so there might be appearance of his person in the ugly form and nature of a Dragon. For God himself in holy Scripture, doth compare the Devil unto a Dragon, as Rev. 12. vers. 3. And there appeared another wonder in Heaven, for behold a great red Dragon, having seven heads, and ten horns, and seven crowns upon his head. Vers. 4. And his tail drew the third part of the stars of heaven, and cast them to the earth: and the Dragon stood before the Woman which was ready to be delivered, to devour her childe when she had brought it forth. Vers. 5. So she brought forth a man-childe, which should rule all Nations with a rod of Iron. And her Son was taken up unto God and to his throne. Vers. 6. And the Woman fled into the Wildernesse, where she hath a place prepared of God, that they should feed her there 1260 days. Vers. 7. And there was a battail in heaven, Michael and his Angels fought against the Dragon, and the Dragon fought and his Angels. Vers. 8. But they prevailed not, neither was their place found any more in heaven. Vers. 9. And the great Dragon that old Serpent called the Devill and Satan, was cast out, which deceiveth all the world, he was even cast unto the earth, and his Angels were cast out with him. Vers. 13. And when the Dragon saw that he was cast unto the earth, he persecuted the Woman which had brought forth a man-childe: and so forth, as it followeth in the Text. Whereupon Saint *Augustine* writeth, *Diabolus Draco dicitur propter insidias, quia occulte insidiatur*: that is, the Devill is called a Dragon because of his treachery, for he doth treacherously set upon men to destroy them.

It was wont to be said, because Dragons are the greatest Serpents, that except a Serpent eat a Serpent, he shall never be a Dragon: for their opinion was, that they grew so great by devouring others of their kinde; and indeed in *Æthiopia* they grow to be thirty yards long, neither have they any other name for those Dragons but Elephant-killers, and they live very long.

Onesicritus writeth, that one *Aposissares* an Indian, did nourish two Serpents Dragons, whereof one was six and forty cubits long, and the other fourscore: and for the more famous verification of the fact, he was a very earnest suter to *Alexander* the Great, when he was in *India*, to come and see them, but the King being afraid, refused.

The Chroniclers of the affairs of *Chius* do write, that in a certain Valley neer to the foot of the Mountain *Pellenæus*, was a Valley full of straight tall trees, wherein was bred a Dragon of wonderful magnitude or greatnesse, whose only voyce or hissing, did terrifie all the Inhabitants of *Chius*, and therefore there was no man that durst come nigh unto him, to consider or to take a perfect view of his quantity, suspecting only his greatnesse by the loudnesse of his voyce, until at length they knew him better by a singular accident worthy of eternal memory. For it hapned on a time that such a violent winde did arise, as did beat together all the Trees in the Wood, by which violent collision the branches fell to be on fire, and so all the Wood was burned suddenly, compassing in the Dragon, whereby he had no means to escape alive, & so the trees fel down upon him and burned him. Afterward, when the fire had made the place bare of wood, the Inhabitants might see the quantity of the Dragon, for they found divers of his bones and his head, which were of such unusual greatnesse, as did sufficiently confirm them in their former opinion: and thus by divine miracle was this monster consumed, whom never any man durst behold being alive, & the Inhabitants of the Countrey safely delivered from their just conceived fear.

It is also reported, that *Alexander* among many other Beasts which he saw in *India*, did there finde in a certain den a Dragon of seaventy cubits long, which the *Indians* accounted a sacred Beast, and therefore intrated *Alexander* to do it no harm. When it uttered the voyce with full breath, it terrified his whole Army: they could never see the proportion of his body, but only the head, and by that they guessed the quantity of the whole body, for one of his eyes in their appearance seemed as great as a *Macedonian* buckler. *Maximus Tyrinus* writeth that in the days of *Alexander*, there was likewise seen a Dragon in *India*, as long as five roods of lands are broad, which is incredible. For he

Ælianus.

likewise saith that the *Indians* did feed him every day with many several Oxen and Sheep. It may be that it was the same spoken of before, which some ignorant men, and such as were given to set forth fables, amplified beyond measure and credit.

Whereas Dragons are bred in *India* and *Africa*, the greatest of all are in *India*, for in *Ethiopia*, *Nubia*, and *Hesperia* the Dragons are confined within the length of five cubits and twenty cubits: for in the time of *Euergetis*, there were three brought into *Egypt*, one was nine cubits long, which with great care was nourished in the Temple of *Esculapius*, the other two were leaven cubits long. About the place where once the Tower of *Babel* was builded, are Dragons of great quantity, and under the Equinoctial, as *Nicephorus Callistus* writeth, there are Serpents as thick as beams, in testimony whereof their skins have been brought to *Rome*. And therefore it is no marvel, although *S. Augustine* writing upon the 148. Psalm, doth say, *Dracones magna quedam sunt animalia, majora non uni super terram*: Dragons are certain great beasts, and there are none greater upon the earth. Neither is it to be thought incredible, that the souldiers of *Anilius Regulus* did kill a Dragon which was a hundred and twenty foot long, or that the Dragons in the dens of the Mountain *Aila*, should grow to great that they can scarce move the fore-parts of their body. I am yet therefore to speak of the Dragons in the Mountains *Emocit*, or of *Agia*, or of *Dachinabades*, or the Regions of the East, or of that which *Augustus* shewed publicly to the people of *Rome*, being fifty cubits long; or of those which be in the *Alpes*, which are found in certain Caves of the South-sides of the hills, so that this which hath been said, shall suffice for the quantity and Countries of Dragons. Besides, there are other kinds of Dragons which I must speak of in order: and first of all of the *Epidaurian* Dragons, which is bred no where but in that Countrey, being tame, and of yellow golden colour, wherefore they were dedicated to *Esculapius*, of whom *Nicander* writeth in this manner.

Nunc viridem & nigrum post dicta venena Draconem

Aspice, quæ patula sago Phæbeia proles

In gelido Peli nutriti culmine, juxta

Letæ Pelethunæ quondam declivia vallis.

In English thus;

After these venoms now behold the Dragon black and green,

Nourished by *Apollo's* son under a Beech full broad,

On top of the cold *Pelus*, as often hath been seen,

By fertile vale of *Pelethun* by sliding road.

There are likewise other kinde of tame Dragons in *Macedonia*, where they are so meek, that women feed them, and suffer them to suck their breasts like little children. their Infants also play with them, riding upon them and pinching them, as they would do with Dogs, without any harm, and sleeping with them in their beds. But among all Dragons, there was none more famous then the Dragon *Python*, or *Pythias*, as the Poets saign, which was bred of the slime of the earth, after the flood of *Deucalion*, and slain afterwards by *Apollo*, whereof there lyeth this tale; That when *Latona* was with childe by *Jupiter* or *Apollo* and *Diana*, *Juno* resisted their birth, but when they were born and laid in the Cradle, she sent the Dragon *Python* to devour them, *Apollo* being but a young Infant, did kill the Dragon with a dart. But this tale seemeth too fabulous and incredible, and therefore they have mended the matter with another device; For they say that *Pythion* by the commandment of *Juno*, did persecute *Latona* throughout all the world, seeking to devour her, so as she had no rest until she came unto her sister *Asteria*, who received her into *Delos*, where she was safely delivered of *Apollo* and *Diana*. Afterward, when the childe was grown up, he slew the Dragon in remembrance and revenge of the wrong done to his mother. But the true cause of this History is delivered by *Pausanias* and *Macrobius*, to be thus; That *Apollo* killed one *Pythion*, a very wicked man in *Delpi*, or, and that the Poets in excuse of the fact, did saign him to be a Dragon, as aforesaid. And so I shall not need to say any more of *Python*, except these verses following out of *Ovid* about his generation:

Sed te quoq; maxima Python,
Tum genuit populisq; novis incognite Serpens
Terror eras: tantum spatii æ monie tenebas.
Hunc Deus arcitenens & nunquam talibus armis
Antè, nisi in damis, caprisque jugacibus usus:
Mille gravem telis exhausta pene pharetra

Perdidit effuso per vulnera nigra veneno.
Neve operis famam posset delere vetustas,
Instituit sacros celebri certamine udos
Pythia perdemite Serpentis nomine dictos.
Ceruleum tali prostratus Apolline Python.

Which may be Englished thus;

But yet thou ugly *Python* wert engendered by her, tho
A terror to the new-made-folk, which never erst had known,
So foul a Dragon in their life, so monstrously fore-grown,
So great a ground thy poison'd paunch did underneath thee hide,
The God of shooting, who no where before that present tide
Those kinde of weapons put in ure but at the speckled Deer,
Or at the Roes so light of foot, a thousand shafts well neer

Did on the hideous Serpent spend, of which there was not one
 But forced forth the venomd-bloud, along his sides to gone :
 So that his quiver almost void, he naid him to the ground,
 And did him nobly at the last by force of shot confound.
 And lest that time should of this work deface the worthy fame,
 He did ordain in minde thereof a great and solemn game,
 Which of the Serpent that he flew, of Python bare the name.

Of the Indian Dragons there are also said to be two kindes, one of them fenny, and living in the marishes, which are slow of pace and without combs on their heads like females : the other in the Mountains, which are more sharp and great, and have combs upon their head, their backs being somewhat brown, and all their bodies lesse scaly then the other. When they come down from the Mountains into the plain to hunt, they are neither afraid of marishes nor violent waters, but thrust themselves greedily into all hazards and dangers : and because they are of longer and stronger bodies then the Dragons of the fens, they beguile them of their meat, and take away from them their prepared booties. Some of them are of a yellowish fiery colour, having also sharp backs like saws ; these also have beards, and when they set up their scales they shine like silver. The apples of their eyes are precious stones, and as bright as fire, in which there is affirmed to be much vertue against many diseases, and therefore they bring unto the Hunters and killers of Dragons no small gain, besides the profit of their skin, and their teeth : and they are taken when they descend from the Mountains into the Valleys to hunt the Elephants, so as both of them are kill'd together by the Hunters.

Their members are very great, like unto the members of the greatest Swine, but their bodies are leaner, flexibly turning to every side, according to the necessity of motion : Their snouts are very strong, resembling the greatest ravening Fishes ; they have beards of a yellow golden colour, being full of bristles : and the Mountain-dragons commonly have more deep eye-lids then the Dragons of the Fens. Their aspect is very fierce and grim, and whensoever they move upon the earth, their eyes give a sound from their eye-lids, much like unto the tinkling of Brasse, and sometimes they boldly venture into the Sea and take Fishes.

of the WINGED DRAGON.

Here be some Dragons which have wings and no feet, some again have both feet and wings, and some neither feet nor wings, but are only distinguished from the common sort of Serpents by the combe growing upon their heads, and the beard under their cheeks.

Saint Augustine saith, that Dragons abide in deep Caves and hollow places of the earth, and that sometimes when they perceive moistnes in the air, they come out of their holes, & beating the air with their wings, as it were with the strokes of Oars, they forsake the earth and flie aloft : which wings of theirs are of a skinny substance, and very voluble, and spreading themselves wide, according to the quantity and largeness of the Dragons body, which caused Lucan the Poet in his verses to write in this manner following :

*Vos quoq; qui cunctis innoxia numina terris
 Serpitibus, aurato nitidi fulgore Dracones,
 Pestiferos ardens facit Africa : ducit is altum
 Aera cum pennis, &c.*

In English thus ;

*You shining Dragons creeping on the earth,
 Which fiery Africk holds with skins like gold,
 Yet pestilent by hot infecting breath :
 Mounted with wings in th' air we do behold.*

The Inhabitants of the Kingdom of Georgia, once called Media, do say that in their Vallies there are divers Dragons which have both wings and feet, and that their feet are like unto the feet of Geese. Besides, there are Dragons of sundry colours, for some of them are black, some red, some of an ash-colour, some yellow, and their shape and outward appearance very beautiful, according to the verses of Nicander.

*Formosa apparet species pulchro illius ore,
Triplice conspicui se produnt ordine dentes,*

Which may be Englished thus;

*Their form of presence outwardly appears
All beautiful, and in their goodly mouth
Their teeth stand double, all one within another:
Conspicuous order so doth bewray the truth.*

*Magna sub egregia scintillant lumina fronte,
Tinctaq; felle tegunt immum palearia mentum.*

*Under their brows, which are both great and wide,
Stand twineckling eyes, as bright as any star,
With red galls tincture are their dewlaps dyed,
Their chinor under-chap to cover far.*

Gillius, Pierius, and Grevinus, following the authority of this Poet, do affirm that a Dragon is of a black colour, the belly somewhat green, and very beautiful to behold, having a treble row of teeth in their mouths upon every jaw, and with most bright and cleer seeing eyes, which caused the Poets to feign in their writings, that these Dragons are the watchfull keepers of Treasures. They have also two dewlaps growing under their chin, and hanging down like a beard, which are of a red colour: their bodies are set all over with very sharp scales, and over their eyes stand certain flexible eye-lids. When they gape wide with their mouth, and thrust forth their tongue, their teeth seem very much to resemble the teeth of wilde Swine: And their necks have many times grosse thick hair growing upon them, much like unto the bristles of a wilde Boar.

Their mouth, (especially of the most tameable Dragons) is but little, not much bigger then a pipe, through which they draw in their breath, for they wound not with their mouth, but with their tails only beating with them when they are angry. But the *Indian, Æthiopian, and Phrygian* Dragons, have very wide mouths, through which they often swallow in whole fowls and beasts. Their tongue is cloven as if it were double, and the Investigators of nature do say, that they have fifteen teeth of a side. The males have combs on their heads, but the females have none, and they are likewise distinguished by their beards.

They have most excellent senses both of seeing and hearing, and for this cause their name *Drakon* cometh of *Derkein*, and this was one cause why *Jupiter* the Heathens great God, is said to be metamorphosed into a Dragon, whereof their flyeth this tale: when he fell in love with *Proserpina*, he ravished her in the likenesse of a Dragon, for he came unto her and covered her with the spires of his body; and for this cause the people of *Sabazii* did observe in their mysteries or sacrifices, the shape of a Dragon rowled up within the compasse of his spires: so that as he begot *Ceres* with childe in the likenesse of a Bull, he likewise deluded her daughter *Proserpina* in the likenesse of a Dragon; but of these transmutations we shall speak more afterwards, and I think the vanity of these took first ground from the *Africans*, who believe that the original of Dragons took beginning from the unnatural conjunction of an Eagle and a she Wolf. And so they say that the Wolf growing great by this conception, doth not bring forth as at other times, but her belly breaketh and the Dragon cometh out, who in his beak and wings resembleth the Dragon his father, and in his feet and tail, the Wolf his mother, but in the skin neither of them both: but this kinde of fabulous generation is already sufficiently confuted. Their meats are fruits and herbs, or any venomous creature, therefore they live long without food, and when they eat, they are not easily filled. They grow most fat by eating of egges, in devouring whereof they use this Art, if it be a great Dragon, he swalloweth it up whole, and then rowleth himself, whereby he crusheth the egges to pieces in his belly, and so nature casteth out the shells, and keepeth in the meat. But if it were a young Dragon, as if it be a Dragons whelp, he taketh the egge within the spire of his tail, and so crushed it hard, and holdeth it fast, untill his scales open the shell like a knife, then sucketh he out of the place opened all the meat of the egg. In like sort do the young ones pull off the feathers from the fowls which they eat, and the old ones swallow them whole, casting the feathers out of their bellies again.

The Dragons of *Phrygia* when they are hungry, turn themselves towards the West, and gaping wide, with the force of their breath do draw the Birds that flie over their heads into their throats, which some have thought is but a voluntary lapse of the Fowls, to be drawn by the breath of the Dragon, as by a thing they love, but it is more probable, that some vaporous and venomous breath is sent up from the Dragon to them, that poysoneth and infecteth the air about them, whereby their senses are taken from them, and they astonished fall down into his mouth. But if it fortune the Dragons finde not food enough to satisfie their hunger, then they hide themselves until the people be returned from the market, or the heard-men bring home their flocks, and upon a sudden they devour either Men or Beasts, which come first to their mouths: then they go again and hide themselves in their dens and hollow Caves of the earth, for their bodies being exceeding hot, they very seldom come out of the cold earth, except to seek meat and nourishment. And because they live only in the hottest Countries, therefore they commonly make their lodgings neer unto the waters, or else in the coldest places among the rocks and stones.

They greatly preserve their health (as *Aristotle* affirmeth) by eating of wilde Lettice, for that they make them to vomit, and cast forth of their stomach whatsoever meat offendeth them, and they are most specially offended by eating of Apples, for their bodies are much subject to be filled with winde, and therefore they never eat Apples, but first they eat wilde Lettice. Their sight also (as *Plutarch* saith) doth many times grow weak and feeble, and therefore they renew and recover the same again by rubbing their eyes against Fennel, or else by eating of it.

Their age could never yet be certainly known, but it is conjectured that they live long, and in great health, like to all other Serpents, and therefore they grow so great. They do not only live on the land, as we have said already, but also swim in the water, for many times they take the Sea in *Æthiopia*, four or five of them together, folding their tails like hurdles, and holding up their heads, so swim they over to seek better food in *Arabia*.

We have said already, that when they set upon Elephants, they are taken and killed of men: now the manner how the *Indians* kill the Mountain Dragons is thus; they take a garment of Scarlet, and picture upon it a charm in golden letters, this they lay upon the mouth of the Dragons den, for with the red colour and the gold, the eyes of the Dragon are overcome, and he falleth asleep, the *Indians* in the mean season watching, and muttering secretly words of Incantation; when they perceive he is fast asleep, suddenly they strike off his neck with an Ax, and so take out the balls of his eyes, wherein are lodged those rare and precious stones which contain in them vertues unutterable, as hath been evidently proved by one of them, that was included in the Ring of *Gyges*. Many times it falleth out, that the Dragon draweth in the *Indian* both with his Ax and Instruments into his den, and there devoureth him, in the rage whereof, he so beateth the Mountain that it shaketh. When the Dragon is killed, they make use of the skin, eyes, teeth, and flesh; as for the flesh, it is of a vitriol or glassie colour, and the *Æthiopians* do eat it very greedily, for they say it hath in it a refrigerative power. And there be some which by certain enchanting verses do tame Dragons, and rideth upon their necks, as a man would ride upon a Horse, guiding and governing them with a bridle.

Now because we have already shewed, that some Dragons have wings, lest it should seem incredible, as the foolish world is apt to believe no more then they see, I have therefore thought good to add in this place, a particular relation of the testimonies of sundry learned men, concerning these winged Serpents or Dragons. First of all *Megasthenes* writeth, that in *India* there be certain flying Serpents, which hurt not in the day, but in the night time, and these do render or make a kinde of urine, by the touching whereof, all the parts of mortal creatures do rot away. And there is a Mountain which divideth aunder the Kingdom of *Narsinga* from *Alabar*, wherein be many winged Serpents sitting upon trees, which they say poyson men with their breath. There be many pestilent winged Serpents which come out of *Arabia* every year by troupes into *Egypt*, these are destroyed by a certain black Bird called *Ibis*, who fighteth with them in the defence of that Countrey where she liveth, so that there lie great heaps of them many times destroyed upon the earth by these Birds, whose bodies may be there visibly seen to have both wings and legs, and their bones being of great quantity and stature, remain unconsumed for many years after. These kinde of Serpents or Dragons, covet to keep about Trees of Frankincense which grow in *Arabia*, and when they are driven away from thence with the fume or smoak of *Stirax*, then they flie (as is aforesaid) into *Egypt*, and this is to be considered, that if it were not for this *Stirax*, all that Countrey would be consumed with Dragons.

Ælianus.
Scaliger.

Ælianus.
Herodotus.

Neither have we in *Europe* only heard of Dragons and never seen them, but also even in our own Country, there have (by the testimony of sundry Writers) divers been discovered and killed. And first of all, there was a Dragon or winged Serpent brought unto *Francis* the French King, when he lay at *Sancton*, by a certain Countreyman, who had slain the same Serpent himself with a Spade, when it set upon him in the fields to kill him. And this thing was witnessed by many learned and credible men which saw the same: and they thought it was not bred in that Countrey, but rather driven by the winde thither from some forain Nation. For *France* was never known to breed any such Monsters. Among the *Pyrenes* also, there is a cruel kinde of Serpent, not past four foot long, and as thick as a mans arm, out of whose sides grow wings much like unto gristles.

Brodeus.
Scaliger.

Gesner also saith, that in the year of our Lord 1543. there came many Serpents both with wings and legs into the parts of *Germany* neer *Stiria*, who did bite and wound many men incurably. *Cardan* also describeth certain Serpents with wings, which he saw at *Paris*, whose dead bodies were in the hands of *Gulielmus Muscius*, he saith that they had two legs and small wings, so that they could scarce flie, the head was little, and like to the head of a Serpent, their colour bright, and without hair or feathers, the quantity of that which was greatest, did not exceed the bignesse of a Cony, and it is said they were brought out of *India*. Besides, a further confirmation of these Beasts, there have been noted in all ages; for it is written in the *Roman Chronicles*, the times of their apparition and manifestation.

Crinitus.

When the River of *Tiber* over-flowed above the banks, then were many Serpents discovered, and many Dragons, as in the time of *Mauritius* the Emperor, at what time a Dragon came along by the City of *Rome*, upon the waters in the sight of all men, and so passed to the Sea: after which prodigy, there followed a great mortal pestilence. In the year 1499. the 26. day of May, there came a Dragon to the City of *Lucerne*, which came out of the Lake through *Rusa*, down along the River, many people of all sorts beholding the same.

Stumpfius.

There have been also Dragons many times seen in *Germany*, flying in the air at mid-day, and signifying great and fearful fires to follow, as it happened neer to the City called *Niderburge*, neer to the shore of the *Rhene*, in a marvellous clear Sun-shine day, there came a Dragon three times successively together in one day, and did hang in the air over a Town called *Sanctagoarin*, shaking his tail over that Town every time: it appeared visibly in the sight of many of the Inhabitants, and afterwards it came to passe, that the said Town was three times burned with fire, to the great harm and undoing

undoing of all the people dwelling in the same : for they were not able to make any resistance to quench the fire, with all the might, Art, and power that they could raise. And it was further observed, that about that time there were many Dragons seen washing themselves in a certain Fountain or Well neer the Town, and if any of the people did chance to drink of the water of that Well, their bellies did instantly begin to swell, and they dyed as if they had been poysoned. Whereupon it was publicly decreed, that the said Well should be filled up with stones, to the intent that never any man should afterwards be poysoned with that water ; and so a memory thereof was continued, and these things are written by *Justinus Goblerus*, in an Epistle to *Gesner*, affirming that he did not write fained things, but such things as were true, and as he had learned from men of great honesty and credit, whose eyes did see and behold both the Dragons, and the mishaps that followed by fire.

When the body of *Cleomenes* was crucified, and hung upon the Crosse, it is reported by them that were the watch-men about it, that there came a Dragon and did winde it self about his body, and with his head covered the face of the dead King, oftentimes licking the same, and not suffering any Bird to come neer and touch the carcasie. For which cause there began to be a reverent opinion of divinity attributed to the King, until such time as wise and prudent men, studious of the truth, found out the true cause hereof. For they say that as Bees are generated out of the body of Oxen, and Drones of Horses, and Hornets of Asles : so do the bodies of men ingender out of their marrow a Serpent, and for this cause the Ancients were moved to consecrate the Dragon to Noble-spirited men, and therefore there was a monument kept of the first *Africanus*, because that under an Olive planted with his own hand, a Dragon was said to preserve his ghost.

But I will not mingle fables and truths together, and therefore I will reserve the moral discourse of this Beast unto another place ; and this which I have written, may be sufficient to satisfie any reasonable man, that there are winged Serpents and Dragons in the world. And I pray God that we never have better arguments to satisfie us, by his corporal and lively presence in our Countrey, lest some great calamity follow thereupon. Now therefore we will proceed to the love and hatred of this Beast, that is observed with man and other creatures.

And first of all, although Dragons be natural enemies to men, like unto all other Serpents, yet many times (if there be any truth in story) they have been possessed with extraordinary love, both to men, women and children, as may appear by these particulars following. There was one *Aleva* a *Thessalian* Neatherd, which did keep Oxen in *Ossa*, hard by the Fountain *Hemonius*, there was a Dragon fell in love with this man, for his hair was as yellow as any gold, unto him for his hair did this Dragon often come, creeping closely as a Lover to his Love : and when he came unto him, he would lick his hair and face so gently, and in so sweet a manner, as the man professed he never felt the like, so as without all fear he conversed with him, and as he came, so would he go away again, never returning to him empty, but bringing some one gift or other, such as his nature and kinde could lay hold on.

Ælianus.

There was a Dragon also which loved *Pindus* the son of *Macedo* King of *Emathia* : This *Pindus* having many Brothers most wicked and lewd persons, and he only being a valiant man of honest disposition, having likewise a comely and goodly personage, understanding the treachery of his Brethren against him, bethought himself how to avoid their hands and tyranny. Now forasmuch as he knew that the Kingdom which he possessed, was the only mark they all shot at, he thought it better to leave that to them, and so to rid himself from envy, fear, and peril, then to embrew his hand in their blood, or to lose his life and Kingdom both together. Wherefore he renounced and gave over the government, and betook himself to the exercise of hunting, for he was a strong man, fit to combat with wilde Beasts, by destruction of whom, he made more room for many men upon the earth, so that he passed all his days in that exercise. It hapned on a day that he was hunting of a Hind-calf, and spurring his Horse with all his might and main in the eager persuit thereof, he rode out of the sight of all his company, and suddenly the Hind-calf leaped into a very deep Cave, out of the sight of *Pindus* the Hunter, and so saved himself. Then he alighted from his Horse, and tyed him to the next Tree, seeking out as diligently as he could for a way into the Cave, whereinto the Hind-calf had leaped : and when he had looked a good while about him, and could finde none, he heard a voyce speaking unto him, and forbidding him to touch the Hind-calf, which made him look about again, to see if he could perceive the person from whom the voyce proceeded, but espying none, he grew to be afraid, and thought that the voyce proceeded from some other greater cause, and so leaped upon his Horse hastily, and departed again to his fellows. The day after he returned to the same place, and when he came thither, being terrified with the remembrance of the former voyce, he durst not enter into the place, but stood there doubting and wondering with himself, what Shepherds or Hunters, or other men might be in that place to diswarn him from his game, and therefore he went round about to seek for some, or to learn from whence the voyce proceeded. While he was thus seeking, there appeared unto him a Dragon of a great stature, creeping upon the greatest part of his body, except his neck and head lifted up a little, and that little was as high as the stature of any man can reach, and in this fashion he made toward *Pindus*, who at the first sight was not a little afraid of him, but yet did not run away, but rather gathering his wits together, remembered that he had about him Birds, and divers parts of Sacrifices, which instantly he gave unto the Dragon, and so mitigated his fury by these gifts, and as it were with a royal feast, changed the cruel nature of the Dragon into kinde usage. For the Dragon being smoothed over with these

these gifts, & as it were overtaken with the liberality of *Pindus*, was contented to forsake the old place of his habitation, and to go away with him. *Pindus* also being no less glad of the company of the Dragon, did daily give unto him the greatest part of his hunting, as a deserved price and ransom of his life, and conquest of such a Beast. Neither was he unrequited for it, for Fortune so favoured his game, that whether he hunted fowls of the air, or beasts of the earth, he still obtained and never missed. So that his fame for hunting procured him more love and honor, then ever could the Imperial Crown of his Country. For all young men desired to follow him, admiring his goodly personage and strength, the Virgins and Maids falling in love, contended among themselves who should marry him: the wives forsaking their husbands, contrary to all womanly modesty, rather desired his company then the society of their husbands, or to be preferred among the number of the Goddesses. Only his Brethren enraged against him, sought all means to kill and destroy him. Therefore they watched all opportunities, lying in continual ambush where he hunted to accomplish their accursed enterprise, which at last they obtained: for as he followed the game, they enclosed him in a narrow straight neer to a Rivers side, where he had no means to avoid their hands, they and their company being many, and he alone, wherefore they drew out their swords and slew him. When he saw no remedy but death, he cryed out aloud for help, whose voyce soon came to the ears of the watchful Dragon, (for no Beast heareth or seeth better) out he cometh from his den, and finding the murderers standing about the dead body, he presently surprized and killed them, so revenging the quarrel of *Pindus*, and then fell upon the dead body of his friend, never forsaking the custody thereof, until the neighbours adjoyning to the place, taking knowledge of the fact, came to bury the bodies. But when they came and saw the Dragon among them, they were afraid, and durst not come neer, but stood afar off, consulting what to do; till at last they perceived that the Dragon began to take knowledge of their fear, who with an admirable curtesie of nature, perceiving their mourning and lamentation for their dead friend, and withall, their abstinence from approaching to execute his exequies, or funerals, began to think that he might be the cause of this their terror, and far standing off from the dead bodies, wherefore he departed, taking his farewell of the body which he loved, and so gave them leave by his absence, to bestow upon him an honourable burial, which they performed accordingly, and the River adjoyning, was named by the name of *Pindus-death*.

By which story may appear, that these savage Dragons are made loving and tame to men, by good turns and benefits bestowed upon them, for there is no nature which may not be overcome by kindness. And yet I may not leave this matter thus, nor from these two examples alone, conclude the practise and possibility of love betwixt Men and Dragons: I will therefore add some three or four examples more.

There was a Dragon the lover of *Aetholis* (as *Plutarch* writeth) who came unto her every night, and did her body no harm, but gently sliding over her, played with her till morning, then also would he depart away as soon as light appeared, that he might not be espied. The Maidens friends came to the knowledge hereof, and so removed her far away, to the intent the Dragon might come no more at her: and thus they remained asunder a great while, the Dragon earnestly seeking for the Maiden, wandered far and neer to finde her out. At last he met with her, and not saluting her gently as he was wont, flew upon her, binding her hands down with the spire of his body, hissing softly in her face, and beating gently with his tail her back-parts, as it were taking a moderate revenge upon her, for the neglect of his love by her long absence.

Gilius.

Another like story unto this is reported by *Aelianus*, of a great Dragon which loved a fair Woman, beloved also of a fair Man, the Woman oftentimes did sleep with this Dragon, but not so willingly as with the Man: wherefore she forsook the habitation of her place for a month, and went away where the Dragon could not find her, thinking that her absence might quench his desire. But he came often to the place where he was wont to meet with the woman, and not finding her, returned quietly back again, and came again another time: at last he grew suspicious, and like a lover failing in his expectation, grew very sorrowful, and so continued till the month was expired, every night visiting the accustomed place. At last the woman returned, and the Dragon presently met with her, and in an amorous fashion, full of suspicion and jealousy, winding about her body, did beat her as you have heard in the former story: and this (saith *Aelianus*) happened in *Judea*, in the days of *Herod* the King.

There was a little Dragon-whelp bred in *Arcadia*, and brought up familiarly with a little boy from his infancy, until the Boy became a young Man, and the Dragon also became of great stature, so that one of them loved another so well as Man and Beast could love together, or rather two playfellows from the Cradle. At last the friends of the Boy seeing the Dragon grow so great in so short a space, began to be suspicious of him; whereupon they took the bed wherein the Boy and the Dragon were lodged, and carryed the same into a far remote place of Woods and Wildernesse, and there set down the bed with the Boy and the Dragon together. The boy after a little while returned, and came home again to his friends; the Dragon wandered up and down in the Woods, feeding upon herbs and poyson, according to his nature, and never more cared for the habitation of men, but rested contented with a solitary life. In the length of time it came to passe that the boy grew to be a perfect man, and the Dragon also remained in the Wood, and although absent one from the other, yet mutually loving as well as ever. It hapned that this young man travelled through that place where the Dragon was lodged, and fell among thieves, when the young man saw their swords about his ears,

he cryed out, and the Dragons den being not far off, his cry came to the Dragons ears, who instantly knowing the voyce of his play-fellow, answered the same with another, at whose hissing the thieves grew afraid, and began to run away, but their legs could not carry them so fast, as to escape the Dragons teeth and claws; for he came speedily to release his friend, and all the thieves that he could find, he put to cruel death, then did he accompany his friend out of the place of peril, and returned back again to his den, neither remembering wrath, for that he was exposed to the Wildernesse, and there left by his play-fellow, nor yet like perverse men, forsaking their old friend in danger.

Suetonius.

They that desire to read more of this subject, shall finde store of examples in *Aelianus* his sixt and thirteen Books. To conclude, when *Messalina* the wife of *Claudius*, did send certain men to take away the life of *Nero*, who was a rival of *Britannicus*; it is said that when they had him in their hands to strangle him, a Dragon appeared out of the earth, or floor of the chamber, and did so terrifie these hangmen, that they ran away and spared *Neroes* life. By which example, another example of piety in Dragons is observed.

Again, *Telephus* ignorantly lying with his mother, had committed incest with her, had not a Dragon by divine providence come and parted them asunder: therefore *Draconi similia est virtus indagatrix, quæ diligenter omnia perscrutatur, rimaturque; studiosissime*, the vertue of discretion or perfect knowledge, is like a Dragon, which diligently searcheth all things, and studiously looketh into every chink: so did this Dragon preserve the chastity of the mother and the son, when they ignorantly and in the dark had defiled each other, but for his appearance and demonstration. I will add but this one example more of their love of chastity in men and women.

In *Lavinium* there was a great holy Wood, neer unto which stood a Temple of *Juno*, in that wood there was a great deep den of a Dragon, unto the which Dragon the Virgins came every year being blinde-folded with clowts, and carrying Marchpanes in their hands: When they entred the Wood, there was a certain spirit (as it was said) without offence did lead them to the den of the Dragon, and so every one of the Virgins did severally offer up their Marchpanes to the Dragon: the Dragon received the Marchpane at the hand of every pure Virgin and unspotted, but if they were defiled, and held only the name of Virgins, then the Dragon refused the Marchpane, and therefore they were all examined at their coming forth, that those which had lost their Virginity might be punished by the Law. And by this story, (although none but Heathens will believe it to be true, because it is a fable merely invented to defend Idolatry, which with my soul and spirit I do detest) yet I may collect thus much as a moral out of a fable, that Dragons in ancient time did honor Virginity. And thus seeing they neither love, nor are beloved of any other creature, I will here leave to talk of their love and friendship, and passe on to their hatred and adversaries.

The examples before expressed being all extraordinary and beside nature, do not conclude, but that there is an ordinary hatred betwixt Men and Dragons, and therefore in the discourse of their enemies, Men must have the first place, as their most worthy adversary, for both Dragons have perished by Men, and Men by Dragons, as may appear by these stories following. When the Region of *Helvetia* began first to be purged from noysome Beasts, there was a horrible Dragon found neer a Countrey Town called *Wilser*, who did destroy all men and beasts that came within his danger in the time of his hunger, inso much that that Town and the fields there to adjoyning, was called *Dedwiler*, that is, a Village of the Wildernesse, for all the people and Inhabitants had forsaken the same, and fled to other places.

Stumpfius.

There was a man of that Town whose name was *Winckelriedt*, who was banished for man-slaughter, this man promised if he might have his pardon, and be restored again to his former Inheritance, that he would combat with that Dragon, and by Gods help destroy him: which thing was granted unto him with great joyfulness. Wherefore he was recalled home, and in the presence of many people went forth to fight with the Dragon, whom he slew and overcame, whereat for joy he lifted up his sword imbrued in the Dragons blood, in token of victory, but the blood distilled down from his sword upon his body, and caused him instantly to fall down dead. And thus this noble Conqueror, a man worthy to be remembered in all ages and Nations, who had strength to kill the Dragon being alive, yet had no power to resist the venom of his blood, he being dead. But had it not been that his hand had been before imbrewed in the blood of a man, I do not believe that the blood of a Dragon could have fallen so heavy upon him. But this is the judgement of GOD, either to punish murder in the same kinde, or also to teach us, that we should not rejoyce in our own merits, lest God see it and be angry. For our Saviour Christ forbade his Disciples that they should rejoyce that the Devils were subject to them; and therefore much lesse may we poor creatures rejoyce for overcoming men or beasts.

Aristotle.

And yet one thing more is to be considered in the death of this man, who was banished for killing a man, and was pardoned for killing a Dragon, and yet killed by the Dragon after the Dragon was slain. Thus blood was the sin because it brought death, & death again brought blood to be the revenger of the first, that the blood of man might be washed away with the blood of man, and the blood of a Serpent coming betwixt. And thus I may truly say as the Christian Poet saith in another case, *Sanguine succrevit, sanguine finis erit*, as it grew, so shall it end in blood.

In the days of *Philip* King of *Macedon*, there was a way into a Mountain of *Armenia*, over which the King had prayed, that never man might go but he might die: wherefore *Socrates*, to try the effect of the Kings prayer, set his Optick Philosophical glasse that he might see what was in

in that way, and presently he perceived two great Dragons, who coming out of their dens, did infect the air thereabouts with a pestilent evaporation of their own breath. This he declared to the King, who for the revocation of his own prayer, armed divers men to go out against them and kill them: who likewise performed the same, and so cleared the way from that annoyance. And thus we see another story of Dragons slain by men.

Hereunto may be added, how *Hercules*, when he was a childe in his cradle, slew two Dragons, as *Pindarus* relateth. And the *Corcyreans* did worship *Diomedes* for killing of a Dragon. *Donatus* a holy Bishop in *Germany*, finding a Dragon to lie secretly hid beside a bridge, killing Men, Oxen, Horse, Sheep, and Goats, he came boldly unto him in the name of Christ, and when the Dragon opened his mouth to devour him, the holy Bishop spitting into his mouth killed him.

When *Orpheus* was in hawking, and while he intended his sport, suddenly a Dragon set upon him, but his hawking Spaniels or Dogs released him of that Danger, for they tore the Dragon in pieces. Many such other stories I could relate, but I spare them here, because I have handled them in the beginning of this story: and so I passe over the slaughter of Dragons by Men, and come to the slaughter of Men by Dragons, which are briefly these that follow.

Petrus Damianus declareth of a certain husband-man, who rising early in the morning, and travelling by the way side, saw a great Dragon lie still upon the earth without motion, he being weary, thought him to be a trunk of some tree, wherefore he sat down upon him, & the beast endured him a little while, but at the last he turned his head in anger, and swallowed him up. After that the *Grecians* fained as though they would go away from *Troy*, and *Sinon* the Traytor was received by the *Trojans* into the City, there were two Dragons which slew the sons of *Laocoon* as they landed in the Island *Porcy*, *Caribee*, and *Chalidne*, which is thus described by *Virgil*;

*At gemini lapsu delubra ad summa Dracones
Effugiant, sequeq; petunt Tritonidos arcem,
Sub pedibusque Dea clypeique sub orbe teguntur:
Tum verò tremefacta novus per pectora cunctis*

*Insinuat pavor, & scelus expendisse merentem
Laocoonia ferunt, sacrum qui cuspide robor
Laeserit, &c.*

Which may be Englished thus;

*Two Dragons slide, and to the top of Temple flie,
Making their way unto the fort of Tritons feirce,
Under the Goddesses feet and shield, in circle down they lie,
What fear did mortal breast possesse then cannot I rehearse:
For then Laocoon did begin to think on's former sin,
When he did harm the sacred thing by thrusting spear within.*

About the Temple of *Jupiter Nemus*, there is a Grove of Cypress trees, among which there is a place wherein a Dragon did destroy *Opheltes*, when he was laid under a green bush by his Nurse. There is a proverb, *Bonos viros vel à mure morderi, malis ne Draconem dentes audere admoliri*: that is to say, every Mouse will bite a good man, but evill men are not touched with the teeth of Dragons.

Alciatus hath a pretty Emblem, whose title is, *Ex arduis perpetuum nomen*, from difficult things and great labours, ariseth immortal fame: wherein he pictureth a Dragon following young Sparrows to take and eat them. His verses in *Latine* are these:

Crediderat platani ramis sua pignora passer.

Et bene, ni sevo visa Dracone forent.

Clutii hic pullos omnes, miseramq; parentem

Saxeus & tali dignus obire nece.

Hac nisi mentitur Chalcas, monumenta laboris

Sunt longi, cujus fama perennis eat.

Which may be thus Englished;

To Plantain-leaves the Sparrow did her young commit,

And safe enough, had not the Dragon them espied,

He eat the young ones all, the dam with sons destroyd,

Well worthy such a death, of life to be denyed;

This is by Chalcas said, a type of labour long,

Whose fame eternal lives in every tongue.

There be certain beasts called *Dracontopides*, very great and potent Serpents, whose faces are like to the faces of Virgins, and the residue of their body like to Dragons. It is thought that such a one was the Serpent that deceived *Eve*, for *Beda* saith, it had a Virgins countenance, and therefore the woman seeing the likenesse of her own face, was the more easily drawn to believe it: into the which when the Devil had entred, they say he taught it to cover the body with leaves, and to shew nothing but the head and face. But this fable is not worthy to be refuted, because the Scripture it self doth directly gainsay every part of it. For first of all it is called a Serpent, and if it had been a Dragon, *Moses* would have said so, and therefore for ordinary punishment, God doth appoint it to creep upon the belly, wherefore it is not likely that it had either wings or feet. Secondly, it was impossible and unlikely, that any part of the body was covered or concealed from the sight of the woman, seeing she knew it directly to be a Serpent, as afterward she confessed before GOD and her husband.

There be also certain little Dragons called in *Arabia*, *Vesga*, and in *Catalonia*, Dragons of houses, these when they bite, leave their teeth behinde them, so as the wound never ceaseth swelling as long as the teeth remain therein, and therefore for the better cure thereof, the teeth are drawn forth, and so the wound will soon be healed. And thus much for the hatred betwixt Men and Dragons, now we will proceed to other creatures.

The greatest discord is betwixt the Eagle and the Dragon, for the Vultures, Eagles, Swans and Dragons, are enemies one to another. The Eagles when they shake their wings, make the Dragons afraid with their rattling noise, then the Dragon hideth himself within his den, so that he never fighteth but in the air, either when the Eagle hath taken away his young ones, and he to recover them flyeth aloft after her, or else when the Eagle meeteth him in her nest, destroying her Egges and young ones: for the Eagle devoureth the Dragons and little Serpents upon earth, and the Dragons again and Serpents do the like against the Eagles in the air. Yea many times the Dragon attempteth to take away the prey out of the Eagles talons, both on the ground and in the air, so that there ariseth betwixt them a very hard and dangerous fight, which is in this manner described by Nicander.

*Hunc petit invisum magni Jovis armiger hostem,
Cumque genis parat acre suis ex ethere bellum:
Pascentem in silvis quam primum viderit illum,
Quod totos ferus in nidos cum mitibus ovib;
Et simul ipsa terens, & vastans pignora perdat.
Non timet hoc Serpens, imò quodam impete dumis
Profiliens, ipsamque aquilam, leporemque tenellum*

*Extrahit ex rapidis vi fraudeque fortior uncis.
Cauta malum declinat avis, fit ibi aspera pugna,
Ut queat extortam victor sibi tollere prædam.
Sed frustra elapsam, & volitantem hinc inde volutem
Insequitur, longos sinuum contractus in orbes,
Obliquoque levans sursum sua lumina visu.*

Which may be Englished thus;

*When as the Eagle, Joves great Bird, did see her enemy,
Sharp war in th' air with beak she did prepare
Gainst Serpent feeding in the Wood, after espy
Cause it her Egges and young fiercely in pieces tare.
The Serpent not afraid of this, leaps out of thorns
With force upon the Eagle, holding tender Hare,
Out of her talons by fraud and force more strong,
That takes and snatches despite her enemies fear.
But wary Bird avoids the force, and so they fight again,
That Victor one of them might joy the prey alone,
The flying fowl by winding Snake is hunted all in vain,
Though up and down his nimble eyes this and that way be gone.*

In the next place we are to consider the enmity that is betwixt Dragons and Elephants, for so great is their hatred one to the other, that in *Aethiopia* the greatest Dragons have no other name but Elephant-killers. Among the *Indians* also the same hatred remaineth, against whom the Dragons have many subtle inventions: for besides the great length of their bodies, wherewithall they claspe and begirt the body of the Elephant, continually biting of him until he fall down dead, and in the which fall they are also bruised to pieces; for the safeguard of themselves they have this device. they get and hide themselves in trees, covering their head, and letting the other part hang down like a rope: in those trees they watch until the Elephant come to eat and crop of the branches, then suddenly before he be aware, they leap into his face, and dig out his eyes, then do they clasp themselves about his neck, and with their tails or hinder-parts, beat and vex the Elephant, until they have made him breathlesse, for they strangle him with their fore-parts, as they beat them with the hinder, so that in this combat they both perish: and this is the disposition of the Dragon, that he never setteth upon the Elephant, but with the advantage of the place, and namely from some high tree or rock.

Sometimes again a multitude of Dragons do together observe the paths of the Elephants, & cross those paths they tie together their tails as it were in knots, so that when the Elephant cometh along in them, they insnare his legs, and suddenly leap up to his eyes, for that is the part they aim at above all other, which they speedily pull out, and so not being able to do him any harm, the poor beast delivereth himself from present death by his own strength, and yet through his blindness received in that combat, he perisheth by hunger, because he cannot choose his meat by smelling, but by his eye-sight.

There is no man living that is able to give a sufficient reason of this contrariety in nature betwixt the Elephant and the Dragon, although many men have laboured their wits, and strained their inventions to finde out the true causes thereof, but all in vain, except this be one that followeth. The Elephants blood is said to be the coldest of all other Beasts, and for this cause it is thought by most Writers, that the Dragons in the Summer time do hide themselves in great plenty in the waters where the Elephant cometh to drink, and then suddenly they leap up upon his ears, because those places cannot be defended with his trunk, and there they hang fast, and suck out all the blood of his body, until such a time as he poor beast through faintnesse fall down and die, and they being drunk with his blood, do likewise perish in the fall.

The Gryffins are likewise said to fight with the Dragons and overcome them. The Panther also is an enemy unto the Dragons, and driveth them many times into their dens. There is a little Bird called *Captilus*, by eating of which the Dragon refresheth himself when he is wearied in hunting of other beasts. And to conclude, he is an enemy unto all kinde of beasts, both wilde and tame, as may appear by these verses of *Lucan*, where he saith.

— Amen.

*Armenta; tota secuti,
Rumpitis ingentes amplexi verberare Tauros:
Nec tutus spacio est Elephas.*

Which may be Englished thus;

*And following close the Herds in field,
Great Bulls with force of might,
And Elephants are made to yeeld
By Dragons valiant sprite.*

In the next place I will passe unto the poyson and venom of Dragons, omitting all Poetical discourses about the worshipping and transmutation of Dragons from one kinde to another, such as are the hairs of *Orpheus*, or the teeth of the Dragon which *Cadmus* slew, into armed men, and such like fables, which have no shew nor appearance of truth, but are only the inventions of men, to utter those things in obscure terms, which they were afraid to do in plain speeches.

It is a question whether Dragons have any venom or poyson in them, for it is thought that he hurteth more by the wound of his teeth, then by his poyson. Yet in *Deut. 22. Moses* speaketh of them as if they had poyson, saying: Their Wine is as the poyson of Dragons, and the cruel venom of Asps. So also *Heliodorus* speaketh of certain weapons dipped in the poyson of Dragons. For which cause we are to consider, that they wanting poyson in themselves, become venomous two manner of ways: First by the place wherein they live, for in the hotter Countries they are more apt to do harm then in the colder and more temperate, which caused the Poet in his verses to write of them in this manner following;

*Vos quoq; qui cunctis innoxia numina terris
Serpitis aurato nitidi fulgore Dracones,
Pestiferos ardens facit Africa: Ducitis alium
Aera cum pennis, &c.*

Which may be Englished in this manner;

*You shining Dragons creeping on the earth,
Which fiery Africk yeelds with skin like gold,
Yet pestilent by hot infecting breath,
Mounted with wings in t' air we do behold.*

So that which is spoken of the poyson of Dragons infecting the air wherein they live, is to be understood of the Meteor called *Draco-volans*, a Fire-drake, which doth many times destroy the fruits of the earth, seeming to be a certain burning fire in the air, sometime on the Sea, & sometime on the land, whereof I have heard this credible story from men of good worth and reputation, happening about some twelve years ago, upon the Western Seas, upon the Coasts of *England*, which because it is well worthy to be kept in remembrance of all posterity, and containeth in it a notable work of God, I have thought good to set it down in this place.

There was an old Fisher-man, which with his two hired servants went forth to take fish, according to his accustomed manner and occupation, and having laid their nets, watched them earnestly to finde the booty they came for, and so they continued in their labour untill mid-night or thereabouts, taking nothing. At last there came by them a Fire-drake, at the sight whereof the old man began to be much troubled and afraid, telling his servants, that those sights seldom portended any good, and therefore prayed God to turn away all evill from them, and withall, willed his servants to take up their Nets, lest they did all repent it afterward; for he said he had known much evill follow such apparitions. The young men his servants comforted him, telling him that there was no cause of fear, and that they had already committed themselves into the hands of Almighty GOD, under whose protection they would tarry untill they had taken some fish: the old man rested contented with their confidence, and rather yeelded unto them, then was perswaded by them. A little while after the Fire-drake came again, and compassed round about the Boat, and ran over the Nets, so that new fears, and more violent passions then before possessed both the old man and his servants. Wherefore they then resolved to tarry no longer, but hastened to take up their Nets and be gone. And taking up their Nets, at one place they did hang so fast, as without breaking they could not pull them out of the water, wherefore they set their Grab-hooks unto them to loose them; for the day before they remembered that a Ship was cast away in the same place, and therefore they thought that it might be the Nets were hanged upon some of the tacklings thereof: and therein they were not much deceived, for it happened that finding the place whereupon the Net did stay, they pulled and found some difficulty to remove it, but at last they pulled it up, and found it to be a chair of beaten gold. At the sight hereof their spirits were a little revived, because they had attained so rich a booty, and yet like men burdened with wealth, (especially the old man,) conceived new fears, and wished he were on land, lest some storm should fall, and lay both it and them the second time in the bottom of the Sea.

So great is the impression of fear, and the natural presage of evill, in men that know but little in things to come, that many times they prove true Prophets of their own destruction, although they

they have little reason till the moment of perill come upon them: and so it fell out accordingly in this old man; for whilest he feared death by storms and tempests on the Sea, it came upon him, but by another way and means. For behold the Devill entred into the hearts of his two servants, and they conspired together to kill the old man their Master, that so between themselves they might be owners of that great rich chair, the value whereof (as they conceived) might make them Gentlemen, and maintain them in some other Countrey all the days of their life. For such was the resolution that they conceived upon the present, that it would not be safe for them to return home again after the fact committed, lest they should be apprehended for murder, as they justly deserved, their Master being so made away by them.

The Devill that had put this wicked motion into their mindes, gave them likewise present opportunity to put the same in execution, depriving them of all grace, pity, and piety, still thrusting them forward to perform the same. So that not giving him any warning of his death, one of them in most savage and cruel manner dashed out his brains, and the other speedily cast him into the Sea. And thus the fear of this old man, conceived without all reason, except superstition for the sight of a Fiery-drake, came upon him in a more bloody manner then he expected: but life suspected it self, and rumors of peril unto guilty consciences, (such as all we mortal men bear) are many times as forcible as the sentence of a Judge to the heart of the condemned prisoner; and therefore it were happy that either we could not fear, except when the causes are certain, or else that we might never perish but upon premonition. And therefore I conclude with the example of this man, that it is not good to hold a superstitious fear, lest God see it, and being angry therewith, bring upon us the evil which we fear. But this is not the end of the story, for that Fire-drake, (as by the sequel appeareth) proved as evill to the servants as he did to the Master.

These two sons of the Devill, made thus rich by the death of their Master, forthwith they failed towards the Coast of France, but first of all they broke the Chair in pieces, and wrapped it up in one of their Nets, making account that it was the best fish that ever was taken in that Net, and so they laid it in one end of their Bark or Fisher-boat. And thus they laboured all that night and the next day, till three or four of the clock, at what time they espyed a Port of Britain, whereof they were exceeding glad, by reason that they were weary, hungry, and thirsty with long labour, always rich in their own conceit by the gold which they had gotten, which had so drawn their hearts from God, as they could not fear any thought of his judgement; And finally it so blinded their eyes, and stopped their ears, that they did not see the vengeance that followed them, nor hear the cry of their Masters blood. Wherefore, as they were thus rejoycing at the sight of land, behold they suddenly espyed a Man of War coming towards them, whereat they were appalled, and began to think with themselves that their rich hopes were now at an end, and they had laboured for other, but yet resolved to die rather then to suffer the booty to be taken away from them. And while they thus thought, the Man of War approached and hailed them, summoning them to come in and shew what they were: they refused, making forward as fast to the Land as they could. Wherefore the Man of War shot certain Muskets at them, and not prevailing, nor they yielding, sent after them his Long-boat, upon the entrance thereof they fought manfully against the assaylants, until one of them was slain, and the other mortally wounded; who seeing his fellow kill'd, and himself not likely to live, yet in envy against his enemy, ran presently to the place where the Chair lay in the Net, and lifting the same up with all his might, cast it from him into the Sea, instantly falling down after that fact, as one not able through weaknesse to stand any longer: whereupon he was taken and before his life left him he related the whole story to them that took him, earnestly desiring them to signifie so much into England, which they did accordingly: and as I have heard, the whole story was printed, and so this second History of the punishment of murder, I have related in this place, by occasion of the Fiery-drake, in the History of the Dragon.

A second cause why poyson is supposed to be in Dragons, is for that they often feed upon many venomous roots, and therefore their poyson sticketh in their teeth, whereupon many times the party bitten by them, seemeth to be poysoned; but this falleth out accidentally, not from the nature of the Dragon, but from the nature of the meat which the Dragon eateth. And this is it which Homer knew and affirmed in his verses, when he described a Dragon making his den neer unto the place where many venomous roots and herbs grew, and by eating whereof he greatly annoyeth mankind when he biteth them.

*Os de Drakoon espi Xein oresteros andra meneft
Bebrocos kaka pharmaka.*

Which may be thus Englished,

*And the Dragon which by men remains,
Eats evill herbs without deadly pains.*

And therefore *Aelianus* saith well, that when the Dragon meaneth to do most harm to men, he eateth deadly poysonful herbs, so that if he bite after them, many not knowing the cause of the poyson, and seeing or feeling venom by it, do attribute that to his nature which doth proceed from his meat. Besides his teeth which bite deep; he also killeth with his tail, for he will so begirt and pinch in the body, that he doth gripe it to death, and also the strokes of it are so strong, that either they kill thereby forthwith, or else wound greatly with the same, so that

*Vincensius.
Solinus.*

that the strokes of his tail, are more deadly then the biting of his teeth; which caused *Niander* to write thus;

*Nec tamen ille graves, ut cetera turba, dolores
Si velit, infixo cum forte momorderit ore,
Suscitat: exiguus non noxia vulnera punctus*

*(Qui ceu rodentes noctu quaque obvia muris)
Infligit, modicum tenuis dat plaga cruorem.*

Which may be thus Englished;

Nor yet he when with his angry mouth
Doth bite, such pains and torments bringeth
As other Serpents, if Ancients tell the truth,
When with his teeth and spear he stingeth:

For as the holes which biting Mice do leave,
When in the night they light upon a prey,
So small are Dragons-bites which men receive,
And harmlesse wound makes blood to run away.

Their mouth is small, and by reason thereof they cannot open it wide to bite deep, so as their biting maketh no great pain; and those kinde of Dragons which do principally fight with Eagles, are defended more with their tails then with their teeth: but yet there are some other kinde of Dragons, whose teeth are like the teeth of Bears, biting deep, and opening their mouth wide, wherewith all they break bones, and make many bruises in the body, and the males of this kinde bite deeper then the females, yet there followeth no great pain upon the wound.

The cure hereof is like to the cure for the biting of any other Beast wherein there is no venom, and for this cause there must be nothing applyed thereunto which cureth venomous bitings, but rather such things as are ordinary in the cure of every Ulcer.

The seed of grasse, commonly called Hay-dust, is prescribed against the biting of Dragons. The Barble being rubbed upon the place where a Scorpion of the earth, a Spider, a Sea or Land-dragon biteth, doth perfectly cure the same. Also the head of a Dog or Dragon which hath bitten any one, being cut off and flayed, and applyed to the wound with a little *Euphorbium*, is said to cure the wound speedily.

And if *Albedismon* be the same that is a Dragon, then according to the opinion of *Avicen*, the cure of it must be very present, as in the cure of Ulcers. And if *Albatraf* and *Haudem* be of the kinde of Dragons, then after their biting there follow great coldnesse and stupidity; and the cure thereof must be the same means which is observed in cold poysons. For which cause the wound or place bitten, must be embrewed or washed with luke-warm Vinegar, and emplaistered with the leaves of Bay, anointed with the Oyl of herb *Mary*, and the Oyl of Wilde-pellitory, or such things as are drawn out of those Oyls, wherein is the vertue of Nettles, or Sea-onions.

But those things which are given unto the patient to drink, must be the juyce of Bay-leaves in Vinegar, or else equall portions of Myrrhe, Pepper, and Rew in Wine, the powder or dust whereof must be the full weight of a golden groat, or as we say a *French Crown*.

In the next place, for the conclusion of the History of the Dragon, we will take our farewell of him in the recital of his medicinal vertues, which are briefly these that follow.

First, the fat of a Dragon dryed in the Sun, is good against creeping Ulcers: and the same mingled with Honey and Oyl, helpeth the dimnesse of the eyes at the beginning. The head of a Dragon keepeth one from looking asquint: and if it be set up at the gates and dores, it hath been thought in ancient time to be very fortunate to the sincere worshippers of GOD. The eyes being kept till they be stale, and afterwards beat into an Oyl with Honey made into Ointment, keep any one that useth it from the terrour of night-visions and apparitions.

The fat of a Hart in the skin of a Roe, bound with the nerves of a Hart unto the shoulder, was thought to have a vertue to fore-shew the judgement of victories to come. The first spindle by bearing of it, procureth an easie passage for the pacification of higher powers. His teeth bound unto the feet of a Roe, with the nerves of a Hart, have the same power. But of all other, there is no folly comparable to the composition which the Magitians draw out of a Dragon to make one invincible, and that is this: They take the head and tail of a Dragon, with the hairs out of the fore-head of a Lyon, and the marrow of a Lyon; the spume or white mouth of a conquering Horse, bound up in a Harts skin, together with a claw of a Dog, and fastned with the crosse nerves or sinew of a Hart, or of a Roe; they say that this hath as much power to make one invincible, as hath any medicine or remedy whatsoever.

The fat of Dragons is of such vertue that it driveth away venomous beasts. It is also reported, that by the tongue or gall of a Dragon sod in Wine, men are delivered from the spirits of the night, called *Incubi* and *Succubi*, or else Night-mares. But above all other parts, the use of their blood is accounted most notable. But whether the *Cinnabaris* be the same which is made of the blood of the Dragons and Elephants, collected from the earth when the Dragon and Elephant fall down dead together, according as *Pliny* delivereth, I will not here dispute, seeing it is already done in the story of the Elephant: neither will I write any more of this matter in this place, but only refer the Reader unto that which he shall finde written thereof in the History of our former Book of Four-footed Beasts.

And if that satisfie him not, let him read *Langius* in the first book of his Epistles, and sixty five Epistle, where that learned man doth abundantly satisfie all men concerning this question, that are studious of the truth, and not prone to contention. And to conclude, *Andreas Balvacensis* writeth, that the Bloud-stone called the *Hematite*, is made of the Dragons blood: and thus I will conclude

clude the History of the Dragon, with this story following out of *Porphyrius*, concerning the good successe which hath been signified unto men and women, either by the dreams or sight of Dragons.

Mamea the Mother of *Alexander Severus* the Emperor, the night before his birth, dreamed that she brought forth a little Dragon, so also did *Olympia* the Mother of *Alexander* the Great, and *Pomponia* the Mother of *Scipio Africanus*. The like prodigy gave *Augustus* hope that he should be Emperor. For when his Mother *Aetia* came in the night time unto the Temple of *Apollo*, and had set down her bed or couch in the Temple among other Matrons, suddenly she fell asleep, and in her sleep she dreamed that a Dragon came to her, and clasped about her body, and so departed without doing her any harm. Afterwards the print of a Dragon remained perpetually upon her belly, so as she never durst any more be seen in any bath.

The Emperor *Tiberius Caesar*, had a Dragon which he daily fed with his own hands, and nourished like good fortune, at the last it happened that this Dragon was defaced with the biting of Emmets, and the former beauty of his body much obscured: Wherefore the Emperor grew greatly amazed thereat, and demanding a reason thereof of the Wisemen, he was by them admonished to beware the insurrection of the common people. And thus with these stories representing good and evill by the Dragon, I will take my leave of this good and evill Serpent.

of the DRYINE.

There be some that confound this Serpent with the Water-snake, and say it is none other then that which of ancient time was called *Hydrus*, for so long as they live in the water, they are called *Hydri*, that is, Snakes of the water, but when once they come to the land, they are called *Chelidri*, and *Chersydri*: but it is certain that the *Chelidrus*, is different from the *Chersydus*, by the strong smell and savour which it carryeth with it wheresoever it goeth, according to these verses made of *Umbo* the Priest in *Virgil*.

*Viperio generi & graviter spirantibus Hydri,
Spargere qui somnos cantuq; manuq; solebat.*

Which may be Englished thus;

*Who could by song and hand bring into deadly sleep
All kinde of Vipers, with Snakes smelling strong and deep.*

Which being compared with that instruction which he giveth to Shepherds, teaching them how to drive away the strong smelling Serpents from the folds, he calleth them *Chelydri*, when he writeth in this manner;

*Disce & odoratam stabulis accendere Cedrum,
Galbanioq; agitare graves nidore Chelydros.*

That is to say in English thus;

*Learn how to drive away strong smelling Chelyders
From folds, by Galbanum and savoury Cedars.*

So that it is clear that these Dryines are the same which are called *Chelydri*, who do stink on the face of the earth, whereby they are oftentimes disclosed although they be not seen: howbeit, some think that this filthy savour doth not proceed from any fume or smoak coming out of their bodies, but rather from their motion, according to the opinion of *Macer* in these following verses.

*Seu terga expirant spumantia Virus
Seu terra fumat qua teter labitur Anguis.*

Which may be Englished in this manner;

*Whether their foming backs that smell
Do send abroad such poyson pestilent,
Or whether th' earth whereon this Snake full fell
Doth slide, yeelds that unwholesome sent.*

It is said that these Dryines do live in the bottom or roots of Oaks, where they make their nests, for which cause they be called *Querculi*, as if they were derived from an Oak, which caused the Countrey people to call it *Dendrogailla*, which signifieth the male and female in this kinde: being bred only in one part of *Africk*, and in *Hellepont*, and there be of them two kindes, one of the length of two cubits, being very fat and round, and very sharp scales over the back; and they are called *Druine* of *Dru*, that signifieth an Oak, because they live in bottom of Oaks: and they are also called *Chelydri*, because of their sharp skins or scales, for it is the manner of the *Latines* and the *Grecians*, to call the hard and rough skin of the body of man and beast, by the name of *Chelydra*; and I take the Serpents *Cylndri*, to be the same that the Dryines be. Within the scales of this Serpent there are bred certain Flyes with yellow wings, as yellow as any Brasse, the which Flyes at length do eat and destroy the Serpent that breedeth them. The colour of their back is blackish, and not white as some have thought, and the savour or smell coming from them like to the smell of a Horses hide, wet as it cometh out of the pit, to be shaven by the hand of a Tawyer or Glover. And *Bellonius* writeth, that he never saw any Serpent greater then this Dryine, which he calleth *Dendrogailla*, nor any that hisseth stronger; for he affirmeth, that one of these put into a sack, was more then a strong Countreyman could carry two miles together without setting it down and resting. And likewise he saith, that he saw a skin of one of these stuffed with hair, which did equall in quantity the leg of a great man. The head of this beast is broad and flat, and *Olaus Magnus* writeth, that many times, and in many places of the North, about the beginning of Summer these Serpents are found in great companies under Oaks, one of them being their head or Captain, who is known by a white crest or comb on the top of his crown, whom all the residue do follow, as the Bees do their King and Captain. And these by the relation of old men are thought to beget a certain stone, by their mutable breathing upon some venomous matter, found in the trees leaves, or earth where they abide; For they abide not only in the roots, but in the hollow bodies of the trees, and sometimes for their meat and food, they leave their habitation, and descend into the Fens and Marishes to hunt Frogs: and if at any time they be assaulted with the Horse-flie, they instantly return back again into their former habitation. When they go upon the earth, they go directly or straight, for if they should winde themselves to run, they would make an offensive noise, or rather yeeld a more offensive smell: according to these verses of the Poet *Lucan*;

Actius.

*Natrix & ambigua coleret qui Syrtidos arva
Chersidros, traëtiq; via fumante Chelydri.*

In English thus;

*The Snake which hunt the doubtful Syrtes sands,
And Chelyders by sliding fume on lands.*

Georgius Fabricius writeth, that he saw in the Temple of *Bacchus* at *Rome*, a company of drunken men dancing, leading a male Goat for sacrifice, having Snakes in their mouths, which Snakes *Prudentius* the Christian poet calleth *Chlydri*, that is, Dryines in these verses following;

*Baccho caper omnibus aris
Ceditur, & virides discindunt ore Chelydros,
Qui Bromium placare volunt, quod & ebria jam tum
Ante oculos regis Satyrorum insania fecit.*

In English thus;

*A Goat to Bacchus on every altar lies,
While sacrificers tear Dryines in pieces small
By force of teeth, and that before the eyes
Of Satyres King, mad drunk they fall.*

The nature of this Serpent is very venomous and hot, and therefore it is worthily placed among the first degree or rank of Serpents, for the smell thereof doth so stupifie a man, as it doth near strangle him, for nature refuseth to breath, rather then to draw in such a filthy air. And so pestilent is the nature of this Beast, that it maketh the skin of the body of a man hurt by it, loose, stinking, and rotten, the eyes to be blinde and full of pain, it restraineth the urine, and if it come upon a man sleeping, it causeth often neezing, and maketh to vomit bloody matter. If a man tread upon it unawares, although it neither sting nor bite him, yet it causeth his legs to swell, and his foot to lose the skin thereof: and that which is more strange, it is reported, that when a Physitian cured the hand of one bitten by this Serpent, the skin of his hand also came off, and whosoever killeth one of these, if once he smell the savour of it, whatsoever he smelleth afterwards, he still thinketh it smelleth of the Dryine. And therefore most pestilent must this Serpent needs be, which killeth both touching and smelling.

When it hath wounded or bitten, there followeth a black or red swelling about the sore, also a vehement pain over all the body through the speedy dispersing of the poyson; also *Pustules* or little wheals, madnesse, driness of the body, and intolerable thirst, trembling and mortification of the members wounded, whereof many die. The cure is like to the cure of *Vipers*, and besides

besides it is good to take Hart-wort drunk in Wine, or Trifoly, or the roots of Daffadil. Acorns of all kinde of Oaks, are profitable against this poyson, being beaten to powder and drunk. And thus much shall suffice for this Serpent.

Of the Serpents called ELEPHANTS.

There be also Serpents called Elephants, because whomsoever they bite, they infect with a kinde of leprosie, and I know not whether the Serpent *Elops*, *Elopi*, and *Laphiati* be the same, but because I finde no matter worthy in them to be spoken of, and they are strangers in our Countrey, the Reader must be contented with their bare names without further description.

OF FROGS.

Frogs are called by the Hebrews, *Zab*, *Zephardea*, *Urdeana*, and *Urdea Akruka*, and *Maskar*; by the Arabians, *Hardun*, *Disdab*, *Disphoa*, *Disdapha*, *Altabaul*; by the Grecians, *Batrachos*: whereof cometh the corrupted word *Brackatas*, and *Garazum*. *Lalages* and *Kembroie*, signifieth green Frogs; the Italians and Spaniards call it *Rana*, by the Latine word; the French, *Grenoville*; the Germans, *Frosch*, and *Frosche*, and *Grassfrosch*, for a green Frog. The Flemings, *Urosch*, and *Uruesch*, and *Pivit*; the Illyrians and Polonians, *Zaba*, by a word derived from the Hebrew. It is some question from whence the word *Rana* is derived, and because of much controversie whether it hath received name, because it liveth on the land and in the water, or from the croaking voyce which it useth: I will not trouble the English Reader with that discourse, only I am assured, that the word Frog in English, is derived from the German word *Frosch*, as many other English words are derived besides the common name of many Frogs. Homer in his Comedy of the fight betwixt Frogs and Mice called *Batrachomyomachia*, hath devised many proper names for Frogs, such as these are; *Limnocharis*, Gracediet, Pleus, Dust-liver; *Hydromedusa*, Water-hunter; *Phuignathos*, Nature-cryer; *Hypsibos*, Loud-cryer; *Leuthaios*, Love-liver; *Poluphonos*, great Labourer; *Krambophagos*, Brasil-eater; *Lymnesios*, Pool-keeper; *Kalaminthios*, Mint-eater; *Hydrocharis*, Water-childe; *Borborokites*, Noise-maker; *Prassaphagos*, Grass-eater; *Pelousios*, dust-creeper; *Pelobates*, dust-leaper; *Krawgasides*, drought-hater; *Prassaios*, Grasse-green; and such other like, according to the witty invention of the Author, all which I thought good to name in this place, as belonging to this History.

In the next place we are to consider the diversity and kindes of Frogs, as they are distinguished by the place of their abode: for the greatest difference is drawn from thence; some of them therefore are Water-frogs, and some are Frogs of the land: the Water-frogs live both in the water and on the land, in marshes, standing pools, running streams, and banks of Rivers, but never in the Sea; and therefore *Rana Marina* is to be understood of a Fish, and not a Frog, as *Massarius* hath learnedly proved against *Marcellus*. The Frogs of the land are distinguished by their living in Gardens, in Meadows, in hollow Rocks, and among fruits: all which several differences shall be afterward expressed, with their pictures in their due places: here only I purpose to talk of the vulgar and common Frog, whose picture with her young one is formerly expressed. Beside, these differ in generation: for some of them are engendered by carnal copulation, and of the slime and rotnesse of the earth. Some are of a green colour, and those are eaten in Germany and in Flanders; some again are yellow, and some of an Ash-colour, some spotted, and some black, and in outward form and fashion they resemble a Toad, but yet they are without venom, and the female is always greater then the male: when the Egyptians will signifie an impudent man, and yet one that hath a good quick sight, they picture a Frog, because he liveth continually in the mire, and hath no blood in his body, but about his eyes.

The tongue is proper to this kinde, for the fore-part thereof cleaveth to the mouth, as in a fish, and the hinder part to the throat, by which he sendeth forth his voyce: and this is to be understood, that all Frogs are mute and dum, except the green Frogs, and the Frogs of the water, for these have voyces. And many times the voyces of Frogs proceedeth from the nature of the Countries wherein they

they live : for once all the Frogs in *Macedonia* and *Cyrenia*, were dum, until there were some brought thither out of some other Countries, as at this day the Frogs of *Seriphus* are all dum, whereupon came the Proverb, *Batrachos ec Seriphou*, A Frog of *Seriphus*, because the Frogs of that Countrey do never croak, although you carry them into any other Countrey.

This *Seriphus* is one of the Islands of the *Sporades* in *Greece*, wherein is the lake called *Pierius*, which doth not run in the Summer, but only in the Winter, and all the Frogs which are cast into that lake, are perpetually silent, and never utter their voyce; whereof there are assigned two causes, one fabulous, and the other true and natural. The first, the *Seriphians* say, that when *Perseus* returned with the head of *Medusa*, having gone very far till he was weary, laid him down beside that lake to sleep, but the croaking Frogs made such a noise, as he could take no rest: Whereat *Perseus* was much offended, and therefore prayed *Jupiter* to forbid the Frogs from crying, who instantly heard his prayer, and injoyed perpetual silence to the Frogs in that water: and this is the fabulous reason, being a meer fiction of the Poets.

The second and more true reason is that of *Theophrastus*, who saith, that for the coldnesse of the water, the Frogs are not able to cry in that place. The voyce of Frogs is said by the *Latinists* to be *Coaxare*, and by the *Grecians*, *Ololugon*; peculiar words to set forth this crying: now because their tongue cleaveth to the palat of their mouth, and their voyce proceedeth but from their throat to their mouth, and the spirit is hindered by the tongue, so as it cannot proceed directly; therefore it hath two bladders upon either side of the mouth, one which it filleth with winde, and from thence proceedeth the voyce. Now when it croaketh, it putteth his head out of the water, holding the neather lip even with the water, and the upper lip above the water: and this is the voyce of the male provoking the female to carnal copulation.

They have but very small lungs, and those without bloud, full of froth like to all other creatures of the water, which do lay egges, and for this cause they do never thirst: wherefore also Sea-calves and Frogs are able to live long under the water. They have a double Liver, and a very small milt, their legs behinde are long, which maketh them apt to leap; before they are shorter, having divided claws which are joyned together with a thin broad skin, that maketh them more apt to swim. The most place of their abode is in fens, or in warm waters, or in fish-pools: but yellow and ash-coloured Frogs abide in Rivers, Lakes, and standing Pools, but in the Winter time they all hide themselves in the earth. And therefore it is not true that *Pliny* saith, that in the Winter time they are resolved into slime, and in Summer they resume again their first bodies, for they are to be seen many times in the Winter; especially in those waters that are never frozen, as *Agrecolaana Mathiolus* hath soundly observed, and they have been seen in certain running streams, holding small fishes in their mouths, as it were sucking meat out of them.

Sometimes they enter into their holes in Autumn before Winter, and in the Spring time come out again. When with their croaking voyces the male provoketh the female to carnal copulation, which he performeth not by the mouth (as some have thought) but by covering her back: the instrument of generation meeting in the hinder parts, and this they perform in the night season, nature teaching them the modesty or shamefastnesse of this action: And besides in that time they have more security to give themselves to mutual imbraces, because of a general quietnesse, for men and all other their adversaries are then at sleep and rest. After their copulation in the waters, there appeareth a thick jelly, out of which the young one is found. But the land Frogs are ingendered out of Eggs, of whom we discourse at this present; and therefore they both suffer copulation, lay their Egges and bring forth young ones on the land. When the Egge breaketh or is hatched, there cometh forth a little black thing like a piece of flesh, which the *Latines* call *Gyrini*, from the *Greek* word *Gyrinos*, having no visible part of a living creature upon them, besides their eyes and their tails, and within short space after their feet are formed, and their tail divided into two parts, which tail becometh their hinder-legs: wherefore when the *Egyptians* would describe a man that cannot move himself, and afterwards recovereth his motion, they decipher him by a Frog, having his hinder-legs. The heads of these young *Gyrini*, which we call in *English* Horse-nails; because they resemble a Horse-nail in their similitude, whose head is great, and the other part small, for with his tail he swimmeth. After May they grow to have feet, and if before that time they be taken out of the water, they die, when they begin to have four feet.

And first of all they are of a black colour and round, and hereof came the Proverb, *Rana Gyrina sapientior*, wiser then a Horse-nail; because through the roundnesse and volubility of his body, it turneth it self with wonderful celerity, which way soever it pleaseth. These young ones are also called by the *Grecians*, *Moluride*, *Brutichoi*, and *Batrachide*, but the *Latines* have no name for it, except *Ranunculus*, or *Rana nascentis*. And it is to be remembred, that one Frog layeth an innumerable company of Egges, which cleave together in the water, in the middle whereof she her self lodgeth. And thus much may suffice for the ordinary procreation of Frogs by generation out of Egges. In the next place I must also shew how they are likewise ingendered out of the dust of the earth by warm, active, and Summer showers, whose life is short, and there is no use of them.

Ælianus saith, that as he travailed out of *Italy* into *Naples*, he saw divers Frogs by the way near *Puteoli*, whose fore-part and head did move and creep, but their hinder-part was unformed and like to the slime of the earth, which caused *Ovid* to write thus;

*Semina limus habet virides generantia Ranas,
Et generat truncas pedibus, & eodem corpore saepe
Altera pars vivit, rudis est pars altera tellus.*

That is to say;

*Durt hath his seed ingendring Frogs full green,
Yet so as feeble without legs on earth they lie,
So as a wonder unto passengers is seen,
One part hath life, the other earth full dead is nye.*

And of these Frogs it is that *Pliny* was to be understood, when he saith, that Frogs in the Winter time are resolved into slime, and in the Summer they recover their life and substance again. It is certain also, that sometime it raineth Frogs, as may appear by *Philarchus* and *Lembus*, for *Lembus* writeth thus: Once about *Dardania*, and *Peonia*, it rained Frogs in such plentiful measure, or rather prodigious manner, that all the houses and high ways were filled with them, and the Inhabitants did first of all kill them, but afterwards perceiving no benefit thereby, they shut their doores against them, and stopped up all their lights to exclude them out of their houses, leaving no passage open, so much as a Frog might creep into, and yet notwithstanding all this diligence, their meat seething on the fire, or set on the table, could not be free from them, but continually they found Frogs in it, so as at last they were enforced to forsake that Countrey. It was likewise reported, that certain *Indians* and people of *Arabia*, were enforced to forsake their Countries through the multitude of Frogs.

Cardan seemeth to finde a reason in nature for this raining of Frogs, the which for the better satisfaction of the Reader, I will here expresse as followeth: *Fiunt haec omnia ventorum ira*, and so forward in his 16. Book *De Subtilitate*, that is to say; these prodigious rains of Frogs and Mice, little fishes and stones, and such like things is not to be wondered at: for it cometh to passe by the rage of the windes in the tops of the Mountains, or the uppermost part of the Seas, which many times taketh up the dust of the earth and congealeth them into stones in the air, which afterwards fall down in rain; so also doth it take up Frogs and Fishes, who being above in the air, must needs fall down again. Sometimes also it taketh up the eggs of Frogs and Fishes, which being kept aloft in the air among the whirl-windes, and storms of shewers, do there engender and bring forth young ones, which afterwards fall down upon the earth, there being no pool for them in the air. These and such like reasons are approved among the learned for natural causes of the prodigious raining of Frogs.

But we read in holy Scripture among the plagues of *Egypt*, that Frogs were sent by God to annoy them; and therefore whatsoever is the material cause, it is most certain that the wrath of God and his Almighty hand, is the making or efficient cause, and for the worthinesse of that divine story, how God maketh and taketh away Frogs, I will expresse it as it is left by the holy Ghost, in ch. 8. *Exod. ver. 5. Also the Lord said unto Moses, say thou unto Aaron, stretch thou out thy hand with thy rod upon the streams, upon the rivers, and upon the ponds, and cause Frogs to come upon the land of Egypt. Ver. 6. Then Aaron stretched out his hand upon the waters of Egypt, and the Frogs came up and covered the land of Egypt. Ver. 7. And the Sorcerers did likewise with their Sorceries, and brought Frogs upon the land of Egypt. Ver. 8. Then Pharaoh called for Moses and Aaron, and said; Pray ye unto the Lord, that he may take away the Frogs from me, and from my people, and I will let the people go, that they may do sacrifice to the Lord. Ver. 9. And Moses said unto Pharaoh, concerning me, Command when I shall pray for thee and thy servants, and thy people, to destroy the Frogs from thee, and from thy houses, that they may remain in the River only. Ver. 10. Then he said to morrow, and he answered, Be it as thou hast said, that thou mayst know that there is none like the Lord our God. Ver. 11. So the Frogs shall depart from thee, and from thy houses, and from thy people, and from thy servants, only they shall remain in the River. Ver. 12. Then Moses and Aaron went out from Pharaoh, and Moses cried unto the Lord concerning the Frogs which he had sent unto Pharaoh. Ver. 13. And the Lord did according to the saying of Moses, so the Frogs dyed in the houses, and in the Towns, and in the fields. Ver. 14. And they gathered them together by heaps, and the land stank of them, &c.*

And this was the second plague of *Egypt*, wherein the Lord turned all the Fishes into Frogs: as the Book of Wisdom saith, and the Frogs abounded in the Kings chamber: and notwithstanding this great judgement of God for the present, Pharaoh would not let the people go, and afterwards that blinde superstitious Nation became worshippers of Frogs, (as *Philastrus* writeth) thinking by this devotion, or rather wickednesse in this observant manner, to pacifie the wrath of God, choosing their own ways before the word of Almighty God: But vain is that worship which is invented without heavenly warrant, and better it is to be obedient to the will of God, then go about to please him with the cogitations of men, although in their pretended holinesse we spend much time, wealth, and blood.

There was one *Cypselus*, the father of *Periander*, who by his mother was hid in a Chest called *Kypselus*, to be preserved from the hands of certain murtherers, which were sent to kill him. Wherefore afterwards the said *Cypselus* consecrated a house at *Delfos* to *Apollo*, because he heard his crying when he was hid in a chest, and preserved him. In the bottom of that house, was the trunk of a Palm-tree and certain Frogs pictured running out of the same: but what was meant thereby is not certainly known, for neither *Plutarch* which writeth the story, nor *Chersias* which relateth it, giveth any signification

nification thereof: but in another place where he enquireth the reason why the Oracle of *Pythia* gave no answer, he conjectured because it was that the accursed thing brought out of the Temple of *Apollo* from *Delphos*, into the *Corinthian* house, had ingraven underneath the Brazen Palm, Snakes, and Frogs, or else for the signification of the Sun rising.

The meat of Frogs thus brought forth are green herbs and Humble-bees, or Shorn-bugs, which they devour or catch when they come to the water to drink: sometime also they are said to eat earth, but as well Frogs as Toads do eat the dead Mole, for the Mole devoureth them being alive. In the moneth of *August*, they never open their mouths, either to take in meat or drink, or to utter any voyce, and their chaps are so fast joyned or closed together, that you can hardly open them with your finger, or with a stick. The young ones of this kinde are killed by casting Long-wort, or the leaves of Sea-lettice, as *Aelianus* and *Suidas* write: and thus much for the description of their parts, generation, and sustentation of these common Frogs.

The wisdom or disposition of the *Aegyptian* Frogs is much commended, for they save themselves from their enemies with singular dexterity. If they fall at any time upon a Water-snake, which they know is their mortal enemy, they take in their mouths a round Reed, which with an invincible strength they hold fast, never letting go, although the Snake have gotten her into her mouth, for by this means the Snake cannot swallow her, and so she is preserved alive.

There is a pretty fable of a great Bull which came to the water to quench his thirst, and whilest the Beast came running greedily into the water, he trod in pieces two or three young Frogs; then one of them which escaped with life, went and told his mother the miserable misfortune and chance of his fellows: she asked who it was that had so killed her young ones, to whom he answered: It was a great one, but how great he could not tell; the foolish Mother-frog desirous to have seen some body in the eyes of her son, began to swell with holding in of her breath, and then asked the young one if the Beast were as big as she? And he answered much greater, at which words she began to swell more, and asked him again if the Beast were so big? To whom the young one answered, Mother leave your swelling, for though you break your self, you will never be so big as he: and I think from this fable came the Proverb, *Rana Gyrina sapientior*, wiser then the young Frog. This is excellently described by *Horace* in his third *Satyre*, as followeth;

*Absentis rane pullis vituli pede pressis
Unus ubi effugit matri denarrat, ut ingens
Bellua cognates eliserit, illa rogare,
Quantane? Num tandem se inflans sic magna fuisset?*

*Major dimidio: Num tanto? Cum magis atq;
Se magis inflaret, non si te ruperis, inquit,
Par eris: hæc à te non multum abludit imago.*

Which may be Englished thus;

*In old Frogs absence, the young were prest to death
By feet of a great Calf, drinking in the water,
To tell the dam, one ran that scap't with life and breath,
How a great beast her young to death did scatter.
How great said she? so big? and then did swell.
Greater by half, said he: then she swoll more, and said
Thus big? but he: cease swelling dam, for I thee tell,
Though break thy self, like him thou never canst be made.*

There is another pretty fable in *Esop*, tasking discontented persons under the name of Frogs, according to the old verse:

*Et veterem in limo rana cecinere querelam,
Nam neque sicca placet, nec quæ stagnata palude
Perpetitur, querula semper convitia rana.*

Which may be Englished in this manner;

*The Frogs amidst the earthly slime,
Their old complaints do daily sing:
Not pleas'd with pools, nor land that drine,
But new displeasures daily bring.*

When *Ceres* went about seeking *Proserpina*, she came to a certain Fountain in *Lycia* to quench her thirst, the uncivil *Lycians* hindered her from drinking, both by troubling the water with their feet, and also by sending into the water a great company of croaking Frogs; whereat the Goddesse being angry, turned all those Countrey people into Frogs. But *Ovid* doth ascribe this transmutation of the *Lycians*, to the prayer of *Laiuna*, when she came to drink of the Fountain to increase the milk in her breasts, at such a time as she nursed *Apollo* and *Diana*, which *Metamorphosis* or transmutation, is thus excellently described by *Ovid*;

*Æternum stagno (dixit) vivatis in isto.
Eveniunt optata deæ, juvat esse sub undis,
Et modo tota cava summergere membra palude,
Nunc proferre caput, summo modo gurgite nare,*

*Sepe super ripam stagni consistere, sepe
In gelidos resilire lacus, sed nunc quoque turpes
Litibus exercent linguas, pulsoque pudore
Quamvis sint sub aqua, sub aqua male dicere tentant.*

*Vox quoque jam rauca est, inflataq; colla tumescunt :
Ipsaque dilatant patulos convitia rictus.
Terga caput tangunt, colla intercepta videntur.*

In English thus,

*Spina vires, venter pars maxima corporis albet,
Limosq; novæ saliant in gurgite rane.*

For ever mought you dwell

In this same pond she said : her wish did take off with speed,
For underneath the water they delight to be indeed :
Now dive they to the bottom down, now up their heads they pop,
Another while with sprawling legs they swim upon the top,
And oftentimes upon the banks they have a minde to stand,
And oftentimes from thence again to leap into the pond :
And there they now do practise still their filthy tongues to scold,
And shamelesly, though underneath the water they do hold
Their former wont of brawling, still avoid the water cold :
Their voyces still are hoarse and harsh, their throats have puffed goawls,
Their chaps with brawling widened are, their hammer-headed jawsles,
Are joyned to their shoulders just, the necks of them do seem
Cut off : the ridge bone of their back sticks up with colour green.
Their panch which is the greatest part of all their trunk is gray,
And so they up and down the pond made newly Frogs do play.

Whatsoever the wisdom of Frogs is, according to the understanding of the Poets, this is certain, that they signifie impudent and contentious persons, for this cause there is a pretty fiction in Hell betwixt the two Poets, Euripides and Aeschylus : for the ending of which controversie, Bacchus was sent down to take the worthyest of them out of Hell into Heaven : and as he went over Charons Ferry, he heard nothing but the croaking of Frogs, for such contentious spirits do best besit Hell. And thus much shall suffice to have spoken of the wisdom of Frogs.

Their common enemies are the Weasels, Poul-cats, and Ferrets, for these do gather them together, and lay of them great heaps within their dens : whereupon they feed in Winter. The Hearn also and Bittern, is a common destroyer of Frogs, and so likewise are some kinde of Kites. The Night-birds, *Gimus* and *Gimeta*, the Water-snake (at whose presence in token of extreame terror) the Frog setteth up her voyce in lamentable manner. The Moles are also enemies to Frogs, and it is further said ; that if a burning Candle be set by the water side, during the croaking of Frogs, it will make them hold their peace. Men do also take Frogs, for they were wont to bait a hook with a little red wooll, or a piece of red cloth, also the gall of a Goat put into a vessel, and set in the earth, will quickly draw unto it all the Frogs that be near it, as if it were unto them a very grateful thing : And thus much shall suffice to have spoken of the enemies of Frogs. Now in the next place we are to consider the several uses, both Natural, Medicinal, and Magical, which men do make of Frogs.

And first of all the green Frogs, and some of the yellow which live in Flouds, Rivers, Lakes, and Fish-pools, are eaten by men ; although in ancient time they were not eaten, but only for Physick, for the broth wherein they were sod, and the flesh also, was thought to have vertue in it to cure them which were stricken by any venomous creeping Beast, especially mixed with Salt and Oyl : but since that time *Aetius* discommendeth the eating of Frogs, proving that some of them are venomous, and that by eating thereof, extreame vomits have followed, and they can never be good, except when they are newly taken, and their skins diligently flayed off, and those also out of pure running waters and not out of muddy stinking puddles : and therefore adviseth to forbear in plenty of other meat, this wanton eating of Frogs, as things perilous to life and health, and those Frogs also which are most white when the skin is taken off, are most dangerous and fullest of venom, according to the counsel of *Fiera*, saying ;

*Ultima, sed nostros non accessura lebetes,
Nolumus, succi est pluvii & limosa maligni.
Ni saliat, putris rana paraba titer.
Ira est & adhuc rauca coaxat aquis.*

In English thus ;

We will not dresse a Frog unlesse the last of all to eat,
Because the juyce thereof is muddy and of rain unclean,
Except it go on earth, prepared way to leap.
For, angry it ever is, and hath hoarse voyce amid the stream.

They which use to eat Frogs, fall to have a colour like lead, and the hotter the Countries are, the more venomous are the Frogs ; in colder Countries, as in Germany they are not so harmful, especially after the Spring of the year, and their time of copulation passed. Besides, with the flesh of Frogs, they were wont in ancient time to bait their hooks, wherewithal they did take purple Fishes, and they did burn the young Frogs, putting the powder thereof into a Cat, whose bowels was taken out, then roasting the Cat, and after she was roasted, they anointed her all over with Honey, then laid

laid her by a Wood side, by the odour and savour whereof, all the Wolfs and Foxes lodging in the said Wood were allured to come to it, and then the Hunters lying ready in wait, did take, destroy, and kill them. When Frogs do croak above their usual custom, either more often, or more shrill then they were wont to do: they do foreshew rain and tempestuous weather.

Wherefore Tully saith in his first Book of Divination, who is it that can suspect, or once think that the little Frog should know thus much, but there is in them an admirable understanding nature, constant and open to it self, but more secret and obscure to the knowledge of men; and therefore speaking to the Frogs, he citeth these verses;

*Vos quoq; signa videtis aquai dulcis alumna,
Cum clamore paratis inanes fundere voces,
Absurdoq; sono fontes & stagna cietis.*

In English thus;

*And you O Water-birds which dwell in streams so sweet,
Do see the signes whereby the weather is foretold,
Your crying voyces wherewith the waters are repleat,
Vain sounds, absurdly moving founts and Fountains cold.*

And thus much for the natural use of Frogs. Now followeth the Magical. It is said that if a man take the tongue of a Water-frog, and lay it upon the head of one that is asleep, he shall speak in his sleep, and reveal the secrets of his heart: but if he will know the secrets of a woman, then must he cut it out of the Frog alive, and turn the Frog away again, making certain characters upon the Frogs tongue, and so lay the same upon the panting of a womans heart, and let him ask her what questions he will, she shall answer unto him all the truth, and reveal all the secret faults that ever she hath committed. Now if this magical foolery were true, we had more need of Frogs then of Justices of Peace, or Magistrates in the Common-wealth.

*Albertus.
Kiranides.
Democritus.*

But to proceed a little further, and to detect the vanity of these men, they also say, that the staffe wherewithal a Frog is struck out of a Snakes mouth, laid upon a woman in travail, shall cause an easie deliverance: and if a Man cut off a foot of a Frog as he swims in the water. and binde the same to one that hath the Gout, it will cure him. And this is as true as a shoulder of Mutton worn in ones Hat healeth the Tooth-ach.

Some again do write, that if a woman take a Frog, and spit three times in her mouth, she shall not conceive with childe that year. Also if Dogs eat the pottage wherein a Frog hath been sod, it maketh him dum and cannot bark. And if a Man cast a sod Frog at a Dog, which is ready to assault him, it will make him run away, (I think as fast as an old hungry Horse from a bottle of Hay.) These and such like vanities have the ancient Heathens (ignorant of GOD) firmly believed, till either experience disapproved their inventions, or the sincere knowledge of Religion inlightning their darknesse, made them to forsake their former vain errors, which I would to GOD had come sooner unto them, that so they might never have sinned; or else being now come unto us their children, I pray GOD that it may never be removed, lest by trusting in lying vanities, we forsake our own mercy. And so an end of the Magical Uses. Now we proceed to the Medicinal, in the biting of every venomous creature. Frogs sod or roasted, are profitable, especially the broth, if it be given to the sick person without his knowledge, mixed with Oyl and Salt, as we have said already. The flesh of Water frogs is good against the biting of the Sea-hare, the Scorpion, and all kinde of Serpents; against Leprosie and scabs, and rubbed upon the body, it doth cure the same.

The broath taken into the body with roots of Sea-holm, expelleth the Salamander: so also the Egges of the Frog, and the Egges of the Tortoise, hath the same operation, being sod with Calaminth. The little Frogs are an antidote against the Toads and great Frogs. *Albertus* also among other remedies, prescribeth a Frog to be given to sick Faulkons or Hawks: It is also good for cricks in the neck, or the Cramp. The same sod with Oyl, easeth the pains and hardnesse of the joynts and sinews: they are likewise given against an old Cough, and with old Wine and sod Corn drunk out of the Vessel wherein they are sod, they are profitable against the Dropsie, but with the sharpest Vinegar, Oyl, and spume of Niter sod together, by rubbing and anointing, cureth all scabs in Horses, and pestilent tumors.

There is an Oyl likewise made out of Frogs, which is made in this manner; they take a pound of Frogs, and put them into a vessel or glasse, and upon them they pour a pinte of Oyl, so stopping the mouth of the glasse, they seethe it as they do the Oyl of Serpents, with this they cure the shrinking of the sinews, and the hot Gout, they provoke sleep, and heal the inflammations in Fevers, by anointing the Temples. The effect of this Oyl is thus described by *Serenus*:

*Sape ita per vadit vis frigoris, ac tenet artus,
Ut vix quesito medicamine pulsa recedat.
Si ranam ex oleo decoxeris, abjice carnem,
Membra fove.*

That is to say;

Often are the sinews held by force invading cold,
Which scarce can be repelled back by medicines tried might,
Then seeke a Frog in purest Oyl, as Ancients us have told,
So haue the members sick therein, Frogs flesh cast out of sight.

And again in another place he speaking of the cure of the Fever, writeth thus;

Sed prius est oleo partus fervere Ranae,
In trivium, illoque artus perducere succo.

In English thus;

But first let Oyl make hot young Frogs new found
In ways, therewith bring sinews weak to weal full sound.

To conclude, it were infinite and needlesse to expresse all that the Physitians have observed about the Medicines rising out of the blood, fat, flesh, eyes, heart, liver, gall, intrails, legs, and sperm of Frogs, besides powders, and distillations; therefore I will not weary the Reader, nor give occasion to ignorant men, to be more bold upon my writing of Physick then is reason, lest that be said against me which proverbially is said of unnecessary things, *Ranis vinum ministras*, you give Wine to Frogs, which have neither need nor nature to drink it, for they delight more in water. And so I conclude the History of this vulgar Frog.

Of the GREEN FROG.

THIS Frog is called *Calamites*, and *Dryophytes*, and *Mantis*, and *Rana virens*. In *Arabia blepharicon*, and *Cucunoinos*, and *Cucumones*, *Irici*, *Ranula*, *Brexantes*, of *Brex-ein*, to rain, and thereof cometh the faigned word of *Aristophanes*, *Brekekekex Koax*; but I think that as our English word Frog is derived from the German word *Frosch*, so the Germans *Frosch* from the Greek word *Brex*. It is called also *Zamia*, that is, *Dammum*, losse, hurt or damage, because they live in trees, and many times harm Men and Cattle underneath the trees; and therefore called *Zamia*, of the Greek word *Zemia*. The Italians call it *Racula*, *Ranocobia*, *Lo Ronovoto*, *Ranocobia de rubetto*. The French, *Croissetz*, and sometimes *Graisset*, *Verdier*; in *Savoy*, *Renogle*. In *Germany*, *Loubfrosch*. In *Poland*, *Zaba Trawna*. Some of the Latines for difference sake call it *Rana Rubeta*, because it liveth in trees and bushes: and for the same cause it is called *Calamites*, because it liveth among reeds, and *Dryopetes*, because it falleth sometimes out of trees.

It is the least of all other Frogs, and liveth in trees, or among fruits and trees, especially in the Woods of Hasels, or Vines, for with its short legs it climbeth the highest trees: infomuch that some have thought it had wings. It is green all over the body, except the feet and the fingers, which are of dusty or reddish colour, and the tops of his nails or claws are blunt and round: In the dissection thereof there was blood found in every part of the body, and yet but little. The heart of it is white, the liver black, mixed with the gall. It hath also a milt, and in the end of July it layeth egges.

It is a venomous Beast, for sometimes Cattle as they brouse upon trees, do swallow down one of these upon the leaves not discerning it, because it is of the same colour: but presently after they have eaten it their Bellies begin to swell, which must needs proceed from the poysoned Frog.

A second reason proving it to be venomous, is for that many Authors do affirm, that hereof is made the *Psilotrum*, for the drawing out of teeth by the roots, and for this cause is concluded to be venomous, because this cannot be performed without strong poyson. But for the cure of the poyson of this Frog, we shall expresse it afterward in the history of the Toad, and therefore the Reader must not expect it in this place. Always before rain they climb up upon the trees, and there cry after a hoarse manner very much, which caused the Poet *Serenus* to call it *Rauco garrula questu*: at other times it is mute, and hath no voyce: wherefore it is more truly called *Mantis*, that is, a Prophet or a Diviner, then any other kinde of Frog, because other Frogs which are not altogether mute, do cry both for fear, and also for desire of carnal copulation, but this never cryeth but before rain.

Some have been of opinion, that this is a dum Frog; and therefore *Vincentius Bellucensis* saith, that it is called a mute Frog from the effect: for there is an opinion, that this put into the mouth of a Dog, maketh him dum, which if it be true, it is an argument of the extreme poyson therein contained, overcoming the nature of the Dog, whose chiefest senses are his taste and his smelling. And thus much shall suffice for the description of this Frog.

The medicinal vertues observed herein are these that follow. First if a man which hath a cough, do spet into the mouth of this Frog, it is thought that it doth deliver him from his cough, and being bound in a Cranes skin unto a mans thigh, procureth venereous desires: but these are but magical devices, and such as have no apparent reason in nature, wherefore I will omit them, and proceed to them that are more reasonable and natural. First, for the Oyl of Frogs, that is the best which is made out of the green Frogs, as it is observed by *Silvius*; and if they are held betwixt a mans hands, in the fit of hot burning Ague, do much refresh nature, and ease the pain. For Fever-heckicks they prepare them thus: they take such Frogs as have white bellies, then cut off their heads and pull out their bowels, afterwards they seethe them in water, until the flesh fall from the bones, then they mingle the said flesh with Barley meal, made into paste, wherewithal they cram and feed Pullen with that paste, upon which the sick man must be fed, and in default of Frogs they do the like with Eels, and other like Fishes. But there is no part of the Frog so medicinable as is the blood, called also the matter or the juyce, and the humor of the Frog, although some of them write, that there is no blood but in the eyes of a Frog: First therefore with this they kill hair, for upon the place where the hair was puld off, they pour this blood, and then it never groweth more: And this as I have said already, is an argument of the venom of this Frog; and it hath been proved by experience, that a man holding one of these Frogs in his hands, his hands have begun to swell, and to break out into blisters. Of this vertue *Serenus* the Poet writeth thus;

*Præterea quascunque voles avertere setas,
Atque in perpetuum rediviva ocludere telo,
Corporibus vulsis saniem perducito rane,
Sed quæ parva situ est, & rauco garrula questu.*

That is to say;

Besides, from whatsoever bodies hairs thou wilt
Be clean destroyed, and never grow again
On them, the matterly blood of Frogs, all spread and spill,
I mean the little Frog questing hoarse voyce amain.

The same also being made into a Verdigrease, and drunk the weight of a Crown, stoppeth the continual running of the urine. The humor which cometh out of the Frog, being alive when the skin is scraped off from her back, cleareth the eyes by an Ointment: and the flesh laid upon them, easeth their pains; the flesh and fat pulleth out teeth. The powder made of this Frog being drunk, stayeth bleeding, and also expelleth spots of blood dried in the body. The same being mingled with Pitch, cureth the falling off of the hair. And thus much shall suffice for the demonstration of the nature of this little green Frog.

Of the Padock or Crooked back F R O G.

IT is apparent that there be three kinds of Frogs of the earth, the first is the little green Frog: the second is this Padock, having a crook back, called in Latine, *Rubeta Gibbosa*; and the third is the Toad, commonly called *Rubetax*, *Bufo*. This second kinde is mute and dumb, as there be many kinde of mute Frogs, such as is that which the Germans call *Feurkrott*, and our late Alchymists *Puriphrunon*, that is, a Fire-frog, because it is of the colour

of fire: This is found deep in the earth, in the midst of Rocks and stones when they are cleft asunder, and amongst metals, whereinto there is no hole or passage, and therefore the wit of man cannot devise how it should enter therein, only there they finde them when they cleave those stones in sunder with their wedges and other instruments. Such as these are, are found near *Tours* in France, among a red sandy stone, whereof they make the Millstones, and therefore they break that stone all in pieces before they make the Millstone up, lest while the Padock is included in the middle, and the Millstone going in the mill, the heat should make the Padock swell, and so the Millstone breaking, the corn should be poisoned. As soon as these Padocks come once into the air, out of their close places of generation and habitation, they swell and so die.

This crook-backed Padock is called by the Germans, *Gartenfrosch*, that is, a Frog of the Garden, and *Grasfrosch*, that is, a Frog of the grasse. It is not altogether mute, for in time of peril, when they are chased by men, or by Snakes, they have a crying voyce, which I have oftentimes proved by experience, and all Snakes and Serpents do very much hunt and desire to destroy these: also I have seen a

Snake hold one of them by the leg, for because it was great she could not easily devour it, and during that time it made a pitiful lamentation.

These Padocks have as it were two little horns or bunches in the middle of the back, and their colour is between green and yellow, on the sides they have red spots, and the feet are of the same colour, their belly is white, and that part of their back which is directly over their breast, is distinguished with a few black spots. And thus much may serve for the particular description of the Padock, not differing in any other thing that I can read of from the former Frogs, it being venomous as they are, and therefore the cure is to be expected hereafter, in the next History of the Toad.

of the T O A D.

TO conclude the story of Frogs, we are now to make description and narration of the Toad, which is the most noble kinde of Frog, most venomous and remarkable for courage and strength. This is called in Hebrew by some Coah; the Grecians call it Phrunon; the Arabians, *Mysoxus*; the Germans, Krott: the Saxons, Quap; the Flemings, Padde; the Illyrians, Zaba; the French, Crapault; the Italians, Rospo, Botta, Boffa, Chiatto, Zatto, Buffo, Buffa, Buffone, and Ramarro; the Spaniard, Sapo escu, erco, the Latines, *Rubeta*, because it liveth among bushes, and *Bufo*, because it swelleth when it is angry.

Now I finde of these Toads two Kindes, the one called *Rubeta palustris*, a Toad of the fens, or of the waters; the other *Rubeta terrestris*, a Toad of the earth: And these in Authors are sometimes confounded, one taken for another. The greatest difference that I can learn, is their seat or place of habitation, for they live both of them in the land and in the water. And of them that be in the water, some of them be smaller then the other, and are therefore called *Rubetula*, that is, little Toads: and I think they be the same which are called by some Authors *Rana Simoides*. Near unto Zurich, there are Toads not half so big as the vulgar Toads, at a place called Kiburg, being of a dirty colour on the back, and sharp boned, the belly white and yellow, or rather betwixt both, the eyes of a gold flaming colour, the buttocks and hinder-legs hairy, and besides that place, these Kindes of Toads are no where found. They have a very shrill voyce, so as they are heard a great way off, like a small bell or trumpet, and they never utter their voyce but in the Spring, and the fore-part of the Summer; for about September they hide themselves in trees, neither do they live among the waters, but on the dry land; when they cry, it is certain that the night following will bring forth no frost.

Like unto this there is a Toad in France called *Bufo cornutus*, a horned Toad, not because it hath horns, for that is most apparently false, but for that the voyce thereof is like to the sound of a Cornet, or rather (as I think) like to a Raven called *Cornix*, and by a kinde of Barbarism called *Bufo cornutus*. The colour of this Toad is like Saffron on the one part, and like filthy dirt on the other: besides, there are other venomous Toads living in sinks, privies, and under the roots of plants.

There is another kind also, like to the Toad of the water, but in stead of bones it hath only gristles, and it is bigger then the Toad of the fen, living in hot places. There is another also, which although it be a Toad of the water, yet hath it been eaten for meat not many years since: the mouth of it is very great, but yet without teeth, which he doth many times put out of the water like a Tortoise to take breath, and in taking of his meat, which are flies, Locusts, Caterpillers, Gnats and small creeping things, it imitateth the Chamæleon, for it putteth out the tongue, and licketh in his meat by the space of three fingers, in the top whereof there is a soft place, having in it viscous humor, which causeth all things to cleave fast unto it which it toucheth, by vertue whereof it devoureth great flies. And therefore the said tongue is said to have two little bones growing at the root thereof, which by the wonderful work of Nature, doth guide, fortifie and strengthen it. And thus much may serve as a sufficient relation unto the Reader for the diversity of Toads.

Now we will proceed to the common description of both Kindes together. This Toad is in all outward parts like unto a Frog, the fore-feet being short, and the hinder-feet long, but the body more heavy and swelling, the colour of a blackish colour, the skin rough, viscous, and very hard, so as it is not easie to be broken with the blow of a staffe. It hath many deformed spots upon it, especially black on the sides, the belly exceeding all other parts of the body, standing out in such manner, that being smitten with a staffe, it yeeldeth a sound as it were from a vault or hollow place. The head is broad and thick, and the colour thereof on the neather part about the neck is white, that is, somewhat pale, the back plain without bunches, and it is said, that there is a little bone growing in their sides, that hath a vertue to drive away Dogs from him that beareth it about him, and is therefore called

called *Apocynon*. The whole aspect of this Toad is ugly and unpleasant. Some Authors affirm that it carryeth the heart in the neck, and therefore it cannot easily be killed, except the throat thereof be cut in the middle. Their liver is very vitious, and causeth the whole body to be of ill temperament: And some say they have two livers. Their milt is very small; and as for their copulation and egges, they differ nothing from Frogs.

There be many late Writers, which do affirm that there is a precious stone in the head of a Toad, whose opinions (because they attribute much to the vertue of this stone) it is good to examine in this place, that so the Reader may be satisfied whether to hold it as a fable or as a true matter, exemplifying the powerful working of Almighty God in nature, for there be many that wear these stones in Rings, being verily perswaded, that they keep them from all manner of gripings and pains of the belly and the smal guts. But the Art (as they term it) is in taking of it out, for they say it must be taken out of the head alive, before the Toad be dead, with a piece of cloth of the colour of red Scarlet, wherewithal they are much delighted, so that while they stretch out themselves as it were in sport upon that cloth, they cast out the stone of their head, but instantly they sup it up again, unlesse it be taken from them through some secret hole in the said cloth, whereby it falleth into a cistern or vessel of water, into the which the Toad dareth not enter, by reason of the coldnesse of the water. These things writeth *Massarius*.

Brasavolus saith, that he found such a thing in the head of a Toad, but he rather took it to be a bone then a stone, the colour whereof was brown, inclining to blacknesse. Some say it is double, namely outwardly a hollow bone, and inwardly a stone contained therein, the vertue whereof is said to break, prevent, or cure the stone in the bladder. Now how this stone should be there ingendered, there are divers opinions also, and they say that stones are ingendered in living creatures two manner of ways, either through heat or extreame cold, as in the Snail, Pearch, Crab, *Indian* Tortoyse, and Toads; so that by extremity of cold this stone should be gotten.

Against this opinion the colour of the stone is objected, which is sometimes white, sometimes brown, or blackish, having a citrine or blew spot in the middle, sometimes all green, whereupon is naturally engraven the figure of a Toad, and this stone is sometimes called *Berax*, sometimes *Crapidine*, and sometimes *Nise*, or *Nuse*, and *Chelonites*. Others do make two kinds of these two stones, one resembling a great deal of milk mixed with a little bloud, so that the white exceedeth the red, and yet both are apparent and visible: the other all black, wherein they say is the picture of a Toad, with her legs spread before and behinde. And it is further affirmed, that if both these stones be held in ones hand in the presence of poyson, it will burn him. The probation of this stone is by laying of it to a live Toad, and if she lift up her head against it, it is good, but if she run away from it, it is a counterfeit.

Geor. Agricola calleth the greater kinde of these stones, *Brontia*, and the lesser and smother sort of stones, *Ceraunia*, although some contrary this opinion, saying that these stones *Brontia*, and *Ceraunia*, are bred on the earth by thundering and lightning. Whereas it is said before, that the generation of this stone in the Toad proceedeth of cold, that is utterly impossible, for it is described to be so solid and firm, as nothing can be more hard, and therefore I cannot assent unto that opinion, for unto hard and solid things, is required abundance of heat: and again, it is unlikely, that whatsoever this Toad-stone be, that there should be any store of them in the world as are every where visible, if they were to be taken out of the Toads alive, and therefore I rather agree with *Salveldensis* a *Spaniard*, who thinketh that it is begotten by a certain viscous spume, breathed out upon the head of some Toad, by her fellows in the Spring time.

This stone is that which in ancient time was called *Batrachites*, and they attribute unto it a vertue besides the former, namely, for the breaking of the stone in the Bladder, and against the Falling-sicknesse. And they further write, that it is a discoverer of present poyson, for in the presence of poyson it will change the colour. And this is the substance of that which is written about this stone. Now for my part I dare not conclude either with it, or against it, for *Hermolaus*, *Massarius*, *Albertus*, *Sylvaticus*, and others, are directly for this stone ingendered in the brain or head of the Toad: on the other side, *Cardan* and *Gesner* confesse such a stone by name and nature, but they make doubt of the generation of it, as others have delivered; and therefore they being in sundry opinions, the hearing whereof might confound the Reader, I will refer him for his satisfaction unto a Toad, which he may easily every day kill: For although when the Toad is dead, the vertue thereof be lost, which consisteth in the eye, or blew spot in the middle, yet the substance remaineth, and if the stone be found there in substance, then is the question at an end, but if it be not, then must the generation of it be sought for in some other place.

Thus leaving the stone of the Toad, we must proceed to the other parts of the story, and first of all their place of habitation, which for them of the water, is neer the water-side, and for them of the earth, in bushes, hedges, rocks, and holes of the earth, never coming abroad while the Sun shineth, for they hate the Sun-shine, and their nature cannot endure it, for which cause they keep close in their holes in the day time, and in the night they come abroad. Yet sometimes in rainy weather, and in solitary places, they come abroad in the day time. All the Winter time they live under the earth, feeding upon earth, herbs, and worms, and it is said, they eat earth by measure, for they eat so much every day as they can gripe in their fore-foot, as it were sizing themselves, lest the whole earth should not serve them till the Spring. Resembling herein great rich covetous men, who ever spare to spend, for fear they shall want before they die. And for this cause in ancient time the wise Painters of Germany,

Germany, did picture a woman sitting upon a Toad, to signifie covetousnesse. They also love to eat Sage, and yet the root of Sage is to them deadly poyson; They destroy Bees, without all danger to themselves, for they will creep to the holes of their Hives, and there blow in upon the Bees, by which breath they draw them out of the Hive, and so destroy them as they come out: for this cause also at the Water-side they lie in wait to catch them. When they come to drink in the day time they see little or nothing, but in the night time they see perfectly, and therefore they come then abroad.

About their generation there are many worthy observations in nature, sometimes they are bred out of the putrefaction and corruption of the earth; it hath also been seen that out of the ashes of a Toad burnt, not only one, but many Toads have been regenerated the year following. In the New-world there is a Province called *Dariene*, the air whereof is wonderful unwholesome, because all the Countrey standeth upon rotten marishes. It is there observed, that when the slaves or servants water the pavements of the doores, from the drops of water which fall on the right hand, are instantly many Toads ingendered, as in other places such drops of water are turned into Gnats. It hath also been seen, that women conceiving with childe, have likewise conceived at the same time a Frog, or a Toad, or a Lizard, and therefore *Platanius* saith, that those things which are medicines to provoke the menstruous course of women, do also bring forth the Secondines. And some have called *Bufonem fratrem Salernitanorum*, & *lacertam fratrem Lombardorum*: that is, a Toad the Brother of the *Salernitan*, and the Lizard the Brother of the *Lombards*: for it hath been seen that a woman of *Salernum*, hath at one time brought forth a Boy and a Toad, and therefore he calleth the Toad his Brother; so likewise a woman of *Lombardy*, a Lizard, and therefore he calleth the Lizard the *Lombards* Brother. And for this cause, the women of those Countries, at such time as their childe beginneth to quicken in their womb, do drink the juyce of Parsley and Leeks, to kill such conceptions if any be.

There was a woman newly married, and when in the opinion of all she was with childe, in stead of a childe she brought forth four little living creatures like Frogs, & yet she remained in good health, but a little while after she felt some pain about the rim of her belly, which afterward was eased by applying a few remedies. Also there was another woman, which together with a Man-childe, in her Secondines did bring forth such another Beast; and after that a Merchants wife did the like in *Anconitum*. But what should be the reason of these so strange and unnatural conceptions, I will not take upon me to decide in nature, lest the Omnipotent hand of God should be wronged, and his most secret and just counsel presumptuously judged and called into question. This we know, that it was prophesied in the Revelation, that Frogs and Locusts should come out of the Whore of *Babylon*, and the bottomlesse pit, and therefore seeing the seat of the Whore of *Babylon* is in *Italy*, it may be that God would have manifested the depravation of Christian Religion, beginning among the *Italians*, and there continued in the conjoynd birth of Men and Serpents: for surely, none but Devils incarnate, or men conceived of Serpents brood, would so stiffly stand in *Romish* error as the *Italians* do, and therefore they seem to be more addicted to the errors of their Fathers, (which they say is the Religion wherein they were born) then unto the truth of Jesus Christ, which doth unanswerably detect the pride and vanity of the *Romish* faith.

But to leave speaking of the conception of Toads in Women, we will proceed further unto their generation in the stomachs and bellies of men, whereof there may more easily a reason be given then of the former. Now although that in the earth Toads are generated of the putrefied earth and waters, yet such a generation cannot be in the body of man, for although there be much putrefaction in us, yet not so much to ingender bones and other organes, such as are in Toads; as for Worms they are all flesh, and may more easily be conceived of the putrefaction in our stomachs. But then you will say, how comes it to passe that in mens stomachs there are found Frogs and Toads? I answer that this evill hapneth unto such men as drink water, for by drinking of water, a Toads egge may easily slip into the stomach, and there being of a viscous nature, cleaveth fast to the rough parts of the ventricle, and it being of a contrary nature to man, can never be digested or avoided, and for that cause the venom that is in it, never goeth out of the Egge either in operation or in substance, to poyson the other parts of the body, but there remaineth until the Egge be formed into a Toad, without doing further harm: and from hence it cometh that Toads are bred in the bodies of men, where they may as well live without air, as they do in the midst of trees and rocks, and yet afterwards, these Toads do kill the bodies they are bred in. For the venom is so tempered, that at last it worketh when it is come to ripenesse, even as we see it is almost an usual thing, to take a poyson, whose operation shall not be perceived, till many days, weeks, or moneths after.

For the casting out of such a Toad bred in the body, this medicine is prescribed: They take a Serpent and bowel him, then they cut off the head and the tail, the residue of the body they likewise part into small pieces, which they seethe in water, and take off the fat which swimmeth at the top, which the sick person drinketh, until by vomiting he avoid all the Toads in his stomach, afterwards he must use restorative and aromatical medicines. And thus much may suffice for the ordinary and extraordinary generation of Toads.

These Toads do not leap as Frogs do, but because of their swelling bodies and short legs, their pace is a soft creeping pace, yet sometimes in anger they lift up themselves, endeavouring to do harm, for great is their wrath, obstinacy, and desire to be revenged upon their adversaries, especially the red Toad; for look how much her colour inclineth to rednesse, so much is her wrath and venom more pestilent. If she take hold of any thing in her mouth, she will never let it go till she

she die, and many times she sendeth forth poyson out of her buttocks or backer parts, wherewithal she infecteth the air, for revenge of them that do annoy her; and it is well observed that she knoweth the weaknesse of her teeth, and therefore for her defence she first of all gathereth abundance of air into her body, wherewithal she greatly swelleth, and then by sighing uttereth that infected air as neer the person that offendeth her as she can, and thus she worketh her revenge, killing by the poyson of her breath. The colour of this poyson is like milk, of which I will speak afterward particularly by it self.

A Toad is of a most cold temperament, and bad constitution of nature, and it useth one certain herb wherewithal it preserveth the sight, and also resisteth the poyson of Spiders, whereof I have heard this credible History related, from the mouth of a true honourable man, and one of the most charitable Peers of *England*, namely, the good Earl of *Bedford*, and I was requested to set it down for truth, for it may be justified by many now alive that saw the same.

It fortuned as the said Earl travailed in *Bedfordshire*, neer unto a Market-town called *Oxbourn*, some of his company espyed a Toad fighting with a Spider, under a hedge in a bottom, by the high-way-side, whereat they stood still, until the Earl their Lord and Master came also to behold the same; and there he saw how the Spider still kept her standing, and the Toad divers times went back from the Spider, and did eat a piece of an herb, which to his judgement was like a Plantain. At the last, the Earl having seen the Toad do it often, and still return to the combat against the Spider, he commanded one of his men to go, and with his dagger to cut off that herb, which he performed and brought it away. Presently after the Toad returned to seek it, and not finding it according to her expectations, swelled and broke in pieces: for having received poyson from the Spider in the combat, nature taught her the vertue of that herb, to expell and drive it out, but wanting the herb, the poyson did instantly work and destroy her. And this (as I am informed) was oftentimes related by the Earl of *Bedford* himself upon sundry occasions, and therefore I am the bolder to insert it into this story.

A story.

I do the more easily believe it, because of another like story related by *Erasmus* in his Book of Friendship, hapning likewise in *England*, in manner as followeth. There was a Monk who had in his chamber divers bundles of green rushes, wherewithal he used to strow his chamber at his pleasure, it hapned on a day after dinner, that he fell asleep upon one of those bundles of rushes, with his face upward, and while he there slept, a great Toad came and sate upon his lips, bestriding him in such manner as his whole mouth was covered. Now when his fellows saw it, they were at their wits end, for to pull away the Toad was an unavoidable death, but to suffer her to stand still upon his mouth, was a thing more cruel then death: and therefore one of them espying a Spiders web in the window, wherein was a great Spider, he did advise that the Monk should be carried to that window, and laid with his face upward right underneath the Spiders web, which was presently accomplished. And as soon as the Spider saw her adversary the Toad, she presently wove her thred, and descended down upon the Toad, at the first meeting whereof the Spider wounded the Toad, so that it swelled, and at the second meeting it swelled more, but at the third time the Spider kild the Toad, and so became grateful to her Host which did nourish her in his Chamber; for at the third time the Toad leaped off from the mans mouth, and swelled to death; but the man was preserved whole and alive. And thus much may suffice for the antipathy of nature betwixt the Toad and the Spider.

A story.

The Mole is also an enemy to the Toad, for as *Albertus* writeth, he himself saw a Toad crying above the earth very bitterly, for a Mole did hold her fast by the leg within the earth, labouring to pull her in again, while the other strove to get out of her teeth, and so on the other side, the Toads do eat the Moles when they be dead. They are also at variance with the Lizard, and all kindes of Serpents, and whensoever it receiveth any wound by them, it cureth it self by eating of Plantain. The Cat doth also kill Serpents and Toads, but eateth them not, and unlesse she presently drink, she dyeth for it. The Buzard and the Hawk are destroyers of Toads, but the Stork never destroyeth a Toad to eat it, except in extremity of famine, whereby is gathered the venomous nature of the Toad.

Now to conclude, the premisses considered which have been said of the Toad, the uses that are to follow are not many, except those which are already related in the Frog. When the *Spaniards* were in *Bragua*, an Island of the *New-found-world*, they were brought to such extremity of famine, that a sick man amongst them was forced to eat two Toads, which he bought for two pieces of gold-lace, worth in *Spanish* money fix Duckats. I do marvel why in ancient time the *Kings of France* gave in their Arms the three Toads in a yellow field, the which were afterwards changed by *Clodoveus* into three Flower-de-luces in a field Azure, as Arms sent unto him from Heaven.

When the *Trojans* dwelt neer *Mæotis*, after the destruction of *Troy*, they were very much annoyed by the *Goths*, wherefore *Marcomirus* their King, determined to leave that Countrey, and to seek some where else a more quiet habitation. Being thus minded, he was admonished by an Oracle that he should go and dwell in that Countrey where the River *Rhene* falleth into the Sea, and he was also stirred up to take upon him that journey, by a certain Magitian-woman, called *Alruna*, for this cunning Woman caused in the night time a deformed apparition to come unto him having three heads, one of an Eagle, another of a Toad, and the third of a Lyon, and the Eagles head did speak unto him in this manner, *Genus tuum o Marcomire opprimet me, & conculcabit Leonem, & interficiet bufonem*; that is to say: Thy stock or posterity, O *Marcomirus*, shall oppresse me, it shall tread the Lyon under foot, and kill the Toad. By which words he gathered, that his posterity should rule over the *Romans*, signified

signified by the Eagle; and over the *Germans*, signified by the Lyon; and over the *French*, signified by the Toad, because the Toad, as we have said, was the ancient Arms of *France*.

It is an opinion held by some Writers, that the Weasels of the water do ingender in copulation with the Toads of the water, for in their mouths, and feet of their belly, they do resemble them: Whereupon these verses were made;

*Bufones gigno putrida tellure sepulta,
Humores pluviæ forte quod ambo sumus,
Humet is & friget, mea sic vis humet & alget,
Cum perit in terra qui prius ignis erat.*

Which may be Englished thus;

*Buryed in rotten earth, forth Toads I bring,
Perhaps because we both are made of rain,
Thou's moist and cold, moist I and ever freezing,
When in the earth, that force from fire came.*

And thus we will descend to discourse of the Toads poyson, and of the special remedies appointed for the same. First therefore, all manner of Toads, both of the earth and of the water are venomous, although it be held that the Toads of the earth are more poysonful then the Toads of the water, except those Toads of the water which do receive infection or poyson from the water, for some waters are venomous. But the Toads of the land, which do descend into the marishes, and so live in both elements, are most venomous, and the hotter the Countrey is, the more full are they of poyson.

The Women-witches of ancient time which killed by poysoning, did much use Toads in their confessions, which caused the Poet in his verses to write as followeth.

*Occurrit Matrona potens, quæ molle Calenum
Porreclura viro, miscet sitiente rubetam.*

Which may be Englished thus;

*There came a rich Matron, who mixed Calen Wine,
With poyson of Toads to kill her Spouse, O deadly crime.*

And again in another place,

*Funus promittere patris
Nec volo nec possum ranarum, in viscera nunquam
Inspexi.*

In English thus;

*I can nor will of Fathers death a promise make,
For of Toads poyson I never yet a view did take.*

When an Asp hath eaten a Toad, their biting is incurable, and the Bears of *Pamphilia* and *Cylicia*, being killed by men after that they have eaten Salamanders or Toads, do poyson their eaters. We have said already, that a Toad hath two livers, and although both of them are corrupted, yet the one of them is said to be full of poyson, and the other to resist poyson. The biting of a Toad, although it be seldom, yet it is venomous, and causeth the body to swell and to break, either by Impostumation, or otherwise, against which is to be applyed common Antidotes, as womens Milk, Triacle, roots of Sea-holm, and such other things. The spittle also of Toads is venomous, for if it fall upon a man, it causeth all his hair to fall off from his head; against this evil *Paracelsus* prescribeth a plaister of earth, mixed with the spittle of a man.

The common people do call that humor which cometh out of the buttocks of a Toad when she swelleth, the urine of a Toad, and a man moistned with the same, be-pissed with a Toad; but the best remedy for this evil, is the milk of a woman, for as it resemblenth the poyson in colour, so doth it resist it in nature. The bodies of Toads dried, and so drunk in Wine after they be beaten to powder, are a most strong poyson, against which and all other such poyson of Toads, it is good to take Plantain and black Hellebore, Sea-crabs dried to powder and drunk, the stalks of Dogs-tongue, the powder of the right horn of a Hart, the milt, spleen, and heart of a Toad. Also certain fishes called Shel-crabs, the blood of the Sea-tortoise mixed with Wine, Cummin, and the rennet of a Hare. Also the blood of a Tortoise of the land mixed with Barley-meal, and the quintessence of Triacle and Oyl of Scorpions, all these things are very precious against the poyson of Serpents and Toads.

We have promised in the story of the Frog, to expresse in this place such remedies, as the learned Physitians have observed for the cure of the poyson of Frogs. First therefore the poyson of the Frog causeth swelling in the body, depelleth the colour, bringeth difficulty of breathing, maketh the breath strong, and an involuntary profusion of seed, with a general dulnesse and restinesse of body: for remedy whereof, let the party be inforced to vomit by drinking sweet Wine, and two drams of the powder of the root of Reeds or Cypress. Also he must be inforced to walking and running, besides daily washing. But if a Fever follow the poyson or burning in the extremities, let the vomit be of water and Oyl, or Wine and Pitch; or let him drink the blood of a Sea-tortoise, mixed with Cummine, and the rennet of a Hare, or else sweat in a Furnace or Hot-house a long time: besides many other such like remedies, which every Physitian, both by experience and reading, is able to minister in cases of necessity, and therefore I will spare my further pains from expressing

expressing them in this place, and passe on to the medicinal vertues of the Toad, and so conclude this history.

We have shewed already that the Toad is a cold creature, and therefore the same sod in water, and the body anointed therewith, causeth hair to fall off from the members so anointed. There is a medicine much commended against the Gowt, which is this: Take six pound of the roots of wilde Cucumber, six pound of sweet Oyl, of the marrow of Harts, Turpentine, and Wax, of either six ounces, and six Toads alive, the which Toads must be bored through the foot, and hanged by a thred in the Oyl until they grow yellow, then take them out of the Oyl by the threds, and put into the said Oyl the sliced root of a Cucumber, and there let it see the until all the vertue be left in the Oyl. Afterwards melt the Wax and Turpentine, and then put them all together in a glasse, so use them morning and evening against the Gowt, *Sciatica*, and pains of the sinews, and it hath been seen that they which have lyen long sick, have been cured thereof, and grown perfectly well and able to walk. Some have added unto this medicine Oyl of Saffron, *Opobalsamum*, bloud of Tortoises, Oyl of Sabine, Swines grease, Quicksilver, and Oyl of Bays.

For the scabs of Horses, they take a Toad killed in wine and water, and so sod in a brazen vessel, and afterwards anoint the Horse with the liquor thereof. It is also said that Toads dryed in smoak, or any piece of them carryed about one in a linnen cloth, do stay the bleeding at the nose. And this *Frederick* the Duke of *Saxony*, was wont to practise in this manner; he had ever a Toad pierced through with a piece of wood, which Toad was dryed in the smoak or shadow, this he rowled in a linnen cloth; and when he came to a man bleeding at the nose, he caused him to hold it fast in his hand until it waxed hot, and then would the bloud be stayed. Whereof the Physitians could never give any reason, except horror and fear constrained the bloud to run into his proper place, through fear of a Beast so contrary to humane nature. The powder also of a Toad is said to have the same vertue, according to this verse;

Buffo ustus sinit nature dote cruorem.

In English thus;

*A Toad that is burned to ashes and dust,
Stays bleeding by gift of Nature just.*

The skin of a Toad, and shell of a Tortoyse, either burned or dryed to powder, cureth the *Fistulae*: Some add hereunto the root of Laurel and Hen-dung, Salt, and Oyl of Mallows. The eyes of the Toad are received in Ointment against the Worms of the belly. And thus much shall suffice to have spoken of the history of the Toad and Frogs.

Of the GREEN SERPENTS.

IN *Valois* there are certain Green-serpents, which of their color are called *Grunling*, and I take them to be the same which *Hesychius* called *Saurite*, and *Pliny* by a kinde of excellency, Snakes, of whom we shall speak afterwards, for I have no more to say of them at this present, but that they are very venomous. And it may be that of these came the common proverb, *Latet Anguis sub herba*, under the green herb lyeth the Green-snake, for it is a friendly admonition unto us to beware of a falshood covered with a truth like unto it.

Of the HÆMORRHE.

THis Serpent hath such a name given unto it, as the effect of his biting worketh in the bodies of men, for it is called in *Latine*, *Hæmorrhous*, to signifie unto us the male, and *Hæmorrhais*, to signifie the female, both of them being derived from the *Greek* word *Aima*, which signifieth bloud, and *Reo*, which signifieth to flow, because whomsoever it biteth, it maketh in a continual bleeding sweat, with extremity of pain until it die. It is also called *Affodius*, and *Afudius*, *Sabrine*, and *Halfordius*, or *Alfordius*, which are but corrupted barbarous names from the true and first word *Hæmorrhous*.

It is doubtful whether this be to be ascribed to the Asps or to the Vipers, for *Isidorus* saith it is *Pliny*. a kinde Asp, and *Ælianus*, a kinde of Viper. They are of a sandy colour, and in length not past one foot, or three handfuls, whose tail is very sharp or small, their eyes are of a fiery-flaming colour, their

their head small, but hath upon it the appearance of horns. When they goe, they go straight and slowly, as it were halting and wearily, whose pace is thus described by Nicander;

Et instar
Ipsius oblique sua parvula terga Ceraſta
Claudicat: ex medio videas appellere dorſo

Parvum navigium, terit imiam lubrica terram
Alvus, & baud alio tacite trahit illa motu,
Ac per Arundineum ſi tranſeat illa grabatum

In English thus;

And like the Horned-serpent, ſo trails this elf on land,
As though on back a little boat it drave,
His ſliding belly makes paths be ſeen in ſand,
As when by bed of Reeds ſhe goes her life to ſave.

The ſcales of this Serpent are rough and ſharp, for which cauſe they make a noiſe when they goe on the earth; the female reſteth her ſelf upon her lower part neer her tayl, creeping altogether upon her belly, and never holdeth up her head, but the male when he goeth holdeth up his head: their bodies are all ſet over with black ſpots, and themſelves are thus paraſtically deſcribed by Nicander;

Unum longa pedem, totoque gracillima tractu,
Ignea quandoque eſt, quandoque eſt candida forma,
Conſtrictumque ſatis collum, et tenuiſſima cauda.
Bina ſuper gelidos oculos frons cornua proferit,

Splendentem quadam radiorum albertia luce,
Silveſtres ut apes, populatricesque Locuſtae:
Inſuper horribile ac aſperrum caput horret.

Which may be Engliſhed in this manner following;

On foot in length, and ſlender all along,
Sometime of fiery hue, ſometime milk-white it is,
The neck bound in, and tayl moſt thin and ſtrong,
Whoſe fore-head hath two horns above cold eyes:

Which in their light reſemble ſhining beams,
Like Bees full wilde, or Locuſts ſpoylers bred,
But yet to look upon all horrible in ſeams,
For why? the cruel Bore they ſhew in head.

They keep in rocks, and ſtony places of the houſes and earth, making their dens winding and hanging, according to theſe Verſes;

Rimofas colit illa Petras, ſibique aſpera teſta,
Et modice pendens facit, inflexumque cubile.

In English thus;

The chinks of Rocks and paſſages in ſtone
They dwell, wherein their lodgings bare,
A little hanging made for every one,
And bending too their ſleepy harbours are.

It is ſaid that Canobus the Governour of Menelaus, chanced to fall upon this Serpent, in revenge whereof Helen his charge, the wife of Menelaus broke his back-bone, and that ever ſince that time they creep lamely, and as it were without loyns; which fable is excellently thus deſcribed by Nicander;

Quondam animoſa Helene cygni Jovis inclita proles
Everſa rediens Troia (niſi vana vultus)
Huic indignata eſt generi, Pharias ut ad oras
Venit, & adverſi declinans flamina venti,
Fluctivagam ſtatuit juxta Nili oſtia claſſem.
Namque ubi nauticus ſeſſum forte Canobus
Sterneret, et bibulis fuſus dormiret arenis:
Leſa venenofos Hemorrhoids impulit iſtus,

Illatamque tulit letali dente quietem:
Protinus ovipera cernens id filia Leda,
Oppreſſa medium ſerpenti ſervida dorſum
Infregit, tritaque excuſſit vincula ſpina,
Que fragili illius ſic dempta e corpore fugit,
Et graciles Hemorrhoids, obliquique Ceraſta
Ex hoc clauda trahunt jam ſoli tempore membra.

Which may be Engliſhed thus;

Once noble Helen, Joves childe by Swan-like ſhape,
Returning back from Troy, deſtroyed by Grecian war,
(If that our ancients do not with fables us beclap)
This race was envied by Pharias anger farre,
When to his ſhores for ſafety they did come,
Declining rage of bluſtring windy ſeas,
Water-biding-Navy at Nilus mouth gan run,
Where Canobus all tyred, fainted for ſome eaſe:
For there this Pilot, or Maſter of the Fleet,
Did haſt from boat to ſleep in dreary ſand,

Where he did feel the teeth of Hemorrhoids deep,
Wounding his body with poiſon, deaths own hand.
But when egge-breeding Ledaes wench eſpyed
This harm, ſhe preſt the Serpents back with ſtroke,
Whereby the bands thereof were all untied,
Which in juſt wrath for juſt revenge ſhe broke.
So ever ſince out of this Serpents frame
And body they are taken, which is the cauſe
That Ceraſts and lean Hemorrhoids are ever lame,
Drawing their parts on earth by natures lawes.

They which are ſtung with theſe Hemorrhoids, do ſuffer very intolerable torments, for out of the wound continually floweth bloud, and the excrements alſo that cometh out of the belly are bloody, or ſometimes little rouls of bloud in ſtead of excrements. The colour of the place bitten is black,

or

or of a dead bloody colour, out of which nothing floweth at the beginning but a certain watery humour, then followeth pain in the stomach, and difficulty of breathing. Lastly, the powers of the body are broken, and opened, so that out of the mouth, gums, ears, eyes, fingers ends, nayls of the feet, and privy parts, continually issueth blood, untill a cramp also come, and then followeth death, as we read in *Lucan* of one *Tullus* a young noble man, slain by this Serpent, described as followeth;

*Impressit dentes Hemorrhoids aspera Tullus
Magnanimo juveni, miratorique Catonis :
Uique solet pariter totis se effundere signis
Coricij pressura croci : sic omnia membra
Emisere simul rutilum pro sanguine virus.*

*Sanguis erant lachryma : quaecumque foramina novis
Humor, ab in largus manat cruor, ora redundant,
Et patulae nares, sudor rubet, omnia plenis
Membra fluunt venis : totum est pro vulnere corpus.*

In English thus;

*The Hemorrhoe fierce, in noble Tullus fastened teeth
That valiant youth, great Catoes scholar deer :
And as when Saffron by Corycians skeeth
Is prest, and in his colour on them all appear :
So all his parts sent forth a poyson red*

*In stead of blood : Nay all in blood went round.
Blood was his tears, all passages of it were sped,
For out of mouth and ears did blood abound.
Blood was his sweat, each part his vein out bleeds,
And all the body blood that one wound feeds.*

The cure of this Serpent, in the opinion of the Ancients, was thought impossible, as writeth *Di-
oscorides*, and thereof they complain very much, using only common remedies, as scarification,
unctions, sharp meats, and such things as are already remembred in the cure of the *Diplas*. But be-
sides these they use Vine-leaves, first bruised and then sod with Honey : they take also the head of
this Serpent and burn it to powder, and so drink it, or else Garlick with Oyl of Flower-de-luce,
they give them also to eat Raisins of the Sun. And besides, they resist the eruption of the blood,
with plaisters laid to the place bitten, made of Vine-leaves and Honey. or the leaves of Purslane and
Barley-meal. But before their urine turn bloody, let them eat much Garlick stamped, and mixed
with Oyl to cause them to vomit, and drink wine delayed with water, then let the wound be washed
with cold water, and the bladder continually fomented with hot Spunges. Some do make the
cure of it like the cure of the Viper, and they prescribe them to eat hard Egges with Salt fish, and
besides, the seed of Radish, the juice of Poppy, with the roots of Lilly, also Daffadil, and Rue,
Trefolie, Cassia, Opoponax, and Cinnamon in potion : and to conclude, the flowers and buds
of the bush are very profitable against the biting of the Hemorrhoe, and so I end the history of
this Serpent.

Of the Horned SERPENT.

THis Serpent because of his Horns (although it be a kinde of Viper) is called in *Greek* *Ker-
astes*, and from thence cometh the *Latine* word *Cerastes*, and the *Arabian*, *Cerust*, and *Ce-
rustes*. It is called also in *Latine*, *Ceristalis*, *Cristalis*, *Sirtalis*, and *Tristalis*. All which are cor-
rupted words, derived from *Cerastes*, or else from one another, and therefore I think it not fit to
stand upon them. The *Hebrewes* call it *Schephiphon*, the *Italians*, *Cerastes*, the *Germans*, *En gekurnte
schlang*; the *French*, *Un Ceraste*, *un serpent Cornu*, that is, a horned Serpent; and therefore I have so
called it in *English*, imitating herein both the *French* and *Germans*.

I will not stand about the difference of Authors, whether this Serpent be to be referred to the
Asps or to the Vipers, for it is not a point materiall, and therefore I will proceed to the description
of his nature, that by his whole history, the Reader may choose whether he will account him a
subordinate kinde unto others, or else a principall of himself. It is an *African* Serpent, bred in the
Lybian sandy seas, places not inhabited by men, for the huge Mountains of sands are so often
moved by the windes, that it is not only impossible for men to dwell there, but also very dange-
rous and perilous to travel through them, for that many times whole troops of men and cat-
tell, are in an instant overwhelmed and buried in those sands. And this is a wonderfull work
of

of God, that those places which are least habitable for man, are most of all annoyed with the most dangerous biting Serpents.

It is also said, that once these Horned Serpents departed out of *Lybia* into *Egypt*, where they depopulated all the Countrey. Their habitation is neer the high-ways, in the sands, and under Cart-wheels: and when they goe, they make both a sound with their motion, and also a furrow in the earth, according to the saying of *Nicander*;

*Ex his alter echis velocibus obvia spinis,
Recto terga tibi prolixum tram te ducit,
Sed medio diffusum hic cerasites se corpore volvit:
Curvum errans per iter, resonantibus aspera squamis.*

Which may be Englished thus;

*Of these the Viper with swift bones thee meets,
Trayling her back in path direct and strait,
The Cerafit more diffused in way thee greets
With crooked turning, on scales make sounds full great:*

*Qualiter equoreo longissima gurgite navis,
Quam violentus agit nunc huc, nunc Africum illuc,
Pellitur, et laterum gemebunda fragore furum
Extra sulcandas sinuos fluctuat undas.*

*Like as a ship tossed by the Western winde,
Sounds as farre off, moved now here, now there,
So that by voyse of shrilling sides we finde
His furrowes turned in Seas and water sphere.*

The quantity of this horned Serpent is not great, it exceedeth not two cubits in length; the colour of the body is branded like sand, yet mingled with another pale white colour, as is to be seen in a Hares skin. Upon the head there are two horns, and sometimes four, for which occasion it hath received the name *Cerasites*, and with these horns they deceive Birds; for when they are hungry, they cover their bodies in sand, and only leave their horns uncovered to move above the earth, which when the Birds see, taking them to be Worms, they light upon them, and so are devoured by the Serpent. The teeth of this Serpent are like the teeth of a Viper, and they stand equall, and not crooked: In stead of a back-bone they have a gristle throughout their body, which maketh them more flexible and apt to bend every way: for indeed they are more flexible then any other Serpent. They have certain red strakes crosse their back, like a Crocodile of the earth, and the skins of such as are bred in *Egypt* are very soft, stretching like a Cheverell-glove, both in length and breadth, as it did appear by a certain skin taken off from one being dead; for being stuffed with Hay, it shewed much greater then it was being alive, but in other Countreys the skins are not so.

I have heard this History of three of these Serpents brought out of *Turkey*, and given to a Noble man of *Venice* alive, who preserved them alive in a great Glasse (made of purpose) upon sand, in that Glasse neer the fire: The description as it here followeth, was taken by *John Faltoner*, an *English* Travailer, saying They were three in number, whereof one was thrice so big as the other two, and that was a female, and she was said to be their Mother: she had laid at that time in the sands four or five Egges, about the bignesse of Pigeons Egges. She was in length three foot, but in breadth or quantity almost so big as a mans Arm: her head was flat, and broad as two fingers, the apple of the eye black, all the other part being white.

Out of her eye-lids grew two horns, but they were short ones, and those were truly Horns, and not flesh. The neck compared with the body was very long and small, all the upper part of the skin was covered with scales, of ash-colour, and yet mixed with black. The tail is at it were brown when it was stretched out. And this was the description of the old one: the other two being like to her in all things, except in their horns, for being small, they were not yet grown. Generally, all these horned Serpents have hard dry scales upon their belly, wherewithall they make a noyse when they go themselves, and it is thus described by *Nicander*;

*Nunc potes actutum, insidiatoremque Cerasiten
Noscere, vipereum veluti genus, huic quia dispar
Non is corpus habet, sed quatuor aut duo profert*

*Cornua, cum mutila videatur Vipera fronte.
Squalidus albenti color est.*

In English thus;

*You well may know the treacher Cerasits noyse,
A Viper-kinde, whose bodies much agree,
Yet these four horns and brandy colour, poyse,
Where Viper none, but forehead plain we see.*

There is no Serpent except the Viper that can so long indure thirst as this horned Serpent, for they seldome or never drink; and therefore I think they are of a Vipers kinde: for besides this also it is observed, that their young ones do come in and out of their bellies as Vipers doe: They live in hatred with all kinde of Serpents, and especially with Spiders. The Hawes of *Egypt* also do destroy horned Serpents and Scorpions: but about *Thebes* in *Egypt* there are certain sacred Snakes (as they are termed) which have horns on their head, and these are harmlesse unto men and beasts, otherwise all these Serpents are virulent and violent against all creatures, especially men: yet there be certain men in *Lybia* called *Pfills*, which are in a league, or rather in a naturall concord with horned Serpents. For if they be bitten by them at any time, they receive no hurt at all: and besides, if they be brought unto any man that is bitten with one of these Serpents, before the poyson be spread all over his body, they help and cure him, for if they finde him but lightly hurt, they only spit upon the wound, and so mitigate the pain, but if they finde him more deeply hurt, then

then they take much water within their teeth, and first wash their own mouth with it, then spit out the water into a pot, and make the sick man to drink it up. Lastly, if the poyson be yet strong, they lay their naked bodies upon the naked poysoned body, and so break the force of the poyson. And this is thus described by the Poet, saying,

*Audivi Lybicos Pſyllor, quos aspera Siris
Serpentumque ferax patria alit populos,
Non ita in inflicium diro, morſuve venenum*

*Ledere: quin læſis ferre & opem reliquis,
Non vi radicam proprio, ſed corpore juncto.*

That is to ſay,

*The Lybian Pſylli, which Serpent-breeding Syrtes dwell
As I have heard, do cure poyſon, ſtings, and bites,
Nor hurt themſelves, but it in other quell:
By no roots force, but joyning bodies quites.*

When a horned Serpent hath bitten a man or beaſt, firſt about the wound there groweth hardneſſe, and then puſtules. Laſtly, black, earthy and pale matter: the genital member ſtandeth out ſtraight and never falleth, he falleth mad, his eyes grow dim, and his nerves immanuable, and upon the head of the wound groweth a ſcab like the head of a Nail, and continually pricking, like the pricking of Needles: And becauſe this Serpent is immoderately dry, therefore the poyſon is moſt pernicious; for if it be not holpen within nine dayes, the patient cannot eſcape death. The cure muſt be firſt by cutting away the fleſh unto the bone, where the wound is, or elſe the whole member if it can be, then lay upon the wound Goats dung ſod with Vinegar or Garlike, and Vinegar or Barley-meal, or the juice of Cedar, Rue, or Nep, with Salt and Honey, or Pitch, and Barley-meal, and ſuch-like things outwardly: inwardly Daffadil and Rue in drink, Radish-ſeed, Indian Cummin, with wine and *Caſtoreum*, and alſo Calamint, and every thing that procureth vomit. And thus much for the deſcription of the Horned Serpent.

Of the HYENA.

There be ſome that make queſtion whether there be any ſuch Serpent as this or no, for it is not very like that there is any ſuch, and that this Hyæna is the ſelf ſame which is deſcribed to be a Four-footed Beaſt, for that which is ſaid of that, is likewiſe attributed to this: namely, that it changeth ſex, being one yeer a male, another yeer a female, and that the couples which ſeem to be marryed together, do by continuall entercourſe, bring forth their young ones, ſo that the male this yeer is the female next yeer, and the female this yeer is the male next yeer. And this is all that is ſaid of this Serpent.

Of the HYDRA, ſuppoſed to be killed by Hercules.

The Poets do ſain, that neer to the Fountain *Amymona*, there grew a Plantain, under which was bred a Hydra which had ſeven heads: whereof one of theſe heads was ſaid to be immortal: with this Hydra *Hercules* did fight, for there was in that immortal head ſuch a poyſon as was incurable; wherewithall *Hercules* moyſtened the head of his Darts after he had killed it: and they ſay, that while *Hercules* ſtruck off one of theſe heads, there ever aroſe two or three more in the room thereof, untill the number of fifty, or as ſome ſay, fourſcore and ten heads were ſtrucken off: and becauſe this was done in the fenne of *Lerna*, therefore there grew a Proverb of *Lerna malorum*, to ſignifie a multitude of unrefiſtable evils.

And ſome ignorant men of late dayes at *Venice*, did picture this Hydra with wonderfull Art, and ſet it forth to the people to be ſeen, as though it had been a true carkaſe, with this inſcription. In the year of Chriſts incarnation, 550. about the moneth of *January*, this monſtrous Serpent was brought out of *Turkey* to *Venice*, and afterwards given to the *French King*; it was eſteemed to be worth 6000. Ducats. Theſe Monſters ſignifie the mutation or change of worldly affairs, but (I truſt ſaid the Author of the inſcription, who ſeemed to be a *German*) the whole Chriſtian World is ſo afflicted, that there is no more evil that can happen to the Chriſtian World, except deſtruction; and therefore I hope that theſe Monſters do not foreſhew any evil to the Chriſtians. Therefore ſeeing the *Turkiſh Empire* is grown to that height, in which eſtate all other former Kingdomes fell, I may divine and prophesie, that the danger threatned hereby, belongeth to the *Turks*, and not unto us, in whoſe Government this Monſter was found to be bred: and the hinder part of his head ſeemeth to reſemble a *Turks Cap*. Thus far this inſcribing Diviner. But this fellow ought firſt of all to have enquired about the truth of this Picture, whether it were ſincere or counterfeit, before he had given his judgement upon it: For that there ſhould be ſuch a Serpent with ſeven heads, I think it unpoſſible, and no more to be beleevd and credited, then that *Cæſar* and *Pollux* were conceived in an Egge, or that *Pluto* is the GOD of Hell, or that armed men were created out of Dragons teeth, or that *Vulcan* made *Achilles* his Armour, or that *Venus* was wounded by *Diomedes*; or that *Ulyſſes* was carryed in Bottles, ſo true I think is the ſhape of this Monſter: for

the head, ears, tongue, nose, and face of this Monster, do altogether degenerate from all kinds of Serpents, which is not usuall in Monsters, but the fore-parts do at most times resemble the kinde to which it belongeth; and therefore if it had not been an unskillfull Painters device, he might have framed it in a better fashion, and more credible to the world. But let it be as it is, how doth he know that this evil doth more belong to the *Turks* then to the Christians? For shall we be so blinde and flatter our selves so far, as not to acknowledge our sins, but to lay all the tokens of judgement upon our adversaries? But if there appeared in us any repentance or amendment of those faults, for which God hath suffered in his justice, that impious Tyrant and Tyrannicall Government to prevail against Christians, then we might think that GOD would look mercifully upon us, and avert his wrath from us upon our enemies. But with sorrow and grief be it spoken, all the Kings and people of *Christendome*, do directly go forward without stumbling in those vile courses, and odious crying sins, for which God hath set up the *Turks* against former ages, and therefore we have no cause to hope that ever this rod shall be cast into the fire, untill the chastisement of Gods children have procured their amendment, and if no amendment, then all the powers of heaven (the blessed Trinity excepted) cannot keep *Christendome* from ruine and destruction, which God of his infinite mercy turn away from us.

To turn again to the story of the Hydra, I have also heard, that in *Venice* in the Dukes treasury, among the rare Monuments of that City, there is preserved a Serpent with seven heads, which if it be true, it is the more probable that there is a Hydra, and then the Poets were not altogether deceived, that say, *Hercules* killed such a one. This Hydra which *Hercules* slew, they say was ingendred betwixt *Echidna* and *Typhaon*, and nourished by *Juno* in *Lerna*, in hatred of *Hercules*: and they say further, that when he came to kill it, there came a Crab or Cancer to help the Hydra against *Hercules*, who instantly called upon *Iolau* for help, and so *Iolau* slew the Crab, and *Hercules* the Hydra.

Phaepatus maketh the story of *Hercules* by killing the Hydra, to be a meer allegory, saying, that the Hydra was a Castle kept by fifty men, the King whereof was called *Lernus*, who was assisted by a Noble man (called *Cancer*) against the assaults of *Hercules*, and that *Hercules* by the help of *Iolau*, King of the *Thebanes*, overcame that King and Castle. Other say, that *Lerna* and *Hydra* signifie the two kinds of Envy, distinguished by *Invidia*, and *Invidentia*, in himself, which arise out of the monstrous filthy fenne of humane corruption, like a monstrous hideous Dragon, with whom he strove, and as he struck off one head or tentation, so two or three other continually arose in the room thereof. And thus much for the Hydra, whether it be true or fabulous.

Of innocent SERPENTS.

I Doe read of two kinds of innocent Serpents, one called *Lybies*, because they are only in *Africk*, and never do hurt unto men, and therefore *Nicaner* was deceived, which maketh this kinde of Serpent to be the same with the *Am-dyte*, whose sting or teeth are very mortall and deadly. There be also other kinds of harmlesse Serpents, as that called *Molurus*, *Mustaca*, and *Mylacris*, which is said to go upon the tail, and it hath no notable property, except that one thing which giveth it the name, for *Molurus* is derived from *Molis Ourin*, that is hardly making water.

There be also domesticall innocent Serpents, *Myagrus*, *Orophia*, and *Spithiurus*, which whether they be one kinde or many, I will not stand upon, for they are all termed by the *Germans*, *Hussunck*, and *Husschlang*; that is, a House-snake. They live by hunting of Mice, and Weasels, and upon their heads they have two little ears, like to the ears of a Mouse, and because they be as black as coals, the *Italians* call them *Sirpe nero*, and *Carbon*, and *Garabonazzo*, and the *French-men*, *Anguille de Hay*, that is, a Snake of hedges. There be some that nourish them in Glasses with branne, and when they are at liberty they live in Dung-hills also, wherein they breed sometimes, they have been seen to suck a Cow, for then they twist their tails about the Cowes legs. *Matthiolus* writeth, that the flesh of this Snake, when the head, tail, intrails, fat, and gall are cut off and cast away, to be a speciall remedy against the French-pox.

There are also other kinds of Innocent Serpents, as that called *Parea*, and in *Italy* *Baron*, and *Pagerina*, which are brought out of the East, where these are bred. There be no other harmfull Serpents in that Countrey. They are of a yellow colour like Gold, and about four spans long: upon either side they have two lines or strakes, which begin about a hand breadth from their neck, and end at their tail. They are without poyson as may appear by the report of *Gesner*, for he did see a man hold the head alive in his hand. And thus much shall suffice to have spoken of Innocent Serpents.

Of the LIZARD.

Although there be many kinds of Lizards, yet in this place I will intreat first of the vulgar Lizard, called in the *Hebrew* *Letaab*, *Lanigermasha*, *Lyjerda*, *Carbo*, *Pelipab*, and *Eglose*; the *Chaldeans*, *Haltetba*, and *Humera*; the *Arabians*, *Ataia*, *Albathae*, or *Albadaie*, *Hardun*, *Arab*, *Samabras*, *Saambras*; the *Grecians* in ancient time *Sauros*, and *Saura*, and vulgarly at this day *Kolisaura*; the *Italians* in some places, *Liguro*, *Leguro*, *Lucerta*, and *Lucertula*; about *Trent*, *Racani*, and *Ramarri*, and yet *Romarro* is also used for a Toad; the *Spaniards*, *Lagarto*, *Lacerta*, *Lagartisa*, and *Lagaruixa*; the *French*, *Lisarde*; the *Germans*, *Adax*, and when they distinguish the male from the female, they expresse the male, *Ein Egochs*, and the female, *Egles*; in *Hessia*, *Lydelstch*; in *Flanders* and *Ilyria*, *Gessierka*, and *Gessiter*; the *Latines*, *Lacertus*, and *Lacerta*, because it hath arms and shoulders like a man, and for this cause also the Salamander, the Stellion, the Crocodile, and Scorpions are also called sometimes *Lacerti*, Lizards. And thus much shall suffice for the name.

The vulgar Lizard is described on this sort; the skin is hard and full of scales, according to this saying of *Virgil*;

Absint & picti squalentia terga Lacerti.

In English thus;

Those put away

And painted Lizards with their scaly backs.

The colour of it is pale, and distinguished with certain rusty spots, as *Pliny* writeth, with long strakes or lines to the tail; but generally they are of many colours, but the green with the white belly living in bushes, hedges, and is the most beautifull, and most respected; and of this we shall peculiarly intreat hereafter. There have been some Lizards taken in the beginning of September,

whose colour was like Brasse, yet dark and dusky, and their belly partly white, and partly of an earthy colour, but upon either side they had certain little pricks or spots like printed Starres: their length was not past four fingers, their eyes looked backward and the holes and passages of their ears were round, the fingers of their feet were very small, being five in number, both before and behind, with small nails, and behind that was the longest which standeth in the place of a mans fore-finger, and one of them standeth different from the other, as the thumb doth upon a mans hand, but on the forefeet all of them stand equall, not one behinde or before another.

These little Lizards do differ from the Stellions in this; that they have blood in their veins, and they are covered with a hard skin, winking with the upper eye-lid. All manner of Lizards have a cloven tongue, and the top thereof is somewhat hairy, or at the least wise divided like the fashion and figure of hair. Their teeth are also as small as hair, being black, and very sharp, and it seemeth also they are very weak, because when they bite, they leave them in the wound. Their lungs are small and dry, yet apt to swell and receive winde by inflammation: their belly is uniform and simple, their intrails long, their Milt round round and small, and their stones cleave inwardly to their loyns: their tail is like the tail of a Serpent; and it is the opinion of *Aristotle*, that the same being cut off, groweth again. The reason whereof is given by *Cardan*, because imperfect creatures are full of moistnesse; and therefore the parts cut off do easily grow again. And *Pliny* reporteth that in his dayes he saw Lizards with double tails, whereunto *Americus Vespusius* agreeth, for he saith, that he saw in a certain Island not far from *Liabon*, a Lizard with a double tail. They have four feet, two behinde and two before, and the former feet bend backward, and the hinder feet forward, like to the knees of a man.

Avicenna.

Now concerning the different kinds of Lizards, I must speak as briefly as I can in this place, wherein I shall comprehend both the Countreys wherein they breed, and also their severall kinds, with some other accidents necessary to be known. There is a kinde of Lizard called *Guarell*, or *Viell*, and *Alguarill*, with the dung whereof the Physicians do cure little pimples and spots in the face, and yet *Bellunensis* maketh a question, whether this be to be referred to the Lizards or not, because Lizards are not found but in the Countrey, out of Cities, and these are found every where.

Marcellus.

There is also another kinde of Lizard called *Lacertus Martensis*, which being salted, with the head and purple Wooll, Oyl of Cedar, and the powder of burnt Paper, so put into a linnen cloth, and rubbed upon a bald place, do cause the hair that is fallen off to come again. There be other Lizards, called by the *Grecians Arura*, and by the *Latines*, *Lacerta Pissinina*, which continually abide in green corn; these burned to powder, and the same mixed with the best wine and honey, do cure blinde eyes by an oyntment.

Albertus writeth, that a friend of his worthy of credit, did tell him that he had seen in *Provence*, a part of *France*, and also in *Spain*, Lizards as big as a mans leg is thick, but not very long, and these did inhabit hollow places of the earth, and that many times when they perceived a man or beast pass by them, they would suddenly leap up to his face, and at one blow pull off his cheek. The like also is reported of *Piemont* in *France*, where there be Lizards as great as little Puppies, and that the people of the Countrey do seek after their dung or excrements, for the sweetnesse and other vertues thereof.

Strabo.
Solinus.

In *Lybia* there are Lizards two cubits long, and in one of the Fortunate Islands called *Capraria*, there are also exceeding great Lizards.

In the Island of *Dioscorides*, neer to *Arabia* the lesser, there are very great Lizards, the flesh whereof the people eat, and the fat they see the, and use in stead of Oyl: these are two cubits long, and I know not whether they be the same which the *Africans* call *Dubb*, and live in the deserts of *Lybia*. They drink nothing at all, for water is present death unto them, so that a man would think that this Serpent were made all of fire, because it is so presently destroyed with water. Being killed there cometh no blood out of it, neither hath it any poyson but in the head and tayl. This the people hunt after to eat, for the taste of the flesh is like the taste of Frogs flesh, and when it is in the hole or den, it is very hardly drawn forth, except with spades and mattocks, whereby the passages are opened, and being abroad it is swift of foot.

Ælianus.
Polycletus.

The Lizards of *India*, especially about the Mountain *Nisa*, are 24 foot in length, their colour variable, for their skin seemeth to be flourished with certain pictures, soft and tender to be handled. I have heard that there hangeth a Lizard in the Kings house at *Paris*, whose body is as thick as a mans body, and his length or stature little lesse; it is said it was taken in a prison or common Gaole, being found sucking the legs of prisoners: and I do the rather beleieve this, because I remember such a thing recorded in the Chronicles of *France*, and also of another somewhat lesser, preserved in the same City, in a Church called *Saint Antonies*. And to the intent that this may seem no strange nor incredible thing, it is reported by *Volaterran*, that when the King of *Portugall* had conquered certain Islands in *Æthiopia*, in one of them they slew a Lizard, which had devoured or swallowed down a whole infant, so great and wide was the mouth thereof: it was eight cubits long, and for a rare miracle it was hanged up at the gate *Flumentana* in *Rome*, in the roof, and dedicated to the Virgin *Mary*. Besides these, there are other kinde of Lizards, as that called *Lacerta vermicularis*, because it liveth upon Worms and Spiders, in the narrow walls of old buildings. Also a silver-coloured Lizard, called *Liacome*, living in dry and sun-shining places. Another kinde called *Senabron*, and *Adare*, and *Sennekie*. *Scen* is a red Lizard, as *Silvaticus* writeth, but I rather take it to be the Scinck, or Crocodile of the earth, which abound neer the red Sea.

There

There is also another kinde of Lizard called *Lacertus Solaris*, a Lizard of the Sun, to whom *Epiphanius* compareth certain Hereticks called *Sampsai*, because they perceive their eye-sight to be dim and dull. They turn themselves fasting in their Caves to the East, or Sun-rising, whereby they recover their eye-sight again.

The picture of the Lizard with the belly upward.

In *Sarmatia*, a Countrey of the *Rutenes*, there is a Province called *Samogithia*, wherein the Lizards are very thick, black, and great, which the foolish Countrey people do worship very familiarly, as the Gods of good fortune; for when any good befallerh them, they entertain them with plentiful banquets and liberal chear: but if any harm or mischance happen unto them, then they withdraw that liberality, and intreat them more courselly, and so these dizzardly people think to make these Lizards by this means, more attentive and vigilant for their welfare and prosperity.

In the Province of *Cataia*, subject to the *Tartars*, there are very great Lizards, (or at least wise Serpents like Lizards) bred, containing in length ten yards, with an answerable and correspondent compasse and thicknesse.

Some of these want their fore-legs, in place whereof they have claws like the claws of a Lyon, or talons of a Falcon. Their head is great, and their eyes are like two great loaves. Their mouth and the opening thereof so wide, as it may swallow down a whole man armed, with great, long, and sharp teeth, so as never any man or other creature durst without terror look upon that Serpent. Wherefore they have invented this art or way to take them.

The Serpent useth in the day time to lie in the Caves of the earth, or else in hollow places of Rocks and Mountains. In the night time it cometh forth to feed, ranging up and down seeking what it may devour, neither sparing Lyon, Bear, nor Bull, or smaller beast, but eateth all he meeteth with until he be satisfied, and returneth again to his den. Now for as much as that Countrey is very soft and miry: the great and heavy Bulk of this Serpent maketh as it were a Ditch by his weight in the sand or mire, so as where you see the trailing of his body, you would think there had been rowled some great vessel full of Wine, because of the round and deep impression it leaveth in the earth.

Now the Hunters which watch to destroy this beast, do in the day time fasten sharp stakes in the earth, in the path and passage of the Serpent, especially neer to his hole or lodging, and these stakes are pointed with sharp Iron, and so covered in the earth or sand, whereby it cometh to passe, that when in his wonted manner he cometh forth in the night season to feed, he unawares fastneth his breast, or else mortally woundeth his belly upon one of those sharp-pointed stakes. Which thing the Hunters lying in wait observing, do presently upon the first noise with their swords kill him if he be alive, and so take out his gall which they sell for a great price, for therewithal the biting of a mad Dog is cured, and a woman in travel tasting but a little of it, is quickly discharged of her burthen. It is good also against the Hemroids and Piles. Furthermore, the flesh of this Serpent is good to be eaten, and these things are reported by *Paulus Venetus*, and this story following.

As *Americus Vesputus* sayled in his journey from the Fortunate Islands, he came unto a Countrey where he found the people to feed upon sod flesh, like the flesh of a serpent, & afterwards they found this beast to be in all things like a Serpent without wings, for they saw divers of them alive, taken and kept by the people to kill at their own pleasure. The mouths whereof were fast tyed with ropes, so as they could not open them to bite either man or beast, and their bodies were tyed by the legs. The aspect of these beasts was fearful to his company, and the strangers which did behold it, for they took them to be Serpents, being in quantity as big as Roe-bucks, having long feet and strong claws, a speckled skin, and a face like a Serpent: from the nose to the tip of his tail, all along the back there grew a bristle, as it were the bristle of a Bore, and yet the said Nation feedeth upon them, and because of their similitude with Lizards, I have thought good to insert their relation among the Lizards in this place, leaving it to the further judgement of the Reader, whether they be of this kinde or not.

In *Calechut* there are Serpents also, or rather beasts remaining in the fenny places of the Countrey, whose bodies are all pild without hair like Serpents: also in their mouth, eyes, and tail they resemble them, and in their feet Lizards, being as great as Boars, and although they want poyson, yet are their

their teeth very hurtful where they fasten them. Like unto these are certain others bred in *Hispaniola*, in an Island called *Hyvona*, having prickles on their back, and a comb on their head, but without voyce having four feet, and a tail like Lizards, with very sharp teeth. They are not much greater then Hares or Conies, yet they live indifferently in trees, and on the earth, being very patient, and induring famine many days. Their skin smooth and speckled like a Serpents, and they have a crap on the belly from the chin to the breast, like the crap of a Bird.

Besides these, there are also some called *Barbati*, about the bignesse of Conies, and of a white ash colour, yet their skin and tail like a Snakes, and they resemble trapped Horses. They have four feet, and with the foremost they dig them holes in the earth, out of which they are drawn again like Conies to be eaten of men, for they have a pleasant tast. To conclude, we do read that in the year 1543. there came many winged Serpents and Lizards into *Germany*, neer *Syria*. and did bite many mortally: And in the year 1551. there were such bred in the bodies of men and women, as we have shewed already in the general discourse of Serpents, first of all recited in the beginning.

In all the nature of Lizards, there is nothing more admirable then that which is reported of them by *Aelianus* of his own knowledge. When a certain man had taken a great fat Lizard, he did put out her eyes with an Instrument of Brasse, and so put her into a new earthen pot, which had in it two small holes or passages, big enough to take breath at, but too little to creep out at, and with her moist earth and a certain herb, the name whereof he doth not expresse: and furthermore, he took an Iron Ring, wherein was set an *Engagataes* Stone, with the Picture of a Lizard ingraven upon it. And besides, upon the Ring he made nine several marks, whereof he put out every day one, until at the last he came at the ninth, and then he opened the pot again, and the Lizard did see as perfectly as ever he did before the eyes were put out: whereof *Albertus* enquiring the reason, could give none, but having read in *Isidorus*, that when the Lizards grow old and their sight dim or thick, then they enter into some narrow hole of a Wall, and so set their heads therein, directly looking towards the East or Sun-rising, and so they recover their sight again. Of this *Albertus* giveth good reason, because he saith, the occasion of their blindness cometh from frigidicy congealing the humor in their eyes, which is afterward attenuated and dissolved by the help and heat of the Sun. The voyce of the Lizard is like the voyce of other Serpents, and if it happen that any man by chance do cut the body of the Lizard asunder, so as one part falleth from another, yet neither part dyeth, but goeth away the upon two legs that are left, and live apart for a little season, and if it happen that they meet again, they are so firmly and naturally conjoynd by the secret operation of nature, as if they had never been severed, only the scar remaineth.

They live in caves of the earth, and in graves, and the green Lizards in the fields and Gardens, but the yellowish or earthy brown Lizard among hedges and thorns. They devour any thing that comes to their mouth, especially Bees, Emmets, Palmer-worms, Grasshoppers, Locusts, and such like things, and four months of the year they lie in the earth and eat nothing.

In the beginning of the year about *March*, they come out again of their holes, and give themselves to generation, which they perform by joyning their bellies together, wreathing their tails together, and other parts of their bodies; afterwards the female bringeth forth Egges, which she committeth to the earth, never sitting upon them, but forgetteth in what place they were laid (for she hath no memory.) The young ones are conceived of themselves, by the help of the Sun. Some there be which affirm that the old one devoureth the young ones as soon as they be hatched, except one which she suffereth to live, and this one is the basest and most dullard, having in it least spirit of all the residue: yet notwithstanding, afterwards it devoureth both his parents, which thing is proved false by *Albertus*, for seeing they want memory to finde out their own Egges, it is not likely that they have so much understanding as to discern their own young ones, nor yet so unnatural as to destroy the noblest of their brood, but rather they should imitate the Crocodile, which killeth the basest and spareth the best spirits.

It is affirmed, that they live but half a year or six months, but it is also false, for they hide themselves the four coldest moneths; and therefore it is likely that they live more then six, for else what time should they have for generation? Twice a year they change their skin, that is in the Spring and Autumn, like other Serpents that have a soft skin, and not hard like the Tortoises. Their place of conception and emission of their Egges is like to Birds: and therefore it is a needlesse question to enquire whether they bring egges forth of their mouth or not, as some have foolishly affirmed, but without all warrant of truth or nature.

They live by couples together, and when one of them is taken, the other waxeth mad, and rageth upon him that took it, whether it be male or female: In the Old Testament Lizards, Weasels, and Mice are accounted impure beasts, and therefore forbidden to be eaten, not only because they live in Graves and design inconstancy of life, but also theeves and treacherous persons. They are afraid of every noise, they are enemies to Bees, for they live upon them; and therefore in ancient time they mixed Meal and juyce of Mallows together, and laid the same before the Hives, to drive away Lizards and Crocodiles. They fight with all kinde of Serpents; also they devour Snails, and contend with Toads and Scorpions. The Night-owls and Spiders do destroy the little Lizards, for the Spider doth so long winde her thred about the jaws of the Lizard, that he is not able to open his mouth, and then she fasteneth her fangs in her brains. The Storks are also enemies to Lizards, according to this saying of the Poet;

— Ser—

— *Serpente citonia pullos*
Nutrit & inventa per devia rura lacerta.
 In English thus;
With Lizards young and Serpents breed,
The Stork seeketh her young ones to feed.

Notwithstanding, that by the law of God, men were forbidden to eat the Lizard, yet the *Troglodites*, *Ethiopians*, did eat Serpents and Lizards, and the *Amazons* did eat Lizards and Tortoises, for indeed those women did use a very thin and slender diet; and therefore *Cælius* doth probably conjecture, that they were called *Amazons*, because *Mazis carebant*, that is, they wanted all manner of delicate fare. We have also shewed already, that the Inhabitants of *Dioscorides* Isle, do eat the flesh of Lizards, and the fat after it is boyled, they use in stead of Oyl.

Concerning the venom or poyson of Lizards, I have not much to say, because there is not much thereof written: yet they are to be reprov'd which deny they have any poyson at all, for it is manifest, that the flesh of Lizards eaten, (I mean of such Lizards as are in *Italy*,) do cause an inflammation and apostumation, the heat of the head-ach, and blindenesse of the eyes. And the Egges of Lizards do kill speedily, except there come a remedy from Faulkons dung and pure Wine. Also when the Lizard biteth, he leaveth his teeth in the place, which continually aketh, until the teeth be taken out: the cure of which wound is first to suck the place, then to put into it cold water, and afterward to make a plaister of Oyl and Ashes, and apply the same thereunto. And thus much for the natural description of the Lizard.

The medicines arising out of the Lizard, are the same which are in the Crocodile, and the flesh thereof is very hot: wherefore it hath vertue to make fat, for if the fat of a Lizard be mixed with Wheat-meal, Halinitre, and Cumin, it maketh Hens very fat, and they that eat them much fatter: for *Cardan* saith, that their bellies will break with fatnesse, and the same given unto Hawks, maketh them to change their feathers.

A Lizard dissected, or the head thereof being very well beaten with Salt, draweth out Iron points of nails, and splents out of the flesh or body of man, if it be well applyed thereunto, and it is also said, that if it be mingled with Oyl, it causeth hair to grow again upon the head of a man, where an Ulcer made it fall off. Likewise a Lizard cut asunder hot, and so applyed, cureth the stinging of Scorpions, and taketh away Wens. Marcellus.

In ancient time with a Field-lizard dryed and cut asunder, and so bruised in pieces, they did draw out teeth without pain; and with one of these sod and stamped, and applyed with Meal or Frankincense to the fore-head, did cure the watering of the eyes.

The same burned to powder, and mixed with Cretick Hony by an Ointment, cureth blindenesse. The Oyl of a Lizard put into the ear, helpeth deafnesse, and driveth out Worms if there be any therein. If children be anointed with the blood fasting, it keepeth them from swellings in the belly and legs: also the liver and blood lapped up in Wooll, draweth out nails and thorns from the flesh, and cureth all kinde of freckles, according to this verse of *Serenus*;

Verrucam poterit sanguis curare Lacerta.
 That is to say;
The blood of Lizards can,
Cure freckles in a man.

The urine (if there be any at all) helpeth the Rupture in Infants. The bones taken out of the Lizards head in the full Moon, do scarifie the teeth, and the brain is profitable for suffusions: The liver laid to the gums, or to hollow teeth, easeth all pain in them. The dung purgeth wounds, and also taketh away the whitenesse and itching of the eyes, and so sharpneth the sight, and the same with water, is used for a salve. *Arnoldus* doth much commend the dung of Lizards mixed with Meal, the black thereof being cast away, and so dryed in a furnace, and softned again with water of Nitre, and froth of the Sea, afterwards applyed to the eyes in a cloth, is very profitable against all the former evils. And thus much shall suffice to have spoken of the first and vulgar kinde of Lizard: for killing of whom *Apollo* was in ancient time called *Saurotonos*.

Of the GREEN LIZARD.

THE greater Lizard which is called *Lacerta Viridis*, the green Lizard, by the *Grecians*, *Chlorosaura*; by the *Italians*, *Gez*, and by the *Germans*, *Gruener Heydix*, is the same which is called *Ophiomachus*, because it fighteth with Serpents in the defence of man. They are of colour green, from whence they are named, and yet sometimes in the Summer they are also found pale. They are twice so big as the former Lizard, and come not neer houses, but keep in Meadows and green fields. They only abound in *Italy*, and it is a beast very loving and friendly unto man, and an enemy to all other Serpents. For if at any time they see a man, they instantly gather about him, and laying their heads at the one side, with great admiration behold his face: and if it chance a man do spit, they lick up the spittle

spittle joyfully, and it hath been seen that they have done the like to the urine of children, and they are also handled of children without danger, gently licking moisture from their mouths. And if at any time three or four of them be taken, and so set together to fight, it is a wonder to see how eagerly they wound one another, and yet never set upon the man that put them together.

If one walk in the fields by hollow ways, bushes, and green places, he shall hear a noise, and see a motion as if Serpents were about him, but when he looketh earnestly upon them, they are Lizards wagging their heads, and beholding his person: and so if he go forward they follow him, if he stand still they play about him. One day (as *Erasmus* writeth) there was a Lizard seen to fight with a Serpent in the mouth of his own Cave, and whilest certain men beheld the same, the Lizard received a wound upon her cheek by the Serpent, who of green, made it all red, and had almost torn it all off, and so hid herself again in her den. The poor Lizard came running unto the beholders, and shewed her bloody side, as it were desiring help and commiseration, standing still when they stood still, and following when they went forward, so that it acknowledged the sovereignty of man, appealing unto him as the chief Justice, against all his enemies and oppressors.

It is reported by the *Italians*, that many times while men fall asleep in the fields, Serpents come creeping unto them, and finding their mouths open, do slide down into their stomachs: Wherefore, when the Lizard seeth a Serpent coming toward a man so sleeping, she waketh him, by gently scratching his hands and face, whereby he escapeth death and deadly poyson.

Palladius.
Pliny.

The use of these green Lizards, is by their skin and gall to keep apples from rotting, and also to drive away Caterpillars, by hanging up the skin on the tops of trees, and by touching the apples with the said gall: also when the head, feet or intrails are taken away, the flesh of the green Lizard is given in meat to one that hath the Sciatica, and thus much for the natural uses of the green Lizard.

Marcellus.

The remedies arising out of this Lizard, are briefly these: First it is used to be given to Hawks, and to be eaten in small pieces, provided so as it be not touched with their talons, for it will hurt their feet, and draw their claws together; also they seethe it in water, then beat it in a mortar. Lastly, when they have poured warm water upon it, they let the Hawk wash her feet in it, and so it causeth her to cast her old feathers and coat, and bringeth a new in the room thereof. This Lizard eaten with sauces to take away the loathing thereof, is good for the Falling-evil: and being sod in three pintes of Wine, until it be but one cup full, and thereof taken every day a spoonful, is good for them that have a disease in the lungs. It is also profitable for them that have pain in the loins. And there are many ways to prepare it for the eyes, which I will not stand to relate in this place, because they are superstitious, and therefore likely to do more harm then good to the English Reader.

There is an Oyl made of Lizards, which is very precious, and therefore I will describe it as I finde it in *Brasavolus*. Take seven green Lizards, and strangle them in two pound of common Oyl, therein let them soke three days, and then take them out, and afterwards use this Oyl to anoint your face every day, but one little drop at once, and it shall wonderfully amend the same. The reason hereof seemeth to be taken from the operation of the dung or excrements, because that hath vertue to make the face white, and to take away the spots.

If the upper part in the pastern of a Horse be broken, put thereinto this Oyl with a little Vinegar, then rub the hoof about therewith, so shall it increase and grow again, and all the pain thereof shall passe away. The making of the medicine is this: Take a new earthen pot, put thereinto three pintes of Oyl, wherein you must drown your Lizards, and so seethe them till they are burned away, then take out the bones, and put in soft Lime half a pound, liquid Pitch a pinte, of Swines grease two pound; then let them be all sod together again & afterwards preserved, and used upon the hoof as need shall require: for it shall fasten and harden the Horses hoof, and there is nothing better for this purpose then this Oyl. The ashes of a green Lizard do reduce skars in the body to their own colour.

The bones of a green Lizard are good against the Falling-evil, if they be prepared in this manner following: Put your green Lizard alive into a vessel full of Salt, and there shut it in safe, so in few days it will consume all the flesh and intrails from the bones, and so the bones may be taken and used in this case like the hoof of an Elk, which are very precious for this sickness, and no lesse precious are these bones. The blood doth cure the beating, bruizings, and thick skins in the feet of men and beasts, being applyed in flocks of Wooll.

The

The eye is superstitiously given to be bound to ones arm on a quartane Ague, and the eyes pressed out alive, and so included in golden buttons or bullets, and carryed about, do also help the pain of the eyes, and in default hereof the blood taken out of the eyes in a piece of Purple wooll, hath the same operation. The heart of a Lizard is also very good against the exulcerations of the Kings-evil, if it be but carryed about in the bosome in some small silver vessel. The gall taketh away the hairs upon the eye-lids that are unseemly, if it be dryed in the same to the thicknesse of Honey, especially in the Dog-days, and mixed with White-wine, then being anointed upon the place, it never suffereth the hairs to grow again. And thus much for the History of the green Lizard.

Of the MILLET or CENCHRINE.

THIS Serpent called by the Grecians *Cenchros*, *Cenchrines*, *Cenchridion*, and *Cenchrites*; is by the Latines called *Cenchria*, *Cenchrus*, and *Milliaria*: because it cometh abroad at the time that Millet-seed floureth, and is ready to ripe, or else because it hath certain little spots upon it like Millet-seed; and is also of the same colour. It is likewise barbarously called *Famusus*, *Aracis*, and *Falivisus*. The Germans of all others have a name for it, for they call it *Punter-schlang*, and *Berg-schlang*. Other Nations not knowing it cannot have any name for it; and therefore I cannot feign any thereof, except I should lie grossly in the beginning of the History. This Serpent is only bred in *Lemnus* and *Samothracia*, and it is there called a *Lyon*, either because it is of very great quantity and bignesse, or else because the scales thereof are spotted and speckled like the *Lybian Lyons*: or because when it fight-eth the tail is turned upward like a Lyons tail, and as a Lyon doth. But it is agreed at all hands, that it is called *Milliaria*, a *Miller*, because in the spots of his skin and colour it resemblenth a *Millet-seed*, which caused the Poet to write on this manner;

Puribus ille notis variatam tingitur alvum,

Quam parvis tinctus maculis Thebanus Ophites.

In English thus;

With many notes and spots, his belly is bedyed

Like Thebane her, Ophites slightly tryed.

But not only his belly, for his back and whole skin is of the same fashion and colour. The length of this Serpent is about two cubits, and the thick body is attenuated toward the end, being sharp at the tail. The colour is dusky and dark like the Millet, and it is then most ireful and full of wrath or courage, when this herb or seed is at the higohst. The pace of this Serpent is not winding or travelling, but str aight, and directed without bending to and fro: and therefore saith *Lucan*; *Et semper recto lapsurus limite Cenchris*: that is, And the Millet alway standing in a straight and right line, and for this cause when a man flyeth away from it, he must not run directly forward, but winde to and fro, crooking like an Indenture, for by reason thereof this Serpents large body cannot so easily and with the like speed turn to follow and persue, as it can directly forward.

It is a very dangerous Serpent to meet withal, and therefore not only the valiantest man, but also the strongest beast is, and ought justly to be afraid thereof, for his treacherous deceits and strength of body; for when it hath gotten the prey or booty, he beclapseth it with his tail, and giveth it fearful blows, in the mean time fasteneth his jaws or chaps to the man or beast, and sucketh out all the blood till it be fully satisfied; and like a Lyon he beateth also his own sides, setting up the spires of his body when he assalteth any adversary, or taketh any resisting booty. I take this to be the same called in *Sicilia*, *Serpa serena*, which is sometimes as long as a man, and as great as the arm about the

the wrist. In the heat of Summer they get themselves to the Mountain, and there seize upon cattel of all sorts, as often as anger or wrath enforceth them.

The nature of it is very hot, and therefore venomous in the second degree: wherefore when it hath bitten any, there followeth putrefaction and rottenesse, as flesh where water lyeth betwixt the skin, like as in the Dropsie: for besides, the common affections it hath with the Viper, and the biting thereof, alike in all things, more deadly and unresistible evils followeth, as drouzy, sleepinesse, and Lethargy, and pain in the belly, especially the Colick, pain in the liver and stomach, killing within two days, if remedy be not provided.

The cure is like the cure of the Vipers biting, Take the seed of Lettice, and Flax-seed, Savory beaten or stamped, and wilde Rue, wilde Betony, and Daffadil two drams in three cups of Wine, and drink the same, immediately after the drinking hereof, drink also two drams of the root of Centaury, or Hartwort, Nosewort, or Gentian, or Sefamine. And thus much for a description of this venomous Serpent, one of the greatest plagues to man and beast in all those Countries or places, wherein it is ingendered, and it is not the least part of English happinesse to be freed by God and Nature from such noysome, virulent and dangerous neighbours.

Of the NEVTE or WATER-LIZARD.

THIS is a little black Lizard, called *Wassermoll*, & *Wasseradde*, that is a Lizard of the Water. In French, *Taffot*; and in Italian *Marasandola*, which word is derived from *Marasso*, a Viper, because the poyson hereof is like the poyson of Vipers, and in the Greek it may be termed *Enudros Samros*. They live in standing waters or pools, as in ditches of Towns and Hedges. The colour as we have said is black, and the length about two fingers, or scarce so long. Under the belly

it is white, or at least hath some white small spots on the sides and belly: yet sometimes there are of them that are of a dusty earthy colour, and towards the tail yellowish. The skin is strong and hard, so as a knife can scarce cut the same, and being cut, there issueth out a kinde of white matterly liquor, like as is in Salamanders.

Being taken, it shutteth the mouth so hard as it cannot be easily opened, neither doth it endeavour to bite, although it be plucked and provoked. The tongue is very short and broad, and the teeth so short and small, as they are scarcely visible within the lips. Upon the fore feet it hath four fingers or claws, but upon the hinder-feet it hath five. The tail standeth out betwixt the hinder-legs in the middle, like the figure of a wheel-whirl, or rather so contracted, as if many of them were conjoynd together, and the void or empty places in the conjunctions were filled. The tail being cut off, liveth longer then the body, as may be seen in every days experience, that is, by motion giveth longer signes and token of life.

This Serpent is bred in fat waters and soils, and sometimes in the ruines of old walls, especially they delight in white muddy waters, hiding themselves under stones in the same water if there be any, and if not, then under the banks side of the earth, for they seldome come to the land. They swim underneath the water, and are rarely seen at the top. Their egges are not past so big as pease, and they are found hanging together in clusters. One of these being put alive into a glasse of water, did continually hold his head above the water like as Frogs do, so that thereby it may be conjectured it doth often need respiration, and keepeth not under water except in fear, and seeking after meat.

There is nothing in nature that so much offendeth it as Salt, for so soon as it is laid upon Salt, it endeavoureth with all might and main to run away, for it biteth and stingeth the little beasts above measure, so that it dyeth sooner by lying in Salt where it cannot avoid, then it would by suffering many stripes, for being beaten it liveth long, and dyeth very hardly. It doth not like to be without water, for if you try one of them, and keep it out of water but one day, it will be found to be much the worse.

Being moved to anger, it standeth upon the hinder-legs, and looketh directly in the face of him that hath stirred it, & so continueth til all the body be white, through a kind of white humor or poyson, that it swelleth outward, to harm (if it were possible) the person that did provoke it. And by this is their venomous nature observed to be like the Salamander, although their continual abode in the water, maketh their poyson the more weak.

Some say that if in France a Hog do eat one of these, he dyeth thereof, and yet doth more safely eat the Salamander. But in England it is otherwise, for I have seen a Hog without all harm carry in his mouth a Newt, and afterward eat it. There be some Apothecaries which do use this Newt in stead

stead of Skinks or Crocodiles of the earth, but they are deceived in the vertues and operation, and do also deceive other, for there is not in it any such wholesome properties, and therefore not to be applied without singular danger. And thus much may suffice to be said for this little Serpent, or Water-creeping creature.

Of the PELIAS.

Aetius making mention of the *Elaps* and *Pelias*, two kindes of Serpents, doth joyntly speak of them in this sort, saying that the signes of these Serpents were so common and vulgarly known, that there was no descriptions of them among the ancient Writers. But the *Pelias* biting causeth putrefaction about the wound or bitten place, but yet not very dangerous, and it bringeth obfuscation or dimnesse to the eyes, by reason that as the poyson is universally distributed over all the body, so it hath most power over the tenderest part, namely the eyes. It is cured by a Pissane with Oyl in drink, and a decoction of such Dockes as grow in ditches, and other simple medicines, such as are applyed to the curing of the Yellow-jaundise. The eyes must be washed with the urine of a childe or young man which never knew any woman carnally, and this may be applyed either simply and alone, or else by Brine and Pickle, so also must the head. After that the body is purged, anoint it with Balsamum and Honey, and take an Eye-salve to sharpen again and recover the sight, and for this cause it is very good to weep, for by evacuation of tears, the venom also will be expelled. But if the eyes grow to pain, then let their Eye-salve be made more temperate and gentle, to keep the head and brain from stupefaction. And thus much for the *Pelias* out of *Aetius*.

Of the PORPHYRE.

There is among the *Indians* a Serpent about the bignesse of a span or more, which in outward aspect is like to the most beautiful and well coloured Purple, the head hereof is exceeding white, and it wanteth teeth. This Serpent is sought for in the highest Mountains, for out of him they take the *Sardius* stone. And although he cannot bite because he wanteth teeth, yet in his rage when he is persecuted, he casteth forth a certain poyson by vomit, which causeth putrefaction where ever it lighteth. But if it be taken alive and be hanged up by the tail, it rendereth a double, one whiles it is alive, the other when it is dead, both of them black in colour, but the first resembleth black Amber. And if a man take but so much of the first black venom as is the quantity of a Sesamine seed, it killeth him presently, making his brains to fall out at his nostrils, but the other worketh neither so speedily, nor after the same manner; for it casteth one into a Consumption, and killeth within the compasse of a year. But I finde *Ælianus*, *Volateran*, and *Textor* to differ from this relation of *Ctesias*, for they say, that the first poyson is like to the drops of Almond trees, which are congealed into a gum, and the other which cometh from it when he is dead, is like to thin mattery water. Unto this *Porphyre* I may add the *Palmer* Serpent, which *Strabo* writeth doth kill with an unrecoverable poyson, and it is also of a Scarlet colour, to the loyns or hinder-parts.

Of the PRESTER.

Although there be many Writers which confound together the *Prestor* & the *Dipsas*, and make of them but one kinde, or Serpent of divers names, yet seeing on the contrary there be as many or more which do distinguish or divide them, and make them two in nature different, one from another, the *Dipsas* killing by thirst, and the *Prestor* by heat, as their very names do signifie, therefore I will also trace the steps of this latter opinion, as of that which is more probable and consonant to truth.

The *Grecians* call it *Prestor* of *Prethein*, which signifieth to burn or inflame, and *Tremellius* and *Junius* think, that the Serpents called fiery Serpents, which did sting the *Israelites* in the Wilderness, were *Prestors*. We finde in *Suidas*, *Prestor* for the fire of Heaven, or for a cloud of fire carryed about with a vehement strong winde, and sometimes lightnings. And it seemeth that this is indeed a fiery kinde of Serpent, for he himself always goeth about with open mouth, panting and breathing as the Poet writeth;

Oraque distendens avidus fumantia Prestor,

Inficit, ut lesus tumida membra gerat.

Which may be Englished thus;

The greedy Prestors wide-open foming mouth

Infests, and swelleth, making the members by heat uncouth.

When this Serpent hath struck or wounded, there followeth an immeasurable swelling, distraction, conversion of the blood to matter, and corrupt inflammation taking away freedom or easinesse

of aspiration, likewise dimming the sight, or making the hair to fall off from the head; at last suffocation as it were by fire, which is thus described by *Manuan* upon the person of one *Narsidius*, saying as followeth;

*Ecce subit facies leto diversa fluenti.
Narsidium Marfi cultorem torridus agri
Percussit prester: illi rubor igneus ora
Succendit, tenditq; cutem pereunte figura,
Miscens cuncta tumor toto jam corpore major.
Humanumq; egressa modum super omnia membra
Efflatur Sanies, late tollente veneno.
Ipse late penitus congesto corpore merfus.*

*Nec lorica tenet distenti corporis auctum.
Spumeus accenso non sic exundat atheno
Undarum cumulus: nec tanto carbasa Coro
Curvavere sinus: tumidos jam non capit artus
Informis globus & confuso pondere truncus.
Intactum volucrum rostris, epulasq; daturum
Haud impune feris, non ausi tradere busto,
Nondum stante modo crescens fugere cadaver.*

Which may be thus Englished;

Lo suddenly a divers fate the joyful current stayed,
Narsidius, which Marsinus mirror did adore,
By burning sting of scorching Prester dead was layed,
For fiery colour his face enflam'd, not as before.
The first appearing visage faild, all was out-stretcht,
Swelling cover'd all, and bodies grossefesse doubled
Surpassing humane bounds and members all ore reacht,
Aspiring venom spreads matter blown in carkasse troubled.
The man lyeth drownd within swoln bodies banks,
No girdle can his monstrous growth contain.
Not so are waters swoln with rage of sandy flanks,
Nor sails bend down to blustering Corus wain.
Now can it not the swelling sinews keep in hold,
Deformed globe it is, and trunk ore-come with waight,
Untoucht of flying Fowls, no beaks of young or old
Do him dare eat, or beasts full wilde upon the body bait,
But that they die. No man to bury in earth or fire
Durst once come nigh, nor stand to look upon that haplesse case,
For never ceased the heat of corps though dead to swell,
Therefore afraid they ran away with speedy pace.

The cure of the poyson of this Serpent, is by the Physitians found out to be wilde Purflain, also the flowers and stalk of the bush, the Beavers stone called *Castoreum*, drunk with *Opoponax* and Rew in Wine, and the little Sprat-fish in diet. And thus much of this fire-burning venomous Serpent.

Of the RED SERPENT.

THis kinde of Serpent being a Serpent of the Sea, was first of all found out by *Pelicerius* Bishop of *Montpelier*, as *Rondoleius* writeth, and although some have taken the same for the *Myrus* or *Berus*, of which we have spoken already, yet is it manifest that they are deceived, for it hath gills covered with a bony covering, and also fins to swim withal, much greater then those of the *Myrus*, which we have shewed already to be the male Lamprey. This Serpent therefore for the outward proportion thereof, is like to the Serpents of the land, but of a red or purplish colour, being full of crooked or oblique lines, descending from the back to the belly, and dividing or breaking that long line of the back, which beginneth at the head, and so stretcheth forth to the tail.

The opening of his mouth is not very great, his teeth are very sharp and like a saw, his gills like scaly fishes, and upon the ridge of his back, all along to the tail, and underneath upon the rine or brim of his belly are certain hairs growing, or at the least thin small things like hairs, the tail being shut up in one undivided fine. Of this kind no doubt are those which *Bellonius* saith he saw by the lake *Abydus*, which live in the waters, and come not to the land but for sleep, for he affirmeth that they are like land Serpents, but in their colour they are red spotted, with some small and dusky spots. *Gillius* also saith, that among the multitude of Sea Serpents, some are like Congers, and I cannot tell whether that of *Virgil* be of this kinde or not, spoken of by *Laocoon* the Priest of *Neptune*.

*Solennes taurum ingentem macabat ad aras.
Ecce autem gemini à Tenedo tranquilla per alta
(Horresco referens) immensis orbibus angues
Incumbunt pelago: pariterq; ad littora tendunt.*

*Pectora quorum inter fluctus arrecta, jubeque
Sanguinea exuperant undas: pars cetera pontum
Pone legit, sinuatque immensa volumine terga.
Fit sonitus fumante salo, &c.*

Which

Which may be Englished thus;

Whilest he a Bull at Altars solemn sacrifice,
Behold (I fear to tell) two monstrous Snakes appeared,
Out of Tenedus shore both calm and deep did rise
One part in Sea, the other on Land was reared:
Their breasts and red blood manes on waters mounted,
But back and tail on Land from foaming Sea thus sounded.

Of the SALAMANDER.

I Will not contrary their opinion which reckon the Salamander among the kindes of Lizards, but leave the assertion as somewhat tolerable: yet they are not to be followed, or to be believed, which would make it a kinde of Worm, for there is not in that opinion either reason or resemblance. What this Beast is called among the Hebrews I cannot learn, and therefore I judge that the Jews (like many other Nations) did not acknowledge that there was any such kinde of creature, for ignorance bringeth infidelity in strange things and propositions.

The Greeks call it *Salamandra*, which word or term is retained almost in all languages, especially in the Latine, and therefore Isidore had more boldnesse and wit, then reason, to derive the Latine *Salamandra*, quasi *Valincendram*, resisting burning, for being a Greek word, it needeth not a Latine notation. The Arabians call it *Saghras*, and *Samabras*, which may well be thought to be derived or rather corrupted, from the former word *Salamandra*, or else from the Hebrew word *Semamit*, which signifieth a Stellion. Among the Italians and Rhetians it retaineth the Latine word; and sometimes in Rhetia it is called *Rosada*. In the Dukedom of Savoy, *Pluvina*. In France, *Sourd*, *Blande*, *Albrenne*, and *Arrassade*, according to the divers Provinces in that Kingdom. In Spain it is called *Salamantegua*. In Germany it is called by divers names, as *Maall*, and *Punter maall*, *Olm*, *Moll*, and *Moleb*, because of a kinde of liquor in it like milk, as the Greek word *Molge*, from *amelgein* to suck milk. Some in the Countrey of Helvetia do call it *Quatteresh*. And in *Albertus* it is likewise called *Rimatrix*. And thus much may suffice for the name thereof.

The description of their several parts followeth, which as *Avicen* and other Authors write, is very like a small and vulgar Lizard, except in their quantity, which is greater; their legs taller, and their tail longer. They are also thicker and fuller then a Lizard, having a pale white belly, and one part of their skin exceeding black, the other yellow like Verdigrease, both of them very splendid and glistering, with a black line going all along their back, having upon it many little spots like eyes: And from hence it cometh to be called a Stellion, or *Animal stellatum*, a creature full of stars, and the skin is rough and bald, especially upon the back where those spots are, out of which as writeth the Scholiast, issueth a certain liquor or humor, which quencherh the heat of the fire when it is in the same.

This Salamander is also four-footed like a Lizard, and all the body over it is set with spots of black and yellow, yet is the sight of it abominable and fearful to man. The head of it is great, and sometimes they have yellowish bellies and tails, and sometimes earthy. It is some question among the learned, whether there be any discretion of sex, as whether there be in this kinde a male and a female. *Pliny* affirmeth that they never engender, and that there is not among them either male or female, no more then there are among Eeles. But this thing is justly crossed, both by *Bellonius* and *Agricola*, for they affirm upon their own knowledge, that the Salamander engendereth her young ones in her belly like unto the Viper, but first conceiveth eggs, and she bringeth forth forty and fifty at a time, which are fully perfected in her womb, and are able to run or go so soon as ever they be littered: and therefore there must be among them both male and female.

The Countries wherein are found Salamanders, are the Region about *Trent*, and in the *Alpes*, and sometime also in *Germany*. They most commonly frequent the coldest and moistest places, as in the shadow of Woods in hedges neer Fountains and Rivers, and sometimes they are found among Corn and Thorns, and among Rocks. They are seldom seen except it be either in the Spring-time, or against rain, and for this cause it is called *Animal vernale*, and *Pluviosum*, a Spring or rainy creature. And yet there were many of them found together in a hole neer unto the City *Sneberg* in *Germany*, in the month of *February*, for they love to live in flocks and troupes together;

together, and at another time in *November*, a living Salamander was found in a Fountain. Howbeit, if at any time it be seen foraging out of his den or lodging place, it is held for an assured presage of rain. But if the Spring-time fortune to be cold or frosty, then they keep home, and go not visibly abroad.

Some do affirm that it is as cold as Ice, and that it therefore quencheth heat or fire like a piece of Ice, which if it be true, then is the old Philosophical Maxime utterly false, namely, that all living creatures are hot and moist, being compared to creatures without life and sense, for there is not any dead or senselesse body that so quencheth fire as Ice doth. But the truth is, that the Salamander is cold, and colder then any Serpent, yet not without his natural heat, which being compared to Ar-mans, may truly be said to be hot, and therefore the venom of the Salamander is reckoned among Septicks, or corroding things.

Willichius.

It naturally loveth milk, and therefore sometimes in the Woods or neer hedges, it sucketh a Cow that is laid, but afterwards that Cows udder or stock dryeth up, and never more yeeldeth any milk. It also greatly loveth the Honey-combe, and some Authors have affirmed, that they use to gape after air or fresh breath, like the *Chamaeleon*, yet they which have kept Salamanders in glasses, never perceived by them any such thing. They are slow of pace, and void ground very sluggishly, and therefore it is justly tearmed a heavy and slothful Beast.

But the greatest matter in the Salamander to be enquired after, is whether it can live and be nourished by and in the fire, or whether it can passe through the fire without any harm, or quench and put out the same. Which opinions in the very relation and first hearing, do crosse one another, for how can that either be nourished or live in the fire, which quencheth the same being put into it? *Aristotle* that never saw a Salamander himself, but wrote thereof by hear-say, hath given some colour to this opinion, because he writeth, *Nonnulla corpora esse animalium quae igne non absumantur Salamandra documento est: quae (ut aiunt) ignem inambulans eum extinguit.* That is to say, the Salamander is an evidence, that the bodies of some creatures are not wasted or consumed in the fire, for (as some say) it walketh in the fire and extinguisheth the same.

Now whether this be seemed so great a Philosopher, to write upon hear-say, who took upon him to gather all natural learning into his own Graunge or store-house, and out of the same to furnish both the present and all future ages, I leave it to the consideration of every indifferent Reader that shall peruse this story. I for mine own part, rather judge it to be lightnesse in him, to insert a matter of this consequence in the discourse of this Beast, without either Authors, or experience gathered by himself. This one thing I marvel at, why the *Egyptians*, when they will expresse or signifie a Man burnt, do in their Hieroglyphicks paint a Salamander, except either fire can burn a Salamander, or else contrary to all their custom, they demonstrate one contrary by another.

Orus.

Nicander plainly affirmeth, that the Salamander doth without all harm passe through the fire, and the Scholiast addeth, that there are certain passages in the skin, out of which issueth a kinde of liquor that quencheth the fire: And he telleth a story of one *Andreas*, who did dip a piece of cloth in the blood of a Salamander, and tryed afterward whether it would burn or not, but did not finde that it would burn, wherefore he put it upon his hand, and thrust that into the fire, and then also he felt no manner of pain. And therefore the said *Nicander* calleth this creature *Ciporrhion*, because of a certain fat humor which issueth out of it, quenching the fire, but I rather think that this fat humor maketh the skin to glisten, for if it were properly fat, it would rather kindle and increase the fire then quench or extinguish the same.

Suidas followeth the common received opinion, that the Salamander quencheth the fire, (although it be not bred of the fire as *Krickets* are) like Ice; and when the fire is so quenched, it is in vain to blow or kindle the same again with any bellows, as they say have been tryed in the Forges of *Smiths*. And this also caused *Serenus* to write, *Seu Salamandra potens, nullisq; obnoxia flammis*: the potent Salamander is never hurt by flames. *Seneca* consenteth hereunto, and *Zoroastres*: and so great hath been the dotage about this opinion, that some have written that it ascendeth up to the fire neer the Moon, far above the reach of the Eagles or swiftest Fowls. Thus say they that write, and maintain the Salamanders abiding in the fire without harm. Now on the contrary, let us also hear their opinions, which deny this natural operation in the Salamander.

Pliny affirmeth, that in his own experience he found that a Salamander was consumed in the fire, and not the fire by it, for he saith he burned one to powder, and used the same powder in medicines.

Sextus also denyeth that it quencheth the fire, and unto this opinion agreeth *Dioscorides*. *Actius* writeth, that when it is first put into the fire, it divideth the flame, and passeth through speedily without harm, but if it tarry long therein it is burned and consumed, because the liquor or humidity thereof is wasted. And this is also granted by *Galen*, *Theophrastus*, and *Niphus*. And *Matthaeolus* affirmeth that he tryed the same, and found that if burning coals were laid upon it, then it burned like unto any other raw flesh, but being cast into the fire, it burneth not speedily.

Albertus writeth, that there were some which brought to him a certain thing which they called Wooll, and said that it would not burn, but he found it not *Lana*, Wooll, but *Lamygo*, that is, a vapoury adhaerency of a thing which flyeth from the strokes of hammers upon hot burning Iron, and being collected upon cloth, or cleaving to any part of the Forge, it there becometh in shew like yellowish pale Wooll.

The said Author affirmeth, that he took a Spider, and laid the same upon a hot burning Iron, where it continued unburned and unharmed without motion a great while, by reason of his thick skin and coldnesse, and unto another he suffered a little candle to be put, which instantly put it out. And for the same causes, that is to say, both the thicknesse of the skin, and cold constitution, cometh it to passe, that a Salamander can live so long in the fire without burning or consuming to ashes: for indeed the skin thereof is so hard, that it is cut or pierced with a knife with great difficulty; and so when the force of the fire hath broken the skin, then also issueth forth a cold humor, which for a season keepeth the heat out. For this Beast is said to be very full of humor, and the certainty thereof may most manifestly appear by his full and grosse body, and also by this, that it is seldom seen to issue or come forth of his den, except it be against rainy weather: and yet as the egges of other Serpents being cast into a hot burning furnace, do for a season rest in the same unburned, and yet are afterward consumed, so is it with the Salamander.

There be some that have found a web out of the hair growing upon Salamanders, which can by no means be set on fire, but this is very false, because the Salamander hath no hair upon it at all. And this kinde of web rather cometh of a kinde of flax that *Pliny* writeth of, or rather of the *Amiantus*-stone, called the *Asbest*, which is found in *Cyprus*, whereof they used to make coverings for the Theaters. This being cast into a fire, seems to be forthwith all in a flame, but being taken out again, it shineth the more gloriously. Cordus.
Dioscorid.

Some also do affirm, that such a piece of cloth or web, may be wrought out of the Salamanders skin, but *Brasavolus* denyeth both the vertue of the stone, and of the Salamanders hide or shell, for he saith he tryed the stone, and it would not be wrought into wooll or spun into thread, and when he cast the Salamanders shell or hide into the fire, it burned, and the matterly cold liquor thereof did almost flie into his face.

But some then will demand, where had Pope *Alexander* that coat, which could not be purged but by fire, which made it alway as white as Snow, or that map or net at *Rome*, wherein (it is said) the Napkin of our Saviour Christ is preserved, which men say is not washed but in the fire, which thing was sent to a Bishop of *Rome* for a present from the King of *Tartars*. Unto whom I answer out of *Paulus Venetus* as followeth. There is a Province in *Tartaria* called *Chinebnitalas*, wherein is a Mountain abounding with Mines of Steel and Copper; now in this Mountain there is a kinde of earth digged up, which yeeldeth a thred like the thred of Wooll. After the digging of it up they dry it in the Sun, and then beat it in a brazen mortar, afterward they spin it and weave it, in the same manner that they spin and weave other woollen cloth. After it is made, they have no means to purge it from spots or from filthinesse, but to cast it into the fire for the space of an hour, and then it is taken forth again as white as any snow.

There is also an Allum called *Alumen Sciole*, and it is the same which among the Ancients is called *Aster samius*, out of which also is made cloth that cannot burn, by reason of a certain Oyl that it containeth or yeeldeth to resist the fire. So out of the stone *Pyrinis* found in *Kisheba*, there cometh out a green liquor pressed with dead coals, and after that, no fire can burn that cloth. There are also certain Mantles in *Bohemia*, (as witnesseth *Agricola*) which could never be burned. And out of *Magnesia* a scaly stone in *Boldecrana*, they make tables, which cannot be clesed but by fire. It is also recorded, that the fore-named *Aster samius*, and pitch quenched in the juyce of Mallows or Mercurial, being anointed upon a mans hand, doth keep them from burning, or sense of extraordinary heat. So *Albertus* writeth of a stone which he calleth *Iscullos*, or *Iscustos*, which I take to be a kinde of the *Asbeste* or *Amiantus*. And this stone is found (as the same Author writeth) in the farthest parts of *Spain*, neer the Straights and *Hercules-pillars*. Cardan.

And this thing seemeth the lesse strange, because they which are anointed with Bird-lime, or else with Vinegar and the white of an egge, do not so quickly feel the strength of fire and heat, when they thrust their hands into the midst of it. It is also found, that the hearts of them that die of the heart-burning disease, or else are killed by poyson, cannot be burned with fire. And therefore when *Germanicus Caesar* was dead, it being suspected that he was poysoned by *Piso*, they cast his heart into the fire and it would not burn, which thing was alleadged against him by *Vitellius* the Oratour. And one *Aesculapius* in an Epistle which he wrote to *Octavian Augustus* saith, that there is a poyson so extream cold, that it keepeth the heart of a man poysoned therewith from burning, and if it lie long in the fire, it waxeth as hard as a stone, which so concreted is called *Profilis*, from the force of the fire, and from the matter whereof it consisteth it is called an humane stone. He also saith, that this is red in colour, mixed with some white, and is accounted precious, because both it maketh a man that weareth it to be a Conqueror, and also preserveth him from all manner of poyson. Pliny.

When the Salamander is provoked, it casteth forth a white matterly liquor or humor, and it is an audacious and bold creature, standing to his adversary, and not flying the sight of a man; and so much the lesse, if it perceive that a man prosecute and follow it, to harm and kill it. The biting of it is very exitial and deadly, and therefore the *French* men use this speech upon the biting of a Salamander;

*Si mordut'a une aressade,
Prens ton linceul & ta flassade.*

That is, if a Salamander bite you, then betake you to the coffin and winding sheet. The *Rhetians* do ordinarily affirm, that when a man is bitten by a Salamander, he hath need of as many Physicians as the Salamander hath spots. And *Arnoldus* saith, that it hath in it as many venoms and means of hurting, as it hath colours distinguished one from another. For when it once biteth and fasteneth teeth, it never letteth go, and being pulled off, it leaveth the teeth behinde, and then there never can be any remedy, and therefore it must be suffered to hang upon the wound until it fall off, either willingly or wearied, or else compelled by the medicines that the wounded patient receiveth. For by this means only is the patient kept alive: yet this is a way to be remembered, that the Salamander doth not alway bite, although provoked, for *Gesner* affirmeth, that he having two of them, could never by beating make them open their mouths, nor that in all his life did he ever hear of any man bitten by them. And of this thing he not only gathereth the difference of time, wherein their rage sheweth it self by biting, and when not, but also the difference of place and region, for that they bite in some Countries, and not in other. When they have bitten, there followeth a vehement pain and scab upon the place, for the cure whereof there must be taken a decoction of Frogs, and the broth must be drunk, and the flesh applyed to the sore; or else other common remedies against the poyson prescribed in the Treatise following.

Ælianus.

The poyson hereof is great, and not inferior to the poyson of any other Serpent, for sometimes by creeping upon Apple-trees, it infecteth and poysoneth all the fruit, so that those which eat the same, die and languish they know not whereof: and if the heel of a man do but touch any small part or portion of the spittle of a Salamander, it maketh all the hair of the body to fall off. The poyson it self is not cold, as some have thought, but hot, like to the poyson of Cantharides, and therefore to be cured by the same means, as by vomits, Glysters, Ephemerons, and such like. Only Swine do eat Salamanders without harm or damage, for there is in them a kinde of resistance in nature, and yet if Man or Dog do chance to eat of that Swine that hath eaten a Salamander, it hath been observed that they perished by the same. And this poyson spreadeth it self the further when it is dead, because it is strengthened by putrefaction, and Wine and Water wherein one of these lyeth dead, is empoysoned and made mortal thereby to others. But in our days Salamanders are not so venomous, if there be any credit in *Brasavolus*, howbeit I have heard and read, that if at this day a Salamander get into a heap of corn, she so infecteth it, that whatsoever eateth of that corn, dyeth as it were of poyson, and the Kine of *Helvetia*, which are sucked by Salamanders, do ever after remain barren, and without milk, and sometime also they die of that evil. And as *Arnoldus* writeth, it casteth forth a certain matterly white humor like milk out of the mouth, whereupon if a man or any other living creature do but tread, he is poysoned thereby, and at the least, all the hair of their body falleth off, and in like sort they infect herbs and plants of the earth by their poyson.

Sometimes it happeneth that beasts or men have swallowed Salamanders, and then the tongue is inflamed, and all the body falleth into grievous torment, by cold corruption and putrefaction, part after part, and also pains in the fundament and in the stomach, likewise Dropsies, and Impostumation in the belly, cramp of the guts, and retention of the urine. For the cure whereof they give sweet water, Calamints, Saint Johns Wort sod with the shells of Pine-apples, leafe of Cypressse, *Galbanus*, and Honey or Rozen, Ammoniack, and Stirax, New Cow-milk, the meal made of Flax-seed with sweet water, sweet Wine and Oyl to cause vomits: Scammony, and a decoction of Calamints and Figs, fat Bacon or Hogs-flesh, and also the Egges of a Tortoise, with the flesh thereof; besides infinite other remedies, ordained by the goodnesse of Almighty God, as Physicians know by their own studies and daily experiments. And therefore I hold it sufficient for me to have lightly touched them, referring those that are desirous to know more, unto the learned collection of *Catromus*.

Out of the Salamander it self arise also some medicines, for it hath a septicke power to eate and corrode to take away hairs, and the powder thereof cureth corns and hardnesse in the feet. The hear tyed to the wrist in a black skin, taketh away a quartain Ague; and also *Kirarides* writeth, that being bound unto a womans thigh, it stayeth her monethly flowers, and keepeth her barren: But this is worthily reprov'd for untruth, and therefore I will not commend it to the Reader. And thus much for the Salamander.

Of the SCORPION.

Scorpius in *Greek* is attributed both to the Scorpion of the Land and of the Sea, although sometimes for difference sake, the Scorpion of the earth be called *Scorpius chersaios*. The derivation is manifold according to some Writers, either of *Scorpizein ton ion*, that is, dispersing his poyson, or of *Sekanoos erpein*, because the motion of it is oblique, inconstant and uncertain, like as the flame of fire beateen with a small winde. The *Grecians* also use for a Scorpion *Blestas*, because it casteth poyson, and *Otiopos* from the number of his eight feet. And in *Æthiopia* there is a kinde of Scorpion which the *Greeks* call *Sybrina*. The *Latines* doe use indifferently *Scorpius*, *Sorpio nepa*, and *Cancer* also *Vinula* and *Geptaria*, as we finde in *Ponzettus*. The *Arabians* have many words, as *Harab*, *Acrob*, *Achrach*, and *Satoracon*, *Hacbarab*, *Algerarat*, *Algeterat*, and *Algenat* and *Alkatareti*, for little Scorpions which draw their tails after them.

them. Howbeit, among these names also *Algarat* signifieth that little kinde of Scorpions, and *Algarat* the Scorpion with bunches on his back. The *Hebrewes* according to the opinion of some, call a Scorpion *Acobabim*; the *Italians*, *Scurtigio*, and *Scorpione terrestre*; the *French*, *La Scorpion*; the *Spaniards*, *Alacram* and *Alacran*, which name they have also given to an Island in the *West-Indies* subject to their dominion. In *Castilia* it is called *Escorpion*, and in *Germany*, *Ehn Scorpion*.

wings and without wings: likewise in *Iberia*, *Caria*, and *Lybia*. And it is also said, that once there were many Scorpions brought into *India*, into that part of the Countrey where the *Rhizophagi* dwell. By the way betwixt *Susis* in *Persia* and *Media*, there were wont to abound Scorpions under every stone and turf, for which cause, when the King of *Persia* was wont to go into *Media*, he gave commandement unto his people to scowr the way, by using all means to kill them, giving gifts to them that killed the greatest number of Scorpions. There is an ancient Town in *Africk* called *Pescara*, wherein the abundance of Scorpions do so much harm, that they drive away the inhabitants all the Summer-time every yeer untill *November* following. And in like sort *Diodorus* declareth of many other places utterly forsaken to avoyd the multitude of Scorpions, as namely, one part of *Arabia*, and the Region of *India* about *Arrhatan*, or the river *Estumenus*, likewise neer the *Cynamolgi* in *Aethiopia*. There is also a City called *Alabanda*, standing betwixt two hills or mountains, like as a Chest turned inward, which *Apollonius* calleth *Cistam inversam Scorpionibus plenam*; a Chest turned inward full of Scorpions. In an Island of *Canaria* also are many Scorpions, and those most pestilent, which the *Turks* gather as often as they may to make Oyl of Scorpions. In *Italy*, especially in the Mount *Testaceus* in *Rome*, are also Scorpions, although not so hurtfull as in *Africa*, and other places, and it is thought that *Pylly*, whose nature cureth all kinde of venomous Serpents harms, did only for lucre sake bring Serpents and Scorpions into *Italy*, and there left them, whereby they encrease to that number and multitude, which now we see them have. And thus much may suffice to have spoken of the Countreys of Scorpions.

The Kindes of Scorpions I finde also to be many, but generally they may be referred unto twain, whereof one is called the Scorpion of the earth, and the other the Scorpion of the water or of the Sea, whose discourse or history is to be found among the fishes, for we in this place doe only write of the Scorpion of the earth, which is also called by *Avicen* a wilde Scorpion. Of this kinde there are many differences. First they differ in sex, for there are males and females, and the female is greater then the male, being also fat, having a grosser body, and a greater and sharper sting, but the male is more fierce then the female. Again, some of these have wings, and some are without wings, and some are in quantity greater then a Bean, as in *Helvetia*, neer *Rapirsnill* by *Zurick*. The Scorpions called *Vinulae*, are of a reddish colour, as it were Rose-water and Wine mixed together: and from thence it is probable that they took their name, and from their colour, the Authors have observed seven severall kinndes.

The first is white, and the biting of this is not deadly.

The second is reddish, like fire flament, and this when it hath wounded causeth thirst.

The third is of a pale colour, and therefore called by the *Grecians*, *Zophorides*, and these when they have wounded a man, cause him to live in continuall motion and agitation of his body, so as he cannot stand still, but remaineth distract and without wit, alway laughing, like a fool.

The fourth kinde is greenish, and therefore termed *Chloros*, which having wounded, causeth intolerable trembling, shaking, and quivering, and cold, so that if the patient be laid in the hot sun, yet he thinketh that he freezeth like hayl, or rather feeleth hayl to fall upon him.

The fifth kinde is blackish pale, and it is called *Empelios*, it hath a great belly and broad, whereof the poyson is great, and causeth after stinging and admirable heavinesse, and sorrowfull spirit. This kinde is called by *Gesner*, *Ventricosum*, because of the large belly, by the *Arabians*, *Algetarat*, and by *Ponzettus*, *Geptaria*. It eateth herbs, and the bodies of men, and yet remaineth insatiable, it hath a bunch on the back, and a tayl longer then other Scorpions.

The

Ælian.

Varin.
Strabo.

Ælian.
Leo Afric.

Strabo.

Cordus.

Gillius.

The sixth is like a Crab, and this is called by *Ælianus* a flamant Scorpion, it is of a great body, and hath tongs and takers very solid and strong, like the Gramuel or Crevish, and is therefore thought to take the beginning from that Fish.

The seventh is called *Mellichlorus*, because of the Honey-colour thereof, or rather Waxe-colour, and the wings it hath on the back, are like the wings of a Locust.

Also Scorpions do differ among themselves in regard of their outward parts, for some of them have wings, as those in *India*, which are spoken of by *Strabo*, *Nicander*, and others, and therefore many times when they settle themselves to flie, they are transported by the winde from one Countrey to another.

Ælianus.

Pliny.

Aristotle.

There is also another difference observed in their tayls, and in their stings, for some of them have six knots on their tayls, and some of them seven, and those which have seven, are more hardy and fierce, but this falleth out very seldome that the Scorpions have seven knots in their tail, and therefore much seldomer to have nine, as writeth *Apollodorus*. For if any have seven, then is there likewise in them a double sting, for there is also another difference, some of them having a single, and some a double sting, yea, sometimes a treble one, and the sting of the male is more thick and strong then the sting of the female.

And to conclude, there is also a difference in motion, for some of them hold up their tayls from the earth, and these are not much venomous, others again draw them along upon the earth, a little rowled together, and these are most deadly and poysonfull, some of them also flie from one Region to another, as we have shewed already.

Pliny.

Ælianus.

Again, there is nothing that giveth a man a more lively difference, then the consideration of their poyson, for the Scorpions of *Pharus*, and that part of the *Alpes* neer *Noricum*, do never harm any living Creature, and therefore are they suffered to abound, so as they live under every stone. In like sort in the *Isle Sanguola*, the Scorpions are like unto those that are in *Castilia* or *Spain*, for there the sting of the Scorpion doth not bring death, yet they cause a smarting pain, like the pain that cometh by the stinging of a Wasp, differing herein, that the Scorpions stinging is more lasting, and continueth longer then the stinging of a Wasp, for it tarrieth about a quarter of an hour, and by the biting thereof all are not pained alike, for some feel more, and some lesser pain. Contrary to these are the Scorpions of *Pescara* in *Afrik*, who ever with their tails wound mortally. And those in *Scythia*, which are great, and hurtfull unto men and beasts, killing Swine, who do not much care for any other Serpent, especially the black Swine, who do also die the sooner, if they drink immediately after the wound received. The like may be said of the Scorpions of *Egypt*. And thus much for the different kindes of Scorpions, wherein nature produceth a notable variety, as may appear by all that hath been said. Now it followeth that we likewise make some relation of their congruity one with another.

They are all little living Creatures, not much differing in proportion from the great Scarabee or Horse-flie, except in the fashion of their tails. Their back is broad and flat, distinguished by certain knots or seams, such as may be seen in Sea-Crabs, yet their head differeth, and hath no resemblance with the Crab, because it is longer, and hangeth farre out from the body, the Countenance whereof is fawning, and Virgin-like, and all the colour a bright brown. Notwithstanding the fair face, it beareth a sharp sting in the tail, which tail is full of knots, wherewithall it pricketh and hurteth that which it toucheth. And this *Pliny* affirmeth to be proper to this Insect, to have a sting in the tayl and to have arms: For by arms he meaneth the two crosse forks or tonges which come from it on both sides, in the tops whereof are little things like pinsons, to detain and hold fast, that which it apprehendeth, whiles it woundeth with the sting in the tayl.

It hath eight feet, four on the one side, and four on the other, from whence, as we have shewed already, it is called *Oëtopos*. For the feet and arms thereof is very much like unto the Sea-crab, and therefore may not unfitly be called either the mother, or the daughter thereof. They have also tongues, wherewithall they use often to lick and smooth over their own bodies. And seeing of all other things they love fresh and clean linnen, whereinto they insinuate, and wrap themselves when they can come unto it, then also first of all they cleanse their whole bodies all over with their tongues, and next to their flesh put on this clean linnen, as a man would put on a shirt.

As we have said already it hath a tayl, wherein the sting thereof is placed, but what this sting is, divers Authors are of divers opinions concerning the same, some affirming it to be hollow, others denying it, finding in it no passage at all to contain or convey poyson. *Ælianus* again saith, that there must needs be in it a passage or cavity, although it be so small as by no means it can be perceived with the eyes of any mortall man, and in that sting is the poyson lesse visible, which when it striketh, disperseth it self instantly into the wound. But what should this poyson be? whether a substance or spirituall humour; surely a substance, which although it be *mole minima*, yet *facultate maxima*, that is, of great power, although of small quantity. And therefore another Author (namely *Gerardus*) writeth hereof after this manner; *Scorpius e centro quodcavum esse creditur emittit humorem venenosum*: That is to say, The Scorpion out of a hollow center, sendeth forth a venomous humour. And of this venom we will afterwards discourse more at large. Thus much in this place may serve to make known the severall parts and members of this Serpent.

Now then it followeth that we inquire about the manner of their breed or generation, which I find to be double, as divers Authors have observed, one way is by putrefaction, and the other by laying of egges, and both these wayes are consonant to nature, for *Lacinius* writeth, that some creatures

are

are generated only by propagation of seed, such are men, Vipers, Whales, and the Palm-tree, some again only by putrefaction, as the louse, fly, grasse, and such like imperfect things, and some both wayes, as Mice, Scorpions, Emmets, Spiders, Purslain, which first of all were produced by putrefaction: and since their generation are conserved by the seed and egges of their own kinde. Now therefore we will first of all speak of the generation of Scorpions by putrefaction, and afterward by propagation.

Pliny saith, that when Sea-crabs dye, and their bodies are dried upon the earth, when the Sun entreth into *Cancer* and *Scorpius*, out of the putrefaction thereof ariseth a Scorpion; and so out of the putrefied body of the Crevish burned, arise Scorpions, which caused *Ovid* thus to write;

*Concava littoreo si demas brachia cancro,
Cetera supponas terræ, de parte sepulta
Scorpius exibat, caudaque minabatur unca.*

And again;

*Obrutus exemptis Cancer tellure lacertis,
Scorpius exiguo tempore factus erit.*

In English thus;

*If that the arms you take from Sea-crab-fish,
And put the rest in earth till all consumed be,
Out of the buried part a Scorpion will arise,
With hooked tayl doth threaten for to hurt thee.*

And therefore it is reported by *Ælianus*, that about *Estamenus* in *India*, there are abundance of Scorpions generated, only by corrupt rain-water standing in that place. Also out of the Basilisk beaten into pieces and so putrefied, are Scorpions engendred. And when as one had planted the herb *Basilica* on a wall, in the room or place thereof he found two Scorpions. And some say that if a man chaw in his mouth fasting this herb *Basil* before he wash, and afterward lay the same abroad uncovered where no sun cometh at it for the space of seven nights, taking it in all the day time, he shall at length finde it transmuted into a Scorpion, with a tayl of seven knots. *Ja. Lacinia.*

Hollerius, to take away all scruple of this thing, writeth that in *Italy* in his dayes, there was a man that had a Scorpion bred in his brain, by continuall smelling to this herb *Basil*, and *Gesner* by relation of an Apothecary in *France*, writeth likewise a story of a young maid, who by smelling to *Basil*, fell into an exceeding head-ache, whereof she dyed without cure, and after her death being opened, there were found little Scorpions in her brain. *Kiramides.*

Aristotle remembreth an herb which he calleth *Sissimbria*, out of which putrefied Scorpions are engendred, as he writeth. And we have shewed already in the history of the Crocodile, that out of the Crocodiles egges do many times come Scorpions, which at their first egression do kill their Dam that hatched them, which caused *Archelams* which wrote Epigrams of wonders unto *Ptolemæus*, to sing of Scorpions in this manner; *Philes. Ælianus.*

*In vos dissolvit morte, & redigit Crocodilum
Natura extinctum, Scorpii omnipotens.*

Which may be Englished thus;

*To you by Scorpions death the omnipotent
Ruines the Crocodil in natures life extinct.*

And thus much for the generation of Scorpions out of putrefaction. Now we will proceed to the second manner of their generation, which is by propagation of seed: for although *Ponzettus* make some question about their copulation, yet he himself inclineth to that opinion, as neerer unto truth, which attributeth carnall copulation unto them, and therefore he alledgeth the example of flies, which admit copulation although they engender not thereby. Wherefore we will take it for granted, that Scorpions lay egges after copulation, which hapneth both in the Spring and Autumne.

And these are for the most part in number eleven, upon which they sit and hatch their young ones, and when once they are perfected within, those egges (which are in sight like the little worms out of which Spiders are engendred) then do they break their egges, and drive the young out. For as *Isidorus* writeth, otherwise the old should be destroyed of the young, even as are the Crocodiles. Some again say, that the old Scorpions do devour their young ones. *Pliny.*

Being thus produced by generation, they live upon the earth, and those which are bred of the Sea-crab, do feed upon the foam of the Sea-water, and a continuall white mould or chalk neer the Sea. But the Scorpions of *Æthiopia* do eat all kinde of worms, flies, and small Serpents. Yea those Serpents whose very dung being troden upon by man, bringeth exulcerations. And a tryall that Scorpions eat flies, was made by *Wolphius* at *Montpelier*, for having a young one in a boxe, for one whole moneth together it lived upon flies, and grew by the devouring of them bigger, being put into the Glasse unto him.

They live among tiles and bricks very willingly, and for this cause they abound in *Rome* in the hill called *Testaceus*. They are also in *Bononia* found in the walls of old houses, betwixt the stones

stones and the mortar. They love also clean clothes, as we have said already, and yet they abhorre all places whereon the Sun shineth. And it seemeth that the Sun is utterly against their nature, for the same Scorpion which *Wolphius* had at *Montpellier*, lived in the Glasse untill one day he set it in the Sun, and then presently after it dyed.

To conclude, they love hollow places of the earth neer gutters, and sometimes they creep into mens beds, where unawares they do much harm: and for this cause the *Lybians*, who among other Nations are most of all troubled with Scorpions, do use to set their beds far from any wall, and very high also from the floor, to keep the Scorpions from ascending up into them. And yet fearing all devises should be too little to secure them against this evil, they also set the feet of their beds in vessels of water, that so the Scorpion may not attempt so much as to climbe up unto them for fear of drowning. And also for their further safeguard, they were socks and hose in their beds so thick as the Scorpion cannot easily sting through them.

Ælianus.

And if the bed be so placed that they cannot get any hold thereof beneath, then they climbe up to the sieling, or cover of the house, and if there they finde any hold for their pinching legs to apprehend and fasten upon, then in their hatred to man-kinde, they use this policy to come unto him. First one of them (as I have said) taketh hold upon that place in the house or sieling over the bed wherein they finde the man asleep, and so hangeth thereby, putting out and stretching his sting to hurt him, but finding it too short, and not being able to reach him, he suffereth another of his fellowes to come and hang as fast by him as he doth upon his hold, and so that second giveth the wound: and if that second be not able likewise, because of the distance, to come at the man, then they both admit a third to hang upon them, and so a fourth upon the third, and a fifth upon the fourth, untill they have made themselves like a chain, to descend from the top to the bed wherein the man sleepeth, and the last striketh him: after which stroke he first of all runneth away by the back of his fellow, and everyone again in order, till all of them have withdrawn themselves.

By this may be collected the crafty disposition of this Scorpion, and the great subtilty and malice that it is endued withall in nature, and seeing they can thus accord together in harming a man, it argueth their great mutuall love and concord one with another, wherefore I cannot but marvell at them who have written that the old ones destroy the young, all but one, which they set upon their own buttocks, that so the Dam may be secured from the sting and bitings of her son. For seeing they can thus hang upon one another, without harm, favouring their own kinde, I see no cause but that nature hath grafted much more love betwixt the old and the young ones, so as neither the old do first destroy the young, nor afterward, that young one preserved, in revenge of his fellowes quarrell, killeth his Parents.

It is reported by *Aristotle*, that there is a hill in *Caria*, wherein the Scorpions do never sting any strangers that lodge there, but only the naturall born people of that Countrey. And hereunto *Pliny* and *Ælianus* seem to subscribe, when they write that *Scorpiones extraneos leniter mordere*, that is, Scorpions bite strangers but gently. And hereby it may be collected, that they are also by nature very sagacious, and can discern betwixt nature and nature; yea the particular differences in one and the same nature. To conclude, Scorpions have no power to hurt where there is no blood.

Albertus.

The naturall amity and enmity they observe with other creatures commeth now to be handled, and I finde that it wanteth not adversaries, nor it again hath no defect of poyson or malice to make resistance and opposition, and to take vengeance on such as it meeteth withall. The principall of all other subjects of their hatred, are Virgins and Women, whom they do not only desire to harm, but also when they have harmed, are never perfectly recovered. And this is at all times of the day, but unto men they are most dangerous in the morning fasting, before they have vented their poyson, and this is to be observed, that their tayls are never unprovided of stings, and sufficient store of venome to hurt upon all occasions.

Ælianus.

The Lyon is by the Scorpion put to flight wheresoever he seeth it, for he feareth it as the enemy of his life, and therefore writeth *S. Ambrose*, *Exiguo Scorpionis aculeo exagitur Leo*, the Lion is much moved at the small sting of a Scorpion. Scorpions do also destroy other Serpents, and are likewise destroyed by them. There was one *Cellarius* a Physitian in *Padua*, who put together into one Viall, a Viper and a Scorpion, where they continually fought together, untill they had killed one another. The Swine of *Scythia*, which do safely eat all other kinde of Serpents and venomous beasts, without all harm, yet are destroyed by eating of Scorpions, and so great is the poyson of the *Sibarite* Scorpion, that the dung thereof being trode upon breedeth ulcers.

And as in this manner we see the virulence, and naturall evill of Scorpions against other living creatures, so now we are to consider the terrors of the Scorpion, for God in nature hath likewise ordained some bodies, whereby the Scorpion should be, and is driven away, scared and destroyed.

First of all therefore men, which are the chief, and head of all living Creatures, do by natural instinct, kill and destroy Scorpions, and therefore *Galen* writeth thus, Let us (saith he) kill Scorpions, Spiders, and Vipers, not because they are evill in themselves, but because it is ingrafted in us by nature, to love that which is good unto us, but to hate and avert from that which is evill unto us, *Non considerantes genitum ne ita sit an secus*, not considering whether it were so bred or not. As we have shewed their generation out of putrefaction to be by heat, so also is their destruction by heat, for they are not able to abide the heat of the Sun, and therefore, although they cannot live in cold Northern Countreys, but in the hotter, yet in the hotter they choose shadowes, holes of the earth, coverture of houses, and such like vile and obscure places, to succour and secure themselves in.

It is also reported, that if Scorpions do at any time behold a Stellion, they stand amazed and wonderfully astonished. The Viper also having killed a Scorpion, becometh more venomous, and the Ibis of Egypt destroyeth Scorpions. There are a little kinde of Emmets, called by the Arabians, *Gerarets*, which are eaters of Scorpions. The quick-sighted Hawks also, from whose piercing eye no Serpent can be hid, when he seeth a Scorpion, he neither feareth nor spareth it. It is also thought that Hares are never molested by Scorpions, because if a man or beast be anoynted with the rennet of a Hare, there is no Scorpion or Spider that will hurt him. Wilde Goats are also said to live without fear of Scorpions, even as the *African Psylli* of whom we have often spoken.

Galen.

Ponzeitus.

Now this vertue against Scorpions is not only in living things, but also in the Plants of the earth, and therefore *Sestius* writeth, that the seed of Nose-wort burned or scorched doth drive away Serpents, and resist Scorpions and so doth the root of the Mast-tree, and the seed of Violets, and the same vertue is ascribed to the herb *Lychnis*, which is Englished Calves-snout, and also to the seed of wilde Parsnip.

Arnoldus.

Aetius.

Palladius.

Rafis.

Strabo.

Plutarch.

The smell of Garlick and wilde Mints set on fire, or strewed on the ground, and Dittany have the same operation: and above all other, one of these Scorpions burned, driveth away all his fellows which are within the smell thereof, and therefore this is a most usuall thing in *Asia* and *Africk*, to perfume their houses with Scorpions burned, and in stead thereof they make as it were little pills of *Galbanum sandracha*, with butter, and the fat of Goats, and thereof altogether make their perfume: also Bettony, and wilde Pellitory with Brimstone. They use also to cover pans with certain things called by them *Alkitran* and *Asa*, and with these they compasse the place wherein the Scorpion lodgeth, and then it is found that they can never stir any more from that place. And some instead thereof, powr Oyl into their holes after them for the same effect. And the Husband-men of *Mauritania* doetye and fasten to their bed-side, sprigs of white thorn, and Hasell-nuts, wherewithall by a secret antipathy in nature, they drive away and keep themselves safe in their beds from the annoyance of Scorpions.

By touching of Hen-bane they lie dead and overcome, but if one touch them again with white Ellebore, they revive, and are released from their former stupefaction. It is also said that the leaves of water-mallows do also astonish Scorpions, and so also doth the Radish-root. The Sea-crab with Basil in her mouth destroyeth the Scorpion, and so doth Tunicle and Mushrom of trees. To conclude, the spittle of a man is death unto Scorpions; and therefore when a certain fellow took upon him to be a cunning Charmer, and by incantation to kill a Scorpion, he added to the words of his Charm a treble spitting in the mouth of the Serpent, and so it dyed: whereupon *Wolphius* which was present, and saw this Charmer, did afterward by himself alone at home, make triall of spittle without a Charm, and so found that it alone killeth Scorpions, especially the spittle of a man fasting, or very thirsty. Moreover, there be certain Lands wherein no Scorpions will live, as that about *Clupea* in *Africk*, and the dust of the Island *Gaulus* neer *Cercina*, being sprinkled upon a Scorpion, doth incontinently kill it. And so much also writeth *Hermolaus*, of the Region *Galatha*.

Gillius.

Aetius.

Solinus.

These and such like things are observed by our painfull and industrious Ancestors about the nature of Scorpions, as well that which is hurtfull unto them, and they are afraid of, as those to which they are enemies in nature, and wound mortally when they light upon them. It is remembered by *Textor* that *Orion* was slain by a Scorpion, whereupon the Poets have made many tales. They say, that when he was grown to be a man he was a great hunter, and a continuall companion of *Diana*, who glorying much in his own strength, boasted that he was able to overcome any Serpent or other wild beast, whereat the Gods being angry, for revenge, and taking down the pride of this young man, caused the earth to bring forth a Scorpion, who killed *Orion*. Whereat *Diana* was very sorry, and therefore in lamentation of her champion, and for the good deeds he had done unto her, translated him into heaven, close by the constellation of the Bull. *Lucan* on the other side saith, that *Diana* sent this Scorpion to kill him, envying his famous success in hunting, and that afterward the Goddess taking pity on him, translated him into heaven. Others write again, that he had his eyes put out by *Oenopion*, and that he came blind into the Island *Lemnos*, where he received a horse of *Vulcan*, upon which he rode to the Sun-rising, in which journey, he recovered again his eye-sight, and so returning, he first determined to take revenge upon *Oenopion* for his former cruelty. Wherefore he came into *Creet*, and seeking *Oenopion*, could not finde him, because he was hid in the earth by his Citizens, but at last coming to him, there came a Scorpion and killed him for his malice, rescuing *Oenopion*. These and such like fables are there about the death of *Orion*, but all of them joyntly agree in this, that *Orion* was slain by a Scorpion. And so saith *Anthologus* was one *Panopæus* a Hunter.

There is a common adage, *Cornix Scorpionum*, a Raven to a Scorpion, and it is used against them that perish by their own inventions: when they set upon others, they meet with their matches, as a Raven did when it preyed upon a Scorpion, thus described by *Alciatus*, under his title *Iusta ultio*, just revenge, saying as followeth.

Raptabat volucer captum pede corvix in auris

Scorpion, audaci premia parva gule.

Ast ille infuso sensum per membra veneno,

Which may be Englished thus;

The ravening Crow for prey a Scorpion took

Within her foot, and therewithall aloft did flie,

But he impos'd her by force and stinging stroke,

Raptorem in stygias compulit ultor aquas.

Orisures digna! alii qui fata parabat,

Iple periit, propriis succubuitque dolis.

So ravener in the Stygian Lake did die. (did kill,

O sportfull game! that he which other for bellies sake

By his own deceit should fall into deaths will.

There

Gyraldus.

There be some learned Writers, who have compared a Scorpion to an Epigram, or rather an Epigram to a Scorpion, because as the sting of the Scorpion lyeth in the tayl, so the force and vertue of an Epigram is in the conclusion, for *vel acriter et false mordeat, vel jucunde & dulciter deleat*, that is, either let it bite sharply at the end, or else delight pleasingly. There be many wayes of bringing Scorpions out of their holes, and so to destroy and take them, as we have already touched in part, unto which I may adde these that follow: A perfume made of Oxe-dung, also Storax, and Arsenick. And *Pliny* writeth, that ten Water-crabs beaten with Basil is an excellent perfume for this purpose, and so is the ashes of Scorpions. And in *Padua* they use this art, with small sticks or straw they touch and make a noyse upon the stones and mortar wherein they have their nests, then they thinking them to be some flies for their meat, instantly leap out, and so the man that deluded them is ready with a pair of tongs or other instrument to lay hold upon them and take them, by which means they take many, and of them so taken, make Oyl of Scorpions. And *Constantinus* writeth, that if a mans hand be well anoynted with juice of Radish, he may take them without danger in his bare hand.

Cardan.

In the next place we are to proceed to the venom and poyson of Scorpions, the instrument or sting whereof, lyeth not only in the tail, but also in the teeth, for as *Ponzettus* writeth, *Ledit scorpium morsu et ianu*, the Scorpion harmeth both with teeth and tail, that is, although the greatest harm do come by the sting in the tayl, yet is there also some that cometh by their biting. This poyson of Scorpions, (as *Pliny* out of *Apollodorus* writeth) is white, and in the heat of the day is very fervent and plentifull, so as at that time they are insatiably and unquenchably thirsty, for not only the wilde or wood Scorpion, but also all other are of a hot nature, and the symptoms of their bitings are such as follow the effects of hot poysons: and therefore saith *Rasis*, all their remedies are of a cold quality. Yet *Galen* thinketh otherwise, and that the poyson is cold, and the effects thereof are also cold. For which cause *Rondeletus* prescribeth Oyl of Scorpions to expell the stone, and also the cure of the poyson is by strong Garlick and the best Wine, which are hot things. And therefore I conclude, that although Scorpions be most hot, yet is their poyson of a cold nature.

In the next place, I think it is needfull to expresse the symptoms following the striking or stinging of these venomous Scorpions, and they are (as *Aetius* writeth) the very same which follow the biting or poyson of that kinde of great *Phalanx* Spider, called also *Teragnatum*, and that is, they are in such case as those persons be which are smitten with the Falling sicknesse.

Aetius.
Ælianus.

He which is stung by a Scorpion, thinketh that he is pressed with the fall of great and cold hayl, being so cold, as if he were continually in a cold sweat, and so in short space the poyson disperfeth it self within the skin, and runneth all over the body, never ceasing untill it come to possesse some predominant or principall vitall part, and then followeth death. For as the skin is small and thin, so the sting pierceth to the bottom thereof, and so into the flesh, where it woundeth and corrupteth either some vein, or arterie or sinew, and so the member harmed swelleth immediately into an exceeding great bulk and quantity and aking, with insufferable torment. But yet (as we have already said) there is a difference of the pain, according to the difference of the Scorpion that stingeth. If a man be stung in the lower part of his body, instantly followeth the extension of his virile member, and the swelling thereof: but if in the upper part, then is the person affected with cold, and the place smitten is as if it were burned, his countenance or face distorted, glewish spots about the eyes, and the tears viscous and slimy, hardnesse of the articles, falling down of the fundament, and a continuall desire to egestion, foaming at the mouth, coughing, convulsions of the brain, and drawing the face backward, the hair stands upright, palenesse goeth over all the body, and a continuall pricking like the pricking of needles.

Also, *Gordomus* writeth, that if the prick fall upon an artery, there followeth swooning, but if on a nerve, there speedily followeth putrefaction and rottennesse. And those Scorpions which have wings, make wounds with a compasse like a bow, whose succeeding symptoms are both heat and cold, and if they hurt about the canicular dayes, their wounds are very seldome recovered.

The *Indian* Scorpions cause death three moneths after their wounds. But most wonderfull is that which *Strabo* relateth of the *Albenian* Scorpions and Spiders, whereof he saith are two kindes, and one kinde killeth by laughing, the other by weeping. And if any Scorpion hurt a vein in the head, it causeth death by madnesse, as writeth *Paracelsus*. When an Oxe or other beast is stricken with a Scorpion, his knees are drawn together, and he halteth, refusing meat; out of his nose floweth a green humour, and when he is laid, he careth not for rising again.

These and such like are the symptoms that follow the bitings and stings of Scorpions, for the cure whereof I will remit the Reader to that excellent discourse written by *Wolphius*, wherein are largely and learnedly expressed, whatsoever Art could collect out of nature. And seeing we in our Countrey are free from Scorpions, and therefore shall have no need to fear their poyson, it shall not I trust offend my Reader, if I cut off the relation of Scorpions cures, as a thing which cannot benefit either the English Reader, or else much adorn this History, and so I will proceed to the medicines drawn out of Scorpions.

Haly.

The application or use of Scorpions in medicine, is either by powder or by Oyl, or by applying them bruised to their own wounds, wherefore every one of these are to be handled particularly; and first of all for the powder, it is made by uftion or burning in this manner. They take ten Scorpions and put them alive into a new earthen pot, whose mouth is to be dammed up with loam or such like stuffe, then must it be set upon a fire of Vine-tree-shreds, and therein must the pot stand

stand day and night untill all within it be consumed to powder, and you shall know by their white colour when they be enough; otherwise, if they be brown or burned, they must be continued longer, and the use of this powder is to expell the stone.

Again, they use to make this powder another way, they take twenty Scorpions, and put them in a little earthen pot with a narrow mouth, which mouth must be stopped, and then the pot put into a Furnace by the space of six hours, which Furnace must also be kept close within, and with a gentle fire: then after six hours take off the pot, and bruise the Scorpions into powder, and keep that powder for the use aforesaid. There are other wayes also to prepare this powder, but in all preparations the attendant and assistant must take heed of the fume or smoak that cometh from it, for that is very venomous and contagious.

But besides, there are many things to be observed herein, as first, that the Scorpions be alive, and that they be killed in Oyl, then, that they be put in whole, with every member, without mutilation, and that the Scorpions appointed for this confection, be of the strongest poyson, and the time of their collection to be when the Sun is in *Leo*, and not in *Scorpius*, as some without reason have imagined.

The Oyl so made, is distinguished into two kindes, one simple, and the other compound. The simple is made of a convenient number of Scorpions, (as it were twenty if they be great, and more if they be little) and they being put into a glasse vessel, Oyl of bitter-Almonds must be powred upon them, and so the vessel stopped close and set in the Sun by the space of thirty dayes, and then stirred and used. Yet the women of *Ferrara* use Oyl-olive in stead of Oyl of bitter Almonds, and also observe no quantity of Oyl, but fill the pot full, and likewise no order in the number of the Scorpions, putting one to day and another to morrow, and so more the next week or moneth, as they can finde them.

Brasavolus.

The compound-oil is thus made, they take round *Astrologe*, *Cypresse*, and *Gentian*, the roots of *Capars*, and upon these they pour Oyl of bitter Almonds, and soak the roots in the Oyl in the hot sun for the space of twenty dayes, then take they a complete number of Scorpions, from betwixt ten to fifteen, these they put again to the Oyl, and so stop up the mouth again, and set it the second time in the sun thirty dayes, and afterward strain it and use it. This compound-Oyl is not so much approved by *Brasavolus*, as the former simple, because the first hath more Scorpions, and the second is stuffed or seasoned with spices.

The green Scorpion which is bred of *Basil*, having seven knots in the tayl, being beaten and pounded with the herb Scorpion, and so made into pills, then dried and put into a glasse, are very profitable to him that hath the Falling-sicknesse, if he take of them three every morning fasting in temperate Wine, but these being given to a sound man putteth him clean out of his wits. If a man take a vulgar Scorpion and drown the same in a porringer of Oyl in the wane of the Moon, and therewithall afterward anoynt the back from the shoulders to the hips, and also the head and forehead, with the tips of the fingers and toes of one that is a demoniack or a lunatick person, it is reported, that he shall ease and cure him in short time. And the like is reported of the Scorpions sting joyned with the top of *Basil* wherein is seed, and with the heart of a Swallow, all included in a piece of Harts skin.

Kiranides.

The Oyl of Scorpions made of common Oyl-olive, is good for the pain in the ears infused by distillation; also it cureth a *Pleurisie* in this manner. They take meal out of a Windmill, and make thereof with water, paste, or little cakes, in quantity like a *French Crown*, these must be sod in a frying-pan in Oyl of Scorpions, and so applyed as hot as can be to the place where the pricking is, and so kept to the same very hot, and when it beginneth to be cold, let new be applyed still, nine times together, successively one time after another. Scorpions bruised in new sweet Wine, doe cure the Kings-evil. The ashes of a Scorpion infused by the yard into the bladder, breaketh and disperfeth both the stone of the bladder and the reyns. And the like operation hath a vulgar Scorpion eaten with vinegar and Rose-cakes applyed to the gowty members, it many times easeth the inflaming pains thereof.

Alexius.

Galenus.

The Oyl of Scorpions is very available in the time of Plague, both by Oyntment and also in position: wherewithall one did affirm to *Volphius* that he gained a great summe of money, which he prepared in this manner. He took a hundred Scorpions, and sod them in the oldest Oyl-olive he could get, untill such time as the Scorpions were consumed, then did he strain them through a linnen cloth, adding unto it an ounce of *Rubarb*, and so shutting it close in a glasse bottle, he set it forty dayes together in the sun, and afterward he gave of it to be used in time of infection, advising them that had it to apply it in oyntment to the pulse, heart, hinder part of the head, neck and nostrils. And if a man began to be sick, within twelve hours after the first sense of his pain, he was annoynted herewith about the tumour, and then was it launced. This oyntment is also commended against all manner of poyson, not onely of other Serpents and venomous beasts, but also of the Scorpion it self. And thus much for the history of the Scorpion.

of the SCYTALLE.

THis Serpent called by the Grecians *Scytale*, is likewise termed by the Latinists, *Scytalis*, and by some *Scicalis*, *Picalis*, *Sciscetalis*, and *Seyseculus*, and by *Albertus*, *Situla*, which we have already interpreted a *Dipsas*, but all of them are most manifestly corrupted from *Scytale*, the first Grecian word. And therefore I will not stand to confute them that call it also *Cecilia*, a blinde worm, because (after the manner of other Serpents) it eateth no Fennell, but this *Cecilia* or blinde Worm, we shall afterward demonstrate to be our English Slow-worm. This *Scytall* is very full of marks or spots upon the back, so variable and delectable, that it possesseth the beholders with admiration, and almost bringeth them asleep looking thereon: for it is also slow, and moveth softly, wherefore it cannot pursue where it would do harm; in stead therefore of celerity, these naturall spots doe hold them that it doth desire to harm, like as they were stupefied and astonished. And in this brightness of the scales, first of all it must lay aside the winter-skin, or else there appeareth not any splendour at all. And it is also said to be so hot and fervide, that it casteth skin in the Winter, according to this saying of *Lucau*;

*Et Scytale sparsis etiam nunc sola pruinis
Exuvias postura suas.*——

That is in English thus;

*None but the Scytall while Winter-frosts abide,
Out of his spotted skin and Scales doth glide.*

The outward form or visible proportion of this Serpent, is like that which we have already called a Double-head, and the Latines, *Amphisbena*, except that the tayl hereof is flatter and thicker. The length of this Serpent is like the longest Worms of the earth, and the thickness like the helve or handle of a spade. And the greatest difference betwixt this and the Double-head, is that this goeth but one way, and the Double-head goeth as well one way as another: and the colour hereof is like the colour of the other. The generall description of this Serpent is thus expressed by *Nicander*;

*Bifronti similem reperis Scytalam Amphisbena
Pinguior est tamen, & cauda, quæ nulla fere exit,
Crassior, ut quantum solita est comprehendere lignum,
Curva manus strictum quoties tenet ipsa ligonem.
Tam proluxa, vagans pluvio quam reptile cælo,
Quod secunda genus sua gignit viscera tellus.
Nec postquam juvenis venienti tempore veris,
Magna Deum quando profert serpentia mater,*

*Liquerit obscuram consueta cubila petram,
Et nitidos tepido sub sole exriverit artus,
Pendentis se fœniculi teneram exedit herbam,
Sæpè per opaca morans imi declivia montis
Se tenet, & multo graviter latet obruta somno,
Eque alta sua conquirat sibi pabula terra:
Nec licet id magno cupiat, studeatque labore
Arescente sitim potis est depellere fauce.*

Which may be Englished thus;

*The Scytall like the Double-head thou shalt in feature finde,
Yet is it fatter, and tayl that hath no end much thicker is,
As big as crooked hand is wonted for to winde
The haft and helve of digging spade the earth that rifts.
As long it is as that thin crawling worm which heavens rain
Begets on fruitfull earth, when bowels warmly moistened are,
And when the Mother-goddesse great sends forth her creeping train,
Which is Yeers-youth, fresh time of Spring, both calm and fair.
Then leaves it off his wonted bed in rock obscure,
And in what sun he stretches out his limbs and sinewes all,
Eating the new sprung-blades of Fennell-herb, so putting teeth in ure,
In holes of the declining hills so keeps both great and small,
Where time in deepest sleep of buried nature it doth passe,
And being hungry, the earth in top of hole it eats,
Quenching the thirst by force of dryest chappes as grasse,
Though without pain, desirelesse it seeks these drinks and meats.*

The biting of this Serpent is like the biting of the Double-head, and therefore the cure is in the same manner, wherefore I shall not need to repeat the signs thereof, or the cure in this place. And so I will conclude the story of this Serpent.

of the SEA-SERPENTS.

AMong the manifold kinds of Sea-serpents, as well known as unknown, (whereof some are like the Lamprey, some like the *Myrus*, and many other like the Serpents of the earth, except in their head, as *Aristotle* writeth, for that is more like the head of a Conger then a Serpent) it peculiarly hath one kinde, in colour and form not unlike an Eel, in length about three cubits, in the gills and finnes resembling a Conger, but it hath a longer snout or beak, which is also fortified inwardly with very many small sharp teeth, the eyes not so great, a smooth or pield skin, and hanging over at the back, having no scales, so as it may easily be sleied. The belly of it is betwixt red and white, and all the body over is set with spires, so as being alive it is not handled without danger. And this is by *Pliny* called the Dragon of the Sea, which cometh out of the Sea into the sands, and therein with an admirable celerity and dexterity maketh his lodging place. For the snout thereof is sharper then the Serpents of the earth, therefore therewith it diggeth and hideth it self in the hole or hollow place which it hath made. This is also called by *Pliny* *Ophidion*, but I think it better to follow *Aristotle*, who doth call it *Ophis thalassios*, a Sea-serpent, the colour whereof is blacker or dimmer then the Conger.

There be also Vipers of the Sea, which are in shew little fishes, about a cubit long, having a little horn in their forehead, the biting or sting whereof is very deadly, and therefore when the Fisher-men have taken any one of these, they instantly cut off the head and bury it in the sand, but the body they eat for good meat: yet these Serpents are thought to be none other then the Fishes called *Arauei*, or Spider-fishes, saving that they are said to have a sharp sting in their head, & this a horn, for all Water or Sea-serpents have harder and less heads then the Serpents of the land.

In the *Germane* Ocean there is found a Serpent about the bignesse of a mans leg, which in the tayl carryeth a sting as hard as any horn, this haunteth only the deepest part of the Sea, yet is it sometime taken by the Fisher-men, and then they cut off the tail, and eat the residue of the body. Yet I will not expressly define whether this may be called a Sea-Serpent, or a Serpentine-fish; it may be it is the same that is a Fork-fish, or Ray, which by reason of the tayl thereof, it might give occasion to *Albertus* to call it a Serpent of the Sea.

There be also Snakes or *Hyders* in the Sea, for although all Water-serpents, as well of the fresh, salt, and sweet waters may be called *Hyders*, or Snakes, yet there be some peculiar Snakes, such as those in the *Indian* Sea, where they have broad tayls, and they harm more by biting with the sharpnesse of their teeth, then by any venom that is contained in them; and therefore in this they somewhat resemble the Snakes of the earth. And *Pliny* writeth, that once before *Persis*, upon the coasts of certain Islands, there were seen of these Sea-hyders very many, of the length of twenty cubits, wherewithall a whole Navy or fleet of ships were mightily affrighted. And the like is reported of three other Islands, lying betwixt the promontory of *Carmania* and *Arabia*; and such were those also in the *African* Sea, who are said by *Aristotle* not to be afraid of a Gally, but will set upon the men therein, and over-turn it. And he himself saw many bones of great wilde Oxen, who had been destroyed by these kinde of Sea-snakes or *Hyders*.

The greatest River that falleth into the red Sea, is called *Sinthus*, the fall whereof afar off, seemeth to the beholders to be like winding Snakes, as though they were coming against the passengers, to stay them from entrance into that Land; and there is not only a sight or resemblance of Serpents there, but also the very truth of them, for all the Sea-men know when they are upon these coasts, by the multitude of Serpents that meet them. And so do the Serpents called *Grae* about *Persis*. And the Coast of *Barace* hath the same noysome premonstration, by occurrence of many odious, black, and very great Sea-serpents. But about *Barygaza* they are lesse, and of yellow earthy colour; their eyes bloody, or fiery red, and their heads like Dragons. *Keranides* writeth of a Sea-Dragon, in this manner, saying: The Dragon of the Sea is a fish without scales, and when this is grown to a great and large proportion, whereby it doth great harm to other creatures, the winds or clouds take him up suddenly into the air, and there by violent agitation, shake his body to pieces: the parcels whereof so mangled & torn asunder, have been often found in the tops of the Mountains. And if this be true (as it may well be) I cannot tell whether there be in the world a more noble part of Divine providence, and sign of the love of God to his creatures, who armeth the clouds of heaven to take vengeance of their destroyers. The tongue of this Sea-Dragon (saith he) is like a Horses tayl, two foot in length; the which tongue preserved in Oyl, and carried about by a man, safeguardeth him from languishing infirmities, and the fat thereof, with the herb Dragon annoynted on the head or sick parts, cureth the head-ache, and driveth away the Leprosie, and all kinde of scabs in the skin.

Here is also the picture of another Sea-serpent, very like to the Serpent of the earth, being three or four cubits long, having a rounder belly then an Eel, but a head like a Conger, and the upper chap is longer, and standeth out further then the nether chap; the teeth grow therein as they do in Lampreys, but they are not so thick, and it hath two small finnes neer the gills like an Eel. The colour of it is yellow, but the beak and belly is of Ash-colour, the eyes yellow, and in all the inward parts it doth not differ from a Lamprey, and there is no man of any understanding, (as writeth *Rondeletius*) but at the very first sight, will judge the same to be a Serpent although the flesh thereof

Among the manifold kinds of Sea-Serpents, as we have seen in the last chapter, some like the Manx, and many others, are distinguished by their heads as different from the rest, for that is more like a crocodile than a serpent, it is pointed, and has a large eye, and a long snout, which is furnished with many sharp teeth, and is capable of being extended and retracted at pleasure. This is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen. It is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen. It is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen.

And this is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen. It is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen. It is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen. It is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen. It is the head of the Sea-Serpent, which is the most dangerous of all the kinds, and is the one that is most commonly seen.

There is no more to be said of the Sea-Serpent, but I must leave it to the reader's judgment. The foot of the Sea-Serpent is also very large, and is capable of being extended and retracted at pleasure. And some say may be seen in the Sea. The Sea-Serpent is also very large, and is capable of being extended and retracted at pleasure. And some say may be seen in the Sea. The Sea-Serpent is also very large, and is capable of being extended and retracted at pleasure. And some say may be seen in the Sea.

be no more harmfull then the Conger or Lamprey; yet for similitude with other Serpents, I could not chuse but expresse the same in this place,

There be also in the *Suevian* Ocean or *Baltick* sea, Serpents of thirty or forty foot in length, whose picture is thus described, as it was taken by *Olaus Magnus*, and he further writeth, that these do never harm any man untill they be provoked.

The same Author also expresseth likewise the figure of another Serpent, of a hundred and twenty foot long, appearing now and then upon the coasts of *Norway*, very dangerous and hurtfull to the Sea-men in calms and still weather, for they lift up themselves above the hatches, and suddenly catch a man in their mouths, and so draw him into the Sea out of the Ship: and many times they overthrow in the waters a laden Vessel of great quantity, with all the wares therein contained. And sometimes also they set up such a spire above the water, that a Boat or little Bark without sayls may passe through the same. And thus much for the Sea-serpents.

Of the SEPS or SEPEDON.

Although I am not ignorant that there be some which make two kindes of these Serpents, because of the two names rehearsed in the title, yet when they have laboured to describe them severally, they can bring nothing or very little wherein their story doth not agree, so as to make twain of them, or to handle them asunder, were but to take occasion to tautologize, or to speak one thing twice. Wherefore *Gesner* wisely pondering both parts, and after him *Cayronus*, deliver their opinions, that both these names do shew but one Serpent, yet according to their manner, they expresse them as if they were two. For all their writings do but minister occasion to the Readers to collect the truth out of their labours, wherefore I will follow their opinion, and not their example. Sepedon and Seps cometh of *Sepein*, because it rotteth the body that it biteth: in colour it neerly resembleth the *Hæmorre*, yet it usually goeth by spires and half-hoops, for which cause as it goeth, the quantity cannot be well discerned, the pace of it being much swifter then the *Hæmorre*. The wound that it giveth is smarting, entring deep and bringing putrefaction, for by an inexplicable celerity, the poyson passeth over all the body, the hair rotteth and falleth from all parts, darknesse and dimnesse is in the eyes, and spots upon the body, like as if a man had been burned in the Sun. And this Serpent is thus described unto us by *Nicander*;

*Jam quæ Sepedonis species sit, quæque corpus
Accipe: diversa tractum ratione figurat.
Quin etiam mutile nulla insunt cornua fronti,
Et color, hirsuti qualem est spectare tapetis,
Grande caput, brevior dum currit, cauda videtur:
Quam tamen obliquo majorem tramite ducit.
Quod fit ab hoc vulnere, magnos nocuosque dolores*

*Excitat, interimens quia fundit & ipse venenum,
Quo sata marcentes tabes depascitur artus,
Indeque siccata resolutus pelle capillus
Spargitur, & volitans candentis pappus achane,
Præterea fœdum turpi vitilagine corpus,
Et veluti urenti maculas à sole videre est.*

Which may be Englished thus;

*Sepedons shape now take, and what his form of body is,
It doth not go as Hemorrhoe doth, but traileth diversly.
His powdered head of Hemorrhoe's horns full happily doth misse,
And colours are as manifold as works of Tapestry:
Great is his head, but running seems the tail but small;
Which winding, it in greater path draws after to and fro,
But where it wounds, by pains and torments great it doth appall,
Killing the wounded, infusing poyson so.
Whereby consumed are the lean and slender sinews,
And dried skin lets hair fall off apace,
Like as the winds drive whites from top of thistle Cardus,
Besides the body filth, as with Sun parched, loseth grace.*

Thus doth Nicander describe the Sepedon: now also we will likewise relate that which another Poet saith of the Seps, that both compared together, may appear but one, therefore thus writeth Lucan, upon occasion of one Sabellus wounded by this Serpent.

Miserique in crure Sabelli

*Seps sterit exiguus, quem flexo dente tenacem
Auulsiſitque manu, piloque affixit arenis.
Parva modò Serpens, sed qua non ulla cruenta
Tantum mortis habet: nam plaga proxima circum
Fugit raptâ cutis, pallentiaque ossa reſexit.
Jamquæ sinu laxo nudum est sine corpore vulnus:
Membra natant sanie, juræ fluxere, sine ullo
Tegmine poples erat: femorum quoq; musculus omnis
Liquitur: & nigra distillant inguina tabe.
Diffiliit stringens uterum membrana, fluminaque
Viscera, nec quantum toto de corpore debet,
Effluit in terras sævum, sed membra venenum
Decoquit: in minimum mors contrahit omnia virus.*

*Vincula nervorum, & laterum textura, cavumque
Pectus, & abstrusum fibræ vitalibus omne,
Quicquid humo est, aperit pestis: natura profana
Morte patet: manant humeri, fortesq; lacerti:
Colla caputq; fluunt, callido non ocyus Austro
Nix resoluta cadit, nec solem cera sequetur.
Parva loquor, corpus sanie stillasse perustum:
Hoc & flamma potest, sed quis rogus abstulit ossa,
Hæc quoque discedunt, putresq; secuta medullas
Nulla manere sinunt rapidi vestigia fati.
Cyniphias inter pestes tibi palma nocendi est:
Eripiunt omnes animam, tu sola cadaver.
Mole brevis seps, peste ingens, nec viscera solum,
Sed simul ossa vorans tabificus Seps.*

Which is to be Englished thus;

*On wretched Sabell's leg a little Seps hung fast,
Which with his hand from hold of teeth he pluckt away
From wounded place, and on a pile the Serpent all agast
He staked in sands, to him O woful wretched day,
To kill this Serpent is but small, yet none more power hath,
For after wound falls off the skin, and bones appear full bare,
As in an open bosome, the heart whole body gnaweth,
Then all his members swam in filth: corruption did prepare
To make his shanks fall off, uncovered were knee-bones,
And every muscle of his thigh resolved, no more did hold,
His secrets black to look upon, distilled all Consumptions,
The rim of belly brake out fierce, which bowels did infold,
Out felt his guts on earth, and all that corps contain,
The raging venom still heating members all,
So death contracted all by little poysons main,
Unloosing nerves, and making sides on ground to fall:
This plague the hollow breast and every vital part
Abstrused, where the fibres keep the life in ure,
Did open unto death: The life, the lungs, the heart.
O death profane, and enemy unto nature.
Out flew the shoulders great, and arm-blades strong,
Both neck and head gush out in matter, all doth run,
No snow doth melt so soon the Southern blast among,
